2024-2025 Undergraduate Catalog

Carnegie Mellon University is accredited by the Middle States Commission on Higher Education. The university is authorized to operate in several states.
www.cmu.edu (http://www.cmu.edu)

Carnegie Mellon University's Undergraduate Catalog is an annual publication that details academic programs and degrees offered, course descriptions, and university policies and services.

While information in this catalog is current as of August 2024, it is subject to change throughout the academic year. Students should consult with their academic department for the most up-to-date information about program requirements. Members of the campus community may direct catalog changes or inquiries to catalog@andrew.cmu.edu. Note that once the PDF of the catalog is final and archived, changes can only be made to the online version.

The next catalog will be published in August 2025; in the interim, new courses will be displayed in the Schedule of Classes (https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/), which is published in November and April each year.

Policy Statement

Carnegie Mellon University does not discriminate in admission, employment, or administration of its programs or activities on the basis of race, color, national origin, sex, disability, age, sexual orientation, gender identity, pregnancy or related condition, family status, marital status, parental status, religion, ancestry, veteran status, or genetic information. Furthermore, Carnegie Mellon University does not discriminate and is required not to discriminate in violation of federal, state, or local laws or executive orders.

The university's Discriminatory and Sexual Misconduct Policy *(*https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/*) contains grievance procedures that provide for the prompt and equitable resolution of Complaints alleging any action which would be prohibited by this Policy.*

Inquiries concerning the application of and compliance with this statement should be directed to the Office for Institutional Equity and Title IX, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA 15213, telephone 412-268-7125.

About CMU

Carnegie Mellon is a private, internationally ranked (https://www.cmu.edu/about/rankings.html) research university with programs in areas ranging from science, technology and business, to public policy, the humanities and the arts. More than 16,000 students in the university’s seven schools and colleges benefit from a small student-to-faculty ratio and an education characterized by its focus on creating and implementing solutions for real problems, interdisciplinary collaboration and innovation.

Undergraduate students can pursue majors in six of the university's seven colleges: the College of Engineering, the College of Fine Arts, the Tepper School's business administration program, the Dietrich College of Humanities and Social Sciences, the Mellon College of Science, and the School of Computer Science.

CMU is positioned like never before to meet the challenges of the 21st century. At the intersection of technology and humanity, CMU research, innovation and creativity will continue to guide our future as a world-class university.

As outlined in the Strategic Plan 2025 (http://www.cmu.edu/strategic-plan/), the university will focus on advancing the individual student experience, the broader Carnegie Mellon community experience, and the social impact of Carnegie Mellon throughout the world.

Take a closer look at CMU (p. 7).

Vision & Mission

Vision

Carnegie Mellon University will have a transformative impact on society through continual innovation in education, research, creativity, and entrepreneurship.

Mission

To create a transformative educational experience for students focused on deep disciplinary knowledge; problem solving; leadership, communication, and interpersonal skills; and personal health and well-being.

To cultivate a transformative university community committed to (a) attracting and retaining diverse, world-class talent; (b) creating a collaborative environment open to the free exchange of ideas, where research, creativity, innovation, and entrepreneurship can flourish; and (c) ensuring individuals can achieve their full potential.

To impact society in a transformative way — regionally, nationally, and globally — by engaging with partners outside the traditional borders of the university campus.

Look at Carnegie Mellon

CMU's History

In a letter written in 1900, industrialist and philanthropist Andrew Carnegie offered to give the city of Pittsburgh $1 million in bonds to found a technical institute. The city provided 32 acres of land near Schenley Park, and the institution became known as the Carnegie Technical Schools. According to Carnegie's plans, the institution would train the sons and daughters of working-class families in five schools: Science and Technology, to train draftsmen and engineer's assistants; Fine and Applied Arts, for designers and art workers; Apprentices and Journeymen, for mechanics in manufacturing and construction; and Margaret Morrison Carnegie College, for home economists or secretaries. Within two decades, the Carnegie Technical Schools offered bachelor's, master's and doctoral programs, and fittingly changed its name to the Carnegie Institute of Technology.

In 1967, the trustees of the Mellon Institute and the Carnegie Institute of Technology merged the two institutions and adopted the name Carnegie Mellon University. In 1968, Margaret Morrison Carnegie College closed and the university organized a new College of Humanities and Social Sciences. New graduate-level colleges and schools also flourished, including the Graduate School of Industrial Administration (GSIA), the Heinz College of Public Policy and Management, and the School of Computer Science. As time progressed, new research centers and institutes developed on and off campus in specialties ranging from art conservation to sustainable computing. In 2004, GSIA was renamed the Tepper School of Business after alumnus David A. Tepper.

Over time, the Carnegie Institute of Technology has developed from a regional, technical college into Carnegie Mellon University, a selective, international research university that ranks among the nation's best colleges.

A Unique Educational Experience

The university's diverse community, focus on strong student-faculty ties and commitment to education outside the classroom combine to create a learning environment that is as uniquely Carnegie Mellon as the Tartan plaid on the kilts of its bagpipers.

Carnegie Mellon strives for a campus culture that reflects a fundamental respect for different ways of living, working, and learning so every student has the opportunity to reach their potential.

A Carnegie Mellon education is marked by its strong focus on fundamental and versatile problem-solving skills in a specific discipline, but the university respects and values students' varied talents and interests that often span many specialties. Students can explore more than one field of study while developing the strong professional core that is the hallmark of a Carnegie Mellon education. The university encourages students to expand their thinking in new and exciting dimensions.

CMU's faculty conduct groundbreaking research, create new and exciting art, and contribute to a growing global scholastic community. They are continuously innovating, and the new knowledge they create and the methods they discover routinely benefit classroom learning. Research is a vital component of undergraduate education at Carnegie Mellon. Students can initiate projects of their own or become involved with existing ones on campus.

A Global Impact

In its 115 years, Carnegie Mellon has soared to national and international leadership in higher education and research. A birthplace of innovation since its founding, it continues to be known for innovation, for solving real-world problems and for interdisciplinary collaboration.

Its alumni can be found across the globe — from Tony Award winners to Nobel Prize and Turing Award winners, from CEOs to entrepreneurs, from professors to artists.

In the 2000s, in response to demand for expanded international educational opportunities, Carnegie Mellon began offering degree programs outside of Pittsburgh. Today its global presence includes campuses in Qatar and Silicon Valley, California, more than a dozen degree-granting locations, and more than 20 research partnerships such as Los Angeles, New York City, Washington, D.C., Portugal, and Africa.

ADMISSION PHILOSOPHY

At Carnegie Mellon, we select our first-year class from a large group of very qualified candidates. We don’t use a calculation to choose who to admit because calculations can’t take into account all the factors we consider when making admission decisions. No single grade, factor, score or activity will automatically gain or deny you admission to Carnegie Mellon. We treat every applicant as an individual, taking great care to make our admission decisions fair, thorough and sensitive. We’re interested in students who can be successful at Carnegie Mellon while taking full advantage of all the university has to offer.

ADMISSION CRITERIA

Our admission process is designed to select a highly talented, diverse undergraduate population with high aspirations who will succeed at Carnegie Mellon. If you’re applying to academic programs, your high school performance will be a significant factor in our admission decision because it’s the most meaningful indication of your motivation and abilities. We pay close attention to your curriculum rigor, the grades you’ve earned and the work you’ve accomplished. We’re interested in seeing that you’ve challenged yourself within your secondary school environment. If you’re applying to programs in the arts, your artistic performance will be either the main factor or a significant factor (depending on the program) in our admission decision.

Standardized test scores add to our knowledge of your preparation, but we don’t make decisions on the basis of test scores alone. Carnegie Mellon is test optional for fall 2025 undergraduate admission applications. However, students applying to the School of Computer Science are strongly encouraged to submit either an SAT or ACT score, including the math subscore, to bolster their application's strength and to aid in determining their ability to succeed academically at Carnegie Mellon. Pursuant to this policy, applicants aren't required to submit SAT or ACT results; however, results will be considered for those who submit them. Students who are unable to take either the SAT or ACT or choose not to submit their standardized test scores will be considered equally for admission along with those who submit scores. Please also note that submission of any prior SAT Subject Test results won’t be considered in our admission review process.

Your non-academic interests, including extracurricular involvement, part-time jobs, family commitments, hobbies and community engagement play a very important role in the admission process. We also consider collaboration, perseverance, passion, advocacy for others and self-direction when making admission decisions. We’re interested in students who can be successful at Carnegie Mellon while fully engaging in the university community. Because we want to have a sense of who you are as a person, we look closely at your Common Application essay, your short answer questions, your secondary school counselor's evaluation and your secondary school teacher's recommendation. By looking at this non-academic information, we develop a sense of your personality, motivation and responsibility.

We don't consider demonstrated interest in our admission process. Demonstrated interest is a term used in undergraduate admission that describes the ways in which a prospective student shows a college that they’re interested by visiting campus and submitting additional materials that aren’t required in the application. As a result, we don't consider a campus visit or communication with the Office of Admission or other members of the Carnegie Mellon community when making admission decisions.

Carnegie Mellon doesn't collect or review criminal history information as part of the admission process. However, individuals who are admitted to Carnegie Mellon will be required to disclose any past criminal conviction as part of the enrollment process. Learn how Carnegie Mellon considers criminal history (https://www.cmu.edu/hub/consumer-information/#criminaljustice) information.

COLLEGE CRITERIA

Each college/program at Carnegie Mellon has admission criteria specifically related to each course of study.

Admission to the Schools of Drama and Music is based primarily on a pre-screen, audition or (for select School of Music programs) portfolio review. Applicants to the Schools of Architecture, Art and Design will be evaluated not only on the basis of their portfolio review but also on their academic performance.

Applicants to the College of Engineering, Mellon College of Science, School of Computer Science and Tepper School of Business will be evaluated on their academic performance, with emphasis on strength in mathematics and science. Applicants to the Dietrich College of Humanities and Social Sciences and the Information Systems program will be evaluated on their academic performance, with emphasis on reading and comprehension abilities along with mathematics coursework. We'll also evaluate both groups of applicants based on their ability to communicate thoughts and ideas in writing.

Applicants should be aware of our admission requirements (https://www.cmu.edu/admission/admission/undergraduate-admission-requirements/) (secondary school preparation, nonacademic information and counselor and teacher recommendations) when submitting applications.

Think carefully about your Carnegie Mellon college selection(s) before applying. While you may apply to up to two colleges or programs that match your interests, bear in mind that most applicants will only be selected for their highest-choice college to which they‘re admissible. It’s rare for students, even of the highest quality, to be granted admission to more than one of their college selections. Early Decision and transfer candidates may only apply to their first-choice college or program at Carnegie Mellon. Please note that admission to the university is always contingent upon maintaining academic performance and community conduct commensurate with that which resulted in admission. Admission decisions will be rescinded for failure to maintain strong academic performance, community conduct, honesty, maturity and/or moral character.

Applying as a First-Year Student

If you're applying to Carnegie Mellon as a first-year undergraduate student entering in fall 2025, here's how to apply. Graduate students should refer to the Graduate and Postdoctoral Affairs website (https://www.cmu.edu/graduate/prospective/) for application instructions.

1. Choose your admission plan. Carnegie Mellon offers the following application plans: Regular Decision, Early Decision and Transfer Admission.

- **EARLY DECISION:** Early Decision is a binding application plan for students who view Carnegie Mellon as their first choice university. This means if you're admitted through Early Decision, you're committed to attending Carnegie Mellon and must withdraw any applications you may have submitted to other institutions. **Applications and supporting admission materials are due by November 1.** *Early Decision is not available for acting, directing, dramaturgy, music theater, BXA Design programs or the School of Music.*
- **REGULAR DECISION:** Regular Decision is the most common plan for students who apply to Carnegie Mellon. It’s common for students to apply Regular Decision to a number of institutions and then compare financial aid offers. **Applications and supporting admission materials are due by January 2.** Applications and supporting admission materials for **Regular Decision for the Schools of Drama and Music is December 1.**
- **TRANSFER ADMISSION:** Each year, Carnegie Mellon admits a small number of transfer students as space permits. The policy for transferring varies from college to college within Carnegie Mellon, so please carefully review the deadlines listed on the Undergraduate Admission website (https://www.cmu.edu/admission/admission/application-plans-deadlines/).

2. Complete the online Common Application (http://www.commonapp.org/). If you're applying for our Regular Decision plan, please request that your secondary school counselor submit all secondary school transcripts, including senior year courses and a school profile, to the Office of Admission as close to January 2 as possible, but no later than January 15. Mid-year grades should be submitted as soon as possible after they become available. It’s your responsibility to check what documents we’ve received on the Where Am I in the Process? portal to acknowledge receipt of these items. Receipt of mailed or faxed materials will be found on your Where Am I in the Process? portal within 7–10 business days after being received by the Office of Admission.

3. Apply for admission only to the specific college(s) or program(s) in which you're interested.

- Rank your program and/or major preference. We strongly urge applicants to indicate a program and/or departmental preference at the time they apply. Although students might not declare a major until the end of their first or second years, we have to limit access to certain departments.
- You may apply to up to two colleges/programs if your second choice program is from the College of Fine Arts—you cannot apply to more than one academic program. (Early Decision and transfer candidates may only apply to one college/program.)
- Students applying to CFA must apply directly to one or more of the following: School of Architecture, School of Art, School of Design, School of Drama or School of Music.
- If applying to more than one college, you must detail your multiple interests in the Carnegie Mellon short response questions.
- Be sure to review the admission requirements for each college/ program.

4. Send a non-refundable application fee of $75 electronically as you complete the Common Application. This fee is required. However, if you have a College Board or NACAC fee waiver or if you have any of the Common Application's listed economic indicators, you can note this on your registration form in order to have your payment waived. Only U.S. citizens, permanent residents and DACA students are eligible for fee waivers. An additional audition/portfolio review fee will be required at the time of online registration for Drama and Music pre-screening, audition or music portfolio review. For School of Music applicants, the additional audition fee is $55. For School of Drama applicants, the audition or prescreening fee is $120. These fees are payable at the time of reserving a pre-screening, audition or portfolio review online on the Fine Arts section of our website. For applicants to the Schools of Art, Architecture or Design, there is a $20 fee to submit the portfolio.

6. If you choose to have your SAT or ACT scores considered, you're required to submit all official results. While we're interested in the general pattern of your scores, we give the most weight to the highest score you've received on the SAT. On the ACT, we give most weight to the set of scores corresponding to the highest composite score. Carnegie Mellon does not super-score the ACT. We believe that college admission testing in the 9th and 10th grades adds to the anxiety of a process that students won't encounter for several years. As a result, we encourage students to submit 11th or 12th grade SAT or ACT scores (tests taken the summer after 10th grade are appropriate). While earlier tests may measure knowledge at the time they are taken, that level of knowledge gradually evolves and doesn't fully represent the knowledge students bring to college first-year courses. Should students present tests taken two or more years in advance of their first-year experience, we have to take the timing of the test result into consideration. The greater the amount of time prior to college matriculation, the less we can rely on the test result as a fair representation of a student's preparation entering first-year college courses.

7. If English is not your native language, submit additional test results. Applicants who don't speak English as a first language must submit the results of the Test of English as a Foreign Language (TOEFL), the International English Language Testing System (IELTS) or the Duolingo English Test.

8. If you're applying to the College of Fine Arts, submit your Common Application before completing portfolio submission, pre-screening or audition requirements. All of our fine arts programs require that students apply to the university and obtain their Application ID before registering for a pre-screening or audition, or before submitting a portfolio.

9. Sign the "FERPA Release Authorization" on the Common Application School Report Form and then request your secondary school counselor complete the form. Your counselor should submit this form to the Office of Admission along with the school profile and your transcript.

10. Choose a teacher to complete the Common Application Teacher Recommendation Form. Make sure it's submitted to the Office of Admission by November 1 for Early Decision and by January 15 for Regular Decision.

11. If you're applying for financial aid, submit all requested documents. We require financial aid applicants to complete the Free Application for Federal Student Aid (FAFSA) and the CSS Profile, and submit signed copies of parent/guardian and student tax documents. Learn more about applying for financial aid (https://www.cmu.edu/admission/costs-aid/) as an applicant.

Application Notification

- Students applying under the Early Decision plan will be notified of a decision by December 15.
- Students applying under the Regular Decision plan will be notified of a decision by April 1.
- Students who are applying for financial aid will also receive financial aid decisions by April 1 as long as they submit their financial aid forms by the preferred February 15 financial aid deadline.

If you're offered admission and wish to enroll at Carnegie Mellon, you're required to pay an $800 non-refundable enrollment deposit by May 1 (or February 15 for Early Decision admits) in order to reserve your place in the first-year class and in university housing. This deposit will be credited to your first semester's charges. The admission staff assumes that a student's deposit to Carnegie Mellon is their only deposit. We reserve the right to cancel our offer of admission if a student also posts a tuition deposit at another university. Throughout the summer, information concerning registration, enrollment, insurance, orientation, housing, dining, and more will be communicated to all incoming students.

Deferred Admission

If you're admitted to Carnegie Mellon and wish to defer your admission for one year, you must submit a written request to the Office of Admission. If permission is granted, your enrollment deposit must be paid to confirm enrollment for the following year. You must agree not to apply to or enroll in a full- or part-time degree program at another institution in the interim.

APPLICATION MISREPRESENTATION

We value academic and artistic integrity and authenticity in the admission process. Furthermore, Carnegie Mellon assumes that lists of activities, accomplishments, awards, essays and recommendations are authentic, original and accurately reflect student achievements. We reserve the right to launch an investigation when falsified transcripts, artistic submissions of work or misrepresentation of credentials that are not accurate, original and authentic representations of a student's ability and level of accomplishment are suspected. A student's admission status will be placed on hold during an investigation and can result in the cancelation of an application or the withdrawal of an offer of admission. Carnegie Mellon does report confirmed cases of misrepresentation to the Common Application.

All offers of admission are based on the assumption that students will maintain the level of academic performance and community conduct that has resulted in admission to Carnegie Mellon. Admitted and enrolled students are expected to abide by Carnegie Mellon's code of conduct, found within our student handbook, The Word.

Application Plans

Early Decision

These plans are ideal for students who view Carnegie Mellon as their first choice or if it has become their first choice before Regular Decision applications are due. For Early Decision, you'll apply by **November 1.** You'll apply to only one college within the university and receive your admission decision earlier (by December 15) in your senior year than our Regular Decision plan. If you're admitted under Early Decision, you've agreed to enroll, so this isn't the best plan if you want to compare financial aid offers from other institutions. *Early Decision is not available for acting, directing, dramaturgy, music theater, BXA Design programs or the School of Music.*

We give three admission decisions for students applying Early Decision: admit, not admit or, in some cases, defer to Regular Decision. Students who receive a "not admit" decision during Early Decision aren't eligible to apply for Regular Decision.

If you apply Early Decision, we encourage you to submit applications to other colleges/universities. However, you must agree to withdraw these applications if notified of Early Decision acceptance.

Applying Early Decision won't affect your overall admission decision. Students applying Early and Regular Decision are admitted at almost exactly the same rate.

Regular Decision

Regular Decision is our most popular application option. You'll apply to up to two colleges (if your second choice is from the College of Fine Arts) by

January 2 (December 1 for Drama and Music applicants). You'll be notified of your decision by April 1. Students admitted under Regular Decision will have until May 1 to accept our offer of admission.

Applying as a Transfer Student

Each year, Carnegie Mellon admits a very small number of transfer students where space permits. The policy for transferring into Carnegie Mellon varies from college to college. If you're interested in transferring into one of our academic programs, we must first make sure there's space available in your program of interest. Please note that space in these programs is extremely limited. If there's space, we'll look closely at your official college transcript, professor recommendations, high school grades and test scores (all SAT, ACT or language proficiency examination scores, if available). If you don't have official ACT or SAT results, there's no expectation to submit them.

In the College of Fine Arts, most transfer applicants are required to complete a pre-screen, audition or portfolio review.

Transfer Application Instructions

1. Apply for admission to the specific college or program in which you're interested. Make sure to note which department you prefer on the Common Application. Transfer students will only be considered for one college.

- Fall transfer is possible if space is available.
- Spring transfer may be possible for some colleges, but is extremely limited due to space constraints. CFA applicants cannot apply for spring admission.
- External transfers cannot apply to BXA programs.

Please submit your application by the deadline:

- Spring transfer: October 15
- Fall transfer: February 15 (December 1 for drama and music, January 3 for architecture, art and design)

Learn more about Transfer Application (https://www.cmu.edu/admission/admission/application-plans-deadlines/) deadlines.

2. Send a non-refundable application fee of $75 electronically as you complete the Common Application. This application fee is required, except in extenuating financial circumstances. To request a waiver, send us a letter from a college advisor or your dean requesting an application fee waiver in place of the application fee. Only U.S. citizens or permanent residents are eligible for fee waivers.

3. Send all college/university and secondary/high school transcripts to the Office of Admission. If you wish to attend Carnegie Mellon as a transfer student and have previously applied to the university, you must resubmit an updated Common Application with your application fee and all other required materials. *If you're admitted, make arrangements to have a final copy of your college transcript(s) sent to Carnegie Mellon.*

4. Send a copy of course descriptions from a college catalog from each college/university you attended so we can evaluate transferable credits. Course descriptions should be sent through the Common Application or by completing a form electronically (https://admission.cmu.edu/register/collegecourses/). You should copy and paste your course descriptions into a single document, saved as a PDF that has your name, address and Common Application ID on the first page. *If you're applying to Dietrich College of Humanities and Social Sciences for admission to select programs, you may also be asked to submit course syllabi.*

5. Sign the "FERPA Release Authorization" on the Common Application College Report Form. Have your dean or advisor at the college you're attending (or last attended) complete this form. Your dean or advisor should return the form directly to the Office of Admission.

6. Once available, check your Where Am I in the Process? portal for an official admission decision. If accepted, you'll need to complete an enrollment reply form. Please note that admission to the university is contingent upon maintaining academic performance and community conduct commensurate with that which resulted in admission. Admission decisions will be rescinded for failure to maintain strong academic performance, community conduct, honesty, maturity and moral character.

Deposit Information for Transfers

If you're offered admission for the spring semester, Carnegie Mellon does not require a tuition deposit due to the short time interval between December 15 and the start of the spring semester. If you're offered admission to the College of Fine Arts for the fall semester, you must pay a non-refundable deposit of $800 by May 1. If you are offered admission to Engineering, DC, IS, MCS, SCS, or Tepper for the fall semester, you must pay a non-refundable $800 deposit by June 1, even if you are receiving financial aid. The enrollment deposit will reserve your place at the university and a place in university housing if available. It will be credited to the first semester charges.

IMPORTANT: If you accept our offer of admission, we assume that your tuition deposit to Carnegie Mellon is your only tuition deposit. We reserve the right to cancel our offer of admission if you post a tuition deposit at more than one university. Enrollment deposits received after the deposit deadline will be returned if space is no longer available.

University Housing for Transfers

University housing isn't guaranteed for transfer students. Housing Services has a webpage available to help you locate housing accommodations (https://offcampus.housing.cmu.edu/) in the local area in the event that campus housing isn't available.

Transfer Credit Evaluated on Individual Basis

The college/school to which you're admitted will determine transfer credit for courses you've taken at other universities. We only offer transfer credit evaluations to admitted students. Transfer credit is considered on an individual basis. We may award elective credit for courses with no Carnegie Mellon equivalent.

Transfer credit for courses you're taking while we're reviewing your existing college record depends upon successful completion of each course. Grades aren't transferred — only credits. Sometimes transfer students have to take specific courses and accumulate a larger total number of credits than the normal amount required for graduation. The time it takes for you to graduate will depend on the time you need to complete the full university degree requirements — not on your class standing at a previous institution.

If you transfer in the fall semester, you'll be given instructions on how to receive an estimate of the additional academic work you must complete in order to fulfill the university degree requirements.

If you transfer in the spring semester, you'll have the opportunity to meet with an associate dean or advisor in order to outline the additional academic work you must complete to meet the university degree requirements.

It's best for transfer students in CFA to assume they'll receive first-year status. Occasionally advanced standing is awarded based on review of previous college courses.

You must make arrangements to have a final copy of your college transcript(s) forwarded to Carnegie Mellon's Office of Admission by July 1.

Applying as an International Student

International students should apply to Carnegie Mellon using the same procedures outlined for either first-year or transfer students. Also, note this additional information:

- Carnegie Mellon doesn't offer financial aid or installment plans to international students. International students aren't eligible for application fee waivers.
- If English isn't your native language, you're required to take the Test of English as a Foreign Language (TOEFL), the International English Language Testing System (IELTS), the Duolingo English Test, or the Cambridge English Assessment. Learn more about accepted scores (https://www.cmu.edu/admission/admission/international-applicants/#language).

Scores should be no more than two years old at the time of application, and we prefer that you submit all English proficiency test results from the past two years.

Regular Decision applicants should arrange to have these scores sent to Carnegie Mellon no later than January 7.

- InitialView (https://initialview.com/home/) or Vericant (https://vericant.cn/en/about-the-interview-en/) interviews are recommended for non-native English speakers but aren't required. Often these interviews can measure readiness for engagement in the classroom and also showcase a student's personality, likes and dislikes as well as the area of intended major. These interviews can also show English language proficiency while also corroborating the application with more details about the student.

Advanced Placement Consideration

Advanced Placement Program

Carnegie Mellon recognizes the Advanced Placement program and may grant advanced placement and credit for test scores of four or five (https://www.cmu.edu/hub/registrar/registration/ap-transfer-credit.html). When you take the tests, be sure you request that the results be sent to Carnegie Mellon.

INTERNATIONAL BACCALAUREATE PROGRAM

Carnegie Mellon also recognizes the International Baccalaureate Examination and may grant advanced standing and/or credit in various fields if scores on the higher level examination range from six and seven. (https://www.cmu.edu/hub/registrar/registration/ap-transfer-credit.html) Make sure you send these examination results to Carnegie Mellon.

College-Level Work

We may grant placement or credit for college work you've completed while in high school. Please have your college transcript(s) sent to Carnegie Mellon for transfer credit evaluation. Please send the descriptions of the college courses as well.

Cambridge General Certificate of Education

Carnegie Mellon recognizes the Cambridge GCE A-Level (advanced level) examinations in various higher-level subjects and may grant advanced placement and/or credit for exemplary grades (https://www.cmu.edu/hub/registrar/registration/ap-transfer-credit.html). Please note that we don't accept GCE "O" level examinations for placement.

College of Fine Arts Requirements

Detailed information may be found on the Office of Admission website (https://www.cmu.edu/admission/).

Deadlines

- Early Decision applicants must submit a complete admission application, including any required artistic evaluation, by November 1.
- Regular Decision applicants to Drama and Music must apply and make all pre-screen, audition or music portfolio review reservations by December 1.
- Regular Decision applicants to Art, Architecture and Design must apply by January 2 and submit their portfolio no later than January 15.
- We recommend that you apply for admission as early as possible in order to register for a pre-screen, audition or portfolio review, which are filled on a first-come, first-served basis.

Communicating Admission Decisions

- Final admission decisions aren't made at the time of your audition or portfolio review. We'll consider the artistic evaluation alongside the rest of your application and notify you of your admission decision by April 1 (by December 15 for Early Decision applicants).

BXA Intercollege Degree Programs

To be considered for the BXA programs (https://www.cmu.edu/admission/majors-programs/interdisciplinary-studies/bxa-intercollege-degree-programs/), you'll first select the College of Fine Arts school that you wish to apply to. You'll then be asked if you're interested in a BXA program and note your interest in either the Bachelor of Computer Science and Arts (BCSA), Bachelor of Engineering Studies and Arts (BESA), Bachelor of Humanities and Arts (BHA) or Bachelor of Science and Arts (BSA).

Note that BXA applicants are only reviewed for the College of Fine Arts (CFA.) If you indicate interest in the BXA program, you will not be reviewed for a second college/program outside of your CFA choice. The intercollege BXA offerings are designed for students who'd like to combine or juxtapose their interests in the arts and another academic program. Students must meet the admission standards of their academic choice and complete the specific application requirements for their CFA focus (portfolio review, pre-screen, audition or interview).

Indicating interest does not mean your offer of admission will include acceptance to one of our BXA programs. Notification of BXA admission will follow your initial offer.

BXA options aren't available for those applying to the School of Drama for Music Theater, or Acting, or for external transfer applicants. Under Early Decision, BXA is only available for the School of Drama options in Design/Production and the Schools of Architecture and Art.

Exploring Carnegie Mellon

A college visit is the best way to discover which school is right for you. We offer both in-person and online visit opportunities. Here are just a few ways to experience Carnegie Mellon from home, on campus and in your area. Learn more and register for visit opportunities (https://www.cmu.edu/admission/visit/).

CARNEGIE MELLON ON CAMPUS

Information Sessions

The Office of Admission offers on-campus information sessions (https://admission.cmu.edu/portal/campus_visit/) throughout the year. The session provides an experiential look at the university through student and faculty stories. You'll have the opportunity to learn more about Carnegie Mellon's areas of study, admission, financial aid and the city of Pittsburgh.

Campus Tour

During our campus tour, student "Tartan Ambassadors" will show you classrooms, laboratories, traditions and unique architecture around campus. They'll also answer your questions and share an insider's perspective on the Carnegie Mellon experience.

Outdoor Campus Walking Route

On this self-guided touring experience, you'll have the opportunity to walk an outdoor path around campus for one hour. Visit the Coulter Welcome Center (https://www.cmu.edu/visit/welcome-center.html) for details about a self-guided tour.

Admission Counseling Session

An Admission Counseling Session (https://admission.cmu.edu/portal/campus_visit/) allows you to meet one-on-one with an Admission Counselor to ask any questions you have regarding Carnegie Mellon, the opportunities on campus, or the application and admission process. These sessions are typically 20-30 minutes long.

Contact Carnegie Mellon for Assistance

If you need assistance while visiting campus, please contact us at admission@andrew.cmu.edu or 412.268.2082. We'll help meet your needs during your visit!

Carnegie Mellon Online

Virtual Campus Tours

When you can't make it to campus, we've got you covered. Our Tartan Ambassadors are hosting live Virtual Tours (https://admission.cmu.edu/portal/virtual_tours/) so you can experience Carnegie Mellon's campus from anywhere in the world. These Virtual Tours will offer you the opportunity to explore our campus while hearing more about the Carnegie Mellon experience.

Remote Information Sessions

Our remote Information Sessions (https://admission.cmu.edu/portal/remote_info_sessions/) are live events designed for you to learn more about the Carnegie Mellon experience. Led by our admission counselors, these hour-long webinars feature student stories, faculty highlights and detailed information about academics, student life and the admission and financial aid processes. You'll also have an opportunity to ask questions.

Remote Admission Counseling Session

We're currently offering remote admission counseling sessions (https://admission.cmu.edu/portal/adm_counseling_session_videocon/) for rising high school juniors and seniors. These virtual sessions allow students approaching the time of application to ask an admission counselor questions and seek guidance about Carnegie Mellon's unique colleges/programs and the admission process. Students and their families can join these sessions via video or phone call. Admission counseling sessions last about 20-30 minutes and allow time for parents or families to ask questions.

Tartan Talks

Tartan Talks (https://admission.cmu.edu/portal/Tartan_Talk/) are an online student panel series where interested visitors can learn more about the student experience at Carnegie Mellon University. Each Tartan Talk will feature our Tartan Ambassadors talking about their student involvement within academics, activities, research, the city of Pittsburgh and more. Bring your questions, and our Tartan Ambassadors will be ready to answer!

Carnegie Mellon in Your Area

Information Sessions Near You

We realize that it's not always possible for you to come to campus. The Admission staff does travel to different parts of the country and may offer information sessions in a city near you (https://www.cmu.edu/admission/visit/visit-opportunities-in-your-area/).

2024-2025 Cost of Attendance

The cost of attendance listed below references typical resident, commuter and off-campus undergraduate students. The academic year tuition charges are for full-time undergraduate students. A full-time student is one registered in a degree program and carrying a schedule of at least 36 units per semester. A student enrolled for less than 36 units per semester will be charged tuition on a per-unit basis. The university reserves the right to change its charges without notice. For full cost of attendance information, visit www.cmu.edu/sfs/tuition (https://www.cmu.edu/sfs/tuition/).

First-Years Entering Fall 2024

Per-Unit Tuition Rate - $898

CATEGORY	RESIDENT	COMMUTER
Tuition	64,596	**64,596**
Housing (1)	10,816	**0**
Food (2)	7,350	**3,674**
First-Year Experience Fee (7)	610	**610**
Technology Fee	470	**470**
Student Activities Fee	308	**308**
Transportation Fee	262	**262**
TOTAL TUITION, FEES & LIVING EXPENSES	**$84,412**	**$69,920**
Books, Course Materials, Supplies, Equipment (3)	1,000	**1,000**
Miscellaneous Personal Expenses (3)	1,300	**1,300**
Estimated Loan Fees (3), (6)	100	**100**
Transportation Allowance (3), (4)	0	**680**
TOTAL COST OF ATTENDANCE	$86,812	**$73,000**

Undergraduates Entering in 2023 & Earlier

CATEGORY	RESIDENT	COMMUTER	OFF-CAMPUS
Tuition	64,596	64,596	**64,596**
Housing (1), (5)	13,810	0	**9,316**
Food (2)	7,040	3,674	**7,040**
Technology Fee	470	470	**470**
Student Activities Fee	308	308	**308**
Transportation Fee	262	262	**262**
TOTAL TUITION, FEES & LIVING EXPENSES	**$86,486**	**$69,310**	**$81,992**
Books, Course Materials, Supplies, Equipment (3)	1,000	1,000	**1,000**

TOTAL COST OF ATTENDANCE	**$88,886**	**$72,390**	**$84,392**

Footnotes:

[1] All incoming first-year students are required to live on campus. Permission for first-year students to commute must be granted by Student Affairs. Off-campus housing allowance for returning students is $9,316.

[2] Food expenses for commuters is reduced based on a student's expected time on campus. For returning students, resident and off-campus food expenses is estimated using first-year resident food expenses minus $310.

[3] These expenses do not appear on the student account.

[4] Transportation allowance for resident and off-campus students varies based on home state.

[5] Housing for returning students is based on an apartment double rate, which is the most commonly available room for these students.

[6] Students who borrow federal loans will incur loan origination fees of 1.057% for Federal Direct Subsidized and Unsubsidized Loans and 4.228% for Federal Parent PLUS Loans. These fees will be included in an individual student's cost of attendance for financial aid purposes, as applicable.

[7] The first-year experience fee is applicable for both incoming first-year undergraduates and incoming transfer students.

Health Insurance

In addition, health insurance coverage is required. If a student is covered under a family's health plan, a waiver may be submitted to University Health Services for approval. View more details and estimated costs at www.cmu.edu/health-services/student-insurance (http://www.cmu.edu/health-services/student-insurance/).

Office of Enrollment Management

Dr. Kristina Wong Davis, Vice Provost for Enrollment Management & Dean of Admission
www.cmu.edu/hub (http://www.cmu.edu/hub/)

The Office of the Vice Provost for Enrollment Management and Dean of Admission provides vision and leadership for all aspects of Carnegie Mellon’s enrollment process. From the point of recruitment, the office is committed to fostering an environment where students and families feel welcome, prepared and supported during their transition to life at CMU all the way through Commencement. The office supports student success and positive outcomes by fostering collaborative partnerships across the university, promoting data driven decision-making, and planning for long-term enrollment strategy.

Enrollment Management is comprised of five functional areas and a one-stop student service center, which provide student-focused and highly efficient services and programs to support and enhance CMU’s recruitment and retention goals. The Office of Admission (p. 8), The HUB (p. 14), University Registrar’s Office (p. 15), Student Financial Services (p. 14), Office of International Education (p. 16), and Enrollment Systems work together to serve students, families and the campus community through strategic enrollment planning and delivering valuable and effective student support and administrative services.

The HUB

Keith Gehres, *Associate Vice Provost for Enrollment Innovation & Student Experience*
Melissa Skasik, *Director of The HUB*
Location: Warner Hall A12, 5000 Forbes Avenue, Pittsburgh, PA 15213
Phone: 412-268-8186
Fax: 412-268-8084
thehub@andrew.cmu.edu
www.cmu.edu/hub (https://www.cmu.edu/hub/)

The HUB Student Service Center

The HUB staff delivers comprehensive service and counsel to students and families regarding financial aid, billing and payment, registration, academic records, and ID Card services. In direct support of student enrollment and persistence, The HUB offers students and families highly integrated information through personal attention and technologically responsive tools in a professional, forward-thinking, and accessible environment.

