

**Graphical representations**

## Visualization Software

Transforms graphical representations into database queries

## Database system

The database system "serves" clean raw data to the visualization software or interactive queries. This is typically read only data.

## Batch processing

The data cleaning operation is executed by Extract and Transform tasks, e.g. defined in Hadoop MapReduce

## HDFS cluster

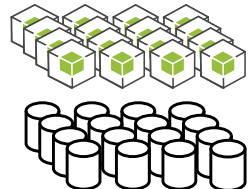

The HDFS storage layer "serves" clean raw data to the intermediate database layer

## Input data

Input data can be collected from several sources: e.g., system logs, web application API, etc ...

**Ingestion phase**

**Load phase**

**SQL-like queries**

**Interactive queries**
