

Total output:
 If both machines process both functions evenly, total output per sec is
 $12 \text{ k packets of VNF1} + 15 \text{ k packets of VNF2} = 27 \text{ k packets}$
 $3 \text{ k packets of VNF1} + 15 \text{ k packets of VNF2} = 18 \text{ k packets}$
 So total output is **45 k packets**.

But if comparative advantage is used, total output is
 $21 \text{ k packets of VNF1} + 30 \text{ k packets of VNF2} = \mathbf{51 \text{ k packets}}$