Professional staff in The HUB serve as liaisons for specific colleges and support enrolled students with key aspects of the enrollment process – financial aid, billing and registration. Contact information for assigned HUB liaisons can be found on The HUB website (https://www.cmu.edu/hub/contact/) or the student's personalized Student Information Online (SIO) account.

Regular office hours for The HUB are: Monday and Wednesday (9 a.m. to 4:30 p.m.), Tuesday and Thursday (10:30 a.m. to 4:30 p.m.), and Friday (9 a.m. to 3 p.m.). These hours are subject to change, so visitors are asked to check The HUB's website (https://www.cmu.edu/hub/contact/) for the most up-to-date hours.

ID Card Services in The HUB

One of the most important items students will need at Carnegie Mellon is their official identification card. The CMU ID Card, administered through The HUB, classifies you as a member of the Carnegie Mellon community and is a part of everyday campus life. From bus access and Plaid Cash to campus events and museum entry, the ID Card is an essential tool for on and off campus.

View more information at www.cmu.edu/idplus (http://www.cmu.edu/idplus/).

Student Financials & Enrollment Systems

Brian Hill, *Associate Vice Provost for Student Financials & Enrollment Systems*
Location: Warner Hall A19, 5000 Forbes Avenue, Pittsburgh, PA 15213
Phone: 412-268-8186
Fax: 412-268-6651
thehub@andrew.cmu.edu
www.cmu.edu/sfs (https://www.cmu.edu/sfs/)

Student Financial Aid Office

Matthew Metz, *Director of Student Financial Aid*
Location: Warner Hall, 5000 Forbes Avenue, Pittsburgh, PA 15213
Phone: 412-268-8186
Fax: 412-268-6651
www.cmu.edu/sfs/financial-aid (https://www.cmu.edu/sfs/financial-aid/)

In alignment with the university's enrollment goals, Student Financial Aid consistently optimizes the utilization of all financial aid resources in order to recruit and retain a high quality and diverse student population. Student Financial Aid strives to deliver superior services that exceed the expectations of students, parents, and internal and external constituencies. Student Financial Aid identifies, creates and delivers strategies that facilitate the integration of financial aid policies. These policies align with current and future university recruitment, retention and enrollment priorities.

How Aid Works

Our financial aid program is need-based, meaning that all aid eligibility is determined by a student's family's financial circumstances. While student's and families have the primary responsibility for paying for college, financial aid can bridge the gap between the total costs and ability to pay.

Nearly half of our undergraduate students rely on some type of financial aid to pay for educational expenses. While many of our graduate students are offered departmental scholarships, grants, stipends, assistantships and fellowships, some rely on other resources, like federal loans, available through the Student Financial Aid Office.

Student financial aid offers may be comprised of scholarships and grants, student employment, and loans. In addition, options like the monthly payment plan may be suggested as a way to help budget payments of educational expenses and to limit debt. Like any major investment, most families pay for education with a mix of current income, savings and borrowing. Finding the right balance among these resources can save money.

For more information or complete steps for applying for financial aid at CMU, visit www.cmu.edu/sfs/financial-aid (https://www.cmu.edu/sfs/financial-aid/).

Types of Financial Aid

There are several types of financial aid available to students, such as federal and private loans, university scholarships, outside scholarships, federal and state grants, and student employment. A full listing and explanation of these types of aid may be found at www.cmu.edu/sfs/financial-aid/types (https://www.cmu.edu/sfs/financial-aid/types/).

Student Financial Aid Terms and Conditions

All students, regardless of whether they are financial aid recipients, are required to confirm agreement to the university’s student financial aid terms and conditions upon their initial log-in to Student Information Online (SIO) and before any financial aid disburses to their account. The terms and conditions apply to all student financial aid, regardless of source (e.g., federal, state or institutional), including grants, scholarships, fellowships, loans and work-study awards.

Learn more at www.cmu.edu/sfs/financial-aid/terms.html (https://www.cmu.edu/sfs/financial-aid/terms.html).

International Undergraduate Students

Only U.S. Citizens or Eligible Non-citizens are eligible to receive federal student aid. U.S. Citizens who were not born in the United States will need to send documentation of citizenship (i.e., a copy of passport or naturalization certificate). Verification is required for Eligible Non-citizens or refugees. Acceptable forms of verification include a photocopy of both sides of the student's I-551 or I-551C card.

Undergraduate international students are not eligible to receive federal or state student financial aid. Additionally, Carnegie Mellon does not award any institutional financial aid funds to undergraduate international students.

Student Accounts Office

Kurt Steinmiller, *Director of Student Accounts*
Location: Warner Hall, 5000 Forbes Avenue, Pittsburgh, PA 15213
Phone: 412-268-8186
Fax: 412-268-6651
www.cmu.edu/sfs/billing (https://www.cmu.edu/sfs/billing/)

The Student Accounts Office serves the university's various academic and administrative departments by processing and invoicing all student-related financial activity and managing the corresponding student financial obligations resulting from this activity. The office strives to serve students by accurately reflecting and communicating these financial obligations, providing timely and consistent responses to inquiries, and instilling financial responsibility and accountability with clear and concise guidance.

Student Financial Obligation Terms

Carnegie Mellon University wishes to be transparent about the financial expectations of students to the university. All students must acknowledge their agreement to the financial obligation terms only one time during their career at the university before access to Student Information Online (SIO) can be granted.

The student financial obligation terms (https://www.cmu.edu/sfs/docs/sfo-terms.pdf) (pdf) detail the student's responsibility to remit payment for charges incurred at the university as well as repercussions of non-payment.

University Charges

All charges incurred at the university are reflected on your student account. Charges include tuition and fees and may include housing, dining, sorority or fraternity charges, health insurance, Plaid Cash, and other miscellaneous charges incurred. Miscellaneous charges may include, but are not limited to, music lessons, library fines, parking fines, or emergency loans.

Student Account Invoices

Student account invoices are produced on the last day of each month. Invoices detail all transactions processed in the month, as well as any charges due in the future. Students receive an email notification to their Andrew email account when an invoice is ready for viewing on Student Information Online (SIO) (https://www.cmu.edu/hub/sio/about.html). Payments for amounts due from a monthly invoice must be received by the 15th of the next calendar month. Any amounts not paid by the stated due date are subject to a 1.5% interest charge each month until the balance is paid in full.

Carnegie Mellon does not print and mail student account invoices.

Billing Authorizations & My Plaid Student

Students may authorize Carnegie Mellon to send a PDF copy of their invoice to another individual's (parent, spouse, etc.) email address. After completing the authorization process, designated recipients will receive an email with a PDF attachment of the invoice and any related billing messages.

Students can also invite a bill payer or other individual to use My Plaid Student (MPS) (https://www.cmu.edu/hub/MyPlaidStudent/), which gives authorized users access to a student's invoices and student account activity, as well as the ability to make payments to the student's account. Students may also authorize their users to request enrollment verifications, and view grades and course schedules, via MPS. .

View more information at www.cmu.edu/hub/parents-and-family (https://www.cmu.edu/hub/parents-and-family/).

Tuition Assessment

The tuition charged to each student will be automatically adjusted on the 10th regularly scheduled class day (refer to the specific date noted in the Official Academic Calendar (https://www.cmu.edu/hub/calendar/) as the “last day to add courses”) based upon each student's schedule at that time. The tuition charged will be increased whenever the number of units added justifies tuition charges greater than those paid by the student at the time of fee settlement. After that time, no tuition adjustments will be made, with the exception of second minis for that particular semester.

For additional information, view www.cmu.edu/sfs/tuition/adjustment (https://www.cmu.edu/sfs/tuition/adjustment/).

Payment Options

Carnegie Mellon University is pleased to offer a wide variety of payment options for students and families. A full listing of these, as well as more information on each type, is available at www.cmu.edu/sfs/billing/payments (https://www.cmu.edu/sfs/billing/payments/).

We recommend that students enroll in Online Banking by linking a U.S. bank account to their student account via SIO. This is the fastest, easiest, and most convenient way to make a payment to or receive a refund from the university. The university does not initiate a withdrawal from a student's bank account; funds are only withdrawn when a student schedules a payment through SIO.

Refunds

If a student account has a negative balance resulting from an overpayment, financial aid, or a reduction of charges, the Student Accounts Office will review the account and issue a refund.

All students are encouraged to authorize electronic deposit of their student account refunds directly into their U.S. checking or savings accounts. Taking advantage of this opportunity eliminates the need to stand in line at The HUB to pick up a refund check and makes the funds available to the student within two business days.

If electronic refunding is not selected, the refund will be generated as a paper check that must be picked up in The HUB. Students who are issued a paper check for a student account refund have six months to cash the check. If the check is not cashed within six months, it will be voided and credited back to the student account and applied to any outstanding charges.

View more details about refunds at www.cmu.edu/sfs/billing/refunds (https://www.cmu.edu/sfs/billing/refunds.html).

Enrollment Systems

Dan Kennedy, *Interim Director of Enrollment Systems*
Location: Cyert Hall, 5000 Forbes Avenue, Pittsburgh, PA 15213

Enrollment Systems is charged with orchestrating the evolution of the Student Services Suite (S3) and related systems. As system administrators, business analysts and web developers, our department supports Carnegie Mellon University's student information system applications. Additionally, the goal of Enrollment Systems is to provide IT support and interface between and among the various student-system linked owners/users and the central IT technicians.

View details about the Student Services Suite (S3) at www.cmu.edu/s (https://www.cmu.edu/sfs/billing/)3-project (https://www.cmu.edu/es/s3-project/).

University Registrar's Office

Keith Gehres, *Associate Vice Provost for Enrollment Innovation & Student Experience*
John Papinchak, *University Registrar*
Location: Warner Hall A19, 5000 Forbes Avenue, Pittsburgh, PA 15213
Fax: 412-268-6651
cmuregistrar@andrew.cmu.edu (university-registrars-office@andrew.cmu.edu)
www.cmu.edu/hub/registrar (https://www.cmu.edu/hub/registrar/)

The University Registrar's Office performs the essential roles of administering the collection and maintenance of student records, ensuring their accuracy and integrity, and enforcing academic policies while providing the best possible services. The University Registrar's Office aspires to provide exceptional, environmentally-conscious services, while anticipating and meeting growing customer requirements with innovative processes, training and self-service applications. The office strives to foster and promote an environment of professional development and appreciation.

The University Registrar's Office produces the Academic Calendar (https://www.cmu.edu/hub/calendar/).

Enrollment

Enrollment is the process whereby eligible students notify Enrollment Services that they will be attending the university by registering for courses and settling their student accounts. Enrollment must be completed before students may begin classes and before they may utilize university facilities.

Registration

Registration is the process of selecting courses for the upcoming semester and discussing those selections with an academic advisor. We strongly encourage students to meet with their academic advisor before finalizing selections and registering for courses. The University Registrar's Office manages the registration process and related activities for all CMU students. Our goal is that our online services make these processes easy and secure. The registration process may be completed in Student Information Online (SIO) (https://www.cmu.edu/hub/sio/about.html) in four easy steps. Students can use the 4 Easy Steps to Registration (https://www.cmu.edu/hub/registrar/registration/steps/) webpage to find step-by-step instructions for course registration at CMU, including a pre-registration checklist, how to plan and check course schedules, share with schedules with advisors, confirm registration start time, and register for courses.

For most entering first-year students, registration is accomplished during the summer, with the assistance of associate deans and department heads. Academic placement and elective choice information is collected through mailed questionnaires during June and July. Most first-years complete their schedules and enrollment information prior to the first day of classes.

Currently enrolled students select their courses for the upcoming semester during Registration Week, prior to the end of each semester. The Schedule of Classes (https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/) is available online prior to Registration Week, listing available courses along with general enrollment information. The university reserves the right to make changes to hours, units or instructional staff when such changes seem necessary or advisable.

Students are not permitted to register for courses in which the prerequisites have not been satisfied. Exceptions to the rule may be granted only upon the recommendation of the teaching department concerned. Unless the prerequisites are satisfied or special approval is obtained when the student enters the course, no credit can be allowed for the course. Students are also discouraged from planning schedules in which course time conflicts exist. For exceptional circumstances, however, students may register for, or add, courses with time conflicts. Information about managing course time conflicts is available on the 4 Easy Steps to Registration (https://www.cmu.edu/hub/registrar/registration/steps/#plan) webpage.

SUMMER & Non-degree COURSEWORK

Summer semester offers a great opportunity to enroll in Carnegie Mellon’s innovative courses and programs in fine arts, business, engineering, technology, liberal arts, and more. Summer classes allow more flexibility to focus on studies outside the typical fast-paced campus environment and more interactive learning with smaller class sizes. Our visiting and non-degree program (https://www.cmu.edu/hub/registrar/registration/vnd/) also allows professionals and non-CMU students to expand their education, and to learn from award-winning faculty. Summer courses are offered via three sessions: Summer All, Summer One and Summer Two.

PCHE Cross-Registration

Cross-registration provides opportunities for enriched educational programs by permitting full-time paying undergraduate and graduate students to cross register for one course at a Pittsburgh Council on Higher Education (PCHE) Institution. Students who are paying full-time Carnegie Mellon tuition (per the requirements of their home college) are eligible. The PCHE course may not count towards full-time status. There is no additional tuition charge, except for special course or laboratory fees. Carnegie Mellon students do not acquire status at the Host Institution, but are given library and bookstore privileges. Credit and grades are transferred directly to the home institution. Cross-registration is not applicable during the Summer Session or during intersessions.

For more information, visit www.cmu.edu/hub/registrar/registration/cross (https://www.cmu.edu/hub/registrar/registration/cross/).

Faculty Course Evaluations (FCEs)

Students play an integral role in the academic life of the university when they participate in the evaluation of the faculty through the Faculty Course Evaluation process. FCE data is important in the evaluation of teaching and learning, as an important piece of the promotion and tenure process and as part of the process of course design and improvement. Student participation in the FCE process is critical to the university's commitment to quality teaching and academic excellence. Students are strongly encouraged to participate in the process with constructive feedback that is relevant to teaching and course content. More information on the Faculty Course Assessment process and results from previous years may be found at www.cmu.edu/hub/fce (https://www.cmu.edu/hub/fce/).

Office of International Education & Study Abroad

Linda Gentile, *Executive Director of the Office of International Education*
Chris Menand, *Director of Study Abroad*
Location: Cyert Hall, Suite 101, 5000 Forbes Ave., Pittsburgh, PA 15213
Phone: 412-268-5231
o (thehub@andrew.cmu.edu)ie@andrew.cmu.edu (oie@andrew.cmu.edu)
w (https://www.cmu.edu/hub/)ww.cmu.edu/oie (https://www.cmu.edu/oie/)

The Office of International Education (OIE) is committed to empowering and inspiring Carnegie Mellon University students, faculty, staff and visitors to achieve their personal and educational goals in a community that encourages and values diverse ideas, life experiences and international perspectives. Supporting the university's educational mission, OIE promotes, advocates and facilitates international and cross-cultural experiences, perspectives and initiatives. OIE is the primary contact for study abroad programs and non-immigrant matters for all students and scholars (foreign professors and researchers) who are not United States citizens or permanent residents.

Foreign Students & Scholars

OIE serves as the liaison to the university for all non-immigrant students and scholars. The foreign student and scholar advisors counsel on immigration/visa, academic, personal, social and acculturation matters. Additional services include workshops in partnership with other offices on cultural adjustment, international career planning and tax filing. OIE supports international student groups, partners and family members with resources and programming that assist with acclimating to the broader community.

Study Abroad

Over 600 Carnegie Mellon students, from all majors, study abroad annually. With careful planning, students may study abroad for a semester, academic year or during the summer in various countries around the world, including Carnegie Mellon’s campus in Doha, Qatar. A well planned study abroad program will allow a student to receive credit for study abroad and graduate on time. There are additional opportunities for short-term, non-credit study abroad experiences. Many students are able to use their Carnegie Mellon funding for study abroad. The study abroad staff assist students in all stages of the process of going abroad. The advisors promote study abroad, advise students, work with the academic departments and conduct information sessions, pre-departure orientations and welcome back workshops. For more detailed information about Carnegie Mellon's study abroad program, see the Undergraduate Options (http://coursecatalog.web.cmu.edu/aboutcmu/undergraduateoptions/#studyabroadtext) section of this catalog or visit www.cmu.edu/studyabroad (http://www.cmu.edu/studyabroad/).

David & Susan Coulter Welcome Center

Rebecca Choltco, *Executive Director of Strategic Communication for Enrollment Management & Interim Director of the Welcome Center*
Location: Tepper Quad, Lower Level, 4765 Forbes Avenue, Pittsburgh, PA 15213
www.cmu.edu/visit/welcome-center.html (https://www.cmu.edu/visit/welcome-center.html)

The Carnegie Mellon University Coulter Welcome Center is a unique destination point for campus visitors. The welcoming space draws people in to engage with students and to see firsthand how Carnegie Mellon's expertise, ambition and world-leading technologies across business, the sciences, the humanities and the arts all benefit humankind. Visitors may register in advance for an in-person campus tour (https://www.cmu.edu/admission/visit/on-campus-visit-opportunities/) led by our Tartan Ambassadors or check out additional virtual opportunities (https://www.cmu.edu/admission/visit/online-visit/) to learn more about CMU and Pittsburgh.

Student Affairs

Gina Casalegno, Vice President for Student Affairs & Dean of Students
Location: Warner Hall 321, 5000 Forbes Avenue, Pittsburgh, PA 15213
Phone: 412-268-2075
www.cmu.edu/student-affairs (http://www.cmu.edu/student-affairs/)

The Division of Student Affairs is available to support and foster student intellectual and personal growth and help students explore and experience the different aspects of college life. We care about you, your studies, your social growth, your well-being and your future and want to help you enjoy a great Carnegie Mellon experience.

Central to our success is a commitment to cultivating deep and meaningful one-to-one relationships with students. We build and sustain collaborative relationships throughout the university to best serve the needs of our student body. Programs, services, and efforts are dedicated to the development of an engaged community among students, faculty, staff and alumni where meaningful and authentic exchanges are valued. Division of Student Affairs staff help students navigate and reflect upon challenges and transitions, and we empower them to become architects of their own learning and development.

The Office of the Dean of Students provides central leadership of meta-curricular experience at Carnegie Mellon, including divisional strategic planning, coordination of student support and crisis intervention, and facilitation of divisional assessment.

Student Affairs is comprised of the following offices and departments, which offer services aimed at enhancing the CMU student experience.

Athletics, Physical Education & Recreation

Josh Centor, *Director & Associate Vice President*
Location: Highmark Center for Health, Wellness, & Athletics, 100 Tech St, Pittsburgh, PA 15213
Phone: 412-268-8054
www.athletics.cmu.edu (https://athletics.cmu.edu/landing/index/)

The Department of Athletics, Physical Education and Recreation has a transformative impact through diverse programs that inspire leadership, teamwork, wellness and resilience, and offers students, staff and faculty opportunity to develop intellect, ethics and character needed to lead meaningful lives while impacting society in profound ways.

Career & Professional Development Center

Kevin Monahan, *Director & Associate Dean of Student Affairs*
Location: West Wing, 2nd Floor, 5000 Forbes Ave, Pittsburgh, PA 15213
Phone: 412-268-2064
career@andrew.cmu.edu
www.cmu.edu/career (http://www.cmu.edu/career/)

The Career and Professional Development Center (CPDC) is Carnegie Mellon University’s centralized career services center providing a comprehensive range of services, programs and materials focusing on career exploration and decision making, professional development, experiential learning and employment assistance to meet today’s evolving workplace and student goals of finding satisfying work.

Students wishing to explore how majors and minors relate to career choice, as well as gain information about particular fields, will work with a career consultant to examine their skills, interests, and values and how they relate to various career fields. Career consultants also coach students in writing resumes and cover letters, networking, locating internship and job opportunities, preparing for interviews, and pursuing graduate school opportunities. Career consultants are assigned to each college and provide individualized support, general career programming, and college-specific workshops. In addition to the workshops presented by the staff, consultants coordinate an annual professional development series presented by prominent alumni and recruiters in various industries and fields.

Handshake

Several thousand summer internships and professional full-time job opportunities are made available to Carnegie Mellon students through Handshake, an online job listing resource. Students can access Handshake through the Center's homepage (https://www.cmu.edu/career/) and can also use the service to search for student employment and on-campus jobs. Handshake also provides information on the hundreds of employers that visit our campus each year. These organizations interview students for internships and professional employment, as well as hold informational sessions in the evenings that are open to the entire campus.

Center for Student Diversity & Inclusion

M. Shernell Smith, *Executive Director*
Location: Cohon University Center, Lower Level, 5000 Forbes Ave, Pittsburgh, PA 15213
Phone: 412-268-2150
C (ocsi@andrew.cmu.edu)SDI@andrew.cmu.edu (CSDI@andrew.cmu.edu)
www.cmu.edu/student-diversity (https://www.cmu.edu/student-diversity/)

The Center for Student Diversity and Inclusion actively cultivates a strong, diverse and inclusive community capable of living out these values and advancing research, creativity, learning and development that changes the world.

The Center offers resources to enhance an inclusive and transformative student experience in dimensions such as access, success, campus climate and intergroup dialogue. Additionally, the Center supports and connects historically underrepresented students and those who are first in their family to attend college in a setting where students’ differences and talents are appreciated and reinforced.

Civility Initiatives

Candace C. Okello, *Assistant Dean of Civility Initiatives*
Location: Office of the Dean, Warner Hall 326, Third Floor, 4910 Forbes Ave, Pittsburgh, PA 15213
Phone: 412-268-2075
www.cmu.edu/student-affairs/civility (https://www.cmu.edu/student-affairs/civility/)

The mission of Civility Initiatives is to strengthen community and interpersonal relationships at CMU. The work of civility supports the academic, diversity, and well-being goals of the university through skill-building for civil discourse, conflict transformation, and restorative practice.

Cohon University Center

Marcia Gerwig, *Director*
Location: Cohon University Center 103, 5000 Forbes Ave, Pittsburgh, PA 15213
Phone: 412-268-2107
infodesk@andrew.cmu.edu
www.cmu.edu/cohon-university-center (https://www.cmu.edu/cohon-university-center/)

Designed to support health, wellness, and community engagement, the Jared L. Cohon University Center offers conference space and meeting rooms, a studio theater, a state-of-the-art fitness center, gymnasium, swimming pool, multiple dining locations, and plenty of gathering and study space.

Community Health & Well-being

Maureen Dasey-Morales, *Associate Vice President*

Location: Highmark Center for Health, Wellness, & Athletics, 100 Tech St, Pittsburgh, PA 15213
www.cmu.edu/wellbeing/ (https://www.cmu.edu/wellbeing/)

Community Health and Well-Being at CMU encompasses the following departments and initiatives: Counseling & Psychological Services, Religious & Spiritual Life Initiatives, Student Support Resources, University Health Services, and Wellness & Meaning-Making Programs. The Community Health and Well-Being services are also supported by departments like Athletics & Recreation, the Center for Student Diversity & Inclusion, the Office of Student Leadership, Involvement, & Civic Engagement, the Student Academic Success Center and many more. During your time at CMU, Community Health and Well-being is here to support and help you discover what well-being means for you. We have a lot of people who care and a lot of resources to help. All of these people and resources are organized into the Community Health and Well-being website (https://www.cmu.edu/wellbeing/) — a space for you to explore the various components of well-being and the opportunity for you to make any or all of it a part of your well-being journey.

Office of Community Responsibility

Lenny Chan, *Director*
Location: Morewood Gardens, 1060 Morewood Ave, Pittsburgh, PA 15213
Phone: 412-268-2140
communityresponsibility@andrew.cmu.edu
www.cmu.edu/student-affairs/ocr (https://www.cmu.edu/student-affairs/ocr/)

The Office of Community Responsibility (OCR) is staffed by an experienced team of professionals dedicated to the growth and development of students both in and outside of the classroom. When faced with a challenging or complicated situation, the office can serve as a resource for students, staff, faculty, and family members looking for guidance. Our staff strives to be approachable, knowledgeable, and current with best practices in the field of student conduct and academic integrity. The heart of our work is rooted in the value and support of our campus community members. We welcome inquiries regarding educational programming, student support, and guidance with the university's student conduct and academic integrity processes.

Counseling & Psychological Services

Shane Chaplin, *Executive Director*
Location: Highmark Center for Health, Wellness, & Athletics, 100 Tech St, Pittsburgh, PA 15213
Phone: 412-268-2922
www.cmu.edu/counselin (http://www.cmu.edu/counseling/)g (https://www.cmu.edu/counseling/)

Counseling and Psychological Services (CaPS) addresses the mental health needs of the university community by providing treatment to students and collaborating with staff, faculty and family members. CaPS helps students improve their psychological health by facilitating insight and fostering deeper understanding of their personal struggles needed to make better choices for themselves. Services at CaPS are developmental in nature, aimed at supporting students in the moment and in their personal growth and maturation over time.

CaPS is attentive to issues of diversity and equality. We respect and value each person as a unique individual. We offer a safe and supportive space for students who identify as LGBTQIA+ to navigate the challenges of exploring and integrating their gender and sexual identities.

Confidential services for students include consultation, short-term individual psychotherapy, crisis support and psychiatric referral when appropriate. Our staff provides consultation and education for students, faculty, staff and family members to address concerns regarding the well-being of a student, and questions about our services or psychological treatment.

CaPS staff also provide training and education for students and staff in support roles (i.e., advisors, Resident Assistants, Orientation Counselors, etc.)

Dining Services

Joseph Beaman, *Director*
Location: Residence on Fifth, 4700 Fifth Ave, Second Floor, Pittsburgh, PA 15213
Phone: 412-268-3782
dining@andrew.cmu.edu
www.cmu.edu/dining (https://www.cmu.edu/dining/)

Carnegie Mellon Dining Services offers a diverse portfolio of dining destinations, enriches and nourishes lives, and enhances the CMU transformative experience for students. We provide a unique and diverse food service program that meets the nutritional, educational, multi-cultural and social needs of students and the university community and contributes to the meta-curricular experience.

Family Engagement

Lauren Moran, *Associate Dean for Family Engagement & First-Year Orientation*
Location: 1060 Morewood Gardens, Pittsburgh, PA 15213
Phone: 412-268-2142
parents (parents@andrew.cmu.edu)@andrew.cmu.edu (career@andrew.cmu.edu)
www.cmu.edu/parents (https://www.cmu.edu/parents/)

Family Engagement encourages students to develop independence and the life skills necessary to successfully navigate their personal affairs as young adults. We know that family plays an important role and are key partners in our students' success. We're here to share information about general campus resources, important events and developmental milestones in the student experience, so students have information to facilitate meaningful interactions during their Carnegie Mellon journey.

First-Year Orientation

Lauren Moran, *Associate Dean for Family Engagement & First-Year Orientation*
Location: 1060 Morewood Gardens, Pittsburgh, PA 15213
Phone: 412-268-2142
orientation@andrew.cmu.edu
www.cmu.edu/first-year-orientation (https://www.cmu.edu/first-year-orientation/)

Orientation & First-Year Programs is responsible for providing vision and leadership for a comprehensive approach to new student orientation and transition programs. The office provides programs, opportunities and services to help students and family members successfully transition to the Carnegie Mellon community.

The office is responsible for program, development, marketing and implementation of orientation and transition programs. Areas of concentration include new student orientation, family programming such as Family Weekend, freshman programming series, and special event planning.

Fraternity & Sorority Life

Lauren Moran, *Interim Director*
Location: 1060 Morewood Gardens, Pittsburgh, PA 15213
cmu-fsl@andrew.cmu.edu
www.cmu.edu/fsl (http://cmu.edu/fsl/)

Fraternity and Sorority Life (FSL) is a core part of the undergraduate experience for many CMU students. The university's fraternities and sororities are committed to academic achievement, service, social interaction, and the wellness of their members. While individually unique, each chapter and council embraces inclusivity and upholds high standards of excellence in all aspects of campus life.

Housing Services & Residential Education

Lisa Hartman, *Director of Housing Services*
Tera Monroe, *Associate Dean & Director of Residential Education*
Housing Location: Residence on Fifth, 4700 Fifth Ave, Second Floor, Pittsburgh, PA 15213

Residential Education Location: Morewood Gardens, Student Life Suite, 1060 Morewood Ave, Pittsburgh, PA 15213
Phone: 412-268-2139 (Housing), 412-268-2142 (Residential Education)
housing@andrew.cmu.edu, resed@andrew.cmu.edu
www.cmu.edu/housing (https://www.cmu.edu/housing/)

The residential experience at Carnegie Mellon embraces all aspects of a student's life. Together, Housing Services and the Office of Residential Education create a lived experience that supports, engages, and inspires students throughout their university experience. It's the place they call home, the place where they will learn more about themselves, their community, and the world around them. Within a 24/7 community of support, staff and residents build meaningful relationships that inspire exploration, growth, and learning.

Pre-College Programs

Beth Yazemboski, *Senior Director*
Location: Residence on Fifth, 5000 Forbes Ave, Pittsburgh, PA 15213
Phone: 412-268-5914
precollege@andrew.cmu.edu (pc-life@andrew.cmu.edu)
www.cmu.edu/pre-college (https://www.cmu.edu/pre-college/)

Our Pre-College Summer Programs for high school rising juniors and seniors will show you what life at Carnegie Mellon is about — from the classroom to what's happening on weekends. You'll meet people from all over the world, be inspired by our world-renowned faculty, take part in the excitement of campus and have the opportunity to explore the city of Pittsburgh.

Religious & Spiritual Life Initiatives

Jennifer McCurry, *Coordinator*
Location: Highmark Center for Health, Wellness, & Athletics, 100 Tech St, Pittsburgh, PA 15213
www.cmu.edu/wellbeing/resources/wellness-initiatives/religous-spiritual (https://www.cmu.edu/wellbeing/resources/wellness-initiatives/religious-spiritual/)

Religious & Spiritual Life Initiatives offers programs and initiatives that cross traditional religious boundaries in order to increase our students' knowledge of and appreciation for the full diversity of the world's religious and spiritual traditions. RSLI's mission is to support all students along the spectrum of religious and spiritual practice and exploration.

Office of Student Leadership, Involvement, & Civic Engagement

Elizabeth Vaughan, *Director & Associate Dean of Student Affairs*
Location: Cohon University Center, 5000 Forbes Ave, Pittsburgh, PA 15213

Phone: 412-268-8704
slice@andrew.cmu.edu
www.cmu.edu/student-affairs/slice (https://www.cmu.edu/student-affairs/slice/)

The Office of Student Leadership, Involvement, & Civic Engagement (SLICE) complements students' academic experiences by providing services and resources that engage students in creating campus culture through social, cultural, intellectual, spiritual, athletic, recreational, artistic, political, and service opportunities. Our staff is committed to delivering quality advising, resource materials, leadership development opportunities, and administrative support services to impact students' growth and development and enhance the success of each student organization.

Our office partners with students to create a vibrant culture of student life on the Carnegie Mellon campus. Our community is home to nearly 250 recognized student organizations that are supported by the Student Activities staff team. In addition to serving as individual advisors to many organizations and providing resources, support, and ad hoc advising to all student organizations, our office also coordinates a slate of opportunities to help Carnegie Mellon students get involved in campus life.

Student Support Resources

Bryan Koval, *Director*
Location: Warner Hall 321, 4910 Forbes Ave, Pittsburgh, PA 15213
Phone: 412-268-2075
www.cmu.edu/wellbeing/resources/student-support-resources (https://www.cmu.edu/wellbeing/resources/student-support-resources.html)

The Student Support Resources team offers an additional level of support and expertise for students who are navigating any of a wide range of life events. Student Support Resources staff members work in partnership with campus and community resources to provide coordination of care and support appropriate to each student's situation.

University Health Services

Christine Andrews, *Executive Director*
Location: Highmark Center for Health, Wellness, & Athletics, 100 Tech St, Pittsburgh, PA 15213
Phone: 412-268-2157
health@andrew.cmu.edu
www.cmu.edu/health-services (https://www.cmu.edu/health-services/)

University Health Services (UHS) is staffed by physicians, advanced practice clinicians, registered nurses, and professional staff who provide medical care, health promotion and insurance services. A list of current services and fees may be found on the University Health Services website (https://www.cmu.edu/health-services/services-and-fees/).

Students are seen by appointment only. Same-day appointments are available on a limited basis depending on availability. We always do our best to work with patients with acute illnesses and injuries. To increase the likelihood of being seen sooner please contact us as early as possible. Call us at 412-268-2157, option 2 to discuss your needs.

HEALTH INSURANCE

Health insurance is vital to ensuring access to care and predictable health care costs, as well as aiding students in the achievement of their personal and academic goals. That is why CMU requires students to have medical insurance that meets university requirements each academic year, either through enrolling in the CMU Student Health Insurance Plan (SHIP) or obtaining a SHIP waiver. Visit the UHS Student Medical Insurance web page (https://www.cmu.edu/health-services/student-insurance/) for more information about student insurance.

Wellness & Meaning-Making Programs

Angie Lusk, *Director*
Location: Highmark Center for Health, Wellness, & Athletics, 100 Tech St, Pittsburgh, PA 15213
Phone: 412-268-7117
alusk@andrew.cmu.edu
www.cmu.edu/wellbeing/resources/wellness-initiatives (https://www.cmu.edu/wellbeing/resources/wellness-initiatives/)

Wellness and Meaning-Making Programs support our students, faculty, and staff as we individually and collectively work towards healthy, fulfilling lives and co-creating an enriching, supportive environment that helps all members to thrive.

Undergraduate Options

This section of the catalog introduces some of the options that undergraduate students can choose from to supplement their degree program, advance their career objectives, or focus on an interest that may be unrelated to their major. From IDeATe, which offers minors and courses in areas that merge technology and creativity like Game Design, to Student Defined Majors, which is designed for students whose academic goals cannot be adequately served by curricula of existing majors or minors, learn more about the additional options offered to CMU's undergraduate students.

Additional Majors/Dual Degrees

Students interested in pursuing more than one area of study are encouraged to consider an additional major or dual degree. Students who complete an additional major will earn a single degree in two areas. Generally, it is possible to fulfill the requirements of both majors in four years by taking the course requirements of the second major in the elective spaces allowed by the first major.

Some majors are offered only as additional majors:

- Students in the College of Engineering may elect to double major in Biomedical Engineering (p.) or Engineering and Public Policy (p. 145), which are offered only as an additional major.
- Students from any college may pursue an additional major in Human-Computer Interaction (p.), Science, Technology and Public Policy (p. 146), or Robotics (p.).

Dual Degree programs allow students to earn two degrees. Students who are interested in an additional major or dual degree are encouraged to review the specific possibilities with the relevant academic advisor.

Accelerated Master's Programs

Qualified undergraduates may apply to one of several programs to earn their bachelor's and master's degrees in five years. For further details about these programs, please refer to the appropriate college or departmental sections.

College of Engineering

The five-year Integrated Master's/Bachelor's programs offered by the Departments of Electrical and Computer Engineering and Civil and Environmental Engineering offers students superior technical preparation for careers in industry. The Departments of Chemical Engineering and Mechanical Engineering also offer fifth-year Accelerated Master's programs. The Department of Materials Science and Engineering offers a cooperative Industrial Internship Option in which students alternate coursework with practical experience in industry. Admission is highly competitive and leads to a Master of Science degree.

Dietrich College of Humanities and Social Sciences

The Department of Philosophy offers two bachelor's/master's degree options: the Bachelor's in Logic and Computation and Master’s in Logic, Computation & Methodology degree as well as a Bachelor’s/Master’s degree in Philosophy. The Institute for Politics and Strategy offers an accelerated Master of Science degree in International Relations and Politics. The Master of Arts in Teaching English to Speakers of Other Languages (TOESL) is a fifth-year master's option for Modern Language students who are concentrating in English as a Second Language. Also, the Department of English offers an accelerated program for undergraduates to obtain a Master of Arts in Professional Writing.

