

1 Supplementary Material

Table 1 summarizes the hyperparameters that we use, which include the dimension H of the LSTM layers, the number of training epochs, and patience. In all the systems, the dimension of the character embedding layer is 100. Throughout, all LSTMs are single-layer. The dimension of the feature embedding layer in HACM is set to 20, and the dimension of the action embedding layer in HAEM is 100. For optimization, we use ADADELTA (Zeiler, 2012) without regularization. All the system are implemented in DyNet (Neubig et al., 2017).

system	HACM			HAEM				Nematus	
setting	low	medium	high	low	medium	rest	high naive model 2		
H	200							300	600
epochs	50	30	20	60	60	35	20	10,000	
patience	10	10	10	30	20	10	10	10	
dropout	0.0			0.5				0.0	0.2

Table 1: Hyperparameters and training choices. All HAEM high setting models except model 2 share the same hyperparameters.

Nematus run Additionally to the settings documented in Table 1, we use the ADAM optimizer with a learning rate of 0.0001 and batch size 1, and set the length limit on the output sequences per language such that at least 99.5% of all training examples can be represented without truncation. The preprocessing for the character-based Nematus run consists in a) replacing uppercase letters by a sequence of * and the corresponding lowercase characters, b) prefixing all morphological features with the first category (almost always the part-of-speech tag of the lemma). We use tied embeddings (Press and Wolf, 2017), including tying the input and output embeddings of the decoder.

1.1 Results on the development set

Tables 2, 3 and 4 show our results on the official development set.
