

1 Supervised fine tuning (Step1)

A pretrained GPT model is used, fine-tuned with labels by creating a supervised dataset.

1.1

The labelers then wrote an appropriate response to the input prompt's

1.2

GPT model will be fine-tuned using new supervised dataset

1.3

2 Reward Model (Step 2)

Supervised fine tuning (SFT) model is used, inputs are fed to the finetuned model, several responses were generated

2.1

Labeler provides a reward for each of these outcomes, ranks the outcomes from best to worst

2.2

This data is used to train a reward model

2.3

After the model is trained in step 1, In this step it generates optimal responses to input

Proximal Policy Optimization (PPO) Reinforcement Learning (Step 3)

3

A new prompt is sampled from the trained dataset

3.1

The PPO model is initialized from the supervised policy

3.2

The policy generates the output

3.3

The reward model calculates a reward for the output

3.4

The reward is used to update the policy using PPO

3.5

In this step unseen input sequences are passed to the clone SFT model, pass the responses to the reward model for understanding, how high quality was this response for that input