Heinz College of Information Systems and Public Policy

Heinz College's Accelerated Master's program allows qualified undergraduate students to earn a prestigious Master of Science degree in Public Policy and Management. For students in the College of Fine Arts or the Bachelor of Humanities and Arts degree program who are interested in careers in arts management, the program leads to a Master of Arts Management degree.

Mellon College of Science

The Honors Programs in the Departments of Chemistry and Mathematics are demanding, accelerated programs that give highly qualified students the opportunity to earn their bachelor's and master's degrees in just four years. Admission is by invitation only.

Tepper School of Business

Students who are interested in business management may wish to consider the Tepper School of Business 3-2 program. Qualified undergraduate students may earn their Master of Business Administration in addition to their bachelor's degree.

Health Professions Program

Jason D'Antonio, PhD, *Director*
Location: Doherty Hall 1320
Phone: 412-268-8494

The Health Professions Program (http://www.cmu.edu/hpp/) (HPP) at Carnegie Mellon University is an advising resource for all university students and alumni who are interested in a career in the health professions. This program complements a student's curricular advising and is meant to help students explore their interests, prepare for graduate programs in the health professions, and facilitate their application process. Students can enroll in the program at any time during their academic career, but the importance of early planning is communicated to interested first-year students. Once enrolled, students meet regularly with the director to discuss course requirements, medical exposure opportunities, and other aspects of preparing to be a competitive candidate.

Students in the HPP span all colleges of the university and have many diverse career interests including medicine, dentistry, optometry, biomedical research, medical physics, biomedical engineering, public health, medical informatics, and health policy.

For students interested in medicine or dental medicine, regardless of a student's major, the basic course requirements outlined below must be completed prior to matriculation:

1. One year of Biology with one lab, plus Biochemistry.

This is typically fulfilled by the following Carnegie Mellon courses:

03-121	Modern Biology	9-10
or 03-151	Honors Modern Biology	
03-135	Structure and Function of the Human Body	9
or 42-202	Physiology	
or 03-220	Genetics	
or 03-320	Cell Biology	
03-124	Modern Biology Laboratory	9-12
or 03-343	Experimental Techniques in Molecular Biology	
or 03-206	Biomedical Engineering Laboratory	
or 02-261	Quantitative Cell and Molecular Biology Laboratory	
03-231	Honors Biochemistry	9
or 03-232	Biochemistry I	

2. One year of Inorganic Chemistry with one lab.

This is typically fulfilled by the following Carnegie Mellon courses:

09-105	Introduction to Modern Chemistry I	10
or 09-107	Honors Chemistry: Fundamentals, Concepts and Applications	
09-106	Modern Chemistry II	10
09-207	Techniques in Quantitative Analysis (non-Chem majors)	9
or 09-221	Laboratory I: Introduction to Chemical Analysis	

3. One year of Organic Chemistry with one lab.

This is typically fulfilled by the following Carnegie Mellon courses:

09-217	Organic Chemistry I	9-10
or 09-219	Modern Organic Chemistry	

09-218	Organic Chemistry II	9-10
or 09-220	Modern Organic Chemistry II	
09-208	Techniques for Organic Synthesis and Analysis (non-Chem majors)	9
or 09-222	Laboratory II: Organic Synthesis and Analysis	

4. One year of Physics with one lab.

This is typically fulfilled by the following Carnegie Mellon courses:

33-121	Physics I for Science Students	12
or 33-141	Physics I for Engineering Students	
33-122	Physics II for Biological Sciences & Chemistry Students	9
or 33-142	Physics II for Engineering and Physics Students	
33-100	Basic Experimental Physics	6-9
or 33-104	Experimental Physics	

5. One year of Math.

21-111	Calculus I	10
21-112	Calculus II	10
21-120	Differential and Integral Calculus	10
21-122	Integration and Approximation	10
or 21-124	Calculus II for Biologists and Chemists	
or 36-200	Reasoning with Data	
or 36-202	Methods for Statistics & Data Science	

6. One year of English.

This is typically fulfilled by the following Carnegie Mellon courses:

76-101	Interpretation and Argument (or any two of 76-106/7/8)	9
76-xxx	English course of the student's choice, typically 200-level or higher	

In addition to these general course requirements, recommended coursework includes statistics, behavioral sciences, ethics, and languages. Interdisciplinary studies are also strongly encouraged, and many students design an undergraduate curriculum that incorporates majors and/or minors in both the natural and social sciences.

Participating in research is a hallmark of the educational experience at Carnegie Mellon in many disciplines. Whether in the psychology lab studying the impact of breast cancer diagnosis on family social dynamics, in the NMR lab imaging metabolic function in the heart or brain, or in the surgery suite testing robotic devices, our students have made significant achievements in research. Health Professions programs are interested in applicants who have experience with the scientific method and who are intellectually curious about biomedical science, social science, biomedical engineering, as well as public health, epidemiology, and the social determinants of health.

Our university policy is to train students to be first class scientists, engineers, artists, writers, managers, or whatever their passion may be. We do not train students to be “pre-med,” but if they choose to use their talents in a health profession, we offer many services to help them obtain their life goals. Regular advising, application workshops, health issue seminars and symposium, community outreach activities, and preceptor-ship/ internship experiences are all part of our programming. The student pre-health organizations on campus: Doctors of Carnegie Society (DOCS); Student Diversity Inclusion Committee (SDIC); Alpha Epsilon Delta (AED); Global Medical Brigades; and Global Public Health Brigades, together with the HPP, provide students with opportunities to learn, explore, and prepare for their chosen area of professional interest.

The HPP has been successful in helping students to define, prepare for, and obtain their professional goals. Our students are regularly accepted at top-level medical, dental and graduate programs, and our alumni continue to serve as outstanding ambassadors of Carnegie Mellon.

IDeATe

The Integrative Design, Arts and Technology (IDeATe) (http://ideate.cmu.edu) network offers students the opportunity to become immersed in a collaborative community of faculty and peers who share expertise, experience, and passions at the intersection of arts and technology. Students will engage in active "learning by doing" in the IDeATe labs and classrooms based in Hunt Library. The program addresses current and emerging real-world challenges that require disciplinary expertise coupled with multidisciplinary perspectives and collaborative integrative approaches.

The IDeATe undergraduate curriculum consists of ten interrelated areas, all of which can be shaped into minors that students pursue alongside their primary majors. The themes of these areas integrate knowledge in technology and arts:

- **Game Design:** Design compelling game experiences and enhance your knowledge of key components of game design such as systems and mechanics, dramatic narrative and character development, programming and engine development, user testing and iterative development. Create games for a variety of audiences, including mobile applications, virtual reality platforms and even tabletop games.
- **Animation & Special Effects (p. 700):** Explore the technical and artistic aspects of 3D and 2D animation in an integrated manner and within different application contexts—from film animation and visual effects to interactive displays.
- **Media Design**: Design digitally mediated experiences across various platforms, from mobile devices to large-scale installations, and for varied applications—from media for daily living to mediated performances).
- **Design for Learning:** Explore the art and science of designing engaging learning experiences that creatively merge technology, learning sciences, and media arts know-how. Create inclusive learning media experiences ranging from mobile games to interactive museum exhibits, augmented classrooms, and adaptive ed-tech.
- **Sonic Arts:** Create experimental music and explore emerging applications and markets for sound design, music creation, and performance.
- **Innovation and Entrepreneurship:** Work collaboratively in hands-on explorations of the problems, opportunities, strategies, and circumstances that lead to innovations. You will experience integrated models of innovation that increase the likelihood of successful products and services that will bring value to society and/or the marketplace.
- **Intelligent Environments:** Design and implement interactive 3D spaces—both physical and virtual—that shape our experience of time and space.
- **Physical Computing:** Build interactive devices combining small programmable electronic controllers with physical embodiments, adding on-board processing and reactivity to nearly anything around you. Create novel games, useful devices, experimental provocations, and more.
- **Soft Technologies:** Weave together a rich set of traditions and experimental techniques to animate soft materials and matter.
- **Immersive Technologies in Arts & Culture:** Blend technological skills with creative imagination and critical humanistic practice.

Individuals who make significant contributions, academically and professionally, in these areas are solidly prepared in a related discipline. Their preparation is combined with the ability to work in multidisciplinary teams that span technology and the arts. IDeATe serves as a multidisciplinary collaborative learning addition to the education (and learning outcomes) that students receive through their disciplinary major rather than a standalone learning experience.

Innovation and advancement in the IDeATe areas, as in many complex areas of inquiry, is the result of collective inquiry and requires deep expertise in all contributing areas of knowledge (i.e., expert technologists and artists). Carnegie Mellon is the only university in the United States with highly ranked departments in key technological and artistic domains. With these resources, Carnegie Mellon is uniquely positioned to create faculty and student teams that contain all necessary, high-level expertise in tech-arts areas of inquiry.

Students who participate in IDeATe will be able to combine the unique experience of a "deep dive" in their chosen discipline while connecting to the diverse areas of knowledge and skill across the university. To help facilitate this experience, the educational objectives of the IDeATe network are:

- Students from any undergraduate major can integrate a tech-arts area of study into their curricular plan through the IDeATe minors, which enhance and synthesize the tech-arts ecosystem at CMU.
- Students in IDeATe have the opportunity to:
    - Immerse themselves in a collaborative community of faculty and peers who share expertise, experience, and passions at the intersection of arts and technology
    - Engage in active "learning by doing" in shared labs and maker spaces
    - Address current and emerging real-world challenges that require disciplinary expertise coupled with multidisciplinary perspectives and integrative approaches.

Across the ten IDeATe areas, there are over 50 multi-disciplinary technology-arts courses that a student can choose from to customize their paths. Students are assisted in their choice of courses and minor by a dedicated IDeATe advisor who works in tandem with the advisor in their home department.

The IDeATe Portal Courses introduce students to the concepts and practices of knowledge areas beyond their discipline that contribute to the subject of each minor/concentration. After completing the portal courses, students should be able to (1) interpret cross-disciplinary communication from their collaborators (and use that interpretation productively in the collaborative work), (2) translate their own disciplinary expertise to describe ideas and outcomes in a way their cross-disciplinary collaborators can understand, and (3) develop interdisciplinary tech-arts prototypes (that include perspectives from multiple disciplines and enable further interdisciplinary communication and collaboration).

The remaining courses of IDeATe deepen exploration in a given area. Each course is focused on a key aspect of the area that it is categorized under. By taking these courses, the student can become familiar with many of the technical and creative issues in the area of the minor and the collaborative processes they entail. These courses are collaborative because they promote hands-on learning through making, critique, and iterative design and they promote learning from both the instructor and the interdisciplinary peer cohort. At the conclusion of each course a student should be in a position to collaboratively plan and implement an established outcome in the area within a limited amount of time and apply skills from both technology and arts disciplines to prototype ideas and leverage the diversity of perspectives to produce innovation in the field.

A completion of a minor should provide multidisciplinary training in the area of the concentration and furthermore *enhance collaborative learning experience and skills of students*: diversify the cohorts of the student, enhance collaboration skills, promote cognitive versatility, facilitate skill transfer across technology and the arts, and produce graduates that can innovate in 21st century creative industries.

For more information, please visit the IDeATe website (https://ideate.cmu.edu).

Minors

In addition to a student's primary degree, they can choose a minor that is a secondary focus to the student's area of study, which can enhance a student's breadth of study and overall experience while not requiring the same amount of coursework as a second major or degree. The following list shows available minors. Unless otherwise indicated, minors are generally open to all university undergraduate students.

Intercollege:

- Game Design (IDeATe) (p. 887)
- Health Care Policy and Management (p. 889) (jointly between the Dietrich College of Humanities and Social Sciences, the H. John Heinz III College, and Mellon College of Science)
- Immersive Technologies in Arts & Culture (p.) (IDeATE and Department of Languages, Cultures, and Applied Linguistics)
- Music Technology (p. 329) (jointly between the School of Music and School of Computer Science)
- Neural Computation (p. 705) (jointly between the School of Computer Science, Mellon College of Science, and Dietrich College of Humanities and Social Sciences)

College of Engineering:

The following engineering minors are open to all Carnegie Mellon students:

- Biomedical Engineering (p. 192)
- Engineering Studies (p. 192)
- Technology and Policy (p. 192)

Designated Minors (open only to engineering students):

- Additive Manufacturing (p. 195)
- Audio Engineering (p. 196)
- Automation and Controls (p.)
- Colloids, Polymers and Surfaces (p. 197)
- Electronic Materials (p. 197)
- Global Engineering (p. 198)
- Materials Science and Engineering (p. 199)
- Mechanical Behavior of Materials (p. 199)

College of Fine Arts:

- Architectural Design Fabrication (p. 209) (available only to B. Arch candidates)
- Architectural Representation and Visualization (p. 209) (available also to B. Arch candidates)
- Architectural Technology (p. 209)
- Architecture (p. 209)
- Architecture History (p. 209) (available also to B. Arch candidates)
- Art (p. 211)
- Building Science (p. 209) (available only to B. Arch candidates)
- Collaborative Piano (p.) (available only to Piano majors in the School of Music)
- Conducting (p. 329) (available only to students in the School of Music)
- Design (p. 212)
- Drama (p. 213)
- History of the Arts (p. 211)
- Media Design (p. 211) (IDeATe)
- Music (p. 213)
- Music Education (p. 329) (available only to students in the School of Music)
- Music Technology (p. 329)
- Music Theory (p. 329)
- Musicology (p. 213)
- Photography (p. 215)
- Sonic Arts (p. 213) (IDeATe)
- Sound Design (p. 329) (IDeATe)

Dietrich College of Humanities and Social Sciences:

- African and African American Studies (p. 540)
- Anthropology (p. 419)
- Arabic Studies (p.)
- Behavioral Economics, Policy and Organizations (p. 497)

Pre-Law Advising Program

Director: Joseph Devine, *Associate Dean for Undergraduate Studies, Dietrich College*
Location: Dietrich College Dean's Office, Baker Hall 154
www.cmu.edu/pre-law (http://www.cmu.edu/pre-law/)

“Law School” is an objective that students frequently mention when asked about post-baccalaureate plans. It seems in its brevity to be a simple enough answer, but in reality it masks a host of complex and momentous personal decisions and strategic tasks.

First and foremost, seeking entry into law school implies an informed decision about the rigors of law school and the realities of professional life as an attorney, as well as a strong and mature commitment to achieving these objectives at significant cost and investment (financial, personal, and intellectual). Second, it implies an understanding of the prolonged sequence of steps involved in the process of selecting law schools to which to apply, actually applying, ultimately selecting a school to attend, financing a law school education, and succeeding in law school. Finally, it implies an understanding of this as one of many options that should be carefully considered before a choice is made that will so significantly influence the course of one’s personal and professional life.

To address these needs, the university offers a pre-law advising program for students and alumni who are contemplating or actively seeking to enter law school. The program consists of a range of support services, coordinated centrally, designed to assist these groups in engaging the complex questions associated with decisions about law school, and in successfully negotiating the sequence of tasks associated with selecting, applying and gaining admission to the best law schools possible.

The emphases of this program are:

- early identification of pre-law candidates;
- stimulation at early stages and throughout this process to consider the essential questions of personal suitability for law school and professional life as an attorney;
- engagement with meaningful substantive issues rooted in the law that illustrate the intellectual complexities of our legal system and the corresponding intellectual acumen needed to enter and thrive in this profession;
- timely direction in designing and executing a well-planned law school research, selection and application strategy;
- gathering and using accurate data on university alumni entering law school and the legal profession.

The program proper consists of several components, organized and made available as an ongoing service to all students and graduates of the university. These components include periodic workshops and seminars, a pre-law website, a pre-law newsletter, and linkage with law school admissions offices, the Law School Admissions Council, and associations (both regional and national) of pre-law advisors. The program also works closely with the student Pre-law Society.

Student Defined Majors

Carnegie Mellon offers the opportunity for undergraduate students to pursue a Student Defined Major. Some colleges have specific processes for Student Defined Majors within their college (see relevant college section of the catalog). For information and advice, interested students are encouraged to speak to the associate dean of their current home college or the college most relevant to the proposed course of study.

The requirements for successful completion of a Student Defined Major include a student proposal approved by an advisor, relevant college(s), the vice provost for education, and successful completion of the approved course of study. In brief:

- A student interested in pursuing a student-defined major must develop a proposal which outlines an intellectually coherent area of study (with degree title) and a plan of study (courses to be taken, pedagogical rationale, and proposed schedule). The proposal should include an explanation of why it is not appropriate or possible to pursue such a program through the curriculum of any one of the colleges. It should outline a program of study for both general education (for example, the core requirements of one of the most relevant colleges or equivalent general education plan) and major requirements. The proposal should designate one of the participating colleges as de facto “home college” for tracking and verification purposes.
- **Proposals must be approved at least one academic year prior to expected graduation.** Students should therefore submit their proposals by the end of their fifth semester, to allow ample time for approval.
- The student's proposal must be approved by a faculty advisor within a college who takes pedagogical responsibility for the program, by the de facto “home college” and by any other colleges involved in granting the degree. The signed proposal will be submitted to the Provost's Office for a final review and approval.
- Once approved by the faculty advisor, colleges, and the Provost's Office, the student's major will be administered by the advisor and their progress tracked by the dean's office of the “home college.” The “home college” will be responsible for monitoring the student's progress and reminding any collateral colleges of the approval of the Student Defined Major so that these colleges may insure the student's ability to enroll in the necessary courses. Upon successful completion of the course of study, the “home college” will be responsible for contacting all the relevant colleges and verifying the completion of the degree. Upon consultation with the “home college", students may receive their diploma in the most relevant department's ceremony.

Note: To distinguish Student Defined Majors from regularly offered majors at Carnegie Mellon, the phrase "(Student Defined Major)" will be added to the end of the major name. This notation will appear on all official documents (transcripts, verification letters, diplomas, etc.).

Student-Taught Courses (StuCo)

The Student College (StuCo) was established in 2001 to provide Carnegie Mellon students with the opportunity to share knowledge through educational, self-designed courses. Students can teach classes on any topic of their choice. However, the course cannot be available through regular university offerings. Courses typically meet once a week (for a full semester) and follow the current Carnegie Mellon academic calendar. Instructors and students receive credit (3 elective units - pass/no pass) for their work.

- All CMU students are eligible to teach StuCo courses and to join the Executive Committee that governs StuCo.

- All currently-enrolled CMU students, staff and community members are eligible to take StuCo courses.
- StuCo classes are taught during the fall and spring semesters.

StuCo courses vary semester to semester. Current classes offered by StuCo for fall 2023 include:

98-012	Student Taught Courses (StuCo): Fun with Robots	3
98-026	Student Taught Courses (StuCo): Genshin Impact: Team Building	3
98-038	Student Taught Courses (StuCo): Anime From Astro Boy to Your Name	3
98-043	Student Taught Courses (StuCo): Chess Tactics and Strategy	3
98-044	Student Taught Courses (StuCo): Introduction to Flag Design	3
98-057	Student Taught Courses (StuCo): Intro to Polytopes	3
98-061	Student Taught Courses (StuCo):UXplore: Uncover the Best of Modern UX Design	3
98-097	Student Taught Courses (StuCo): Intro to 3D Modeling- Character Design Pipeline	3
98-099	Student Taught Courses (StuCo): Problem Solving through Solving Problems	3
98-122	Student Taught Course (StuCo): Blackjack Techniques	3
98-123	Student Taught Courses (StuCo): Introduction to Hand Lettering	3
98-128	Student Taught Courses (StuCo): Fundamentals of Improv Comedy	3
98-148	Student Taught Courses (StuCo): Introduction to Student Journalism	3
98-154	Student Taught Courses (StuCo): Intro to Open-Source FPGA & ASIC Chip Design	3
98-156	Student Taught Course: Contemporary and Marginalized Poetics Workshop	3
98-157	Student Taught Courses (STUCO): Music: Deep-diving Artists and Genres	3
98-179	Student Taught Courses (StuCo): Introduction to Japanese Mahjong	3
98-203	Student Taught Courses (StuCo): Music and Interaction	3
98-205	Student Taught Courses (StuCo): Introduction to Minecraft	3
98-226	Student Taught Courses (StuCo): Movies You Should Have Watched By Now	3
98-230	Student Taught Courses (StuCo): Avatar: The Last Airbender & The Legend of Korra	3
98-242	Student Taught Courses (StuCo): Introduction to Esoteric Programming Languages	3
98-244	Student Taught Courses (StuCo): Sign Language Through Pop Music	3
98-258	Student Taught Courses (StuCo): Introduction to Competitive Pokemon	3
98-266	Student Taught Courses (StuCo): Private Pilot Ground School	3
98-272	Student Taught Courses (StuCo): Financial Literacy for Beginners	3
98-288	Student Taught Courses (StuCo): Star Wars: The Course Awakens	3
98-301	Student Taught Courses (StuCo): Taylor Swift Through the Eras	3
98-303	Student Taught Courses (StuCo): Introduction to Freestyle Rap	3
98-309	Student Taught Courses (StuCo): Build Your Own Startup	3
98-317	Student Taught Courses (StuCo): Hype for Types	3
98-335	Student Taught Courses (StuCo): Introduction to Glowstringing/Poi	3
98-341	Student Taught Courses (StuCo): Build Your Own Breadboard Computer	3
98-369	Student Taught Courses (StuCo): Brooklyn Nine-Nine	3
98-374	Student Taught Courses (StuCo): Steep by Steep: Investeagation into Tea Culture	3
98-375	Student Taught Courses (StuCo): Introduction to AI Alignment	3
98-390	They Came as Romans: Roman Civilization 360	3

For detailed information on the Student College, please visit the StuCo website (http://www.cmu.edu/stuco/).

Study Abroad Programs

Carnegie Mellon students from every major may be able to study in any part of the world for a semester, year or summer. Short-term programs during spring and winter break are also possible. A well planned study abroad program, in coordination with one's academic advisor, will allow a student to receive credit for study abroad and graduate on time. Most students study abroad during their junior year; however, a growing number of students are studying abroad during their sophomore and senior years.

The study abroad advising staff offers general information sessions as well as individual advising appointments to assist students in all stages of the study abroad process. The Office of International Education (OIE) also has useful web links to help students find the most appropriate study abroad program. In addition, OIE offers orientations to help with personal, academic and acculturation issues, before and after a study abroad experience.

Carnegie Mellon offers students a variety of payment options for study abroad to allow students to study abroad regardless of financial need. There are three categories of programs: Exchange Programs, Sponsored Programs, and External Programs. A description of each program follows.

More detailed information can be found at www.cmu.edu/studyabroad (http://www.cmu.edu/studyabroad/).

Exchange Programs

Students who participate in exchange programs pay Carnegie Mellon tuition and receive their regular financial aid package. Students are responsible for room, board, travel and miscellaneous expenses.

University Exchanges

Carnegie Mellon University has university-wide exchange programs with institutions located in Australia, Chile, Hong Kong, Israel, Japan, Mexico, Qatar, Singapore, and Switzerland.

Departmental Exchanges

Chemical Engineering, the College of Engineering, Design, Drama, Economics, Electrical and Computer Engineering, Heinz College, Computer Science and Business offer departmental exchange programs. Students should contact their department or the study abroad website for additional information.

Sponsored Programs

The university has designated a few study abroad programs administered by other organizations or universities as sponsored programs. To participate in these programs, students pay a university fee equivalent to current tuition, room and board, and retain their eligibility for all financial aid. Carnegie Mellon in turn pays the program costs to the study abroad program or institution. Where applicable, funds are distributed to the student for room, board, travel, and personal expenses.

Currently, Carnegie Mellon has approximately 50 sponsored programs available around the world. A full list can be found at www.cmu.edu/studyabroad (http://www.cmu.edu/studyabroad/) or in consultation with a study abroad advisor.

External Programs

Students may also participate in a program hosted by another university or study abroad organization if the student's home department approves the program and its course offerings. Students will pay the other organization or institution directly. Students who receive institutional aid from Carnegie Mellon will not be eligible for this aid while they are abroad. However, students with state and federal aid will still qualify. Students can learn more about external program options during study abroad advising appointments, information sessions, or on the study abroad website.

Undergraduate Academic Regulations

All enrolled students are required to comply with the university's Academic Regulations, as well as official University Policies (www.cmu.edu/policies (https://www.cmu.edu/policies/)). Students are expected to familiarize themselves with these regulations and are also advised to pay special attention to all academic dates and deadlines (www.cmu.edu/hub/calendar (https://www.cmu.edu/hub/calendar/)). The university reserves the right to change regulations and policies whenever such action is deemed appropriate or necessary.

Academic regulations are compiled by the University Registrar's Office. Students who have questions regarding these regulations should consult with their academic advisor.

Courses & Registration

Availability of Required Courses

In order to ensure that students do not have to compete for access to their required courses, registration priority is given to students who are registering for courses in their primary major. Although the university encourages the exploration of other disciplines, access to courses outside a student's primary major (including those courses that fulfill requirements for an additional major, minor, etc.) is on a space-available basis and is not guaranteed. Students must meet course pre- and co-requisites when registering, and are subject to course space availability. The university is committed to ensuring that each degree candidate has access to a normal course load before permitting other students to register for a greater than normal number of units.

Change in Schedule (Add/Drop)

Scheduling changes must be made within the period in the semester as established in the Official Academic Calendar (https://www.cmu.edu/hub/calendar/). A student **cannot drop a course** by simply notifying the instructor or by ceasing to attend class. A student dropping all of their courses (with the intent of leaving the university) must file an Application for Withdrawal or an Application for Leave of Absence (see the "Student Leave Policy" (p.) for more information).

Students are considered full time if registered for 36 or more units. Students should be sure to confirm their class level and enrollment status in SIO (https://s3.as.cmu.edu/sio/) prior to registering. Students must be registered for courses by the tenth day of classes or they will be administratively withdrawn for the semester. Any student who has been administratively withdrawn in error should immediately contact their academic advisor.

Students may drop a course by following the instructions for dropping a course in Student Information Online (SIO) on or before the appropriate deadline as published in the Official Academic Calendar. When a course is dropped by the drop deadline, the course is removed and does not appear on the academic record. Students may also use a late drop voucher for a limited number of course drops after the deadline during the pursuit of their degree. This action must be taken through consultation with their academic advisor or associate dean. Undergraduate students will receive three course drop vouchers throughout their undergraduate academic career and master's students will receive one voucher per 12 months of study. Only one drop voucher may be used per semester. In order to drop below 36 units, students must see their advisor for special permission. Vouchers are not intended to be used for exceptional or extenuating circumstances and they cannot be used to drop below full-time status (36 units). International students who wish to drop below full-time must consult the Office of International Education.

Students with a pending or documented academic integrity violation may not drop the course or change the course to P/NP, including the use of a voucher.

Undergraduate students who wish to withdraw from a course after the drop deadline must complete a Course Withdrawal form and **must** obtain their academic advisor's signature. The advisor will indicate whether they "recommend" or do "not recommend" withdrawal from the course on the form, sign the petition and submit it to the University Registrar's Office. When a course is withdrawn by the course withdrawal deadline, a "W" grade appears on the academic record.

The Late Add form is used for adding a course or switching sections after the add period and during the semester in which the course is offered. Students can check SIO to see if the appropriate schedule changes have been made. Undergraduate students who add a course or switch a section after the add period are required to obtain the permission of their advisor and home dean's office. Graduate students must have the permission of their department.

View details about course adds, drops and withdrawals on The HUB website (https://www.cmu.edu/hub/registrar/course-changes/).

Free Electives

A free elective is any Carnegie Mellon course that a student completes that is not being used to fulfill a college, school, major or minor requirement. A maximum of nine units of physical education and/or student-taught (StuCo) courses may be included in the tally of units required for graduation.

Overloads

The university is committed to insuring that each degree candidate has access to a normal course load before it permits other students to register for a greater than normal number of units. A normal course load has been established by each academic department. Students should check with their academic advisor or department for the definition of a normal course load. Individual colleges may have overload policies that are more restrictive, therefore students should consult with their advisor when considering an overload. Students may register for an overload up to 12 units with the approval of their academic advisor if they have demonstrated their ability to successfully complete a normal course load. Successful completion of a normal course load is defined as having earned at least a 3.00 (3.50 for students in ECE) cumulative QPA through the preceding semester or at least a 3.00 (3.50 for students in ECE) semester QPA in the current semester (in which case all final grades must be recorded before the student can register for the overloaded class). Overloads greater than 12 units or other exceptions must have the approval of the student's associate dean. First-year and transfer students are limited to a normal course load in their first semester of attendance.

Summer Classes

Per the Associate Deans' Council, undergraduate students are limited to registering for 24 units in summer sessions without advisor approval. If the student's advisor wishes to approve additional units after consulting with the student, the advisor can increase the student's course load units.

Conduct of Classes

Students are expected to attend all scheduled classes unless the instructor explicitly informs the class that other ways of doing the work are acceptable. The action to be taken in regard to tardiness, absence from class or making up late work is the responsibility of the individual instructor; the instructor should consult with the department head and the student's dean if major action, such as dropping the student from the course, is being considered.

All classes will be held at their scheduled hour on days immediately before and after all holidays and recesses. Both faculty and students are expected to be present.

Members of athletic teams and other student organizations are permitted to be absent from classes to participate in authorized contests and presentations, either at home or out of town, provided the following conditions are met:

- All work missed must be made up to the satisfaction of the instructor concerned;
- No trip shall involve an absence of more than two days, excluding days when classes are not scheduled;
- The total number of days of absence shall not exceed six per sport or per organization annually;
- Each student will obtain an absence authorization signed by the director or sponsor of the organization involved and by the Dean of Student

Affairs. The student will present this authorization to the instructor. This is not an excuse for work missed.

Technology affords many students access to mobile devices. It is expected that students will respect the wishes of faculty with regard to the use of electronic devices within the academic environment.

Students who, because of religious beliefs, cannot attend class may arrange as individuals to be absent, provided the work missed is made up in a manner satisfactory to the instructor of the class missed.

No student shall leave a scheduled exercise because of the absence of the instructor until a reasonable time has passed. By tradition and as a matter of courtesy a student should wait 10 minutes before leaving.

Course Attendance, STUDENT ACCOUNT BALANCE and Enrollment

A student is responsible for the payment of charges incurred at the university by the stated payment deadline. The purpose of this policy statement is to detail the specific process and action steps to be used to resolve any outstanding student account balance.

Students will be held financially and academically accountable for courses they attend or for which they are enrolled. Enrollment in a course which is not actively taken, or contrarily, the taking of a course for which enrollment has not been completed, will result in the assignment of a grade and responsibility for applicable tuition charges.

Students who fail to resolve their enrollment and balances will be prohibited from using university academic and administrative services. The services include, but are not limited to, computing facilities, library services, housing, dining, career center services, degree verification and the release of academic transcripts for the upcoming semester.

Undergraduate Course Meetings

Usually, no undergraduate classes, exams, academic, or artistic activities (including extra help sessions, rehearsals, ROTC drill, make-up exams, etc.) are scheduled on weekdays between 4:50 and 6:50 p.m. On occasion, some courses may be scheduled during these hours by the University Registrar's Office when they also are offered at other times; students may elect to take such courses during the 4:50 to 6:50 p.m. period.

Grades, Transfer Credit, Advanced Placement

Grading Policy

www.cmu.edu/policies/student-and-student-life/grading.html (https://www.cmu.edu/policies/student-and-student-life/grading.html)

This policy offers details concerning university grading principles for students taking courses, whether those students are undergraduates, non-degree students or graduate students. This policy covers the specifics of assigning and changing grades (including final and mid-semester grades, incompletes and conditional failures), grading options (audit and pass/fail), drop/withdrawals, and course repeats, as well as defines the undergraduate and graduate grading standards.

Questions about grading for a specific course should be addressed to the instructor of the course in question. Graduate students with questions about pass/fail and drop/withdrawal should contact their individual program. Appeals for an exception to any grading policy may be made by the dean's office of the student's home college.

Definitions

Certain terms are used in this document with specific meanings, as defined in this section.

Student means any full-time or part-time degree-seeking undergraduate or graduate student, or full-time or part-time non-degree student.

Non-degree student means a student who is not in a university degree program.

Faculty means members of the university's Faculty Organization as defined in the Faculty Handbook, plus instructors and special faculty appointments (even in their first year), and part-time faculty.

Instructor means a faculty member, teaching assistant, and /or lecturer who is the instructor of record, as recorded in the Student Information System (S3).

Policy Provisions

Assigning Grades

Final grades are awarded to each student, in each course scheduled, at the end of the semester, mini-semester or summer session. All students taking a course at Carnegie Mellon must be assigned grades.

The University Registrar's Office will query instructors who do not assign a grade to a student. Copies of the query regarding the lack of grade will be sent to the course's department head and associate dean. If the instructor does not assign a letter grade or an incomplete grade within one month of that query, the teaching department head will be responsible for insuring that a grade is assigned.

Changing a Grade

A student who believes that an assigned grade is incorrect may request that a final grade be changed. This action should be taken as soon as possible but no later than one year after the final course grade was issued. Final grades will be changed only in exceptional circumstances and only with the approval of the instructor and, for undergraduates, with the approval of the dean's office of the college/school offering the course; for graduate students, department approval is required. The intention of this policy is to ensure that, under normal circumstances, all students in a class are treated equally and no student is unduly advantaged.

Mid-Semester Grades

Mid-semester grades provide valuable feedback to students as they assess their performance in courses. Furthermore, mid-semester grades and the QPAs they generate are used by deans and advisors in identifying and dealing in a timely way with students in academic trouble. Therefore it is imperative that mid-semester grades accurately reflect student performance and are turned in on time.

Mid-semester grades are not permanent and are kept only until final grades are recorded. Because mid-semester grades are not permanent, changes of mid-semester grades as a rule will not be accepted.

Incomplete Grades

Carnegie Mellon students are expected to complete a course during the academic semester in which the course was taken. However, if the instructor agrees, a grade of I (incomplete) may be given when a student, for reasons beyond their control, has been unable to complete the work of a course, but the work completed to date is of passing quality and the grade of incomplete provides no undue advantage to that student over other students.

In awarding an I grade, an instructor must specify the requirements for completing the work and designate a default letter grade where no further work is submitted. Students must complete the required course work no later than the end of the following academic semester, or sooner if required by prior agreement. The instructor must record the permanent grade by the last day of the examination period of that following semester, or the University Registrar's Office will administratively assign the default grade.

Pass/No Pass Grades

Undergraduate students may elect to take a free-elective course pass/no-pass unless precluded by the course, the course's department or the student's home department/college. Policies for graduate students vary and students should be advised to check with their individual colleges/departments/programs for details.

A student must submit a Pass/No-Pass form to the University Registrar's Office indicating the course they are electing as pass/no-pass before the end of the university's withdrawal period. This decision is irreversible thereafter. No information regarding the student's decision will be passed on to the instructor. Instructors will submit letter grades, which will automatically be converted to pass/no-pass.

Work graded A through D will receive credit for units passed and be recorded as P on the student's academic record; below D work will receive no credit and will be recorded as N on the student's academic record. No quality points will be assigned to P or N units; P or N units will not be factored into the student's QPA.

In exceptional circumstances, departments may ask to designate a course pass/no-pass or request that the course be evaluated only with letter grades. The College Council must approve designating a course as pass/no-pass only or as graded only. If such a decision will have an adverse effect on the requirements of any other college, Academic Council must review the decision. The decision to designate a course as graded or pass/no-pass must be made before the add period for the course and is irreversible thereafter.

Audit Grades

Auditing is presence in the classroom without receiving academic credit, a pass/fail or a letter grade. The extent of a student's participation must be arranged and approved by the course instructor. A student wishing to audit a course is required to register for the course, complete the Course Audit Approval form, obtain permission of the course instructor and their advisor, and return the form to The HUB prior to the last day to add a course.

Any student enrolled full-time (36 units) may audit a course without additional charges. Part-time or non-degree students who choose to audit a course will be assessed tuition at the regular per-unit tuition rate.

Drop/Withdrawal Grades

Students at Carnegie Mellon may drop a course by accessing online registration in SIO on or before the drop deadline as published in the official university calendar. Policies for graduate students vary and students should be advised to check with their individual colleges/departments/programs for details. When a course is dropped by these deadlines, the course is removed and does not appear on the academic record.

Undergraduate students who wish to withdraw from a course after the drop deadline must complete a Course Withdrawal form and **must** obtain their academic advisor's signature. The advisor will indicate whether they "recommend" or do "not recommend" withdrawal from the course on the form, sign the petition, and assign the "W" (withdrawal) grade in S3. The "W" grade will appear on the academic record. Withdrawal grades do not apply to graduate students, except in CFA, DC and SCS. Students may use a late drop voucher for a limited number of course drops after the deadline during the pursuit of their degree. This action must be taken through consultation with their academic advisor or associate dean. Learn more about course drops, withdrawals and vouchers at www.cmu.edu/hub/registrar/course-changes (https://www.cmu.edu/hub/registrar/course-changes/).

Undergraduates who are registered as full-time students as of the 10th day of classes are expected to remain full-time for the duration of the semester. Full-time is defined as registered for a minimum of 36 units. Permission to drop below the 36-unit minimum can only be granted in extraordinary circumstances by the student's home associate dean. Undergraduates who are registered as part-time are also subject to the above deadlines to drop or withdraw from a course.

Course Repeats

When a course is repeated, all grades will be recorded on the official academic transcript and will be calculated in the student's QPA. This is the case regardless if the first grade for the course is a passing or failing grade, including pass/fail.

Undergraduate students who wish to repeat a course already passed must obtain approval from the student's dean or department head. When a student takes a course they have already passed, only one set of units will count toward graduation requirements.

University Grading Standards

The undergraduate student grading standard is as follows:

Grade	Quality Points	Definition
A	4.0	**Excellent**
B	3.0	**Good**
C	2.0	**Satisfactory**
D	1.0	**Passing**
R	0.0	**Failure**
P	Non-Factorable	**Passing**
N	Non-Factorable	**Not Passing**
O	Non-Factorable	**Audit**
W	Non-Factorable	**Withdrawal**
I	Non-Factorable	**Incomplete**
AD	Non-Factorable	**Credit granted for work completed at another institution or examination credit**

This grading standard is for all students classified as seeking an undergraduate degree and special students taking undergraduate courses.

Any +/- grades received by undergraduate students when taking graduate-level courses will automatically convert to the corresponding letter grade as listed in the scale above.

The graduate student grading standard is as follows:

Grade	Quality Points	Definition
A+	4.33	**(Not applicable to CIT or Dietrich College students)**
A	4.0	
A-	3.67	
B+	3.33	
B	3.00	
B-	2.67	
C+	2.33	
C	2.00	
C-	1.67	
D+	1.33	**(Not applicable to Tepper School, Heinz College, or Dietrich College students)**
D	1.00	**(Not applicable to Tepper School, Heinz College, or Dietrich College students)**
R	0.0	**Failure**
S	Non-Factorable	**Satisfactory**
P	Non-Factorable	**Passing**
N	Non-Factorable	**Not Passing**
O	Non-Factorable	**Audit**
W	Non-Factorable	**Withdrawal**
I	Non-Factorable	**Incomplete**
AD	Non-Factorable	**Credit granted for work completed at another institution or examination credit**

Grading standards are based upon a student's home academic program and is defined by their home college. The college's standards determine if certain grades are applicable and if undergraduate courses are factored into their mid-semester and final semester quality point averages (QPA). Otherwise, the university policy is that only graduate courses (600 level and higher) are factored into the semester QPA.

Pass/fail policies for graduate students vary and students should be advised to check with their individual college/department/program for details.

Minimum passing grades in graduate courses are determined by the department and college policy. Any course that a graduate student completes will be graded using the scale above. This includes undergraduate courses taken by graduate students, and non-degree students taking graduate courses.

Contact

Questions concerning this policy or its intent should be directed to the University Registrar's Office at 412-268-7404.

Units and Quality Points

Carnegie Mellon has adopted the method of assigning a number of “units” for each course to represent the quantity of work required of students. For the average student, one unit represents one work-hour of time per week throughout the semester. The number of units in each course is fixed by the faculty member in consultation with the college offering the course. Three units are the equivalent of one traditional semester credit hour.

Hence, a 9-unit semester-long course should require 9 hours of student engagement, on average, including class time; if the instructor requires 3 hours of lecture and 1 hour of recitation, they can expect students to spend 5 hours outside of class engaging in class work. For mini courses that run for only seven weeks, the conversion from units to number of hours per week during the mini involves multiplying by 2. For example, a 6 unit mini course should on average involve 12 hours of student engagement; if the instructor requires 3 hours of lecture and 3 hours of lab, they can expect the students to spend 6 hours outside of class.

Final grades are given “Quality Point Values” as follows:

Grade	Meaning	Quality Point Value
A	Excellent	**4**
B	Good	**3**
C	(Satisfactory)	**2**

D	Passing	**1**
R	Failure	**0**

Units earned for a course multiplied by the Quality Point Value of the grade given for that course equals the quality points for that course. For example, a 9-unit course assigned a “C” grade is awarded 18 quality points (9 units x 2 quality points = 18 quality points). Total Quality Points divided by Total Units Factorable equals the Quality Point Average.

For example, a student's record in one semester might be:

11 units x 4 quality points	=	**44 quality points**
10 units in Physics “R”		
10 units x 0 quality points	=	**0 quality points**
9 units in Chemistry “B”		
9 units x 3 quality points	=	**27 quality points**
9 units in History “C”		
9 units x 2 quality points	=	**18 quality points**
9 units in English “D”		
9 units x 1 quality point	=	**9 quality points**
Total Units = 48		
Total Quality Points = 98		
Quality Point Average (98 divided by 48) = 2.04		

“I” (incomplete), “P” (pass), and “W” (withdrawal) grades are not awarded quality points and are not considered “factorable” units when calculating the QPA.

The same procedure is applied to all grades earned at the university to establish the Cumulative Quality Point Average.

Dean's List

Undergraduate students who meet specific academic requirements are added to their home college's Dean's List each semester. This is noted on the student's transcript for applicable semesters. Each college may have its own requirements for Dean's List qualification; these are described in the individual college sections of the catalog. Note: Only undergraduate *degree-seeking* students may earn a place on the Dean's List. Non-degree students are not eligible.

Transfer Credit Evaluation and Assignment Policy

https://www.cmu.edu/policies/student-and-student-life/transfer-credit-evaluation-and-assignment.html

The Policy on Grades for Transfer Courses, originally dated January 13, 1993, and approved by the Committee on Educational Programs and Student and Faculty Affairs states:

Carnegie Mellon University offers students the opportunity to take courses for credit through a cross-registration program and through the receipt of transfer credit from other accredited institutions. The Carnegie Mellon University transcript will include information on such courses as follows:

Carnegie Mellon courses and courses taken through the university's cross-registration program will have grades recorded on the transcript and be factored into the QPA. All other courses will be recorded on this transcript indicating where the course was taken, but without grade. Such courses will not be taken into account for academic actions, honors or QPA calculations. Note: Suspended students may take courses elsewhere; however, they may receive transfer credit only if their college's and department's policies allow this.

Definitions

A Carnegie Mellon course is one conducted under Carnegie Mellon University regulations regarding course content and grading and taught by faculty under the supervision of a Carnegie Mellon academic unit. Courses taught by Carnegie Mellon faculty on the Carnegie Mellon campus qualify. Courses that are part of the regular offerings of other universities do not qualify, unless faculty at the other universities receive appointments at Carnegie Mellon and handle Carnegie Mellon students under Carnegie Mellon academic regulations.

Courses offered for cross-registration are those taken under the PCHE (Pittsburgh Council on Higher Education) agreement during the regular academic year.”

Only official and final college or university transcripts will be accepted for the awarding of transfer credit. Grade reports, letters and the like are not acceptable. It is the responsibility of the Office of Undergraduate Admission and the University Registrar's Office to verify official transcripts. Official transcripts for the awarding of transfer credit will reside in the student's permanent university academic folder in the University Registrar's Office.

It is the responsibility of each academic department to review and establish transfer course credit for their degree-seeking students.

Transfer Credit Evaluation Procedure

External Transfer Students

External applicants applying for transfer to Carnegie Mellon will arrange for submission of:

- official transcripts to the Office of Undergraduate Admission as part of the admission process.
- official, final transcripts to the Office of Undergraduate Admission once they are admitted and prior to their beginning coursework at Carnegie Mellon.

As part of the admission process, the Office of Undergraduate Admission will verify the official final transcripts, and then send them to the appropriate academic unit responsible for college/department acceptance decisions. Each unit will be responsible for the review of transfer credit and the establishment of transfer course credit for each individual student.

Current Students

Current Carnegie Mellon students taking courses at other accredited institutions (colleges and universities), during either summer semesters or as part of exchange programs or other departmentally approved programs, or while on leave from Carnegie Mellon, must arrange for the submission of official final transcripts to the University Registrar's Office.

Upon receipt, the University Registrar's Office will verify these official transcripts and send a copy of the transcript to the appropriate academic unit responsible for that student's college/department transfer credit decisions. The official transcript will reside in the student's university academic record in the University Registrar's Office. Each unit will be responsible for its students' transfer credit review and the establishment of transfer course credit for each individual student. Should a unit receive the official transcript, it must be sent immediately to the University Registrar's Office.

Administrative Procedures on Transfer Credit

To be considered for transfer credit, an approved course must be taken for an assessed grade and completed with a grade of C- or better (or equivalent of a U.S. C- grade). Ungraded or pass/fail courses may receive credit if the transcript key indicates that the mark represents a grade of C- or better. CMU does not discriminate against particular institutional settings or modes of delivery and strives for fairness and transparency as outlined in the Middle States Commission on Higher Education standards.

The coursework must be issued on an official transcript from a regionally accredited US college or university, or from an international institution of post-secondary education that carries globally recognized accreditation from the relevant Ministry of Education (or equivalent higher-education authority/appropriate government agency) and that offers university-level academic degree program courses comparable to a U.S. associate’s or bachelor’s degree. Transcripts from institutions outside the United States should be evaluated course-by-course by a NACES-approved credential evaluator and sent to CMU as part of the undergraduate admissions process.

Courses eligible for evaluation will be considered case-by-case to confirm equivalencies based on course content and academic rigor. Courses must include the same, or similar, content to CMU undergraduate courses; require the same, or similar, prerequisite coursework; and be offered at the same level of instruction. The student’s home major or minor department will determine how approved credit will apply to a student’s major or minor. Approved courses not given a direct equivalency may serve as general electives, units towards the degree, and breadth units where appropriate. A candidate for a bachelor's degree must complete at least 180 units of coursework at CMU.

CMU will not accept any math courses below Calculus 1. English-language courses, career preparation and first-year seminars, Algebra-based physics, and first-year writing are also not permitted to be transferred to CMU.

Standard Course Equivalents for Advanced Placement/International Baccalaureate Units Policy

The university has standard units assigned to Advanced Placement (AP) and International Baccalaureate (IB) credits for all majors. Standard course equivalencies for each exam will be determined by "expert departments" in each college for each acceptable AP/IB score.

Under this procedure, students' AP or IB credit for a particular course will only go toward their degree requirements if allowed by the home department or college policies. Should a student decide to transfer to another major and/or academic unit within the university, AP/IB credit applicability to new degree requirements will depend upon the requirements of the new home department (or college). Students may only be granted credit for the Higher Level IB exams. This policy assumes no significant AP and/or IB exam changes. In the event of significant exam changes, students will be notified of any resulting policy changes no later than July 30 prior to their enrollment to take effect the fall of that year.

Credit is also given for Cambridge International/EdExcel Advanced Level courses. Learn more about AP, IB and Cambridge credits at www.cmu.edu/hub/registrar/registration/ap-transfer-credit.html (https://www.cmu.edu/hub/registrar/registration/ap-transfer-credit.html).

Rank in Class

Undergraduates at Carnegie Mellon pursue degrees in one or more of our ten schools or colleges. They may choose to pursue coursework, majors and minors within and between schools/colleges. In an institution where students' educational experiences are so varied, class rank is not a meaningful way to measure achievement.

Carnegie Mellon does not report nor record students' rank in class, rank in college and rank in department. Graduate school and/or employment requests that ask for a students' rank will be completed with the statement "Carnegie Mellon does not report rank in class."

Transcripts & Verifications

Transcripts

The student's official transcript is to be considered the official record for all degree(s), major(s), minor(s), and honors. The official Carnegie Mellon transcript includes both the undergraduate and/or graduate record(s). All transcripts come in individually sealed envelopes, unless otherwise specified. Transcript requests are not processed if the student has an outstanding obligation, financial or otherwise. We cannot accept phone or email requests and we are not able to fax a transcript under any circumstances.

Visit www.cmu.edu/hub/registrar/student-records (https://www.cmu.edu/hub/registrar/student-records/) for complete information, including how to order a transcript.

Verifications

Enrollment and degree verifications are available for currently enrolled Carnegie Mellon students and Carnegie Mellon Alumni. A verification officially confirms information about you. Please note that we cannot fax your QPA or verifications that contain anything besides the following:

- Name
- Local address
- Local phone number
- Email address
- Class
- College
- Department
- Dates of attendance
- Date(s) of graduation
- Degree(s) awarded

The most common reasons for requesting a verification are:

- Student loan agencies and insurance companies asking if a student is enrolled.
- Scholarship committees asking if a student maintained a certain QPA.
- Potential employers asking if a student graduated with a certain degree.

Online Verification Ordering

Currently enrolled Carnegie Mellon students may order enrollment verifications via Student Information Online (SIO) (https://s3.as.cmu.edu/sio/). Additional information can be found at www.cmu.edu/hub/registrar/student-records (https://www.cmu.edu/hub/registrar/student-records/).

Full-Time Status

Undergraduates who are registered as full-time students as of the end of the course add period (typically, the 10th regularly scheduled class day) are expected to remain full-time for the duration of the semester. Full-time is defined by a minimum of 36 units. Permission to drop below the 36 unit minimum must be granted by the student's associate dean. Undergraduates who are registered as part-time are also subject to the above deadlines to drop or withdraw from a course.

Students carrying a full-time course load at the end of the course add period (typically, the 10th regularly scheduled class day) are not ordinarily permitted to drop below 36 units after that time. Exceptions must be authorized by the student's associate dean.

Class Level Standing

Students should refer to the sections of the catalog pertaining to their college and/or department to determine the number of units required each academic year by their specific curriculum. Students must achieve passing grades in order to earn units; students do not earn units for incomplete or failed courses.

A first-year student becomes a second-year student after earning passing grades in three-fourths of the units required by their first-year curriculum.

A second-year student becomes a third-year student after earning the number of units required by their first-year curriculum plus three-fourths of the number of units for the second year.

A third-year student becomes a fourth-year student after earning the number of units required by their first-year and second-year curriculum plus three-fourths of the number of units for the third-year.

Classification of students is made only at the time of their first registration in any academic year and remains unchanged throughout the rest of that academic year.

Course Description Requests (for prior years)

Please note that University Archives does not have access to transcript and verification information. They maintain only the course description archives. If you call or email this office, your request will not be processed. Please contact:

Archives/Art Inventory Specialist

Graduation & Diplomas

Degree Requirements

Students are responsible for checking to ensure that the degree requirements (as listed in the appropriate catalog at the time of their matriculation) have been met. They may also refer to the Stellic (https://academicaudit.andrew.cmu.edu/) online degree audit application. If the degree requirements have been modified by College Council action, the student is responsible for checking to ensure that the modified requirements have been met.

To be eligible to graduate, undergraduate students must complete all residence and course requirements for their program with a cumulative Quality Point Average of at least 2.0. For undergraduate students who enrolled at Carnegie Mellon as a first-year and whose first-year grades cause the cumulative QPA to fall below 2.0, this requirement is modified to be a cumulative QPA of at least 2.0 for all courses taken after the first year. Note, however, the cumulative QPA that appears on the student's final transcript will be calculated based on all grades in all courses taken, including their first year. Some programs may have additional QPA requirements in order to graduate. Students are encouraged to confirm all graduation requirements with their academic advisor.

No student may receive a diploma until all financial obligations to the university have been met.

Residency Requirement

A candidate for the bachelor's degree must complete at the university a minimum of four semesters of full-time study, or the equivalent of part-time study, comprising at least 180 units of coursework. Note that these are minimum residency requirements applicable to all university undergraduates. Some of the university's colleges and departments have developed more restrictive requirements in this area. Students should consult that section of the catalog in which their college or department's academic regulations are presented for the residency requirements applicable to them. Deviation from these policies requires action by the dean of the student's home college.

Implications of Residency Requirements for transfer students seeking a second undergraduate degree: Students who received degrees from other universities could have up to 2 years of credits earned elsewhere applied to their Carnegie Mellon degree requirements and would need to meet Carnegie Mellon's Residency Requirement and complete at the university a minimum of four semesters of full-time study, or the equivalent of part-time study, comprising at least 180 units of coursework. Deviation from these policies will require action by the dean of the student's home college.

Diplomas

A Carnegie Mellon diploma is a student's certificate of accomplishment. The diploma is printed with the name the student approved within Student Information Online (SIO) , along with the student's primary degree and major (i.e., Bachelor of Arts in Creative Writing), and if applicable, additional major(s). Minors are not listed on a diploma, although they do appear on an official transcript.

Diplomas are distributed to graduates during or immediately following the May Commencement Ceremony. Certain circumstances will result in students receiving their diplomas at a later date; these students will be informed of this well before the ceremony. If a student is unable to attend the ceremony, diplomas will be mailed in the weeks following commencement. Diplomas are not available prior to the stated date of graduation. August and December graduates will receive their diploma via the mail.

The diploma is 14x17 inches and is marked with a multi-colored and gold seal.

Graduation with University Honors

In recognition of exemplary academic achievement as undergraduates, some candidates for undergraduate degrees will be named to the University Honors List. Each of the undergraduate colleges will select students for honors on the basis of a cumulative grade point average (typically when cumulative QPA is greater than 3.5) and/or recommendation of the faculty.

Standard Degree Terminology

Carnegie Mellon University offers a wide variety of programs; the opportunities vary greatly between and among the colleges. For the purposes of clarification, this section defines:

- standard degree terminology;
- changes to the existing degree declaration process;
- the existing procedure for creating new degrees, majors and minors.

Degree

Examples: B.S. (Bachelor of Science); M.F.A. (Master of Fine Arts); Ph.D. (Doctor of Philosophy)

Major

Field studied in greatest depth by fulfilling a department-determined set of course requirements. The primary major is the field in which the degree is granted.
Example: Creative Writing; Physics; Marketing
Students may pursue an additional major(s) in a single degree program.

Minor

Field(s) studied for educational enrichment by fulfilling a department-determined set of course requirements. Graduate students may not pursue minors. Minors are not listed on the diploma but appear on the student's transcript. The type of degree sought is determined by the major (that of the home department), not the minor. Examples: Film Studies; Game Design

Option

(Now referred to variously as track, option, etc.)
A specific area of study associated with the major or an additional major(s), which transforms the title of the major or additional major.
Examples: Civil Engineering (Biomedical Engineering Option) Physics (Computer Science Option)

Concentration

(Now referred to variously as track, option, etc.)
A specific area of study generally associated with a major or additional major, which appears only on the transcript.

Home College

The college into which the student was originally admitted or into which the student formally transferred.

Home Department

The department into which the student was originally admitted or the department offering the major which the student has declared.

Concurrent College/Department

College/department other than the home college/department, granting the second of multiple degrees, or offering the additional major(s) of the double or triple major, or minor.

Single Degree/Major

One diploma, stating the degree and the major field of study. Currently, the Statute of Limitations on earning an undergraduate degree is eight years.
Examples: B.A. in Psychology; M.S. in Chemistry.
Requirements: Fulfillment of all requirements of the home college.
Declaration: At least by registration time (early November), during the first semester of the junior year.
Certification: Home college, home department.

Major-Declaration Process

For undergraduates, depending on the student's college, the major is usually declared at the end of the first year or sophomore year. Departments enter the appropriate majors upon declaration.

For graduate students, the major is usually indicative of the department and is supplied by the department.

Joint Degree

Degree program offered between two or more colleges or departments.

Examples: B.H.A from the College of Fine Arts and the Dietrich College of Humanities and Social Sciences; M.S. in Colloids, Polymers, and Surfaces (Chemistry and Chemical Engineering).

Multiple Degrees

More than one degree granted by the university (whether simultaneous or sequential). The students receives one diploma for each degree. When awarded simultaneously, two degrees are referred to as dual degrees, three degrees as triple degrees. Multiple graduate degrees may be given in conjunction with an outside university.

Examples of how such degrees appear on the respective diplomas:

- Bachelor of Fine Arts in the field of Art; Bachelor of Science in the field of History
- Bachelor of Science in the field of Physics; Bachelor of Science in the field of Computer Science

Requirements: Multiple bachelor's degrees

Declaration: Undergraduates must declare at least by registration time (early November), during the first semester of the junior year.

To receive multiple bachelor's degrees the student must:

- satisfy all requirements for each degree.
- complete an aggregate number of units that exceeds, by at least 90, the minimum unit requirement for the degree with the smallest such

requirement (i.e., if one of the degrees requires a minimum of 360 units and the other requires 380 units, a total of at least 450 units (90 plus 360, the smallest of the two) is required to obtain both degrees).

- comply, for each degree, with the statute of limitations regarding the time at which units are earned.
- while working towards more than one degree simultaneously, designate one of the departments (and if necessary colleges) as the home college/department.

Additional Major

One degree, stating the major in the home department first and the additional major second. The type of degree given (B.A., B.S.) is determined by the major of the home department.

For example, a student whose home department is Physics:

This degree is valid: B.S. in Physics with an additional major in History

This degree is not valid: B.S. in History with an additional major in Physics

The intent of a double major is an in-depth understanding of two major fields. Students may pursue a second major in a field where the primary degree is different from the degree associated with the additional major: i.e., B.S. in Economics with an additional major in History.

Requirements: If the double majors involve two different colleges OR the same college, the student must fulfill:

- all requirements (including core) for the first major degree as defined by the home college;
- all major requirements (including core prerequisites) for the additional major;
- any specific requirements for double majors imposed by the department(s)/college(s) involved.

Declaration: At least by registration time (early November), during the first semester of the junior year.

Certification: Home college, home department; concurrent college (if any), concurrent department (if any).

Additional Majors

One degree, stating the major of the home departments first, the second and the third major afterwards. The type of degree sought (B.A., B.S.) is determined by the major in the home department.

For example, for a History student, this degree is valid: B.A. in History with additional majors in Professional Writing and in Hispanic Studies. This degree is not valid: B.A. in Professional Writing with additional majors in History and in Hispanic Studies.

Requirements: If the triple major involves two or three different colleges OR the same college, the student must fulfill all requirements listed for each additional major.

Declaration: At least by registration time (early November), during the first semester of the junior year.

Certification: department

Concurrent college (if any), concurrent department (if any)

Second concurrent college (if any), second concurrent department (if any)

Minor

One degree, stating the major first and the minor second (or third, if there is also (an) additional major(s) involved). The type of degree sought (B.A., B.S.) is determined by the major (that of the home department). Minors are not listed on the diploma, but appear on the transcript.

Examples: B.F.A. in Music Performance (Voice) with a minor in Theatre Arts; B.S. in Applied History with an additional major in Information Systems and a minor in Mathematics.

Requirements: The student would generally take 45 units pertaining to the minor, in addition to fulfilling all requirements for the major degree (as defined by the home college). The “minor” courses are negotiated between the student and the department certifying the minor.

Declaration: At least by registration time (early November), during the first semester of the junior year.

Certification: department

Concentrations (Tracks, Options, Specializations, Area Cores, etc.)

These concentrations will not be considered part of the student's degree title unless the concentration is included as part of the major or (an) additional major(s) field title.

Additional Majors/Minors Declaration Process

For undergraduates, all variations on a student's intended degree and major field must be declared by the end of the first semester of the student's junior year. Having already declared a major, students should be well prepared by this time to choose additional majors and/or minors.

It is assumed that by these proposed deadlines, the student will have taken a majority of degree requirements and electives. The student can then, in conjunction with an advisor, review their course history and decide which options may or may not apply towards a supplemental degree and field(s), and then receive a detailed curriculum for attaining the additional desired degree, major or minor. The student should then notify the college/department offering the additional program. Upon receipt of this notification, the college/department will update the Student Information System which will allow this information to be reflected in the Commencement System for graduation. This procedure ensures that when a student is expected to graduate, all degree/major information is immediately accessible, and certification of the degree is simplified.

Multiple Degrees Involving Graduate Degrees

Policies involving multiple graduate degrees or a graduate/undergraduate degree program or sequence are dictated by each college involved.

Examples: M.S. in Public Management and Policy and the degree of Juris Doctor (Heinz College/University of Pittsburgh School of Law).

Declaration: Undergraduates: at least by registration time (early November), first semester junior year.

Declaration: Graduates: upon admittance OR by the end of the semester preceding the expected graduation date.

Certification: Home college, home department and concurrent college (if any), concurrent department (if any).

Degree Certification

undergraduate PROGRAM STANDARD DEGREE REQUIREMENTS & DEGREE CERTIFICATION

Carnegie Mellon undergraduate students are expected to complete their program of study within eight semesters of full-time enrollment, or 10 semesters for undergraduate students in the Bachelor of Architecture (B.Arch.) program. The standard undergraduate program of study is grounded in a primary degree and its requirements, and may be complemented by an additional major(s) or minor(s) as part of the student’s academic plan or as a requirement of the primary major. Upon completion of all primary degree requirements within the program of study in the standard number of eight semesters (or 10 for B.Arch.), the degree will be certified by the student’s academic program in the semester in which the student completes the requirements.

Early Completion

Students who complete their primary degree requirements within their program of study in fewer than eight semesters (or 10 for B.Arch.) may have their degree certified upon the completion of all requirements in consultation with their academic advisor(s).

Longer-than-Standard Completion

Longer-than-standard degree completion may occur due to academic interruptions in making progress toward the degree as defined by the academic program and/or the Student Financial Aid Satisfactory Academic Progress policy, interruptions of full-time study or progress toward the degree due to serious, documented medical issues, or other unusual or unforeseen circumstances. Students who complete their primary degree requirements within their program of study in more than the standard number of semesters will be certified in the semester in which they have completed their primary degree requirements, pursuant to close and regular consultation with their academic advisor(s).

Additional Guidance for Students

Program of study. Students seeking guidance about their program of study and degree requirements should consult with their academic advisor and/or appropriate associate dean.

Financial aid and student account. Students are expected to make normal progress toward their degree in order to graduate within the standard timeframe for their program of study. Under U.S. Federal Title IV regulations, student eligibility for federal financial aid is contingent upon enrollment in and successful completion of courses that are counted as credit toward their current degree program. To receive the maximum amount of federal and state financial aid for which they may be eligible, students must enroll each semester in at least 36 units that count toward their current degree level. CMU institutional undergraduate grants support undergraduate degree completion and on-time graduation; institutional undergraduate grants for students in undergraduate programs and in integrated undergraduate and master's degree programs are renewable for eight semesters (and 10 for B.Arch.). (See separate guidance regarding integrated bachelor-master's degree programs.)

Students should consult with their designated college liaison in The HUB regarding billing and financial aid, particularly for early completion, longer-than-standard completion, or integrated undergraduate and master's degree programs.

International students. Immigration status for students in F-1 and J-1 non-immigrant status is tied to making normal progress toward completing degree requirements. Therefore, F-1 and J-1 students who are considering completing their degree requirements early, anticipating longer-than-standard completion, or moving from an undergraduate to a graduate student classification (integrated undergraduate-graduate study), should consult with their designated advisor in the Office of International Education (OIE) to ensure compliance with immigration regulations.

Guidance for Academic Advisors and Deans

Advisors and associate deans may direct questions regarding degree certification, norms or exceptions to the University Registrar or to the Vice Provost of Education.

Integrated Bachelor & Master's Degree Programs STANDARD DEGREE REQUIREMENTS & DEGREE CERTIFICATION

The integration of bachelor and master's degree programs ("IBM" programs) benefits CMU students who elect to maximize their use of time and academic energy to blend their undergraduate studies with master's-level study in close combination, in an integrated program of study at CMU. Some CMU departments and programs have developed integrated options for students in response to student desires for such opportunities and to enliven their graduate programs with students who are well-acclimated to the rigor and demands of the CMU educational experience.

General Information

Carnegie Mellon students in integrated bachelor-master's programs are expected to complete their degree requirements within a standard length of time for their full-time program of study as outlined in the Undergraduate Catalog and relevant Graduate Student Handbook. This document describes several standard models for the CMU integrated bachelor-master's degree programs, some of which involve acceleration of either the undergraduate or the graduate degree component (or both) within the integrated program designs. Each CMU integrated program offers specific, pre-determined model(s) of integrated study reflecting one of the following:

- 4+0 meaning that a student will complete both undergraduate and master's degree coursework in eight semesters (four years) of full-time study. This model generally applies when the undergraduate and graduate field of study are the same, such as an undergraduate and master's degree in Chemistry or Mathematics.
- 3-1-1 meaning three years of full-time undergraduate coursework, followed by one year of integrated undergraduate and graduate study, and one year of exclusively master's level coursework for a total of five years of full-time study. And example would be undergraduate degrees integrated with Heinz College or Tepper graduate degree programs. The undergraduate degree generally is completed in eight semesters of full-time study (or less.)
- 4+1 semester meaning eight semesters (four years) of full-time undergraduate coursework including integration of some master's level courses, followed by one semester of exclusively master's level coursework for a total of four and a half years. The undergraduate degree generally is completed in eight semesters of full-time study (or less.)
- 4+2 semesters meaning eight semesters (four years) of full-time undergraduate coursework including integration of some master's level courses, followed by two semesters of exclusively master's level coursework for a total of five academic years. The undergraduate degree is completed in eight semesters of full-time study (or less.)
- 4+3 semesters meaning eight semesters (four years) of full-time undergraduate coursework including integration of some master's level courses, followed by three semesters of exclusively master's level coursework for a total of five and a half academic years. The undergraduate degree is completed in eight semesters of full-time study.
- 5+1 for architecture meaning five years of Bachelor of Architecture (B.Arch.) undergraduate coursework followed by two semesters of full-time master's level coursework for a total of six academic years. The B.Arch. undergraduate degree generally is completed in 10 semesters.

The standard undergraduate program of study is grounded in a primary degree and its requirements, and may be complemented by an additional major(s) or minor(s) as part of the academic plan. Some students decide to apply for one of CMU's several integrated degree programs to complement their undergraduate degree with an integrated or accelerated master's degree. Depending on the model of the integrated program, when an undergraduate student applies to an IBM program, they recognize that the standard for undergraduate study will be eight semesters (or 10 for B.Arch.), plus one, two, three or four additional semesters of full-time graduate-level study (except for the 4+0 model, above) to complete the master's degree.

CMU students in most IBM programs are considered to be undergraduates until they have completed the requirements for their bachelor degree at which point they are certified by their undergraduate academic program; this typically occurs at the time determined to be the standard for their integrated program following a successful seven or eight semesters (or 10 for B.Arch.) of full-time enrollment, depending on the design of their integrated program. However, in one rare model, the integrated program design holds the bachelor degree certification to be given concurrently with the master's degree in the ninth or tenth semester of full time enrollment.

Early Completion of Undergraduate Degree

An IBM student who has completed all undergraduate degree requirements in fewer than the standard number of semesters for their program may request an early undergraduate degree certification from their undergraduate program, in close consultation with their academic advisor(s). This situation, while possible, is not common due to the necessity of staying on track for both undergraduate and master's degree programs in an integrated manner.

Movement from Undergraduate to Graduate Student Classification

Students in an IBM program who are certified as having completed their undergraduate degree – typically in the number of semesters that is the standard for their integrated program – then will be classified as a graduate student at CMU, and are expected to complete their graduate degree requirements within the standard length of time for their integrated program of study. Students should be aware of and plan for financial implications, including financial aid, and/or F-1/J-1 non-immigrant implications due to the change of level when moving from undergraduate student status to graduate student status at CMU. (See details below.)

Standard for Graduate Component of IBM Student/Program

Upon completion of the graduate program degree requirements in the standard period of study, the graduate degree will be certified in the semester in which the student completes the requirements by the student's graduate program.

Early Completion of Graduate Degree Requirements

Early completion of the graduate degree requirements. Graduate students who consider the completion of all degree requirements in less than the standard length of time for their program of study must consult with their degree-granting program or department to determine if early degree certification is allowed academically and under what circumstances.

Incomplete Graduate Degree Requirements

In some cases, students in an IBM program may withdraw from the graduate component of the program of study and, therefore, will not be certified or awarded the graduate degree. Any such withdrawal decision also may require close consultation with the undergraduate advisor to determine eligibility for undergraduate degree completion and certification if the undergraduate degree is not already certified.

Extended or Longer-than-Standard Graduate Degree Completion

Longer-than-standard degree completion may occur due to academic interruptions in making progress toward the degree as defined by the academic program, interruptions of full-time study or progress toward the degree due to serious, documented medical issues, or other unusual or unforeseen circumstances.

IBM students who require longer than the standard time to complete their graduate degree requirements are expected to remain in close contact with their graduate program, and will be certified at the end of the semester in which they have completed their degree requirements. Students shall reference the CMU Policy on Master's Student Statute of Limitations (https://www.cmu.edu/policies/student-and-student-life/masters-students-statute-of-limitations.html) regarding guidelines and restrictions which place an upper limit on the maximum length of time allowable for master's degree completion and certification.

Additional Guidance for Students

Program of study. Students seeking guidance about their program of study and degree requirements should consult with their academic advisor and/or appropriate associate dean.

Financial aid and student account. Students are expected to make normal progress toward their degree in order to graduate within the standard timeframe for their program of study. Under U.S. Federal Title IV regulations, student eligibility for federal financial aid is contingent upon enrollment in and successful completion of courses that are counted as credit toward their current degree program. To receive the maximum amount of federal and state financial aid for which they may be eligible, students must enroll each semester in at least 36 units that count toward their current degree level. CMU institutional undergraduate grants support undergraduate degree completion and on-time graduation; institutional undergraduate grants for students in undergraduate programs and in IBM programs are renewable for eight semesters (and 10 for B.Arch.).

Students should consult with their designated college liaison in The HUB regarding billing and financial aid, particularly for early completion, longer-than-standard completion, or integrated bachelor and master's degree programs.

International students. Immigration status for students in F-1 and J-1 non-immigrant status is tied to making normal progress toward completing degree requirements. Therefore, F-1 and J-1 students who are considering completing their degree requirements early, anticipating longer-than-standard completion, or moving from an undergraduate to a graduate student classification (integrated undergraduate-graduate study), should consult with their designated advisor in the Office of International Education (OIE) to ensure compliance with immigration regulations.

Guidance for Academic Advisors and Deans

Advisors and associate deans may direct questions regarding degree certification, norms or exceptions to the University Registrar or to the Vice Provost of Education.

Academic Actions

Each college may have its own regulations and procedures regarding academic actions, but in general, the following apply to all undergraduate students.

Student Suspension/Required Withdrawal Policy

Policy Statement

University Suspension is a forced, temporary leave from the university. There are three types of suspension for students that apply to both graduate and undergraduate students:

- **Academic Suspension** is the result of poor academic performance or violation of academic regulations and is imposed by the student's college or academic department (see university and college academic policies).
- **Disciplinary Suspension** is the result of serious personal misconduct and is imposed by the Office of Student Affairs (see The Word/Student Handbook (https://www.cmu.edu/student-affairs/theword/)).
- **Administrative Suspension** is the result of failure to meet university financial obligations or failure to comply with federal, state or local health regulations and is imposed by Student Financial Services (see Student Financial Obligation Terms (https://www.cmu.edu/sfs/billing/sfo.html)).

Suspended students may not:

- register for courses
- attend classes
- live in residence halls or Greek housing
- use campus facilities, including athletic facilities, libraries and computer clusters
- participate in student activities
- be members of student organizations
- have student jobs*

**Students on academic suspension may have a summer campus job if they accepted the job before they were suspended.*

Employment

Although suspended students may not hold student jobs, students on academic suspension may, under certain circumstances, have a non-student job with the university; students on disciplinary or administrative suspension may not.

To have a non-student job, students on academic suspension must receive approval from their associate dean (undergraduate students) or department head (graduate students) to ensure that the job will not violate their suspension terms. Students in violation of this will lose their degree student status, meaning they would have to reapply for admission to Carnegie Mellon through either the Office of Undergraduate Admission or the appropriate graduate department.

Transfer Credit

Suspended students may take courses elsewhere; however, they may receive transfer credit only if their college's and department's policies allow this.

Appeals

To appeal any action of this policy, the student may write to the following individuals:

- Academic Suspension: Associate dean (undergraduate students) or department head (graduate students)
- Disciplinary Suspension: Dean of Student Affairs
- Administrative Suspension: Vice Provost for Enrollment Management and the Dean of Student Affairs, in consultation with the student's associate dean

Returning from Suspension

In order to return from a suspension, a student must have the following approval:

- Academic Suspension: Associate dean (undergraduate students) or department head (graduate students)
- Disciplinary Suspension: Dean of Student Affairs
- Administrative Suspension: Vice Provost for Enrollment Management and the Dean of Student Affairs, in consultation with the student's associate dean

---

Procedure for the Appeal of Grades & Academic Actions

In the event a student believes an assigned grade or an imposed academic action is incorrect or not appropriate, the student may follow the processes outlined below to seek a prompt and equitable resolution of the matter.

If a student believes a grade has been incorrectly assigned, the student should:

1. Present the case to the faculty member responsible for the course, providing all supporting data concerning the nature of the discrepancy.
2. If, after a decision is rendered, the student believes that their concerns have not been adequately resolved, the student may pursue a formal appeal with the department responsible for the course. To appeal to the department, a student must present a written statement detailing the grounds for the appeal with appropriate documentation to the head of the department responsible for the course. This appeal must be submitted within seven (7) days of receipt of the faculty member's decision. The department head will provide a written decision, including the basis for it, within thirty (30) days, or as soon thereafter as practical.
3. If the student is not satisfied with the department head's resolution, the student may pursue the appeal at the college level. To appeal at the college level, the student must present copies of all documents originally sent to the faculty member and department head, along with a formal letter of appeal, to the dean of the college responsible for the course. This appeal must be submitted within seven (7) days of receipt of the department head's decision. The dean, or the dean's designate, will review the appeal and will render a written decision, including the basis for it, within thirty (30) days, or as soon thereafter as practical.

If a student believes an academic action is inconsistent with the policies of the college or merits additional review, a student should:

1. Submit a formal written appeal, as specified in the initial academic action, to the associate dean of the college responsible for the decision, with a copy to the dean, requesting review of the action including all relevant materials to substantiate their case and support their concerns.
2. The dean of the college, or the dean’s designate, will review the appeal and issue a decision and the basis for it within thirty (30) days.

If, after carrying out the steps of either process described above, the student believes that the matter has not been adequately resolved, or if no decision has been rendered by the appropriate date, the student may appeal at the university level. To appeal at the university level, the student must present copies of all previously submitted documents and a formal letter of appeal to the Provost. The Provost or another designated university officer will respond in writing with a final resolution, including the basis for it, within thirty (30) days, or as soon thereafter as practical.

Other Academic Regulations

English Fluency for Non-Native English Speakers

To be successful at Carnegie Mellon University, students who are nonnative speakers of English need to begin their undergraduate work with a strong foundation in academic English and a high level of proficiency with speaking, listening, reading and writing in English. The importance of English language abilities cannot be overstated since there are no basic English as a Second Language (ESL) courses at Carnegie Mellon. All students will have sufficient English language proficiency to be able to participate fully in the academic work and to interact in daily life outside of the classroom.

Students' English proficiency will enable them to handle the demands of academic work, including the ability to comprehend, process, and master complex material presented in English, both in written and spoken form. Students will be able to communicate their ideas and questions to faculty, classmates, and others, in a classroom environment that is often highly participatory. For example, many classes require group discussion, team projects, oral presentations, and/or independent research. In addition to proficient English skills, studying in a new culture requires openness and flexibility to adapt to a new, and often very different, academic system.

To assess the language of non-native English speaking applicants, a minimum TOEFL score of 600 (paper based, PBT), or 100 (internet based, iBT) has been established as the standard for admission. This minimum score indicates that an applicant has the fundamental building blocks of language needed for academic tasks and for continued language development. Since neither the PBT or iBT versions of TOEFL access speaking, students who take these tests should additionally seek feedback on their speaking skills and work to improve conversational skills before beginning academic work.

Exchange Students

Each term, Carnegie Mellon welcomes exchange students from partner institutions around the world. Exchange students enrich the learning experience at Carnegie Mellon and are expected to be full participants in the curricular and meta-curricular life. Therefore, their admission should adhere to the English language guidelines described above. Exchange students submit standardized English language testing scores (such as the TOEFL) as part of the Exchange application process, and present the same high level of English language abilities as degree-seeking students. With exchange students, high-level English abilities are particularly critical since academic, personal and extracurricular experiences must be maximized in a short period of time, sometimes only four months in duration.

Withdrawal of a Degree

The university reserves the right to withdraw a degree even though it has been granted should there be discovery that the work upon which it was based or the academic records in support of it had been falsified. In such a case the degree will be withdrawn promptly upon discovery of the falsification.

Information for Graduating Students

Graduating students may wear one stole ONLY with their academic regalia. Students are certainly permitted to receive/purchase more than one stole if they are a member of multiple organizations that issue stoles and may choose to wear a particular stole to the main commencement ceremony and another to their diploma ceremony.

Graduating students who are a member of a club/organization that issues a pin to designate affiliation are permitted to wear more than one pin with the academic regalia in addition to one stole.

Retention of Student Work

The university reserves the right in all colleges to retain indefinitely any student work the faculty may select. All work not retained by the university must be claimed at the time specified on the bulletin boards (or other forms of communication) of the department concerned; otherwise, the work will be destroyed.

Degree Statute of Limitations

www.cmu.edu/policies/student-and-student-life/ug-statute-of-limitations-student.html (https://www.cmu.edu/policies/student-and-student-life/ug-statute-of-limitations-student.html)

All units required for an undergraduate degree, whether earned in residence, transferred from another institution or granted via advanced placement, must have been earned within eight years of the date on which the degree is granted. This statutory period can be extended by the Dean of the student's college under the following conditions:

- the courses taken prior to the statutory period still represent a reasonable part of the student's total academic program;
- the prior courses provide adequate preparation for courses which must still be taken to fulfill the degree requirements;
- there is a legitimate reason(s) for the student not completing the academic program within the statutory period.

A request for a waiver of the statute of limitations must be submitted to the dean of the student's college. The request for a waiver should address all of the above conditions for an extension. For cases in which a waiver is granted, the waiver covers specific courses and is intended for a specific period during which the program must be completed.

New Degree, Major, or Minor

Departments proposing new degrees, majors, additional majors, and/or minors must complete a New Academic Program Process (NAPP Step 2) form. This should include any and all notations to the university diploma and/or transcript (new degrees, majors, minors, options). Departments proposing to offer a new degree, major, additional major and/or minor must follow university policies for approval as follows:

- Document the program by completing the New Academic Program Process (NAPP Step 2) form. Departments proposing new degrees and majors must complete this form and attach course descriptions, curriculum proposal, list of present faculty who will support the program, and verify the availability of other units' courses. This documentation must indicate the starting semester for the program, and in the case of new majors, also indicate if it is available only as a major/additional major/minor, or in combination.
- Receive department approval.
- Receive dean and College Council approval.
- Submit all program documentation complete with College Council approval to the Vice Provost for Education. New majors or degrees will not be processed without the approval of the Provost's Office.
- The Provost's Office will approve or deny, and inform the sponsoring department and Enrollment Services.
- The department may then publicize and offer the program for student enrollment.

Inter-campus Undergraduate Student Transfer Process

Undergraduate students enrolled at either the Pittsburgh or Doha campuses of Carnegie Mellon University may request consideration for internal transfer to the other undergraduate campus through a formal application process. Students must be in good standing with a QPA of 3.0 or higher, and must have completed two full semesters at their campus of initial enrollment. The first step in the process is consultation with the student's home campus Associate Dean for Education to fully discuss their potential interest in a transfer. Students will be required to document their interests and offer a compelling academic and/or personal rationale to support their inter-campus transfer request application. The deadline for application is the first day of the spring semester for transfer in the subsequent fall semester.

University Policies

A University Policy is a rule that has been officially sanctioned by the president of Carnegie Mellon University and that generally has university-wide applicability. A policy may include governing principles, may either mandate or constrain action, may ensure compliance with laws, or may mitigate the university's risk. Broadly, a policy is either academic or administrative in scope and application and must be approved by the president (and Board of Trustees as required), in order to become official University Policy.

Additional University Policies and information may be found at www.cmu.edu/policies (https://www.cmu.edu/policies/).

Academic Integrity

www.cmu.edu/policies/student-and-student-life/academic-integrity.html (https://www.cmu.edu/policies/student-and-student-life/academic-integrity.html)

Students at Carnegie Mellon are engaged in intellectual activity consistent with the highest standards of the academy. The relationship between students and instructors and their shared commitment to overarching standards of respect, honor and transparency determine the integrity of our community of scholars. The actions of our students, faculty and staff are a representation of our university community and of the professional and personal communities that we lead. Therefore, a deep and abiding commitment to academic integrity is fundamental to a Carnegie Mellon education. Honesty and good faith, clarity in the communication of core values, professional conduct of work, mutual trust and respect, and fairness and exemplary behavior represent the expectations for ethical behavior for all members of the Carnegie Mellon community.

Policy Statement

In any manner of presentation, it is the responsibility of each student to produce her/his own original academic work. Collaboration or assistance on academic work to be graded is not permitted unless explicitly authorized by the course instructor(s). Students may utilize the assistance provided by the Student Academic Success Center and the Academic Resource Center (CMU-Q) unless specifically prohibited by the course instructor(s). Any other sources of collaboration or assistance must be specifically authorized by the course instructor(s).

In all academic work to be graded, the citation of all sources is required. When collaboration or assistance is permitted by the course instructor(s) or when a student utilizes the services provided by the Student Academic Success Center and the Academic Resource Center (CMU-Q), the acknowledgement of any collaboration or assistance is likewise required. This citation and acknowledgement must be incorporated into the work submitted and not separately or at a later point in time. Failure to do so is dishonest and is subject to disciplinary action.

Instructors have a duty to communicate their expectations including those specific to collaboration, assistance, citation and acknowledgement within each course. Students likewise have a duty to ensure that they understand and abide by the standards that apply in any course or academic activity. In the absence of such understanding, it is the student’s responsibility to seek additional information and clarification.

Policy Violations

Cheating occurs when a student avails themselves of an unfair or disallowed advantage which includes but is not limited to:

1. Theft of or unauthorized access to an exam, answer key or other graded work from previous course offerings.
2. Use of an alternate, stand-in or proxy during an examination.
3. Copying from the examination or work of another person or source.
4. Submission or use of falsified data.
5. Using false statements to obtain additional time or other accommodation.
6. Falsification of academic credentials.

Plagiarism is defined as the use of work or concepts contributed by other individuals without proper attribution or citation. Unique ideas or materials taken from another source for either written or oral use must be fully acknowledged in academic work to be graded. Examples of sources expected to be referenced include but are not limited to:

1. Text, either written or spoken, quoted directly or paraphrased.
2. Graphic elements.
3. Passages of music, existing either as sound or as notation.
4. Mathematical proofs.
5. Scientific data.
6. Concepts or material derived from the work, published or unpublished, of another person.

Unauthorized assistance refers to the use of sources of support that have not been specifically authorized in this policy statement or by the course instructor(s) in the completion of academic work to be graded. Such sources of support may include but are not limited to advice or help provided by another individual, published or unpublished written sources, and electronic sources. Examples of unauthorized assistance include but are not limited to:

1. Collaboration on any assignment beyond the standards authorized by this policy statement and the course instructor(s).
2. Submission of work completed or edited in whole or in part by another person.
3. Supplying or communicating unauthorized information or materials, including graded work and answer keys from previous course offerings, in any way to another student.
4. Use of unauthorized information or materials, including graded work and answer keys from previous course offerings.
5. Use of unauthorized devices.
6. Submission for credit of previously completed graded work in a second course without first obtaining permission from the instructor(s) of the second course. In the case of concurrent courses, permission to submit the same work for credit in two courses must be obtained from the instructors of both courses.

Procedures for dealing with allegations of these policy violations are detailed in the university’s Academic Disciplinary Action Procedures, which are published in The WORD student handbook (https://www.cmu.edu/student-affairs/theword/). Periodic review of these procedures will be overseen by the Dean of Student Affairs or her/his designee in consultation with Faculty Senate and the relevant student governing bodies. Any amendments to these procedures are subject to the approval of Faculty Senate. Additional guidelines and procedures for graduate students may exist at the college/department/program level, in which case they are communicated in the college/department/program graduate student handbook.

Computing Policy

www.cmu.edu/policies/information-technology/computing.html (https://www.cmu.edu/policies/information-technology/computing.html)

Statement

The purpose of this policy is to set forth guidelines so that members of our community may use the campus network and computing facilities in ways that are responsible and respectful of privacy. This policy sets forth the university’s expectations of acceptable behavior on the part of computer systems users at Carnegie Mellon by providing guidelines for appropriate use of computing and related communication systems and examples of inappropriate use. These standards of acceptable behavior also extend beyond the campus community into the Internet. Just as it is unacceptable to violate others’ rights to privacy, property and resources within Carnegie Mellon, it is also unacceptable to violate those rights on systems that are not at Carnegie Mellon but are accessible through Carnegie Mellon’s connection to the Internet.

This policy applies to all users of Carnegie Mellon computing systems, including students, faculty and staff, and any others granted the use of university computing resources. It applies to the use of all computing facilities owned, leased, operated or contracted by Carnegie Mellon University. As used in this policy, terms such as “computing,” “computing/communications systems,” “computing resources,” etc., refer to all computers, communication systems, and peripherals, software, telephones and systems with similar functions, which are owned by Carnegie Mellon, or which utilize Carnegie Mellon infrastructure such as telephone lines or computer networks.

Although this policy does not attempt to deal specifically with legal issues, university members are responsible to act in compliance with the law, including any federal, state and local laws governing computer and telecommunications use, as well as all other applicable university policies.

Privileges and Responsibilities

Every member of the Carnegie Mellon community who uses computing and related communications systems at Carnegie Mellon, or systems that belong to Carnegie Mellon or which rely on Carnegie Mellon's infrastructure has the responsibilities described in this policy. This includes members of the Carnegie Mellon community who have restricted privileges, such as alumni who may have electronic mail forwarding access, but no access to "login" resources. Individuals with personally-owned computers, but who rely upon the university network to connect those computers (either through an on-campus or remote network connection, such as Ethernet, wireless, dialup, DSL) are expected to abide by the policies set forth in this document. Personally-owned computers operating in stand-alone mode or networked through a non-university connection are not covered under this policy, but those users are encouraged to consult the usage policies set forth by their Internet Service Provider.

A fundamental premise of this policy is that anyone sharing computing resources with other individuals should behave as a reasonable, mature and ethical person. The user must recognize that computer systems and networks do not exist in some special rule-free environment; on the contrary, use of computers is a form of communication, and every component of a computing environment and every piece of information it contains belong to the university, the university community as a whole, or some individual or group within that community.

Access to Carnegie Mellon's computing resources is contingent upon being a member of the university community and adhering to university and Computing Services policies, guidelines and procedures, including this policy. Misuse may result in the loss of access and/or university disciplinary action. For some users and certain systems, access may be authorized by specific departments, research centers or other organizations affiliated with Carnegie Mellon. In such cases, any department- or group-specific policies and guidelines must be adhered to when using resources provided by the department or group. This is in addition to university policies and Computing Services guidelines and procedures.

Any user who suspects a violation of the University's computer use policies, or who has knowledge of potential vulnerabilities or security loopholes in a system or network at Carnegie Mellon, should immediately notify the Computer and Network Security Coordinator or abuse@andrew.cmu.edu.

Maintain the Security and Confidentiality of your Account

Users assume personal responsibility for the use made of their computer accounts. This responsibility begins with selecting a secure password, and involves maintaining the confidentiality of that password and changing the password regularly in order to assure the continued security of your account. For guidance in selecting a secure password, see Managing Your Andrew Password. If you believe that someone has made unauthorized use of your account, you should change your password immediately and report the incident to the Computer and Network Security Coordinator or abuse@andrew.cmu.edu.

Respect for Others' Property and Privacy Rights

Users are responsible to respect copyright agreements and intellectual property ownership. Any material that is the work of another, whether explicitly copyrighted or not, should not be distributed by a user without appropriate acknowledgement and/or permission of the creator; unless permission has been granted by the owner of copyright protected materials, distribution of copyright protected material via the university network or computer systems is prohibited. So while the university has been granted permission by software vendors to distribute certain software packages via the network, it is not generally permissible for individual users to distribute that same software to others via the university network or computer systems. See the sections in this policy on Misuse and Inappropriate Behavior. While there may be cases in which property rights to particular programs, data, etc., are ambiguous or in dispute, the user must assume that any information not created by themselves belongs to someone else and must respect that person's privacy and property rights to that information. (In certain situations, even information created by the user may not belong to that user but rather to the university or others.) This policy is not intended to limit "fair use" as permitted under the Copyright Act and users having questions about whether a particular use constitutes a "fair use" may consult the General Counsel for advice.

Improper/Illegal Communications

Any communications that would be improper or illegal on any other medium are equally so on the computer: libelous material, obscene messages, harassment, forgery, threats, etc. However, this is not intended to restrict the free expression of ideas. Communication conducted in accordance with the university policy on Free Speech and Assembly and Controversial Speakers and with the statement on Academic Freedom and Responsibility enunciated in the Appointment and Tenure Policy of Carnegie Mellon University will not be considered a violation of this policy. For further guidelines, see also the university policy on Separation of Individual's and Institution's Interests.

Responsible Sharing of Resources

Where a resource such as memory, CPU time or access to network resources belongs to the whole community collectively, it must be shared.

It is unacceptable to make such excessive use of system or network resources that other users cannot obtain access. Examples include excessive use of CPU time during a period of heavy use on a timesharing system, excessive use of disk space on a system that does not limit such utilization, the use of an excessive amount of network bandwidth in an environment of networked computers, and any activity that makes a system unusable or significantly degrades performance for others. A novice user might be unaware that a particular action constitutes "excessive use" but, without doubt, once a system administrator makes them aware of the fact that such an action is unreasonable, that user will be held responsible for any further such infractions. If you are unsure whether your needs constitute excessive use, contact the system administrator. Similarly, if you need an unusual amount of disk space, CPU time or other resources, check with the system administrator to find out whether this use can be accommodated, rather than risk interfering with the work of others on the system.

Risks of Data Loss and Data Persistence

Although the university will make efforts to secure the network and university controlled servers from abuse and damage, it cannot guarantee against data loss by a student, faculty, member or staff, either on a university-operated or an individually-owned computer.

Users should know that even those files that they have "deleted" using the appropriate procedures in the application or operating system, may indeed be recoverable if they exist in a system backup file or other persistent form. If the university is asked to recover such data by subpoena, it must cooperate, and data that the user believes to have been destroyed may be recovered in the process.

Personal Use

While the university makes computer resources available primarily to achieve its goals of education and research, and for administrative activities, it realizes the need to encourage the personal use of computing for the convenience of the campus community. Thus, it is reasonable to allow the use of computing resources for computer mail, document preparation, personal or course Web page publication, or other activity that can facilitate convenience or enhance productivity, to the extent that the activity is within the limits described by Responsible Sharing of Resources. Any personal use of computing resources related to operating a personal business or commercial enterprise is prohibited unless permission to do so has been specifically granted by the provost or the provost's designee.

We do recognize the difficulty of distinguishing whether certain cases of "personal use" are allowable, such as activities that result in personal financial gain (e.g. checking stock prices online), relate to a commercial business (e.g. university-sponsored technology transfer efforts), or support (but do not constitute operating) a personal business (i.e., a student developing a business plan or a faculty member writing a report for a consulting engagement outside the university). In such cases, we rely on individuals to be responsible and judicious in the use of university's shared computing resources. In particular ensuring:

- appropriate use of resources (e.g. any such work is completed outside of university time and does not utilize shared resources such as CPU cycles or network bandwidth to a degree that adversely impacts academic or research activities);
- appropriate use of licenses (e.g. do not use software procured with academic use licenses for commercial applications or development, unless the license explicitly permits such use);
- appropriate marketing (e.g. no creation of ".com" domains within Carnegie Mellon's "edu" domain, no advertising services and products using Carnegie Mellon email accounts, and no advertising using web pages on Carnegie Mellon servers (any server with a .CMU.EDU host name).

In cases of questionable personal use of resources, you may contact advisor+@andrew.cmu.edu to determine whether a particular activity is permissible.

We reserve the right to restrict personal use of university systems and networks by an individual or by the community at large, if the use of resources for such activities becomes excessive. If you need unlimited access to computer networks for private or business purposes, you can subscribe to a commercial service.

For information regarding the use of resources to produce intellectual property and profit from the development of such property see Carnegie Mellon University's Intellectual Property Policy and the Policy on Conflict of Interest/Commitment.

Privacy

The user must presume that the contents of any other users' directory are private unless expressly designated otherwise, just as one would presume that the contents of someone's apartment or office are private. The only exceptions to this rule are: that in some environments, files such as "plan files" may be considered public even if the user has not expressly designated them as such; and that some services such as web pages and anonymous or "guest access" ftp services may be considered to be public, but only for those areas not protected by password and which are "obviously" public. An unprotected account or shared device (such as a shared disk on a networked computer) are not considered to be public unless the name or service expressly indicates that it is. In such cases, any files or other data which would appear to be private in nature, by virtue of the file name or data stored, even if "publicly accessible" should be considered to be private. The user accessing such files has a responsibility to ask the owner of the files or service if the files are intended to be publicly accessible before the user does more than a "cursory glance" sufficient to cause the question.

A user can explicitly grant access to his or her directories, files or to services run from his or her systems. However, users who issue general or vague invitations to browse through their files incur a special obligation to protect any material that they do not wish others to see. Indeed, all users are urged to maintain protection levels on their files consistent with the access they are actually willing to give to other users.

Access to Faculty Data

Electronic data on a faculty member's account, whether stored on a computer in the faculty member's office or elsewhere under the proprietary control of that faculty member, may not be examined, i.e., the contents of the data read by a person, without the faculty member's consent, except in cases of emergency or in response to a valid subpoena, search warrant, or order of a court. Posting of data by a faculty member on servers available to the public or to students shall be understood to imply consent, and electronic access given to specific parties by the faculty member will likewise imply consent for those parties to access permitted data. Emergencies may include, for example, but are not limited to, the death, incapacity or disappearance of the faculty member, or the search for and examination of files used for apparently malicious activity in an account which endangers the integrity of shared computers, the network, or other aspects of the university's computing infrastructure.

Only specifically designated individuals are permitted to determine what passes for an "emergency." Such individuals may be specifically designated, or may be designated by job position/description. All assignments for individuals or positions will be done by Provost or by a designate of the Provost.

Whenever possible and legally permissible, notification must be given to the faculty member whose data are subject to subpoena, search warrant, or order of court prior to compliance therewith, and, whenever possible and legally permissible, sufficient time must be allowed, before intrusion, to allow the faculty member to file a motion to quash. Information obtained from an examination warranted by an emergency cannot be used as evidence in University sanctions of any faculty member, and cannot be released to the public, or to the university community or to public officials, except as such releases are essential to resolution of the emergency, or constitute evidence of a crime concealment of which would obstruct justice, and in the latter case release may only be to appropriate law enforcement officials. Any intrusion by an employee of the University into a faculty member's electronic data must be reported to the faculty member as soon as possible, and within five days of the event in writing both to the faculty member, if possible, and unless prohibited by order of court, and to an Ombudsman, who shall be a member of the regular faculty selected annually by the Nominating Committee of the Faculty Senate and who has been endorsed by majority vote of the Faculty Senate. The Ombudsman shall be a current or retired regular faculty member who holds no administrative appointment and is not a member of the Faculty Review Committee. The Ombudsman shall have authority to investigate whether an intrusion was warranted by the policy and, (i) shall inform the President and the affected faculty member of the Ombudsman's findings; (ii) where a violation of the policy is found, shall inform the Faculty Review Committee of the policy violation; and (iii) where appropriate, in the absence of the affected faculty member, to bring a grievance before the Faculty Review Committee. Violation of any aspect of this policy is a sanctionable offense.

For purposes of this section, the term "faculty" shall mean any person who is a member of the Faculty Organization as defined in Article III of the Constitution of the Faculty Organization.

Access to Staff Data

Electronic data on a staff member's account, whether stored on a computer in the staff member's office or elsewhere under the proprietary control of that staff member, may not be examined, i.e., the contents of the data read by a person, without the staff member's consent, except in cases of emergency, in response to a valid subpoena, search warrant, order of a court, or by specific request by the staff members' supervisor for the purpose of accessing work-related electronic data. Posting of data by a staff member on servers available to the public or to members of the university shall be understood to imply consent, and electronic access given to specific parties by the staff member will likewise imply consent for those parties to access permitted data. Emergencies may include, for example, but are not limited to, the death, incapacity or disappearance of the staff member, or the search for and examination of files used for apparently malicious activity in an account which endangers the integrity of shared computers, the network, or other aspects of the university's computing infrastructure.

Only specifically designated individuals are permitted to determine what passes for an "emergency." Such individuals may be specifically designated, or may be designated by job position/description. All assignments for individuals or positions will be done by Provost or by a designate of the Provost.

Whenever possible and legally permissible, notification must be given to the staff member whose data are subject to subpoena, search warrant, or order of court prior to compliance therewith. Information obtained from an examination warranted by an emergency will not be released to the public, or to the university community or to public officials, except as such releases are essential to resolution of the emergency, or constitute evidence of a crime concealment of which would obstruct justice, and in the latter case release may only be to appropriate law enforcement officials. Any such findings may be reported to the staff member's supervisor, department head, or to Human Resources for appropriate investigation and action. Any intrusion by an employee of the University into a staff member's electronic data must be reported to the staff member as soon as possible, and within five days of the event via electronic mail unless prohibited by order of court, or due to a continuance of an ongoing investigation by the University. Violation of any aspect of this policy is a sanctionable offense.

When possible, staff members will be informed about the issuance of court orders, or other intrusions into their electronic data. In cases where a staff member believes that electronic data in their account has been inappropriately accessed by another staff member, the incident should be reported to Human Resources.

Access to Student Data

Electronic data stored in a student account, whether stored on a computer in the student's residence or elsewhere under the proprietary control of that student, may not be examined, i.e., the contents of the data read by a person, without the student's consent, except in cases of emergency or in response to a valid subpoena, search warrant, order of a court, or by order of the Office of the Dean of Student Affairs. Posting of data by a student on servers available to the public shall be understood to imply consent, and electronic access given to specific parties by the student will likewise imply consent for those parties to access permitted data. Emergencies may include, for example, but are not limited to, the death, incapacity or disappearance of the student, or the search for and examination of files used for apparently malicious activity in an account which endangers the integrity of shared computers, the network, or other aspects of the university's computing infrastructure.

Only specifically designated individuals are permitted to determine what passes for an "emergency". Such individuals may be specifically designated, or may be designated by job position/description. All assignments for individuals or positions will be done by Provost or by a designate of the Provost.

Whenever possible and legally permissible, notification must be given to the student whose data are subject to subpoena, search warrant, or order of court prior to compliance therewith. Information obtained from an examination warranted by an emergency will not be released to the public, or to the university community or to public officials, except as such releases are essential to resolution of the emergency, or constitute evidence of a crime of concealment which would obstruct justice, and in the latter case release may only be to appropriate law enforcement officials. Any findings of potential wrongdoing unrelated to the original intent of the search, must be reported to the Office of the Dean of Student Affairs for appropriate investigation and action. Any intrusion by an employee of the University into a student's electronic data must be reported to the student as soon as possible, and within five days of the event via electronic mail to the student, if possible, unless prohibited by an order of the court or because of an ongoing investigation conducted by the University. Violation of any aspect of this policy is a sanctionable offense.

When possible, students will be informed about the issuance of court orders, or other intrusions into their electronic data, including the purpose of the search. In cases where a student believes that electronic data in their account has been inappropriately accessed by a staff member, the incident should be reported to Office of the Dean of Student Affairs.

Note: Removable media such as floppy disks, zip drives, tapes, or CDs in a faculty or staff office, or in a residence hall are not subject to search by Computing Services, though Computing Services will assist authorized law enforcement agencies or authorities to read data after they are obtained, at the agencies' or authorities' request.

Protecting Confidential Information

Users who maintain confidential information, such as records relating to employees or students, are responsible for following privacy-related policies and laws.

Protecting Personal Information

As is described throughout this policy, data transmitted across the university network or stored on university systems may be accessed by others as a result of misuse by an individual, as an incidental result of the routine operation of the network and systems, or in response to a court subpoena or university investigation into suspected or alleged misuse. While complete privacy of personal data may not be possible, users who wish to ensure a higher degree of privacy for their data are encouraged to use encryption, PGP security, or other techniques to reduce the risk that others may access their data. For more information on these techniques, see various newsgroups (e.g. comp.security.pgp) or web references (e.g. comp.security.pgp FAQ).

Misuse and Inappropriate Behavior

The following activities are expressly prohibited at Carnegie Mellon:

- Using a computer system without proper authorization granted through the University, college, or department management structure. Some activities such as "port scanning" are not expressly prohibited. However, if the target of such scanning requests that an individual or system stop performing such actions, the person or system performing the scans must stop scanning the target machine unless the scans are being carried out by a system administrator who has the authority and responsibility over the machine(s) being scanned or for the network being used.
- Concealing your identity, or assuming the identity of another (e.g., by sending forged electronic mail). Note that some forms of electronic communication, such as browsing Web pages, passively "identify" users. Keeping your identity private either by not setting an identity in your browser or by using a Web-anonymizer in order to protect yourself from being put onto mailing lists is not a violation of this policy.
- Sharing your password or account with the specific exception of staff or faculty members allowing their support personnel to access their accounts in order to provide services appropriate to their job functions. Note that some policies for the accessing of specific systems or data (see Data and Computer Security, Confidentiality of Administrative Data) explicitly forbid the sharing of passwords used to access them, and that such restrictions for those specific systems override this policy.
- Using another person's computer account, userID, files, or data without appropriate permission, as described in the previous bullet (e.g. using an account found "logged in" on a cluster machine).
- Deleting or tampering with another user's files or with information stored by another user on any information-bearing medium (disk, tape, memory, etc.). Even if the user's files are unprotected, with the exception of files obviously intended for public reading, such as Web pages, it is improper for another user to read them unless the owner has given permission (e.g. in an announcement in class or on a computer bulletin board).
- Attempting to "crack" or guess other users' passwords. System administrators or those specifically designated by the administrator or owner of a system may attempt to crack passwords in order to test and enhance the security of the system. In cases where an individual or department "owns" machines which use password files controlled by another organization (e.g. Andrew machines or their like), the owner may not attempt to crack passwords without explicit permission by the owners of the password database.
- Obtaining passwords by other means, such as password capturing programs.
- Attempting to circumvent system security (e.g. breaking into a system or using programs to obtain "root" access), without the explicit permission of the owner of that system.
- Denying appropriate access to resources to other users (e.g. "ping flooding" another system, sending "mail bombs," or modifying a login file in order to cause a user to not be able to log in).
- Releasing programs such as viruses, Trojan horses, worms, etc., that disrupt other users, damage software or hardware, disrupt network performance, or replicate themselves for malicious purpose.
- Sending commercial solicitations via electronic mail (i.e. spamming) to individuals, or to newsgroups or mailing lists where such advertising is not part of the purpose of the group or list. (It is permissible to send a commercial solicitation to a "for sale" newsgroup, provided that the advertisement conforms to other policies and guidelines at Carnegie Mellon.)
- Any "mass mailing" which is solicitous in nature, unless the mailing is in the conduct of university business.
- Reselling of services based on the university network, such as web hosting, mailing services or the selling of shell accounts.
- Running a proxy server which results in inappropriate or unauthorized access to university materials to non-university members.
- Advertising commercial businesses or ventures on Web pages hosted by Carnegie Mellon, unless prior authorization has been granted.
- Using mail messages to harass or intimidate another person (such as by repeatedly sending unwanted mail or broadcasting unsolicited mail).
- Violations of any local, state or federal laws, such as the distribution of copyright-protected materials (e.g. the distribution of commercial software, music or films in electronic format without appropriate permissions by the owner, even if the user distributing the materials notifies others of their copyright status).
- Tampering with, willful destruction of or theft of any computer equipment, whether it belongs to the university or to an individual. Tampering includes any deliberate effort to degrade or halt a system, to tie up a system or to compromise the system/network performance. Willful destruction includes any deliberate disabling or damaging of computer systems, peripheral equipment such as scanners or printers, or other facilities or equipment including the network, and any deliberate destruction or impairment of software or other users' files or data.
- The unauthorized removal of university or another's computing equipment, which constitutes theft.

This list should not be considered to be complete or exhaustive. It should, however, serve as a set of examples of obviously inappropriate behaviors. If you are in doubt about the appropriateness of something that you want to do, contact the Computing Services Help Center at 8-HELP, or send mail to advisor+@andrew.cmu.edu and ask first.

Enforcement

Inappropriate behavior in the use of computers is punishable under the general university policies and regulations regarding faculty, students and staff. The offenses mentioned in this policy range from relatively minor to extremely serious, though even a minor offense may be treated severely if it is repeated or malicious. Certain offenses may also be subject to prosecution under federal, state or local laws.

Appropriate disciplinary action depends not only on the nature of the offense, but also on the intent and previous history of the offender. The range of possible penalties includes reprimands, loss of computing privileges, course failures for students, disciplinary probation, suspension or dismissal from the university and/or criminal prosecution.

Offenses that are minor or appear to be accidental in nature are often handled in a very informal manner such as through electronic mail. More serious offenses will involve formal procedures pursued through the Division of Student Affairs for students, Human Resources and/or the hiring university department or administrative unit for staff, or the Faculty Review Committee for faculty.

Restrictions of Privileges During Investigations

During the course of an investigation of alleged inappropriate or unauthorized use, it may be necessary to temporarily suspend a user's network or computing privileges, but only after determining there is at least a prima facie case against the individual, as well as a risk to the university or it's computing resources if privileges are not revoked. In these cases, it is important to recognize that the restriction of network or computing privileges is intended to protect the system rather than to punish the individual. For example, if a computer account has been used to launch an attack on another system, that account will be rendered inactive until the investigation is complete. This is a necessary action taken to prevent further misuse and does not presume that the account holder initiated the misuse. Unsubstantiated reports of abuse will not result in the suspension of accounts or network access unless sufficient evidence is provided to show that inappropriate activity occurred. For example, if someone reports that their computer was "attacked" by a Carnegie Mellon system, the burden will be upon the complainant to provide sufficient data logs or other evidence to show that the incident did, indeed at least appear to be an attack.

Adverse Impact on Shared Systems

The university reserves the right to discontinue communication with external systems that are known to harbor spammers or account crackers, despite the fact that this may restrict certain acceptable communications. When deemed necessary, this action will be taken to protect the security and safety of our systems. Similarly, there may be cases where a particular service or activity on a given University system will, by the very nature of its legitimate operation, tend to generate attacks from other Internet sites. If these attacks are frequent and severe enough to cause service interruptions for larger parts of the campus community, it may be necessary to temporarily or permanently remove these systems from the campus network. In cases where such an action is deemed necessary, network administrators will work with the maintainers of the system to identify alternative methods of network access. In cases where the university restricts access to external sites or removes network access for internal sites, the purpose of the action is to maintain the security and reliability of the computer systems and networks rather than to punish an individual or a site, or to restrict the free expression of ideas.

Discriminatory and Sexual Misconduct Policy (Interim)

https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/index.html (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/)

I. Policy Statement

The mission of Carnegie Mellon University is to cultivate a transformative educational experience for its Students that is committed to promoting and safeguarding their personal health and well-being. In addition, the mission is to create a collaborative environment open to the free exchange of ideas, where research, creativity, innovation, and entrepreneurship can flourish and where individuals can achieve their full potential. Consistent with the university's Statement of Assurance (https://www.cmu.edu/policies/administrative-and-governance/statement-of-assurance.html), it is the policy of Carnegie Mellon University to maintain an academic and work environment that promotes the confidence to work, study, innovate, and perform without fear of discriminatory and sexual misconduct. Such misconduct diminishes individual dignity, is contrary to the values of the university, and is a barrier to fulfilling the university's mission. It will not be tolerated at Carnegie Mellon University. This Policy contains grievance procedures that provide for the prompt and equitable resolution of Complaints alleging any action which would be prohibited by this Policy.

It is the responsibility of every member of the University community to foster an environment free of discriminatory and sexual misconduct. All members of the University community are encouraged to take reasonable and prudent actions to prevent or stop such behavior. In the event an Employee becomes aware of potential Prohibited Conduct, they should report the information to the Office for Institutional Equity and Title IX (the "IEX Office"). See Section III of this Policy for more information about making a Report of Prohibited Conduct.

The Policy prohibits the types of misconduct listed below and defined in Section VII.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#prohibited-conduct) (referred to collectively as "Prohibited Conduct"):

- Discrimination (including Disparate Treatment) (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#discrimination);
- Discriminatory Harassment (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#discriminatory-harassment);
- Sex Discrimination (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#discrimination)
- Sex-Based Harassment (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#sex-based-harassment), including
  - Quid Pro Quo Sex-Based Harassment,
  - Hostile Environment Sex-Based Harassment,
  - Sexual Assault,
  - Dating Violence,
  - Domestic Violence,
  - Stalking (based on sex), and
- Stalking (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#stalking)
- Retaliation (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#retaliation); and
- Violation of Protective Measures (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#violation).

This Policy is intended to: (1) prevent, eliminate, and remedy the effects of Prohibited Conduct; (2) foster an environment where all individuals are well-informed and supported in reporting Prohibited Conduct; and (3) provide an adequate, reliable, prompt, fair and impartial process for all parties once the university receives a Report of possible Prohibited Conduct. While these principles are clear and straightforward, the detailed procedures set forth in this Policy and related documents are necessary to assure that these matters are handled in an impartial, thoughtful, and thorough manner, consistent with the university's dedication to the integrity of its process.

Employees (including Faculty and Staff), Students, or third parties who violate this Policy may face, as appropriate, responsive action up to and including termination, expulsion, or other actions.

Nothing in this Policy shall be construed to abridge the free expression of ideas that is essential to the university's mission. The discourse conducted in accordance with the university's Freedom of Expression Policy (https://www.cmu.edu/policies/administrative-and-governance/freedom-of-expression.html) and with the statement on Academic Freedom and Responsibility enunciated in the Appointment and Tenure Policy (https://www.cmu.edu/policies/faculty/appointment-and-tenure-policy.html), whether in written, spoken, or electronic forms, shall be consistent with this Policy.

This Policy is intended to meet the university's obligations under Title VI of the Civil Rights Act of 1964 ("Title VI"); Title VII of the Civil Rights Act of 1964 ("Title VII"); Title IX of the Education Amendments of 1972 ("Title IX"); the Jeanne Clery Disclosure of Campus Security Policy and Campus Crime Statistics Act ("Clery Act"), as amended by the Violence Against Women Reauthorization Act of 2013 ("VAWA"), with respect to its application to sexual misconduct; and other applicable law and regulations.

II. Jurisdiction

This Policy applies to Employees (including Faculty and Staff), Students, and third parties and to all conduct within the university's Programs or Activities, as defined below. However, the university will address conduct contributing to a Hostile Environment even if the underlying conduct itself occurred outside the university's Programs or Activities, including if it occurred outside the United States, and including conduct occurring online via computer and internet networks or on digital platforms, including social media sites.

The university retains discretion to determine whether conduct outside of its Programs and Activities is within its jurisdiction. In making this determination, the university will consider the severity of the alleged conduct, the risk of ongoing harm, whether both parties are members of the University community, impact on University Programs or Activities (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#university-programs), and whether the off-campus conduct is part of a series of actions that occurred both on and off campus.

Some forms of conduct which may be considered inappropriate or unacceptable within the University community, such as incivility or bullying, may not meet the definition of Prohibited Conduct under this Policy. However, the university retains discretion to report the conduct to an internal university department or authority such as Human Resources, Office of Community Responsibility, or relevant academic department or dean to determine and implement appropriate responsive action, including review for possible misconduct under other university policies.

This Policy does not apply to the implementation or appeal of requests for modifications or academic adjustments for individuals with disabilities. Concerns related to the implementation or appeal of requests for modifications or academic adjustments should be submitted to the Office of Disability Resources (https://www.cmu.edu/disability-resources/students/forms.html) (students) or HR Disability Services (https://www.cmu.edu/hr/work-life/accommodations/) (Faculty and Staff).[1] This Policy supersedes any conflicting information in any other university policies with respect to the definitions or procedures relating to Prohibited Conduct.

[1]Individuals with a Disability are entitled to reasonable accommodations that would enable them to participate in all processes provided for under this Policy, including, but not limited to, making a Report or Complaint, participating in an Alternative Resolution Process, and/or participating in an investigation and adjudication under the grievance procedures. If an individual requires such reasonable accommodations, they should promptly notify the IEX Office, which may consult, as appropriate, with the Office of Disability Resources or Human Resources; individuals should not assume that the IEX Office is on notice that they have a Disability, even if registered to receive accommodations via the Office of Disability Resources, Human Resources, or another academic or administrative unit.

III. Reporting

The university strives to create an environment where all members of the University community are aware of options for informing the university about instances of suspected Prohibited Conduct, how to seek assistance and support, and how to pursue university action for their own protection and that of the entire campus community. This Policy distinguishes the action of making a Report of possible Prohibited Conduct from filing a Complaint. Thus, information shared about suspected Prohibited Conduct does not automatically trigger the initiation of grievance procedures (investigation or adjudication), as discussed below in Section VI.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/complaint-resolved.html#a). This section outlines the mechanisms for making a Report and how the university will respond to information it receives.

A. How to Make a Report

Any individual, including Students, Employees (including Faculty and Staff), or third parties are encouraged to submit Reports of suspected Prohibited Conduct directly to the IEX Office (https://www.cmu.edu/title-ix/) in-person, via e-mail, phone call, or online.

- *To report in person:*
  - IEX Office/Title IX Coordinator
    4615 Forbes Avenue, Suite 330
    Pittsburgh, PA 15213
- *To report by phone or email:*
  - Please call (412) 268-7125 or
    email institutionalequity@andrew.cmu.edu
- *To report online:*
  - Please complete this Report Form (https://cmu.hracuity.net/webform/index/2e196578-4892-4aab-af10-72cc76b5b71f/) (not anonymous).
- *To report anonymously, online or by phone:*
  - Please go to cmu.ethicspoint.com (https://secure.ethicspoint.com/domain/media/en/gui/81082/) or call 844-587-0793.

The university maintains a Resource Guide (https://www.cmu.edu/title-ix/resources-and-information/sexual_misconduct.html) for individuals who file reports of Prohibited Conduct that provides information for community members about obtaining support from campus and/or community resources, filing reports of Prohibited Conduct through the university's policies, and how to support a friend or family member who has been impacted by such conduct. Individuals who report Prohibited Conduct in Pennsylvania will also be informed of their rights as a victim of a crime under Pennsylvania law (https://pcv.pccd.pa.gov/for-victims/Pages/Your-Rights-as-a-Victim.aspx).

Inquiries about the application of civil rights laws to the university or questions regarding this Policy may be directed to the IEX Office, and may also be directed externally to the United States Department of Education's Office for Civil Rights ("OCR"), contact for which follows.

Office for Civil Rights
U.S. Department of Education
400 Maryland Avenue, SW Washington, D.C. 20202-1100
Phone: (800) 421-3481
Fax: (202) 453-6012
TDD#: (877) 521-2172
Email: OCR@ed.gov
Web: https://www.ed.gov/ocr (https://www.ed.gov/ocr/)

B. Mandatory Employee Reporting

All Carnegie Mellon Employees are required to report information about potential violations of this Policy to the IEX Office or the Title IX Coordinator. Reports may be submitted by phone (412-268-7125), email (institutionalequity@andrew.cmu.edu), or in-person by visiting the IEX Office at 4615 Forbes Ave., Pittsburgh, PA 15213. In addition, all teaching assistants are required to report information about potential violations of this Policy that is received within the student's role as a teaching assistant.

Sharing information with the IEX Office does not automatically trigger the university to initiate a Complaint or impose any obligations on the Complainant. However, disclosing information to the IEX Office enables the university to offer Supportive Measures to the parties so that they may maintain equal access to their education and work environments. As detailed in Section VI.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/complaint-resolved.html#a), in some circumstances, the IEX Office may initiate a Complaint based on the information received.
Upon receipt of a Report, the university will promptly contact the Complainant to discuss appropriate Supportive Measures (see Section V.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/respond-report.html#a)) and to explain the process for filing a Complaint (see Section VI.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/complaint-resolved.html#a)). Complainants are not obligated to respond to outreach from the university and the university will respect this decision, with limited exceptions where it is obligated by law or to act in the safety interest of the community.

With respect to Students who are also Employees, whether the individual is a mandatory reporter depends on the context in which the person learns of the alleged Prohibited Conduct. Mandatory reporter responsibilities are triggered if the person learned of the alleged Prohibited Conduct in the context of an Employee role, when they would, in that role, be considered a mandatory reporter. Mandatory reporter responsibilities are not triggered if the person learned of the alleged Prohibited Conduct in the context of their receipt of an education as a Student at Carnegie Mellon. However, student workers employed as a Resident Assistant or as a Community Advisor are required to report all potential violations of this Policy, regardless of whether such information is received in the course of the student worker's employment or as a student.

Public Awareness Events

Employees are required to report information disclosed at sexual misconduct public awareness events (e.g., Take Back the Night, candlelight vigils, protests, or survivor speak-outs in which participants may disclose incidents of Prohibited Conduct). However, disclosures at such events will not prompt the university to take responsive action unless the information reveals an immediate and serious threat to the health or safety of a Complainant, any Students, Employees, or other persons, or unless the individual affected by the alleged Prohibited Conduct clearly indicates that they desire responsive action be taken. The university will still use the information disclosed to inform its education and prevention efforts.

Classroom Disclosures

Disclosures of alleged Prohibited Conduct which occur in connection with a class or other academic setting are not exempt from reporting and such disclosures must be reported to the Title IX Coordinator as described above.

Exceptions to Mandatory Reporting:

Confidential Employees (see Section IV, below) are not required to make a Report when a person informs them of conduct that may constitute Prohibited Conduct if that information is provided while the Confidential Employee is functioning within the scope of their duties to which confidentiality applies.

Importantly, Confidential Employees must provide individuals who have disclosed potential Prohibited Conduct, upon receipt of such information:,

- Explain that they are a Confidential Employee;
- Provide contact information for the IEX Office;
- Explain how to report Prohibited Conduct; and
- Inform the disclosing individual that the IEX Office may be able to offer and coordinate Supportive Measures, as well as initiate an Alternative Resolution Process or investigation under the Grievance Procedures.

If you are unsure of whether you are required to report information, please contact the IEX Office in order to help clarify your responsibilities.

C. Anonymous Reporting

Any individual may make a report of Prohibited Conduct to the IEX Office, and if preferred, may do so without disclosing one's name using the online reporting portal, available online and by phone, listed above and here:

cmu.ethicspoint.com (https://secure.ethicspoint.com/domain/media/en/gui/81082/)
844-587-0793

Depending on the level of information available about the incident or the individuals involved, the university's ability to respond to an anonymous report may be limited. The university will, however, take whatever steps it deems appropriate and in the best interests of the overall University community, consistent with the information available. The university will never refuse to respond to a report solely on the grounds that it was made anonymously.

Information collected through the anonymous reporting line will be shared only with necessary university officials in order to respond to the reported concern. Information is kept confidential and no personally identifiable information is shared, except as necessary to follow this Policy, without the party's consent.

Filing an anonymous report does not satisfy the mandatory reporting obligations of Employees under Section III.B.

D. Reports to Law Enforcement

An individual who experiences, witnesses, or learns of possible criminal conduct may contact law enforcement directly by calling:

- 911 (for emergencies off-campus)
- University Police Department
  300 South Craig Street
  Pittsburgh, PA 15213
  (412) 268-2323 (for emergencies on-campus)
  campuspd@andrew.cmu.edu

Making a report to law enforcement does not generally obligate an individual to pursue a criminal complaint, or to participate in the university's disciplinary process. An individual may choose to participate in the university's disciplinary process, an external criminal process, both, or neither. In the event that both criminal and disciplinary processes are at issue, the university may comply with law enforcement requests for temporary delays in the disciplinary process in order to permit law enforcement to gather evidence for a criminal investigation.

Information about local medical care, local hospitals, including where a person may obtain an examination by a Sexual Assault Nurse Examiner (SANE) is available on the website for IEX Office (https://www.cmu.edu/title-ix/resources-and-information/).

Medical care may address physical and mental health concerns, including, where applicable, those related to pregnancy and/or sexually transmitted infections. Medical providers may also be able to assist in the collection and preservation of evidence. The ability to collect and preserve evidence of Sexual Assault is limited in time, so it is essential that care be sought as soon as possible. Individuals should avoid showering/bathing, douching, and, if possible, urinating. In the event of oral sexual contact, individuals should avoid eating, drinking, or brushing teeth. Any soiled clothes, towels, or bedding should be retained in paper bags. Preserving physical evidence in this manner may facilitate a criminal investigation, but seeking medical treatment does not obligate an individual to pursue a criminal complaint.

E. How the Office for Institutional Equity and University Police Share Information about Prohibited Conduct

The university's process for addressing Prohibited Conduct is separate from the law enforcement process for addressing crimes.

The university strongly believes that the decision as to whether to report a crime should be left to the individual(s) impacted by the crime, except in very limited circumstances where there may be an immediate threat to the University community or other legal obligation to report. The IEX Office will share de-identified information about Reports with University Police where required for the purpose of complying with the university's federal reporting obligations to facilitate accurate compilation of crime statistics, and to ensure that other public safety responsibilities are addressed. In extremely limited circumstances, the IEX Office may share identifying information with University Police, for example, where the university is obligated to report a "Timely Warning" pursuant to Jeanne Clery Disclosure of Campus Security Policy and Campus Crime Statistics Act (e.g., when a crime has been committed on or near University Property which represents a serious, ongoing threat and/or is part of an ongoing pattern). The report does not constitute a criminal complaint to law enforcement, although the University Police Department may contact individuals to offer assistance, inquire about their willingness to preserve evidence, or file a criminal complaint.

Making a report to the University Police means that information will be shared with others as is necessary and appropriate. For example, if an individual makes a report of Prohibited Conduct to the University Police Department that has not already been reported to the IEX Office, the University Police Department will report the matter to the IEX Office. The purpose of this report is to ensure that the university can take appropriate actions to seek to eliminate Prohibited Conduct, prevent its recurrence, and remedy its effects. The Complainant or others may be contacted by the IEX Office to follow up on the information received from the University Police Department to offer supportive measures, including filing a Complaint with the IEX Office (https://www.cmu.edu/title-ix/).

F. Annual Training

As required by applicable Title IX regulations, the university must ensure that all university Employees receive training related to their duties under Title IX promptly upon hiring or change of position that alters their duties under Title IX and annually thereafter.

All Employees must be annually trained on:

1. The obligation to address Sex Discrimination in University Programs or Activities and how to report Prohibited Conduct to the IEX Office;
2. The scope of conduct that constitutes Sex Discrimination, Sex-Based Harassment, and related Retaliation under this Policy; and
3. All applicable notification and information requirements, including the Employee's mandatory reporting obligation with respect to known or suspected Sex Discrimination, and the Employee's duty to provide certain required disclosures to a Student, as discussed further below, when informed by a Student of that Student's Pregnancy or related conditions.

Additional training on specific topics is required of investigators, decisionmakers, and other persons who are responsible for implementing the university's grievance procedures or have the authority to modify or terminate Supportive Measures; facilitators of any Alternative Resolution Process; and the university's Title IX Coordinator and designees. Additional information regarding training is available on the IEX website (https://www.cmu.edu/title-ix/education-and-training/).

G. Amnesty for Students When Reporting Prohibited Conduct to the University

The university will not pursue violations of the university's Alcohol and Drug Policy (https://www.cmu.edu/policies/administrative-and-governance/alcohol-and-drug-policy.html) and/or Hazing Policy (https://www.cmu.edu/student-affairs/theword/community-policies/hazing.html) against any Student in an investigation under this Policy for potential violations of the Alcohol and Drug Policy (https://www.cmu.edu/policies/administrative-and-governance/alcohol-and-drug-policy.html) and/or Hazing Policy (https://www.cmu.edu/student-affairs/theword/community-policies/hazing.html), as long as any such violations did not and do not place the health or safety of any other person at risk. The university may, however, initiate an assessment, educational discussion, or pursue other developmental interventions (non-disciplinary options) to address hazing or the use of alcohol or other drug use.

V. Confidential Resources and Privacy

Carnegie Mellon understands that some individuals impacted by Prohibited Conduct, particularly conduct involving sexual violence, may not be ready or may not be willing to report through a channel that may lead to an investigation or other university action, no matter how discreet. For such individuals, several confidential resources are available both on and off campus.

A. Confidential University Employees

The following university Employees are designated as Confidential Employees who are able to confidentially receive and discuss information related to alleged Prohibited Conduct.[1]

- Employees in Counseling and Psychological Services (CaPS);
- Employees in University Health Services (UHS);
- Religious and Spiritual Life Coordinator;
- The Student and Faculty Ombudsperson;
- The Staff Ombudsperson; and
- Employees who conduct human subjects-research studies that have been approved by the Institutional Review Board (IRB) and which are designed to gather information about Sex Discrimination, with respect to information disclosed in the course of conducting the approved study;

In order for confidentiality to apply, Confidential Employees must be functioning within the scope of the Employee's job duties to which confidentiality applies. Confidentiality does not apply if the Employee receives information outside the scope of such job duties.

Although Confidential Employees are exempt from mandatory reporting, as required by law, Confidential Employees must provide the following information to any person who informs the Confidential Employee of conduct that reasonably may constitute Sex Discrimination or other Prohibited Conduct under this Policy:

1. That they are a Confidential Employee;
2. How to contact the Title IX Coordinator;
3. How to make a Complaint of Prohibited Conduct; and
4. That the IEX Office and Title IX Coordinator may be able to offer and coordinate Supportive Measures, as well as initiate an Alternative Resolution Process or investigation under the Grievance Procedures.

Confidential Employees can provide individuals with assistance, support, and additional information. Confidential Employees are prohibited from disclosing confidential information unless (1) given permission by the person who disclosed the information; (2) there is an imminent threat of harm to self or others; (3) the conduct involves suspected abuse of a minor under the age of 18; or (4) as otherwise required or permitted by law or court order. Confidential Employees may be required to report non- identifying information to University Police Department for crime reporting purposes.

Contact information for Campus Confidential Employees:

- Counseling and Psychological Services (https://www.cmu.edu/counseling/) (CaPS) (Student only)
  412-268-2922
- University Health Services (https://www.cmu.edu/health-services/) (Student only)
  412-268-2157
- University Health Services - Health Promotions Team (Student only)
- Staff Ombudsperson (https://www.cmu.edu/hr/resources/ombudsperson/)
  412-268-1018
- Student and Faculty Ombudsperson
- Religious and Spiritual Life Coordinator;
  412-268-3559

In addition, Carnegie Mellon employees may seek confidential assistance through the Employee Assistance Program (https://www.cmu.edu/hr/work-life/support/eap/) (CMU Employees only).

B. External Community Resources

Individuals may also seek assistance and support from a variety of external resources, including those listed below. These resources are available free of charge to students, undergraduate and graduate, faculty and staff, regardless of whether a person lives in campus housing and regardless of an individual's sex, gender, or sexual orientation. Individuals may contact the resources directly or the university can assist individuals with connections by request.

- Women's Shelter and Center of Greater Pittsburgh (https://wcspittsburgh.org/)
- Pittsburgh Action Against Rape (https://paar.net/)
- Center for Victims (https://www.centerforvictims.org/)
- Persad (https://www.persadcenter.org/)

C. Privacy

Although often conflated, privacy and confidentiality are distinct terms with distinct meanings. Privacy refers to the university's commitment to sharing information related to any Report, Complaint, Supportive Measures, Alternative Resolution Process, or grievance procedures under this Policy only:

- To a person with a legal right to receive disclosures of information, or with prior written consent;
- When necessary to effectuate this Policy, or to otherwise address conduct which may reasonably constitute Prohibited Conduct;
- As required by Federal law or regulation, including by the terms and conditions of a Federal award (e.g., a grant award or other funding agreement); and/or
- When required or permitted by State or local law or the Family Educational Rights and Privacy Act ("FERPA"). See the university's Policy on Student Privacy Rights (https://www.cmu.edu/policies/student-and-student-life/privacy-rights-students.html) for more information about FERPA.

The university provides training to personnel regarding the safeguarding of private information, instructs parties and witnesses about the university's privacy-related expectations, and will take other reasonable steps to prevent and address the parties' and, if applicable, their Advisors', unauthorized disclosure of information and evidence obtained solely through the grievance procedures.

In any grievance process, other than as provided for in this Policy, the university will not restrict the ability of either party to discuss the allegations prompting a Report or Complaint, including for the purposes of obtaining and presenting evidence (such as by speaking to witnesses), consulting with family members, confidential resources, or advisors, or otherwise preparing for or participating in the grievance procedures.

---

[1]This section address confidentiality with respect to reports under this Policy. This section does not affect any other legal privileges, such as physician-patient or counselor-client privileges. Only certain licensed treatment providers in UHS and CaPS have physician-patient or counselor-client privilege. Please contact UHS or CaPS for more information about these privileges.

V. How the University Responds to Reports

A. Supportive Measures

The university is committed to helping Complainants and Respondents continue their education and employment after a report of alleged Prohibited Conduct. Regardless of whether Complainant chooses to pursue an Alternative Resolution Process, grievance procedures, or no further process, the Title IX Coordinator or a designated university official conducts an initial assessment to determine next steps and will initiate contact the Complainant to discuss the availability of Supportive Measures. Respondents will also be offered supportive measures after receiving a Notice of Allegation.

Supportive Measures are non-disciplinary, non-punitive individualized services, assistance, and other measures that the university offers and may put in place, without fee or charge, as appropriate and available, after receiving a Report of possible Prohibited Conduct. Supportive Measures are designed to restore or preserve access to the University's Programs and Activities, or provide support during the grievance process or during the Alternative Resolution Process. Supportive Measures cannot be unreasonably burdensome to a party.

Supportive Measures are available before and after a Complaint is filed, and in cases in which no Complaint is filed.

Upon receipt of a Report, the Title IX Coordinator, or their designee, will contact the Complainant (1) to discuss the availability of Supportive Measures and (2) to explain that Supportive Measures are available with or without the filing of a Complaint. The Title IX Case Manager helps determine the appropriate Supportive Measure(s) to be implemented. The Title IX Case Manager will assess with the relevant party the unique facts and circumstances of their situation and identify steps to help the individual meet their educational or employment expectations.

Supportive Measures may be modified or terminated at the conclusion of a grievance process or Alternative Resolution Process.

Examples of Supportive Measures include, but are not limited to:

- Academic support services and accommodations, including the ability to reschedule classes, exams and assignments, transfer course sections, or withdraw from courses;
- Academic schedule modifications (typically to separate Complainant and Respondent);
- Work schedule or job assignment modifications (for university employment);
- Changes in on-campus work or university housing location;
- On-campus counseling services and/or assistance in connecting to community-based counseling services;
- Assistance in connecting to community-based medical services;
- No contact agreements or orders, which may be mutual or non-mutual;
- Temporarily limiting an individual's access to certain university facilities or activities;
- Information about and/or assistance with obtaining personal protection orders;
- Leaves of absences;
- Increased monitoring and security of certain areas of the campus;
- Options for emergency Housing;
- Individualized limitations on the parties' communications and interactions with each other; or
- A combination of any of these measures.

Changes in class, work, housing, extracurricular, and/or other activities may be made regardless of whether there is or is not a comparable alternative.

The university will maintain Supportive Measures provided to the Complainant or Respondent as confidential to the extent that maintaining such confidentiality would not impair the university's ability to provide the Supportive Measures or restore or preserve a party's access to university's Programs or Activities.

B. Appeals and Modifications of Supportive Measures

Complainants and Respondents may seek modification or reversal of a decision related to the creation, denial, modification, or termination of a Supportive Measure. If a party's condition materially changes, the individual may seek additional modification or termination of a Supportive Measure applicable to them. Requests for the appeal, modification, or termination of Supportive Measures must be submitted in writing to the IEX Office via email to institutionalequity@andrew.cmu.edu. The decisionmaker on the appeal will be someone other than the person who made the decision being challenged, and who will have the authority to make the requested modification or reversal.

VI. How a Complaint is Resolved

A. Initiating a Complaint

A Complaint may be filed with the IEX Office orally in person, by mail, or by email. Complainants are strongly encouraged, but not required, to submit a Complaint Form [pdf] (https://www.cmu.edu/title-ix/tix-formal-complaint-form_2022.pdf). A Complainant may file a Complaint at any time, but significant delays between the time an incident occurs and conducting an investigation may impede or limit the availability of Relevant evidence and/or availability of witnesses.

Upon the filing of a Complaint, the IEX Office will contact the Complainant to confirm receipt of the Complaint and to confirm the allegations as understood by the IEX Office. Before initiating the grievance procedures, the IEX Office will review the Complaint to determine whether there is any basis to dismiss the Complaint, as detailed in Section VI.B below. Otherwise, the IEX Office will initiate the grievance procedures and commence an investigation as detailed in Section VI.C below. The Complainant may also wish to pursue the Alternative Resolution Process, an alternative track discussed further below, instead of or after filing a Complaint.

In certain circumstances, the IEX Office may file a Complaint and initiate an investigation in the absence of an identifiable Complainant or when a Complainant is unwilling to proceed with a Complaint. In making the determination to initiate a Complaint, the IEX Office must consider, at a minimum, the following factors:

1. The Complainant's request not to proceed with the initiation of a Complaint;
2. The Complainant's reasonable safety concerns regarding the initiation of a Complaint;
3. The risk that additional acts of Prohibited Conduct would occur if a Complaint is not initiated;
4. The severity of the alleged Prohibited Conduct, including whether the alleged misconduct, if established, would require the removal of a Respondent from the university's campus or imposition of another Disciplinary Sanction to end the Prohibited Conduct and prevent its recurrence;
5. The age and relationship of the parties, including whether the Respondent is an Employee of the university;
6. The scope of the alleged Prohibited Conduct, including information suggesting a pattern, ongoing Prohibited Conduct, and/or Prohibited Conduct alleged to have impacted multiple individuals;
7. The availability of evidence to assist the Hearing Officer or other decisionmakers in determining whether Prohibited Conduct occurred; and
8. Whether the university could end the alleged Prohibited Conduct and prevent its recurrence without initiating a Complaint.

After considering the above factors and any other relevant factors, if the IEX Office determines that the conduct as alleged presents an imminent and serious threat to the health or safety of the Complainant or another person, or that the conduct as alleged prevents the university from ensuring equal access on the base of any Protected Class to the University's Programs or Activities, the IEX Office may initiate a Complaint and commence an investigation.

If the IEX Office decides to initiate a Complaint, the IEX Office will notify the Complainant (if identifiable) prior to the initiation of the Complaint in order to address any reasonable safety concerns, including via options for Supportive Measures under Section V.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/respond-report.html#a). Regardless of whether a Complaint is initiated, the IEX Office will take other appropriate prompt and effective steps necessary to ensure the Prohibited Conduct does not continue or recur within the University's Programs or Activities.

The IEX Office may consolidate complaints of Prohibited Conduct against more than one Respondent, or by more than one Complainant against one or more Respondents, or by one party against another party ("cross complaints"), when the allegations of Prohibited Conduct arise out of the same alleged facts or circumstances. When the university receives a report of alleged conduct that could constitute Prohibited Conduct under this Policy and could also violate other university policies, the university, in its discretion, will determine which policy/ies and procedures apply and whether action will be taken under multiple policies.

Both the Complainant and the Respondent may select an Advisor of their choice. Details concerning the role of the Advisor are set forth in the applicable adjudication procedures under Section VI.D.

The Respondent is presumed to be Not Responsible for any alleged Prohibited Conduct until a determination is made at the conclusion of the adjudication procedures set forth in this Policy.

The university will not discipline a party, witness, or others who participate in the investigation or adjudication of a Complaint for making a false statement or for engaging in consensual sexual conduct based solely on the determination of responsibility for Prohibited Conduct under this Policy. Allegations that an individual has provided a false statement must be separately reviewed under applicable university policy (e.g., *The Word*, the Staff Handbook, or the Code of Business Ethics) and such allegations, in general, will be stayed until the completion of the underlying proceedings in this Policy. Allegations of a violation of the Consensual and Intimate Relationship Policy Regarding Undergraduate Students (https://www.cmu.edu/policies/student-and-student-life/consensual-relationships.html) must be separately reviewed under that policy.

The IEX Office will establish and maintain on its website reasonably prompt time frames (https://www.cmu.edu/title-ix/university-response/discriminatory-and-sexual-misconduct-investigation-and-resolution-process.html) for the major stages of the Complaint process. These timeframes may be extended on a case-by-case basis for good cause. When such timeframes are extended, the IEX Office will provide written notice of the reason for delay to the Complainant and Respondent.

For any allegation of Prohibited Conduct that allegedly occurred before the effective date of this Policy, the university will use the applicable policy that was in effect at the time the Prohibited Conduct allegedly occurred for the purpose of defining conduct that constitutes a violation of policy. However, the matter will be investigated and adjudicated using the current procedures as set forth in this Section VI of this Policy. Complaints filed before the effective date of this Policy and that were still pending as of such effective date will be completed using the policy in effect when the Formal Complaint was filed.

B. Dismissal and Withdrawal of a Complaint

At any time during the pendency of a Complaint, the IEX Office may dismiss the Complaint on any of the following bases:

1. The university is unable to identify the Respondent after taking reasonable steps to do so;
2. The Respondent is not or is no longer a Student or Employee of the university and is not otherwise participating in the University's Programs or Activities;
3. The Complainant voluntarily requests to withdraw any/all allegations in writing and the IEX Office declines to initiate/continue the Complaint/grievance procedures, as described further below, and/or without the Complainant's withdrawn allegations, the conduct that remains alleged in the Complaint, if any, would not constitute Prohibited Conduct even if established); or
4. The IEX Office determines that even if proven, the alleged conduct would not constitute Prohibited Conduct.

Upon dismissal of a Complaint, the IEX Office will provide prompt written notice to the Complainant of the basis for the dismissal and the right to appeal the dismissal decision under Section VI.F. If the dismissal occurs after the Respondent has been issued a Notice of Allegations, the IEX Office will also provide such written notice to the Respondent.

If a Complaint is dismissed before the IEX Office has issued a Notice of Allegations to the Respondent, only the Complainant will have the opportunity to appeal the decision to dismiss the Complainant. If the Complaint is dismissed after the IEX Office issued a Notice of Allegations to the Respondent, the Complainant and Respondent will have an equal opportunity to appeal the dismissal decision.

A Complainant who filed a Complaint may request withdrawal of such complaint at any time by submitting a written request to the Investigator assigned to the case or the IEX Office. After a Complainant requests withdrawal of a Complaint, the IEX Office will review the matter, considering the same factors as specified in Section VI.A, to determine whether to grant the request for withdrawal or to continue the Complaint. If the IEX Office refuses a request by a Complainant to dismiss a Complaint, the Complainant will be notified in writing of the decision and rationale.

C. Investigation Procedures

After deciding to commence an investigation, the Title IX Coordinator will appoint an investigator to review, assess, and investigate the Complaint (the "Investigator"). The Investigator may be a staff member in the IEX Office, a staff member in Human Resources, a staff member in another department at the university, or an external professional. The Title IX Coordinator is responsible for ensuring that the Investigator has been appropriately trained and is free of conflicts of interest or bias — for or against Complainants or Respondents generally, or a specific Complainant or Respondent — that would impair the investigation. If a party has concerns about bias in favor of or against a specific Complainant or Respondent, bias in favor of or against Complainants or Respondents generally, or a potential conflict of interest which involves the Title IX Coordinator, facilitator of an Alternative Resolution Process, investigator, decisionmaker, or appeals decisionmaker, the party should direct those concerns to the Title IX Coordinator. Concerns regarding bias or conflict of interest on the part of the Title IX Coordinator will be referred to the Vice Provost for Diversity, Equity and Inclusion and Chief Diversity Officer (or designee) for review.

The IEX Office will send the Complainant and Respondent a written Notice of Allegations. If in the course of an investigation, the IEX Office decides to investigate additional allegations of Prohibited Conduct not included within the original notice or if it is necessary to make revisions to the allegations, the IEX Office will issue an amended Notice of Allegations to the Complainant and Respondent. The issuance of a Notice of Allegations may be reasonably delayed as necessary to address any reasonable concerns for the safety of any person as a result of providing such notice.

The Notice of Allegations will include:

- information about the Alternative Resolution Process and grievance procedures;
- the identities of the parties involved in the incident(s), the conduct alleged to constitute Prohibited Conduct, and the date(s) and location(s) of the alleged incident(s), if known;
- information about the university's prohibition on Retaliation;
- a statement that the parties are entitled to an investigative report summarizing all Relevant evidence and retain the equal right to access such evidence upon request;
- a statement that the Respondent is presumed not responsible for the alleged Prohibited Conduct until a determination is made at the conclusion of the grievance procedures, after the parties have had an opportunity to present Relevant (not otherwise impermissible) evidence to a trained, impartial decisionmaker;
- notice that the Parties have the right to be accompanied by an Advisor of choice, who may be but need not be an attorney;
- notice that knowingly making false statements or submitting false information is prohibited;
- information about Supportive Measures;
- a statement regarding the standard of proof to be used in considering the facts and evidence;
- the range of possible Disciplinary Sanctions and Remedies; and
- information about the appeals process.

The Investigator will conduct an investigation and prepare a preliminary investigative report that fairly summarizes the Relevant evidence gathered during the investigation. The Investigator will, prior to any interviews or meetings with the parties, provide written notice of the date, time, location, and purpose of the interview or meeting, with sufficient time for the party to prepare for the interview or meeting.

Prior to preparing any report, the Investigator will request Relevant information from the parties as well as work to gather other Relevant available evidence. The ultimate responsibility for gathering available Relevant evidence rests with the university. Throughout the investigation, the university will provide both parties equal opportunity for the parties to present witnesses, including fact and expert witnesses, and other inculpatory and exculpatory evidence. The parties may offer testimony from an expert witness, as specified in Appendix B (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/appendix-b.html) to this Policy.

The preliminary investigative report will be made available to the Complainant, Respondent, and their respective Advisors in electronic or hard-copy format. Any Relevant evidence collected during the investigation will also be made available to the Complainant, Respondent, and their respective Advisors for inspection and review in electronic or hard-copy format. The Complainant and Respondent will have at least seven (7) calendar days to review and respond to the preliminary investigative report. The Investigator will consider any responses submitted by the Complainant, Respondent and their respective Advisors and prepare a final investigative report ("Investigative Report").

D. Adjudication Procedures

The specific procedures for adjudicating allegations of Prohibited Conduct are based upon the nature of the parties' relationship to the university.

1. Where the Complainant or Respondent is a Student — the matter will be handled in accordance with the Hearing Procedures set forth in Section VI.E and the Appeal Procedures set forth in Section VI.F. This subsection supersedes and controls over all other provisions of this Section VI.D.

   When a Complainant or Respondent is both a Student and an Employee (a "Student Employee"), the university will undertake a fact- and circumstance-specific inquiry to determine how the matter will be adjudicated, including consideration of whether the party's primary relationship with the university is to receive an education, and whether the alleged Prohibited Conduct occurred while the party was performing employment-related work. Typically, if a Respondent who is a Student Employee may experience a change in their employment status as a result of the outcome of a grievance process, but not a change in their student status, the matter will proceed as though the Respondent was a Staff member.
2. Where the Respondent is a Faculty member — the matter will be handled in accordance with the Hearing Procedures set forth in Section VI.E and the Appeal Procedures set forth in Section VI.F.

3. Where the Respondent is a Staff member — the IEX Office will send the Investigative Report to the Assistant Vice President of Human Resources, People and Organization Effectiveness, in Human Resources and the matter will be handled in accordance with the procedures set forth in the Staff Handbook (https://www.cmu.edu/hr/resources/policies/staff-handbook.html), Volume II, Section 10c. The Assistant Vice President of Human Resources, People & Organizational Effectiveness also has discretion to refer the matter for live hearing using the Hearing Procedures set forth in Section VI.E and the Appeal Procedures set forth in Section VI.F.
4. Where the Respondent is a Participant in a Summer Program:
    a. For cases involving allegations of Sex-Based Harassment or if the Complainant or Respondent is deemed to be a Student, the matter will be handled in accordance with the Hearing Procedures set forth in Section VI.E and the Appeal Procedures set forth in Section VI.F.
    b. For other allegations under this Policy, the matter will be handled in accordance with the Summer Programs Code of Conduct.
5. Where the Respondent is an on-going affiliate of the university who is not a Faculty member, Staff member, Student, or Participant in a Summer Program:
    a. For allegations of Sex Discrimination or Sex-Based Harassment, the IEX Office will appoint an Investigator to conduct an investigation in accordance with Section VI.C. After the completion of the Investigation, the Title IX Coordinator has discretion to either:
        i. Instruct the Investigator to make a determination of responsibility for each allegation in the Formal Complaint using the preponderance of the evidence standard. In conducting this review, the Investigator will follow the Procedures for Adjudication without a Live Hearing [pdf] (https://www.cmu.edu/policies/forms-and-documents/adjudication-procedures.pdf). Based on the Investigator's findings of responsibility, the Investigator will coordinate with the Title IX Coordinator and other university officials as necessary to determine appropriate Disciplinary Sanctions and/or Remedies. Appeals will be handled via the procedures set forth in Section VI.F; or
        ii. Refer the matter for live hearing in accordance with the Hearing Procedures set forth in Section VI.E and the Appeal Procedures set forth in Section VI.F
    b. For allegations of Prohibited Conduct that do not constitute Sex Discrimination or Sex-Based Harassment, the IEX Office will determine the appropriate manner of resolution in accordance with the university's commitment to a prompt and equitable process and consistent with any applicable state and federal law and regulations.

E. Live Hearing Procedures

The following procedures apply to live hearings held under this Policy, as indicated in Section VI.D.

Appointment of Hearing Officer

After reviewing the Investigative Report prepared under Section VI.C, the IEX Office will appoint a hearing officer ("Hearing Officer") who will be responsible for conducting a review of the case, presiding over a live hearing if necessary, and making findings of fact and a determination of responsibility with respect to each allegation in the Complaint.

Conduct of the Hearing & Written Determination

The Hearing Officer will conduct a live hearing in accordance with the Hearing Procedures for the Adjudication of Discriminatory and Sexual Misconduct [pdf] (https://www.cmu.edu/policies/forms-and-documents/hearing-procedures.pdf) ("Hearing Procedures"). The hearing will take place no sooner than ten (10) days after the parties are provided with the Investigative Report.

At the conclusion of the hearing, the Hearing Officer will objectively evaluate all Relevant evidence, both inculpatory and exculpatory, and make findings of fact and a determination of responsibility with respect to each allegation. The determination of responsibility will be made using the preponderance of evidence standard.

If the Hearing Officer determines that the Respondent is responsible for any allegation, the Hearing Officer will contact the appropriate sanctioning officer, as specified below, to review the findings of fact and determination(s) regarding responsibility ("Sanctioning Officer"). The Sanctioning Officer will have sole responsibility for determining the appropriate Disciplinary Sanctions and any Remedies related to any finding of responsibility made by the Hearing Officer. The Sanctioning Officer will provide a written determination regarding Disciplinary Sanctions and/or Remedies to the Hearing Officer. If the Hearing Officer determines that the Respondent is not responsible for any of the allegations, the Sanctioning Officer will not be contacted. Where the appointed Hearing Officer is an Employee of the university, the same individual may be appointed to serve as both the Hearing Officer and Sanctioning Officer.

The applicable Sanctioning Officer is based on the nature of the Respondent's relationship to the university:

- Sanctioning Officer for Students: Associate Vice President of Student Affairs for Community Life or designee (in consultation with the Community Standards Review Board (https://www.cmu.edu/student-affairs/theword/community-standards/definitions.html))
- Sanctioning Officer for Staff: Assistant Vice President for Human Resources, People & Organizational Effectiveness or designee
- Sanctioning Officer for Faculty: Vice Provost for Faculty or designee

The Hearing Officer will prepare a written determination regarding the findings of fact and the determination regarding responsibility for each allegation, with rationale and appeals information. Where applicable, the written decision of the Sanctioning Officer regarding Disciplinary Sanctions and/or Remedies will be attached to or incorporated into the written determination prepared by the Hearing Officer.

Notice of Written Determination

The written determination will be provided to the IEX Office. Except as detailed below regarding cases involving Student-Respondents, the IEX Office is responsible for providing the Complainant and Respondent with a copy of the written determination. Both parties must be provided the written determination simultaneously.

For Cases Involving Student-Respondents — Depending on the nature of the category of alleged Prohibited Conduct, the right of the Complainant to receive notice of the outcome(s), as well as the right to appeal the outcome(s), is restricted by the Family Educational Rights and Privacy Act (FERPA).;

Consistent with FERPA and applicable Title IX regulations, in Student-Respondent cases the outcome(s) applicable to a Student-Respondent will be disclosed to the Complainant only for the following offenses under this Policy:

- Sex-Based Harassment (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#sex-based-harassment), including
    - Quid Pro Quo Sexual Harassment,
    - Hostile Environment Sexual Harassment,
    - Sexual Assault,
    - Dating Violence,
    - Domestic Violence,
    - Stalking (based on sex),
- Stalking (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#stalking)
- Sex Discrimination (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#discrimination); and/or
- Retaliation (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#retaliation) where the underlying protected activity is related to the exercise of rights related to and/or Complaints of Sex Discrimination, including Sex-Based Harassment.

Consequently, as required by FERPA, in Student-Respondent cases, the outcome(s) applicable to a Student-Respondent will not be disclosed and the Complainant cannot appeal such outcome(s) for the following offenses under this Policy:

- Violation of Protective Measures (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#violation);
- Discrimination (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#discrimination) and/or Discriminatory Harassment (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#discriminatory-harassment) on the basis of race, color, national origin, disability, age, religion, ancestry, family status, parental status, marital status, veteran status, and genetic information;[1] and
- Retaliation (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/definitions.html#retaliation) where the underlying protected activity is related to the exercise of rights related to and/or complaints of race, color, national origin, disability,

age, religion (including creed, ancestry and belief), veteran status, and genetic information.

For Student-Respondent cases, the IEX Office will provide the Student-Respondent with a complete copy of the written determination for all allegations. Where applicable, the IEX Office will coordinate with the Hearing Officer to edit or redact the written determination issued to the Complainant in order to remove information related to the outcome(s) of alleged offenses which the university is not permitted to disclose, per the list above. Regardless of the type of allegation, any outcomes that apply to the Complainant (e.g. Remedies) will be shared with the Complainant.

Additional Procedures for Disciplinary Sanctions Against Faculty Respondents

In the case of sanctions against a Faculty Respondent, the Disciplinary Sanctions determined by the Sanctioning Officer for Faculty will be provided to the President as recommended Disciplinary Sanctions. The President will take no action on the recommended Disciplinary Sanctions until either (i) the completion of any appeal filed by any party under Section VI.F or (ii) the deadline to file an appeal under Section VI.F passes without any appeal being filed. If an appeal is filed, the President or the President’s designee will render a decision on the appeal consistent with the procedures in Section VI.F. If any Disciplinary Sanctions remain after the completion of the appeal or where no appeal is filed by the appeal deadline, the President will thereafter render a decision based on both the recommendation of the Sanctioning Officer for Faculty as well as the underlying findings of fact and determination(s) of responsibility by the Hearing Officer (or Appeal Officer, if applicable). If the President decides to initiate the procedure for dismissal for cause or for the imposition of another Disciplinary Sanction against a Faculty Respondent, the matter will then follow the process set forth in the subsection "Procedure" of the section of the Appointment and Tenure Policy of Carnegie Mellon University (https://www.cmu.edu/policies/faculty/appointment-and-tenure-policy.html) titled, "Dismissal for Cause and Other Sanctions," but will be subject to the "Exceptions" provision of that subsection such that no Ad-Hoc Committee will be required.

F. Appeal Procedures

Except as specified in Section VI.E for Student-Respondent cases, both the Complainant and Respondent have the right to file an appeal regarding (i) the determination under Section VI.E or (ii) the dismissal of a Complaint under Section VI.B. An appeal must be submitted in writing to the Office of the President (with a copy to the IEX Office) within seven (7) calendar days of the official notification of the determination under Section VI.B or Section VI.E.

The written appeal request must state the basis for the appeal. The basis for an appeal will be limited to one or more of the following:

- Procedural irregularity that would change the outcome of the matter;
- New evidence that would change the outcome and that was not reasonably available when the determination regarding responsibility or dismissal was made;
- The Title IX Coordinator, Investigator(s), Hearing Officer, or Sanctioning Officer had a conflict of interest or bias for or against Complainants or Respondents generally or the individual Complainant or Respondent that would change the outcome of the matter; and
- The sanctions imposed are disproportionate to the finding of responsibility.

The President or the President’s designee will serve as the Appeal Officer. The Appeal Officer will inform the other party or parties that an appeal has been filed and provide such party or parties with a copy of the written appeal. The non-appealing party will have a reasonable, equal opportunity to submit a responsive written statement for consideration by the Appeal Officer.

The Appeal Officer will review the written appeal and any response and determine whether, in the judgment of the Appeal Officer, sufficient grounds exist for at least one basis of appeal. An appeal that does not meet at least one of the acceptable bases for appeal may be dismissed without further review.

Appeals will be decided by the Appeal Officer in a timely manner as circumstances warrant. While an appeal is under review, the Appeal Officer will update the Respondent(s) and Complainant(s) as necessary about the anticipated timeline.

The Appeal Officer has the authority to modify the decision as deemed appropriate for resolution of the matter being appealed, which could entail (i) sending the matter back to an Investigator, the Hearing Officer, or a new Hearing Officer, as necessary to remedy the error or (ii) a decrease or change to the nature of the sanction(s). The Appeal Officer may also remand the matter for a new process under Section VI.D.

The Appeal Officer will issue a written decision describing the result of the appeal and the rationale for the result. The Appeal Officer will provide the written decision simultaneously to both the Complainant and Respondent. The IEX Office will also receive a copy of the decision.

G. Possible Disciplinary Sanctions and Remedies from Adjudication

Possible outcomes from a violation of this Policy range from educational outcomes to separation from the university. A detailed list of the possible remedies and sanctions is available in Appendix A to this Policy (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/appendix-a.html).

H. Alternative Resolution Process

Sections VI.A through VI.G of this Policy describe procedures for the grievance procedures for Complaints of Prohibited Conduct. Separate from these grievance procedures, the university offers an Alternative Resolution Process which may be available on a voluntary basis to resolve a matter under this Policy.

Individuals interested in an Alternative Resolution Process should contact the IEX Office to discuss options. For information regarding the types of Alternative Resolution Process that may be available please see the IEX Office website on Alternative Resolutions (https://www.cmu.edu/title-ix/how-to-report-+-options-for-resolution/alternative-resolution-options.html).

Either party may request to pursue an Alternative Resolution Process at any time before a finding of responsibility resulting from any process under Section VI.D or Section VI.E. Alternative Resolution Process may also be requested before the initiation of a Complaint. The Title IX Coordinator has discretion to determine whether the parties will be permitted to pursue an Alternative Resolution Process. In general, mediation and other procedures that are similar to mediation will not be used to resolve matters involving an allegation of sexual violence (i.e., Sexual Assault, Dating Violence, Domestic Violence, or any other form of Prohibited Conduct that involves the use of violence). An Alternative Resolution Process is not permitted if such a process would conflict with federal, state, or local law; the university may also decline to permit an Alternative Resolution Process when it determines that the alleged conduct presents a future risk of harm to others.

After receiving a request to pursue an Alternative Resolution Process, the IEX Office will contact both parties to assess mutual interest in the Alternative Resolution Process. If both parties wish to pursue Alternative Resolution, and the Title IX Coordinator agrees that Alternative Resolution is appropriate under the specific facts and circumstances of the case, the IEX Office will initiate the Alternative Resolution Process (https://www.cmu.edu/title-ix/how-to-report-+-options-for-resolution/alternative-resolution-options.html). While every Alternative Resolution Process will be tailored to the facts and circumstances of the individual case, in no case will the facilitator of the Alternative Resolution Process be the same as the investigator or decisionmaker for grievance procedures involving the same matter.

As participation is voluntary, the university does not require parties to waive the right to an investigation and adjudication as a condition of (continuing) enrollment or (continuing) employment, or the exercise of any other right. During any Alternative Resolution Process, either party has the right to withdraw from the process at any time prior to the conclusion of the process. If a Complaint is pending at the time of the withdrawal from the Alternative Resolution Process, the matter will proceed to investigation under Section VI.C or to adjudication under Section VI.D, as appropriate.

Before initiating an Alternative Resolution Process, the university will notify the parties of:

- the allegations;
- the requirements of the Alternative Resolution Process;
- that each party has the right to withdraw their agreement to participate in the Alternative Resolution Process prior to agreeing to a resolution, and can at that time initiate or resume the grievance procedures, as applicable;
- that agreement to a resolution at the conclusion of the Alternative Resolution Process precludes the parties from initiating or resuming grievance procedures arising from the same allegations;
- the potential terms that may be requested or offered in an Alternative Resolution Process agreement, including notice that an alternative resolution agreement is binding only on the parties; and

- which records will be maintained as part of the Alternative Resolution Process and circumstances under which such records could be shared in the event that the Alternative Resolution Process is not completed and grievance procedures are initiated or resumed.
    - Specifically, if the grievance procedures are resumed after an attempted Alternative Resolution Process:
        - neither the university nor a party will access consider, disclose, or otherwise use information, including records, obtained solely through an Alternative Resolution Process as part of the investigation or outcome determination, and
        - in such cases, the Alternative Resolution Process facilitator could serve as a witness for purposes other than providing information obtained solely through the Alternative Resolution Process.

I. Student Emergency Removal; Employee Administrative Leave

Where there is an immediate threat to the physical health or safety of any Students or other individuals arising from alleged Prohibited Conduct, the university may remove an individual from the University's Program or Activity and issue any necessary related no-trespass and no-contact orders during the pendency of the investigation. The university will make the decision to remove an individual from the University's Program or Activity based on an individualized safety and risk analysis.

For Students, an emergency removal decision will be made in accordance with the Safety Intervention Protocol (https://www.cmu.edu/student-affairs/theword/community-policies/safety-intervention-protocol.html) set forth in *The Word*, subject to the limitation of this section. In the event the university removes any person on this basis, the university will provide the affected individual with notice of the decision and an opportunity to appeal, as specified in the Safety Intervention Protocol.

With respect to Employee Respondents, subject to the procedures in the Staff Handbook (for staff employees) or the Faculty Handbook and Appointment and Tenure Policy (for faculty employees), an Employee Respondent may be placed on administrative leave from employment during the pendency of grievance procedures under this Policy. Administrative leave may include complete removal from the workplace or limitations on access to the workplace, and may be imposed with or without pay. In the event administrative leave is imposed, the Respondent is given the opportunity to seek modification or reversal of the leave.

---

[1]Discrimination or discriminatory harassment based on family status, parental status, or marital status is Sex-Discrimination where the specific facts and circumstances indicate that the alleged misconduct is sex-based." For example, treating a female parent differently than a male parent or treating an individual in a same-sex marriage differently than an individual in a heterosexual marriage.

VII. Definitions

A. Prohibited Conduct Definitions

Prohibited Conduct means one or more categories of prohibited behavior including:

- Discrimination (including Disparate Treatment);
- Discriminatory Harassment;
- Sex Discrimination
- Sex-Based Harassment, including
    - Quid Pro Quo Sex-Based Harassment,
    - Hostile Environment Sex-Based Harassment,
    - Sexual Assault,
    - Dating Violence,
    - Domestic Violence,
    - Stalking (based on sex), and
- Stalking
- Retaliation; and
- Violation of Protective Measures.

Definitions for each of the types of Prohibited Conduct are provided below.

Discrimination means subjecting an individual or class of individuals to adverse action, including treating an individual or class of individuals differently ("Disparate Treatment") on the basis of a Protected Class.

When Discrimination is based on sex, including sex stereotypes, sex characteristics, sexual orientation, and/or gender identity; Parental, Family, or Marital Status; and/or Pregnancy or Related Conditions, it is considered Sex Discrimination. Sex-Based Harassment, including Sexual Assault, Dating Violence, Domestic Violence, and Stalking (based on sex), is a form of Sex Discrimination, but separately defined under this Policy.

This definition incorporates all exceptions under applicable Title IX regulations, including specifically 34 C.F.R. § 106.31.

Discriminatory Harassment means unwelcome conduct of a verbal, nonverbal, or physical nature, including electronic communication, on the basis of a Protected Class, when such conduct

- Based on the totality of the circumstances, evaluated subjectively and objectively, is sufficiently severe or pervasive that it limits or denies a person's ability to participate in or benefit from any University Program or Activity through the creation of a Hostile Environment.

Discriminatory Harassment and Sex-Based Harassment are different offenses under this Policy. Discriminatory Harassment does not include conduct that meets the definition of Sex-Based Harassment under this Policy.

Sex-Based Harassment means any harassment based on sex, including sex stereotypes, sex characteristics, sexual orientation, gender identity, and/or Pregnancy or Related Conditions, that falls into one or more of the following categories:

1. An Employee, agent, or other person authorized by the university to provide an aid, benefit, or service under any University Program or Activity explicitly or impliedly conditions the provision of such an aid, benefit, or service on a person's participation in unwelcome sexual conduct ("Quid Pro Quo Sex-Based Harassment");
2. Unwelcome sex-based conduct that, based on the totality of the circumstances, evaluated subjectively and objectively, is sufficiently severe or pervasive that it limits or denies a person's ability to participate in or benefit from any University Program or Activity ("Hostile Environment Sex-Based Harassment"). Whether a Hostile Environment is created is a fact-specific inquiry that includes consideration of the following:
    - The degree to which the conduct affected the Complainant's ability to access any University Program or Activity;
    - The type, frequency, and duration of the conduct;
    - The parties' ages, roles within the University's Programs or Activities, previous interactions, and other factors about each party that may be relevant to evaluating the effects of the conduct;
    - The location of the conduct and the context in which the conduct occurred; and/or
    - Other Sex-Based Harassment in the University's Programs or Activities.

    Examples of conduct that may constitute Hostile Environment Sex-Based Harassment include, but are not limited to:
    - Unwanted intentional touching that otherwise does not typically constitute Sexual Assault, defined in this Policy;
    - Unwanted sexual advances, including repeated unwanted requests for dates, or repeated unwanted requests for sexual contact;
    - Unwanted written, verbal, or electronic statements of a sexual nature, including sexually suggestive comments, jokes, videos or innuendos;
    - Exposing one's genitalia, breasts, or buttocks, to another; and/or
    - Touching oneself sexually for others to view.
3. Sexual Assault, Dating Violence, Domestic Violence, Sexual Exploitation and Stalking (based on sex). Each of these forms of Sex-Based Harassment are separately defined below.

Sexual Exploitation means intentionally or knowingly taking sexual advantage of another person or violating the sexual privacy of another when Consent is not present. Sexual Exploitation is a form of Sex-Based Harassment and includes, but is not limited to, the following actions (including when they are done via electronic means, methods, or devices):

- Engaging in sexual voyeurism, including observing or permitting others to witness or observe the sexual or intimate activity (e.g., disrobing, bathing, toileting) of another person without that person's Consent;
- engaging in indecent exposure, or exposing intimate parts (including genitalia, groin, breasts, and/or buttocks), or causing another to expose intimate parts, when Consent is not present;

- recording or distributing information, images, or recordings of any person engaged in sexual or intimate activity in a private space without that person's Consent;
- prostituting another individual;
- causing Incapacitation of another person (through alcohol, drugs, or other means) for the purpose of compromising that person's ability to give Consent to non-consensual sexual activity; or
- actively aiding or assisting another person in committing an act of Sex-Based Harassment, including Sexual Assault, Dating Violence, Domestic Violence, and/or Stalking.

Sexual Assault means a forcible or nonforcible sex offense under the uniform crime reporting system of the Federal Bureau of Investigation, which includes the following acts:

1. Rape means the carnal knowledge of a person, without the Consent of the victim, including instances where the person is incapable of giving consent because of their age or temporary or permanent mental or physical incapacity;
2. Sodomy means oral or anal sexual intercourse with another person, without the Consent of the victim, including instances where the person is incapable of giving consent because of their age or temporary or permanent mental or physical incapacity;
3. Sexual Assault with an Object means to use an object or instrument to unlawfully penetrate, however slightly, the genital or anal opening of the body of another person, without the Consent of the victim, including where the person is incapable of giving consent because of their age or temporary or permanent mental or physical incapacity;
4. Fondling means the touching of the private body parts of another person for the purpose of sexual gratification, without the Consent of the victim, including where the person is incapable of giving consent because of their age or temporary or permanent mental or physical incapacity;
5. Incest means sexual intercourse between persons who are related to each other within the degrees wherein marriage is prohibited by law; or
6. Statutory Rape means nonforcible sexual intercourse with a person who is under the statutory age of Consent in the applicable jurisdiction.

   In the Commonwealth of Pennsylvania, the age of Consent for sexual activity is 16. Minors aged 16 years of age or older can legally consent to sexual activity with anyone they choose, as long as the other person does not have authority over them as defined in Pennsylvania's institutional sexual assault statute. Minors under the age of 13 cannot consent to sexual activity. Minors aged 13-15 years old cannot consent to sexual activity with anyone who is 4 or more years older than they are at the time of the activity.

Dating Violence means violence committed by a person who is or has been in a social relationship of a romantic or intimate nature with the victim and where the existence of such a relationship is determined based on a consideration of the length, type, and frequency of interactions between the persons involved in the relationship.

Domestic Violence means a felony or misdemeanor crime committed by a current or former spouse or intimate partner of the victim under the family or domestic violence laws of the state, or by a person similarly situated to a spouse of the victim; by a person with whom the victim shares a child in common; by a person who is cohabitating with or has cohabitated with the victim as a spouse or intimate partner; or by any other person against an adult or youth victim who is protected from that person's acts under the family or domestic violence laws of the jurisdiction.

Stalking means engaging in a course of conduct directed at a specific person that would cause a Reasonable Person to fear for their safety or the safety of others or suffer substantial emotional distress. Stalking based on sex is a form of Sex-Based Harassment.

Retaliation means intimidation, threats, coercion, discrimination or other adverse action against any person by the university, a Student, or an Employee, or another person authorized by the university to provide aid, benefit, or service under the University's Programs or Activities, for the purpose of interfering with any right or privilege secured by applicable federal, state, or local discrimination laws (e.g., Title IX of the Civil Rights Act of 1972, Title VI of the Civil Rights Act of 1964, Title VII of the Civil Rights Act of 1964, the Americans with Disabilities Act, the Pennsylvania Human Relations Act, etc.), or because the person has reported information to the university, to an external agency, or to law enforcement; made a Complaint; testified, assisted, participated, or refused to participate, in any manner in an investigation, proceeding, hearing, or alternative resolution under this Policy.

Retaliation includes retaliation by peers ("Peer Retaliation"), such as retaliation by a student against another student but also Retaliation by a student against an employee, or by an employee against a student, as well as by an employee against another employee of more or less senior role. An individual need not be a Complainant or Respondent to have committed or been affected by Retaliation. It is not Retaliation for the university to require an employee, or other person authorized by the university to provide aid, benefits, or services as part of University's Programs or Activities to participate as a witness in, or otherwise assist with, any investigation or adjudication under this Policy.

A finding of Retaliation under this Policy is not dependent on a finding that any alleged underlying Prohibited Conduct occurred. Retaliation is also prohibited by the university's Policy Against Retaliation (https://www.cmu.edu/policies/administrative-and-governance/whistleblower.html).

Similarly, charging an individual with a code of conduct violation for making an allegedly materially false statement in bad faith in a Report, Complaint, or in the course of a grievance proceeding under this Policy does not constitute prohibited Retaliation, provided, however, that a determination regarding responsibility, alone, is not sufficient to conclude that any party made a materially false statement in bad faith. Retaliation also does not include pursuit of civil, criminal, or other legal action, internal or external to the university.

Violation of Protective Measures
Any violation of an agreement or order that limits an individual's contact or interactions with another individual. Such agreement or order may have been issued under the authority of the university; another institution; or a local, state, or federal government or court.

B. Definitions Relating to Consent

Consent means a knowing and voluntary agreement to engage in sexual activity at the time of the activity. In order to be valid, consent must be knowing, voluntary, active, present, and ongoing. Consent should be demonstrated through mutually understandable words or actions.

- Silence, remaining still or inactive (passive), or not actively resisting sexual activity does not constitute consent.
- Consent to engage in one sexual activity does not mean consent to engage in another sexual activity. Consent must be obtained each time, at each step of sexual activity.
- Prior consent does not mean future consent. Consent must be obtained each time, at each step of sexual activity, even for those in an ongoing sexual relationship.
- Consent can be withdrawn at any time. If one individual withdraws consent through clear words or actions, the other person must cease sexual activity immediately.
- Consent cannot be obtained through Force, Incapacitation, or Coercion (as defined herein).

Consent may be invalid where one party has lied to or knowingly deceived the other party as to the use of internal or external condoms or other single-use devices used to prevent the spread of sexually transmitted infections during a sexual encounter.

Force means using physical control (such as restraining a person), physical violence (such as hitting, choking, or displaying a weapon), or threats of either, to cause a person to submit to unwanted sexual activity.>

Coercion means using an unreasonable amount of pressure or threats that would overcome the will of a Reasonable Person and cause them to submit to unwanted sexual activity.

Coercion requires more than an attempt to persuade someone to engage in sexual activity. Coercion can include threats, such as threats to cause academic, employment, reputational, or economic harm. When one person expresses that they do not consent to sexual activity or are withdrawing consent for sexual activity, applying continued pressure in order to get the person to submit to unwanted sexual activity can be considered Coercion.

Incapacitation means that a person lacks the ability to make informed, deliberate choices about whether or not to engage in sexual activity. A person is Incapacitated – unable to give consent – because they are:

- under the age of consent (generally 16 years of age in Pennsylvania; *see* definition of Statutory Rape for additional information);
- physically or mentally helpless;
- asleep or unconscious; or
- unaware that sexual activity was requested, suggested, initiated and/or is taking place.

A person may be Incapacitated by the use of alcohol or other drugs. Incapacitation is a state beyond intoxication or drunkenness. A person is not necessarily Incapacitated solely as a result of drinking or using drugs; the level of impairment must be significant enough to render the person unable to give Consent.

For example, a person who is Incapacitated may not be able to answer some or all of the following questions:

- Do you know where you are?
- Do you know how you got here?
- Do you know what is happening?
- Do you know whom you are with?

A person who is Incapacitated may also demonstrate physical signs including but not limited to:

- slurred or incomprehensible speech;
- unsteady manner of walking or inability to walk; and/or
- vomiting or incontinence (a lack of voluntary control over urination and/or defecation).

If a person under the influence of alcohol or drugs decides to participate in sexual activity that they would not participate in while sober, it does not necessarily mean that the person was Incapacitated or that the Consent was not valid.

Importantly, being impaired by alcohol or other drugs is not a defense to a failure to obtain Consent.

C. Protected Class Definitions

Protected Class
Consistent with the university's Statement of Assurance, "Protected Class" means any legally-protected characteristic, including race, color, national origin, sex (including sex stereotypes, sex characteristics, sexual orientation, gender identity, and pregnancy or related conditions), disability, age, parental status, family status, marital status, religion, creed, ancestry, belief, veteran status, genetic information or any other class protected from discrimination under federal, state, or local laws or executive orders.

The following definitions of specific categories of Protected Classes are provided as a helpful resource. To the extent these definitions are inconsistent with any applicable federal, state, or local law the university will apply the applicable legal definition.

Expressing a political view or a view on world events will not be cause alone for determination that behavior is Prohibited Conduct under this Policy.

Race means the ancestry or physical or cultural characteristics associated with a certain race, such as skin color, hair texture or styles, or certain facial features.

Color means a person's pigmentation, complexion, or skin shade or tone.

National Origin means a group of people sharing a common language, culture, ancestry, race, and/or other social characteristics.

Sex means sex stereotypes, sex characteristics, sexual orientation, gender identity, and/or pregnancy or related conditions.

Sexual Orientation means a person's actual or perceived predisposition or inclination toward a particular type of sexual activity or behavior.

Gender Identity means an individual's sense of their gender, which may or may not be different from their sex assigned at birth.

Sex Stereotypes means fixed or generalized expectations regarding a person's aptitudes, behavior, self-presentation, or other attributes based on sex.

Sex Characteristics means physiological sex-based characteristics including, but not limited to, a person's anatomy, hormones, and chromosomes associated with male or female bodies and intersex traits.

Pregnancy or Related Condition means (1) Pregnancy, childbirth, termination of pregnancy, or lactation; (2) Medical conditions related to pregnancy, childbirth, termination of pregnancy, or lactation; (3) Recovery from pregnancy, childbirth, termination of pregnancy, lactation, or related medical conditions.

Note, in some jurisdictions, including the City of Pittsburgh, the "partner" of a person who is pregnant or has a pregnancy related condition is protected from discrimination and may be entitled to certain reasonable accommodations. For more information, please see Human Resource's Pregnancy Support and Accommodations Policy [pdf] (https://www.cmu.edu/hr/assets/hr/pregnancy-support-policy.pdf).

Parental Status means the status of a person who, with respect to another person who is under the age of 18 or who is 18 or older but is incapable of self-care because of a physical or mental disability, is (1) a biological parent, (2) an adoptive parent, (3) a foster parent, (4) a stepparent, (5) a legal custodian or guardian, (6) in loco parentis with respect to such person, or (7) actively seeking legal custody, guardianship, visitation, or adoption of such person.

Marital Status means the state of being married or not married.

Family Status refers to the configuration of a person's family or their role in a family.

Disability means a physical or mental impairment that substantially limits one or more major life activities, a person who has a history or record of such an impairment, or a person who is perceived by others as having such an impairment.

Age
How old a person is.

Religion means all aspects of religious observance, religious practice, religious creed, and religious belief or nonbelief, as defined under Title VII of the Civil Rights Act of 1964 and similar federal, state and local religious discrimination laws.

Ancestry means the common physical, cultural or linguistic characteristics of a person's ancestors.

Veteran means a person who served in any branch of the U.S. military.

Genetic Information means with respect to any person, information about (i) such person's genetic tests, (ii) the genetic tests of family members of such person, and (iii) the manifestation of a disease or disorder in family members of such person.

D. Policy Definitions

Advisor means, an individual who provides support and advice for the Complainant or Respondent. The Complainant and Respondent may have an Advisor of their choice, who may be, but is not required to be, an attorney.

Complainant means a Student, Employee, or other person who is alleged to have been subject to conduct that could constitute Prohibited Conduct under this Policy. In some cases, a Complainant may be different from the person who initially reports information to the university. In the event a Complaint is brought by the IEX Office, the individual affected by the alleged Prohibited Conduct that is the subject of the Complaint remains the Complainant, and the Civil Rights Coordinator does not become the Complainant.

Disciplinary Sanctions
Consequences imposed on a Respondent following a determination that the Respondent is responsible for having committed Prohibited Conduct.

Employee means person who is employed by the university to perform one or more of the following roles: regular instructional faculty, supplemental instructional faculty, research track faculty, visiting faculty, librarians, archivists, curators, graduate student instructors, graduate student staff assistants, graduate student research assistants, postdoctoral research fellows, and all regular and temporary Staff.

Faculty/Faculty Member means all individuals who hold appointments on the tenure-track, research-track, teaching-track, librarian/archivist-track, and special faculty track of the university, as well as individuals holding emeritus faculty status.

Complaint means an oral or written request to the university that objectively can be understood as a request for the university to investigate and make a determination about alleged Prohibited Conduct, as set forth in the procedures outlined in Section VI (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/complaint-resolved.html). It is the policy of the university to confirm a Complainant's request in writing prior to initiating the grievance procedures. A Complaint can be made by a Complainant[1] or the IEX Office as set forth in Section VI.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/complaint-resolved.html#a). A Complainant must have been enrolled, employed, or otherwise participating or attempting to participate in the university's Programs or Activities at the time the alleged Prohibited Conduct occurred in order to file a Complaint under this Policy, although the Complainant need not be enrolled, employed, or otherwise participating or attempting to participate in the university's Education Program or Activity at the time the Complaint is made. constitute Prohibited Conduct, the Title IX Coordinator has discretion to file a Complainant, as detailed in Section VI.A (https://www.cmu.edu/policies/administrative-and-governance/sexual-misconduct/complaint-resolved.html#a), even if the report was not submitted by an individual who is participating or attempting to participate in the university's Education Program or Activity. With respect to allegations of Sex Discrimination other than Sex-Based Harassment, a Complaint may be brought by any Student or employee, or any other person who was participating or attempting to participate in the Education Program or Activity at the time the alleged conduct took place.

Preponderance of the Evidence means to prove that something is more likely than not.

Reasonable Person means a person using average care, intelligence, and judgment in the known circumstances.

Relevant
Related to the allegations of Prohibited Conduct at issue and whether or not the alleged Prohibited Conduct occurred. Questions are Relevant if they may aid in showing whether the alleged Prohibited Conduct occurred, and evidence is Relevant if it may aid a decisionmaker in determining whether the alleged Prohibited Conduct occurred. The following evidence is impermissible (and will not be considered Relevant) even if it would otherwise be considered Relevant:

- evidence protected under a privilege recognized by federal or state law, unless the person holding the privilege has waived it voluntarily;
- records that are made or maintained by a physician, psychologist, or other recognized professional or paraprofessional in connection with the provision of treatment to a Party or witness, unless the person has voluntarily consented, in writing, to the use of such records in the Grievance Procedures; and/or
- evidence and questions about the Complainant’s sexual interests or prior sexual conduct, unless:
  - offered to prove that someone other than the Respondent committed the conduct alleged, or
  - if concerning specific incidents of prior sexual activity with the Respondent which are offered to prove consent.

Such impermissible evidence will not be accessed, considered, disclosed, or used, except to determine whether one of the preceding exceptions applies.

Remedies
Measures provided, as appropriate, to a Complainant or other person whose equal access to the university’s Programs and Activities was determined to have been limited or denied by Prohibited Conduct, in order to restore or preserve that person’s access.

Report
Any notice of conduct that may constitute Prohibited Conduct. A Report may come from any individual, not just a Complainant. Not every Report is or will result in a Complaint.

Respondent means an individual who is reported to have engaged in Prohibited Conduct. In the event that a Complaint alleges that a university policy or practice discriminates on the basis of Protected Class, the university is not considered a Respondent. In such cases, the university will follow this Policy, including the Grievance Procedures, although the university will, necessarily, not be entitled to certain procedural rights and steps afforded to individual Respondents. In the event a Complaint against an individual Respondent is based on actions the Respondent took in accordance with a university policy or practice, the Complaint may, in the university’s sole discretion, be amended to substitute the university as Respondent. This determination will be made after a consideration of factors including, but not limited to, whether the individual was, in fact, following the university policy or practice; what actions the individual took; and whether the individual could be subject to Disciplinary Sanctions.

Staff/Staff Member means all Employees of the university who do not hold faculty appointments. Staff does not include individuals whose primary relationship with the university is as a Student.

Student means a person who gained admission to the university.

University's Programs or Activities
Conduct that takes place in the “University’s Programs or Activities” means conduct that is subject to the university’s disciplinary authority and which occurs in the United States, including on-campus, or, if applicable, in any building owned or controlled by a student organization recognized by the university. Conduct is subject to the university’s disciplinary authority if it occurs in a location, at an event, or in a circumstance where the university exercises substantial control over both the Respondent and the context in which the conduct occurs. However, the university will address conduct contributing to a Hostile Environment even if the underlying conduct itself occurred outside the University’s Programs or Activities, including if it occurred outside the United States, and including conduct occurring online via computer and internet networks or on digital platforms, including social media sites). University Programs or Activities also includes the conduct within the university’s disciplinary authority at the university’s international locations, such as Carnegie Mellon University Qatar and Carnegie Mellon University Africa.

[1]A Complaint may also be brought by a parent, guardian, or other authorized legal representative with the legal right to act on behalf of a Complainant, where applicable.

VIII. Additional Provisions Pertaining to Parental, Family, or Marital Status, and Pregnancy or Related Conditions

In determining whether a person satisfies any university admissions policy or criterion, or in making any offer of admission, the university will treat Pregnancy or Related Conditions in the same manner and under the same policies as any other temporary medical condition.

The university will not make pre-admission or pre-employment inquiry as to the Marital Status of an Applicant, including whether an Applicant is "Miss or Mrs." The university may ask an Applicant to self-identify their sex, but only when asking this question of all Applicants. The response will not be used as a basis for discrimination.

The university will not adopt or apply any policy, practice, or procedure, or take any employment action, concerning the current, potential, or past Parental, Family, or Marital Status of a Student, Employee, or applicant that treats persons differently on the basis of sex, or which is based upon whether an Employee or applicant for employment is the head of household or principal wage earner in such Employee’s or applicant’s family unit.

The university will not discriminate against, establish or follow any policy, practice, or procedure that discriminates against, or exclude from employment any person on the basis of current, potential, or past Pregnancy or Related Conditions.

IX. Title IX Coordinator

Carnegie Mellon has appointed a Title IX Coordinator to oversee the university’s compliance with Title IX of the Education Amendments of 1972, Title VI of the Civil Rights Act of 1964, and other applicable federal, state, and local civil rights laws. The Title IX Coordinator is responsible for this Policy, as well as the Statement of Assurance.

The university’s Title IX Coordinator is:

Elizabeth Rosemeyer
Assistant Vice Provost for Diversity, Equity and Inclusion & Title IX Coordinator
4615 Forbes Avenue, Suite 330
Pittsburgh, PA 15213
(412) 268-7125
institutionalequity@andrew.cmu.edu

In accordance with applicable Title IX regulations, the Title IX Coordinator is responsible for the following:

- Taking prompt and effective steps to ensure that Sex Discrimination does not continue or recur, and to remedy its effects;
- Monitoring CMU’s Programs or Activities for barriers to reporting conduct that may constitute Sex Discrimination and taking steps reasonably calculated to address such barriers;
- Facilitating the provision of a non-discriminatory environment and equal access to individuals experiencing Pregnancy or Related Conditions; and
- When notified of conduct that reasonably may constitute Sex Discrimination,
  - Treating Complainants and Respondents equitably;
  - Offering and coordinating Supportive Measures for the Complainant and, if Alternative Resolution Process or Grievance Procedures are pending, the Respondent;

- Notifying Complainants or, if different, individuals making Reports, of the Alternative Resolution Process and Grievance Procedures, as available and appropriate;
- Notifying the Respondent of the Alternative Resolution Process and Grievance Procedures, as available and appropriate, if a Complaint is made;
- In the event of a Complaint, initiating the Grievance Procedures or, if available and appropriate and requested by all Parties, the Alternative Resolution Process; and
- In the absence of a Complaint made by a Complainant, or in the event of the withdrawal of any or all of the allegations in a Complaint, determining whether to initiate a Complaint.

The Title IX Coordinator manages the Office for Institutional Equity and Title IX ("IEX Office"). Employees in the IEX Office are designees of the Title IX Coordinator and may carry out the duties and responsibilities of the Title IX Coordinator. The Title IX Coordinator may also delegate certain responsibilities to other university employees.

X. Recordkeeping

There is a seven-year record retention period for:

- Reports; Complaints; and records documenting the response to Reports and Complaints, including any Supportive Measures provided, any emergency removals or administrative leave imposed, and any Alternative Resolution Process or grievance procedures undertaken, including the resulting outcome (e.g., the result of any Alternative Resolution Process, determinations of responsibility, Disciplinary Sanctions imposed on the Respondent, Remedies provided to the Complainant, appeals and the results of such appeals);
- Any records documenting action taken by university to address Reports of Sex Discrimination, prevent its recurrence, and remedy its effects; to address any barriers identified to reporting such conduct; and to educate employees about their mandatory reporting responsibilities;
- All materials used to provide required training;
- Any audio or audiovisual recording or transcript required to be retained; and
- Any other records documenting the actions taken to satisfy the university’s obligations to prevent discrimination and ensure equal access for individuals due to Pregnancy or Related Conditions, including facilitating reasonable modifications for Students and facilitating temporary adjustments, leave, and/or lactation time and space for Employees.

Policies on Examinations

www.cmu.edu/policies/student-and-student-life/examination-policies.html (https://www.cmu.edu/policies/student-and-student-life/examination-policies.html)

Preamble

The Faculty Senate adopted the following policies on the administration of examinations for the undergraduate courses (defined as courses that are numbered 6xx or below). These policies represent an understanding between faculty and student concerning an important but often stressful period, especially at the conclusion of each academic semester and at mid-semester. There should be no expectation that the following points will cover every conceivable situation. The student should anticipate the demands of the exam schedule, plan accordingly and early, and be prepared. The faculty should recognize that the student is encumbered with many tightly orchestrated and intensive obligations during this period over which they have no control: expectations should be reasonably consistent with the number of course units and, of course, should be made known to the student well in advance of the final examination period, preferably as part of the course syllabus.

In order to help students plan their time and study optimally for examinations, this document lays out in some detail the policies regarding final and in-term examinations. Instructors are requested to provide notification of the major in-term examinations in the course syllabus. The final examination date is posted early in the semester. It is the responsibility of the student to give his or her instructor sufficient notice and to work with the instructor to reschedule examinations if this is needed.

Definitions

- Final examination period.The university's official final examination period begins on the Monday immediately following the last day of classes and continues through the last day of scheduled final examinations, with the exception of reading day(s).
- Scheduled final examinations. Scheduled final examinations are those scheduled by Enrollment Services.
- Self-scheduled examinations.An instructor may choose not to fix a schedule for the final examination, but instead allow each student to choose the examination time; such exams are called self-scheduled examinations.
- Final examinations. Final examinations can either be comprehensive, covering all course materials, or non-comprehensive, covering only a part of the course.
- In-term examinations. Major examinations during the semester are referred to here as in-term examinations.

I. In-Term Examinations

1. All in-term examinations should be given during the regularly scheduled class time. However, if the exam requires additional time to complete, then examinations may be administered outside of regularly scheduled class time.
2. No examinations given outside of class time (excluding make ups and self-scheduled examinations) shall be administered on a Friday after 4:30 pm, or at any time Saturday or Sunday.
3. The instructor administering an exam (or another required class event) that falls outside class time must make any and all reasonable accommodations to provide an alternative time to students who have conflicts with the proposed time period, including those conflicts due to activities, meetings, other classes, etc. (provided that the instructor is notified of such conflict in a timely manner).
4. No student shall be required to take more than two full-period in-class or out-of-class examinations on the same day. It is the responsibility of the student to notify the instructor in a timely manner of their circumstance so that appropriate accommodations can be made.

II. Final Examinations

1. All scheduled final examinations are held at the end of the semester during the university's official final examination period. Comprehensive final examinations are not required for each course, but are given at the option of the department or instructor. The reading day and weekend preceding the examination days shall never be used for examination purposes of any kind, unless a student opts to take a self-scheduled examination during this time. Non-comprehensive final examinations or final projects (but not both) are allowed during this final examination period only in courses that do not give a final comprehensive examination.
2. Instructors are expected to return all work assigned no later than the last regular day of classes in courses for which there is a final examination. In cases when this is not possible, an answer key, solution sets or equivalent feedback should be provided unless the final examination will not cover material in work that has not been returned.
3. No other coursework, including laboratory or studio work, will be due during the final examination period unless it is assigned in advance and in lieu of the course's final examination. Regardless of whether there is a final examination in the course, no classes other than review sessions shall be held during the final examination period. Review sessions should be scheduled for optimal attendance, and a serious effort should be made to accommodate students who cannot attend. In appreciation of the time required to prepare for final examinations, no other examinations, portfolio reviews, critiques or juries shall be scheduled for the last class day of a course with a final examination.
4. Instructors shall never exert or submit to pressures to move an examination so that people can leave earlier nor pressure students to take an examination on a reading day or weekend preceding examinations.
5. No student is required to take more than two scheduled examinations that start within a 25-hour period. A student who has more than two examinations scheduled within a 25-hour period or has two examinations scheduled at the same time should first contact the instructors of the courses for assistance in resolving conflicts. If the problem cannot be resolved by that means, the student should contact the associate dean of his or her home college.
6. Take-home final examinations shall be given for any 24-hour period of the student's choosing during the final examination period.
7. Students are expected to present themselves at the place assigned at the start of the examination; late arrival will reduce the total time a student has to complete the examination, unless instructor's course policy indicates otherwise. Instructors reserve the right to require

attendance within a specific time period. Students who miss an examination with a reasonable excuse and wish to petition for a make-up final examination should check with the instructor. Instructors are encouraged to include late arrival policy and make-up exam policy in the course syllabus.

8. Any student shall be permitted to review his or her corrected, graded final examination in the presence of an instructor or a teaching assistant. Any controversy arising from this review shall be dealt with in accordance with the university procedure for the appeal of grades and academic actions. A final examination that is not returned to a student will be kept available for a year for review. In the event that the instructor or teaching assistant is not available for the review, the responsibility shall rest with the department head of the instructor offering the course or his or her designee. Since instructors are expected to return all work assigned before the final examinations, they are not responsible for retaining unclaimed coursework.
9. Concerns related to final examination, complaints about violations of the final examination policy or alterations of the final examination schedule should be directed to the department head of the instructor offering the course or to the associate dean of the student's home college.

Contact

Questions concerning this policy or its content should be directed to the Vice Provost for Education, (412) 268-5865.

Final Examination Conflict Guidelines

Recognizing that students will, on occasion, encounter foreseeable or unforeseeable conflicts with scheduled final examinations, the following guidelines have been approved by the University Education Council (UEC), the Associate Deans' Council (ADC), and the Associate Deans for Graduate Programs (ADGP) to inform the actions of students and the decisions of instructors.

Foreseeable Conflicts:

Before negotiating any exam conflicts, students should recognize the following expectations. Students should carefully consider the dates of each semester's final exam period as reflected in the university's official academic calendar. Until the university publishes the detailed final examination schedule (usually by early October in the Fall semester and by late February in the Spring semester), students should plan according to the assumption that their final exams could be scheduled for any day/time during the final exam period. Therefore, students should avoid making any personal arrangements (such as travel) that could ultimately conflict with the final exam period.

In developing the final examination schedule, the University Registrar's Office deploys significant effort in consultation with associate deans to minimize direct and 25-hour conflicts for individual students. Once the final exam schedule is published for the semester, each student should immediately review the schedule to determine whether there are conflicts. If the student's schedule presents any final exams that directly conflict with each other, or if the student's schedule presents more than two final exams to begin in a twenty-five hour period, then the student is responsible for immediately initiating the following process so that the relevant instructors can reach a timely and effective resolution that is consistent with university policy (noting that no action is necessary if a student voluntarily elects to take the exams according to the published schedule):

1. The student should begin by discussing the conflict with all relevant instructors to determine if they can suggest a resolution. This discussion should be completed at least two weeks prior to the exams.
2. If one of the course instructors offers an alternate time for the exam, the student must agree to that resolution unless another exam conflicts with the alternate proposed time.
3. If a resolution cannot be found, the following hierarchy is recommended for compromise (Student’s Home Department> Student’s College> Smallest Course Size> Higher Course level):
    - If one of the courses is offered in the student’s home department, the home department should be the first to accommodate.
    - If the course is offered within the student’s home college, then the student’s college should accommodate a course that is not within the student’s college.
    - An instructor teaching a smaller course size should accommodate before an instructor from a larger course size accommodates.
    - Finally, if a resolution still has not been reached, an instructor teaching a higher course level should accommodate before an instructor from a lower course level accommodates.

At any point during this process, the student's academic advisor or academic associate dean from the home academic college may be consulted to verify the existence of the conflict and assist in the negotiation and resolution.

Other foreseeable conflicts may be personal in nature, such as a religious holy day or observance, or a singular, significant obligation. As stated earlier, students are expected to review the final exam schedule as soon as it is published to identify such conflicts. A student faced with such a conflict should first exhaust all reasonable means to otherwise resolve it. If such efforts are unsuccessful, then the student should immediately contact the instructor and explain the circumstances, recognizing that the current Policy on Examinations (https://www.cmu.edu/policies/student-and-student-life/examination-policies.html) does not require the instructor to offer an alternate exam time in response to foreseeable, personal conflicts. The mutual respect and goodwill between instructor and student should guide their negotiation of such conflicts as they attempt to balance the student's needs with those of the academic enterprise. At any point in the process, the student's academic advisor, academic associate dean and/or student affairs liaison may be consulted to assist in identifying reasonable accommodations or solutions.

Students hoping to resolve cases involving foreseeable conflicts should expect that their instructors may require them to take a rescheduled final examination on the Make Up Final Exam Day (https://www.cmu.edu/hub/registrar/exams-and-grading/make-up.html).

Unforeseeable Conflicts

In exceptional circumstances, a student may encounter a medical, personal or family emergency that unexpectedly interferes with their ability to participate in a scheduled final examination. When encountering such a situation, the student should contact the instructor as soon as is reasonably possible, and ideally before the final examination has been administered. The student's academic advisor, academic associate dean and/or student affairs liaison may serve as both advocate for the student and point of verification for the instructor.   After reviewing the matter, should an accommodation be granted by the instructor, the instructor may elect to institute one of several options, including: rescheduling the exam for later in the final examination period; assigning an "I" incomplete grade until a make-up exam can be administered in the following semester; or utilizing another method for resolving missed exams that has been outlined in the course syllabus.

Student Health Insurance Policy

www.cmu.edu/policies/student-and-student-life/student-health-insurance.html (https://www.cmu.edu/policies/student-and-student-life/student-health-insurance.html)

Reason for Policy

The high cost of health care in the United States presents a potentially serious health and financial risk to students and their accompanying dependents. The absence of adequate insurance coverage can result in temporary or permanent interruption of a student's education. The university is committed to offering student health insurance that provides access to quality health care and achieves a balance between premium cost and adequate coverage without overburdening students' financial resources. This balance is best achieved through a mandatory/hard waiver insurance program that mitigates the effect of adverse selection.

Policy Statement General Requirements

All full-time students are required to carry health insurance and will be assessed a charge for the individual basic mandatory plan offered through the university student health insurance program. The charge will appear on the invoice of the first semester of attendance in the academic cycle. The student is required to take one of the following three actions:

1. Enroll in the basic plan as charged.
2. Upgrade the benefit plan by enrolling in the enhanced student health insurance options during the open enrollment period.
3. Apply for a waiver from the mandatory plan.

Requirements for Waiver

Application for a waiver from the university student health insurance plan must be made to Student Health Services by the last day of the open enrollment period. Students applying for waiver must provide documentation of continuing coverage verifying that they are enrolled as the dependent, partner/spouse or principal in an employer or government-sponsored insurance plan. Additionally, the plan must meet minimum standards for coverage as set forth below:

- It must offer at least 75% coverage for inpatient and outpatient medical services in the Pittsburgh area.
- It must include mental health benefits.
- The deductible must not exceed $500 per accident or illness.
- It must offer medical benefits of at least $50,000 per accident or illness.
- It must cover pre-existing conditions.

Contact

Questions should be directed to Student Health Services at 412-268-2157.

Carnegie Mellon Freedom of Expression Policy

www.cmu.edu/policies/administrative-and-governance/freedom-of-expression.html (https://www.cmu.edu/policies/administrative-and-governance/freedom-of-expression.html)

Freedom of Expression Policy

Carnegie Mellon University values the freedoms of speech, thought, expression and assembly - in themselves and as part of our core educational and intellectual mission. If individuals are to cherish freedom, they must experience it. The very concept of freedom assumes that people usually choose wisely from a range of available ideas and that the range and implications of ideas cannot be fully understood unless we hold vital our rights to know, to express, and to choose. The university must be a place where all ideas may be expressed freely and where no alternative is withheld from consideration. The only limits on these freedoms are those dictated by law and those necessary to protect the rights of other members of the university community and to ensure the normal functioning of the University.

Rights

On Carnegie Mellon's Campus, anyone may distribute printed material, offer petitions for signature, make speeches, and hold protests or demonstrations outside university buildings. All such activities must be peaceful, avoiding acts or credible threats of violence and preserving the normal operation of the university. No event shall infringe upon the rights or privileges of anyone not in sympathy with it, and no one will be permitted to harm others, damage or deface property, block access to university buildings or disrupt classes. The enforcement of these conditions will not depend in any way on the message or sponsorship of the act or event. When guests are invited by a recognized campus organization, they may express their ideas not because they have a right to do so, but because members of the campus community have a right to hear, see, and experience diverse intellectual and creative inquiry. Defending that right is a fundamental obligation of the university. Controversy cannot be permitted to abridge the freedoms of speech, thought, expression or assembly. They are not matters of convenience, but of necessity.

Responsibilities

Freedom of expression must be at once fiercely guarded and genuinely embraced. Those who exercise it serve the Carnegie Mellon community by accepting the responsibilities attendant to free expression. University organizations that sponsor invited guests to campus are expected to uphold Carnegie Mellon's educational mission by planning carefully to create safe and thoughtful experiences for those involved. Hosts are responsible for the behavior of their guests and should exercise due care to ensure that all participants abide by relevant university policies.

Considerations for Planning Campus Events

Consistent with the rights and responsibilities outlined in the university's policy on Freedom of Expression, university hosts must follow all applicable policies related to space reservation, use, safety and security, keeping in mind the responsibility to have campus police present for any event with 100 or more persons in attendance.

Hosts should consider the items below as guidance in planning campus events, recognizing that not all of the items will apply to all events:

1. A public declaration of the event, its purpose, the identification of sponsors and co-sponsors, and contact information for those seeking further information.
2. A plan for advertising the event, including advance notice to relevant members of the community who may wish to co-sponsor, protest, or host other events in response to the planned activity.
3. Where appropriate, a clear and detailed contract with outside speakers, artists, or suppliers of services to ensure continuity of purpose and the ability of the host to control the event reasonably, consistent with the host's intent.
4. A plan for access to the event, including notifying the community of reserved seats, ticketing, queuing protocol, or other relevant details or restrictions well in advance of the activity.
5. A provision for security before, during, and after events, managed in coordination wit the University Police. Specifically, non-university security personnel must have their allowable duties clearly delineated, in partnership with the University Police, with their role generally limited to personal security and not to space management.
6. A plan for participant engagement at the event, such as through a question and answer session, if relevant, with a clear delineation of the planned ground rules for the event set out well in advance.
7. A strategy for hosting of additional events, discussions, or town meetings before or after a principal event to help provide a context in which the principal event may be best experienced.

The Office of Student Activities and the Office of the Dean of Student Affairs may assist in, or directly coordinate, some aspects of campus events, such as fostering discussions preceding or following an event, or accommodating an opposing view at an alternative event. It is assumed that the spirit of community, both among people with groups with opposing views, as well as between event sponsors and the Student Activities and Student Affairs staffs, will foster communication and cooperation in the planning of campus events. Wherever possible, Student Affairs will work in concert with University Police to notify occupants of buildings in advance of any potential disruption caused by such events.

Security Personnel Statement

At times, members of the campus community or their invited guests may have a legitimate basis for being accompanied by independent security personnel. It is incumbent upon the host of such an individual to ensure that University Police approve in advance the presence and scope of involvement of any such security personnel.

Student Immunization Policy

www.cmu.edu/policies/student-and-student-life/immunizations.html (https://www.cmu.edu/policies/student-and-student-life/immunizations.html)

Reason for Policy

Vaccine-preventable diseases continue to occur on American campuses and pose a significant threat to the public health of the campus community. Outbreaks not only impose a significant cost to infected individuals in terms of mortality and morbidity but also can be costly to the university by disrupting university activities.

Policy Statement

The goal of the Student Health Services and the university is to provide adequate protection of the campus community against vaccine-preventable diseases by requiring students to be vaccinated against and/or screened for certain highly contagious diseases. This goal can best be achieved through a mandatory prematriculation immunization requirement. The following requirements are consistent with Pennsylvania State Law and with the recommendations of the American College Health Association, the Advisory Committee on Immunization Practices.

Requirements for All Full-Time Students

All entering full-time students born after 1956 must demonstrate proof of immunity against measles, mumps and rubella by either providing dates of inoculation of two doses of the measles vaccine and at least one dose of mumps and rubella or providing blood titers that demonstrate immunity to these infections or providing documentation from a physician of having had the infection.

Additional Requirements for Students Residing in University Housing

- All students residing in university housing must demonstrate immunity against Hepatitis B by either providing documentation of having initiated or completed the three dose vaccination series.
- The student is expected to complete the series within six months of initiation of the series.
- All students residing in university housing must provide documentation of having been vaccinated against meningococcal meningitis within three years prior to enrollment in the university.
- All full-time international students must provide documentation of having had a PPD skin test to screen for tuberculosis within one year prior to enrollment in the university regardless of prior BCG inoculation. If the results of the skin test are positive, a chest x-ray is required.

Request for Waiver

- A student may request a waiver from any vaccination for medical reasons or if vaccination conflicts with personal or religious beliefs. Application for waiver is to be made in writing to Student Health Services prior to the first day of classes in his/her first semester of attendance at the university. In the case of an outbreak of a contagious disease on campus for which the student has not been immunized, the university reserves the right to ask the student to leave campus until the outbreak is over.
- A student may request a waiver from tuberculin skin testing if the student is from a country that has been identified by the Centers for Disease Control as having low prevalence of tuberculosis.

Penalty for Noncompliance

- If the student fails to comply with the immunization policy, the Student Health Services will notify Enrollment Services who will place a hold on the student's registration until the requirements are met and assess a fee of no more than $50 to the student's account.
- Additionally, if the student is a resident in university housing and fails to comply with the immunization requirements, they will be removed from housing.

Contact

Questions should be directed to Student Health Services at 412-268-2157.

Related Policies and Procedures

The university complies with OSHA regulations regarding occupational exposure to blood-borne pathogens. Questions regarding these regulations should be directed to Environmental Health & Safety at 412-268-8182.

Additional recommendations

A PPD skin test for tuberculosis is recommended for domestic students who have traveled to an area where tuberculosis is endemic. All students should have a booster dose of tetanus/diphtheria every ten years after completion of the primary series.

Intellectual Property Policy

www.cmu.edu/policies/administrative-and-governance/intellectual-property.html (https://www.cmu.edu/policies/administrative-and-governance/intellectual-property.html)

1. Purpose

The policy reflects the following goals:

- To create a university environment that encourages the generation of new knowledge by faculty, staff, and students.
- To facilitate wide transfer of useful inventions and writings to society.
- To motivate the development and dissemination of intellectual property by providing appropriate financial rewards to creators and the university, and administrative assistance to creators.
- To ensure that the financial return from the development of intellectual property does not distort decisions and operations of the university in a manner contrary to the mission of the university.

The policy is based upon the following principles relating the university to society:

- The mission of the university remains the generation and dissemination of knowledge.
- Intellectual property will be generated within the university, and there exists an obligation to disseminate it. An interface is needed if better technology transfer is to be achieved, and the university will provide mechanisms for that function.

The policy is based upon the following principles relating faculty, staff and students to the university:

- Intellectual property is created by individuals, or by groups of individuals, who are entitled to choose the course of disclosure; academic freedom of individuals is a higher priority than possible financial rewards.
- There exists a historical tradition allowing authors to retain ownership of intellectual property rights from textbooks and works of art.
- The university is the support of the whole campus community, and is thereby entitled to share in financial rewards.
- There should be incentives for all parties to pursue financial rewards together, consistent with the expressed goals of the policy. The distribution of these rewards should reflect, insofar as possible, the creative contributions of the creator, and the resources contributed by and risks assumed by both the creator and the university in developing intellectual property.
- Since it is frequently difficult to assess risks meaningfully, resources and potential rewards, negotiated agreements are to be encouraged whenever possible.

2. Definitions

Certain terms are used in this document with specific meanings, as defined in this section. These definitions do not necessarily conform to customary usage.

Intellectual Property includes any patentable invention, any copyrightable subject matter, or trade secret. It also includes works of art, and inventions or creations that might normally be developed on a proprietary basis.

University means Carnegie Mellon.

Student means any full-time or part-time graduate or undergraduate student, regardless of whether the student receives financial aid from the university or from outside sources. It is the responsibility of students who are also employees of other outside entities to resolve any conflicts between this policy and provisions of agreements with their employers prior to beginning any undertaking at the university that will involve the development of intellectual property.

Faculty means members of the university's Faculty Organization as defined in the Faculty Handbook, plus instructors and special faculty appointments (even in the first year), and part-time faculty.

Staff means any employee of the university other than students and faculty as defined above. If a student is also a part-time university employee, he is considered as staff with regard to intellectual property developed as a result of his employment, and as a student with regard to other intellectual property. A full-time non-faculty employee who is also taking one or more courses is considered to be staff. Visitors to the university who make substantial use of university resources are considered as staff with respect to any intellectual property arising from such use. (The distinction between faculty and staff does not affect intellectual property rights except for representation on the Intellectual Property Adjudication Committee [see Section 5].)

Creator means any person or persons who create an item of intellectual property.

Net proceeds to the university means all proceeds received by the university on intellectual property that it assigns, sells or licenses, minus any application, litigation, interference, or marketing costs directly attributable to the intellectual property being licensed. Deducted costs shall be reasonable and fair, and shall be properly disclosed; the sources and amounts of compensation shall also be properly disclosed.

Net proceeds to the creator means all proceeds received by the creator from intellectual property owned by him that he sells, assigns or licenses, less the costs of application, legal protection, or litigation, interference, travel and other marketing costs directly attributable to the intellectual property being exploited. Such net proceeds do not include compensation legitimately received by the creator for consulting services or interest or other return on invested labor or capital. Deducted costs shall be reasonable and fair, and shall be properly disclosed; the sources and amounts of compensation shall also be properly disclosed.

Substantial use of university facilities means extensive unreimbursed use of major university laboratory, studio or computational facilities, or human resources. The use of these facilities must be important to the creation of the intellectual property; merely incidental use of a facility does not constitute substantial use, nor does extensive use of a facility commonly available to all faculty or professional staff (such as libraries and offices), nor does extensive use of a specialized facility for routine tasks. Use will be considered “extensive” and facilities will be considered “major” if similar use of similar facilities would cost the creator more than $5000 (five thousand dollars) in constant 1984 dollars if purchased or leased in the public market. Creators wishing to directly reimburse the university for the use of its facilities must make arrangements to do so before the level of facilities usage for a particular intellectual property becomes substantial. (This provision is not intended to override any other department or university policy concerning reimbursement for facilities usage.)

In general:

In any given year the equivalent figure for a particular amount of money in constant 1984 dollars will be obtained by multiplying that amount of money by the ratio of the most recent quarterly Disposable Personal Income Deflator divided by the average monthly Disposable Personal Income Deflator for the year 1984.

As used in this policy, the masculine gender includes the feminine gender, singular or plural, wherever appropriate.

3. Policy Provisions

This section states the policies concerning ownership of intellectual property created at the university. In order of precedence, ownership of intellectual property shall be as follows:

3-1. Externally Sponsored Work

Ownership Provisions: Intellectual property created as a result of work conducted under an agreement between an external sponsor and the university that specifies the ownership of such intellectual property shall be owned as specified in said agreement. If the university declares itself to be a sponsor, but does not declare itself to be the owner of the intellectual property, ownership shall be determined in accordance with 3-6-4 below.

Procedural Provisions: It is the responsibility of the Office of Sponsored Research of the university to inform each person whose intellectual property rights are limited by an externally sponsored contract of the intellectual property provisions of that contract in advance of the beginning of work thereon. Such notice is to be in writing and the university may require written acknowledgment of such provisions by any person working on externally sponsored projects. A summary of external sponsorship agreements limiting the intellectual property rights of potential creators will be maintained by the Office of Sponsored Research and will be available to the general university community.

If the university fails to notify a creator, effectively and in advance, of limitations imposed on his intellectual property rights by external sponsorship agreements, the creator is entitled to receive from the university 50% (fifty percent) of the net proceeds to the university resulting from his intellectual property.

3-2. Internally Sponsored Work

Ownership Provisions: When the university provides funds or facilities for a particular project to the extent of substantial use, it may also choose to designate itself as sponsor of that work. The university may declare itself the owner of intellectual property resulting from said work. In such cases the university must specify in advance the disposition of any intellectual property rights arising from the project. If the university declares itself to be a sponsor, but does not declare itself the owner of the intellectual property, ownership shall be determined in accordance with 3-6-4 below.

Procedural Provisions: It is the responsibility of the Office of Sponsored Research of the university to inform each person whose intellectual property rights are limited by internally sponsored work of the intellectual property ownership rights specified by the university as to that work in advance of the beginning of work thereon. Such notice is to be in writing and the university may require written acknowledgment of such provisions by any person working on internally sponsored projects. A summary of work for which university sponsorship limits the intellectual property rights of potential creators will be maintained by the Office of Sponsored Research and will be available to the general university community.

If the university fails to notify a creator, effectively and in advance, of limitations imposed on his intellectual property rights by internal university sponsorship, the creator is entitled to receive from the university 50% (fifty percent) of the net proceeds to the university resulting from his intellectual property.

3-3. Individual Agreements

Ownership Provisions: Intellectual property which is the subject of a specific agreement between the university and the creator(s) thereof shall be owned as provided in said agreement. Such agreements by the university and the faculty are encouraged.

Procedural Provisions: Except where limited by external sponsorship agreements, creators and the university may negotiate individual agreements to govern ownership of intellectual property regardless of the applicability of any other provision hereof.

3-4. Intellectual Property Created Within Scope of Employment

Ownership Provisions: Intellectual property created by university employees who were employed specifically to produce a particular intellectual property shall be owned by the university if said intellectual property was created within the normal scope of their employment. Faculty are presumed not to be hired to produce a particular intellectual property. On the other hand, computer programs written on the job by staff computer programmers would fall under this provision.

3-5. Public Dedication

Ownership Provisions: Except when limited by sub-parts 3-1, 3-2, 3-3 or 3-4 above, the creator of any intellectual property may choose to place his or her creation in the public domain. In such cases both the creator and the university waive all ownership rights to said property.

Procedural Provisions: Creators wishing to place their intellectual property in the public domain are responsible for ascertaining that the right to public dedication of that intellectual property is not limited by any external agreement, university sponsorship arrangement or terms of employment as described in Provisions 3-1, 3-2 or 3-3. The university provost will provide such a determination in writing upon request by the creator. It is also the creator's responsibility to ensure that disclosure does not include valuable intellectual property owned by others. (This provision does not release the university from its general obligation to notify creators of limitations to intellectual property rights specified in Provisions 3-1 and 3-2.)

To facilitate the actual transfer of knowledge of the intellectual property to the public at large, the creator shall provide the university with a complete description and documentation of the property placed in the public domain, specifically including a copy of the property in the case of printed material, and complete machine-readable source code in the case of software. All such material provided to the university will be placed in the University Library and made available to the public at large. The university will take appropriate action on a regular basis to publicize summary descriptions of intellectual property recently placed in the public domain. The university will also provide any member of the general public copies of such material on a cost-recovery basis.

The provisions of this section do not apply to the normal scholarly or creative publication processes unless the creator intends to waive all proprietary rights to the publication.

3-6. In General

Unless governed by sub-parts 3-1, 3-2, 3-3, 3-4 or 3-5 above, owner-ship of intellectual property created at the university shall be deter-mined as follows:

3-6-1. Traditional Rights Retained

Ownership Provisions: In keeping with academic traditions at the university, the creator retains all rights to the following types of intellectual property, without limitation: books (including textbooks), educational course-ware, articles, non-fiction, novels, poems, musical works, dramatic works including any accompanying music, panto-mimes and choreographic works, pictorial, graphic and sculptural works, motion pictures and other similar audio-visual works, and sound recordings, regardless of the level of use of university facilities. This provision does not include computer software (other than educational course-ware) or data bases.

Procedural Provisions: The types of intellectual property listed in the preceding paragraph share the attribute that they display information or visual or auditory appearances which are fully revealed to the purchaser or consumer. Thus, for example, source code listings would also be considered within this category. On the other hand, most computer software and data bases do not share this attribute; they are characterized by their capacity to perform tasks. Because of their utilitarian nature, ownership rights with respect thereto are governed by 3-6-3 or 3-6-4. Educational course-ware is included in this provision in all cases because of its role in furthering the primary educational mission of the university.

This provision applies regardless of any university sponsorship of the work, and it may be modified only by a specific prior agreement between the creator and the university. The use of university-owned computers and other facilities in the preparation of books and similar works does not alter this provision, though other university policies may limit such use or require reimbursement to the university. Similarly, the use of externally sponsored resources does not alter this provision, unless the creator is effectively notified in advance of such limitations to his rights in accordance with 3-1.

3-6-2. No Substantial Use of University

Facilities Ownership Provisions: The creator owns all intellectual property created without substantial use of university facilities, including intellectual property rights in computer software and data bases.

3-6-3. Substantial Use of University Facilities - No External or Internal Sponsorship

Ownership of intellectual property created with substantial use of university facilities, but not directly arising from externally sponsored work, or from work for which the university has declared itself as sponsor, shall be determined as set forth hereinafter depending on whether the creator or the university develops said property.

3-6-3-1. Development by Creator

Ownership Provisions: The creator originally owns intellectual property created with substantial use of university facilities but no external or internal sponsorship, and retains said ownership by commercial development of said property subject to the following:

(i) the university shall receive 15% (fifteen percent) of the net proceeds to the creator above $25,000 (twenty-five thousand dollars) in constant 1984 dollars from all sources (in the case of patents and copyrights, this provision shall be limited to the life of the patent or copyright), and

(ii) the university shall receive a perpetual, non-exclusive, non-transferable, royalty free license to use said intellectual property. In the case of software, this license includes access by specified university personnel to the source listings, and the university shall require each person to whom a disclosure is made to execute in advance a binding confidentiality agreement in favor of and enforce-able by the creator. If the intellectual property is created solely by a student or students, the creator is exempt from the obligation to pay to the university a fraction of his net proceeds, but not from the provision of this paragraph for a non-exclusive license to the university.

Procedural Provisions: If the creator develops an intellectual property that is covered by this provision, he must make full and fair disclosure to the university of all such sources of compensation relating to that intellectual property.

3-6-3-2. Development by the University

Ownership Provisions: When intellectual property is created with substantial use of university facilities, but not directly arising from sponsored research, the creator will originally retain the rights to the property, provided that he desires to commercially develop the property himself or to make it available to the public. If, however, the creator elects not to commercially develop same or fails to show diligence in pursuing such development, then the ownership rights to that property may be acquired by the university. Intellectual property acquired by the university in this fashion will be treated as in 3-6-4-1 below.

Procedural Provisions: At the time the intellectual property is disclosed to the university's provost as required under Section 4-1, or at any time thereafter, the university may request that the creator decide whether he will develop the intellectual property or will grant the rights to the university, and execute documents to pass on the title. Such a decision must be made within one year of the request or the creator will automatically lose his rights in favor of the university.

3-6-4. Substantial Use of University Facilities - External or Internal Sponsorship

Ownership of intellectual property created with substantial use of university facilities and directly arising from work sponsored under an agreement between an external sponsor and the university, or from work for which the university has declared itself a sponsor, but for which neither the external sponsor nor the university have specified the ownership of resulting intellectual property shall be determined as set forth hereinafter depending on whether the creator or the university develops said property.

3-6-4-1. Development by University

Ownership Provisions: The university originally owns intellectual property created with substantial use of university facilities provided by an external agreement or internal university sponsorship and retains said ownership by commercial development of said property, subject to the following: in all cases, the creator shall receive 50% (fifty percent) of the net proceeds to the university.

Procedural Provisions: When an intellectual property is created with substantial use of university resources provided by an external research contract or a specific university sponsorship agreement, and when that contract or agreement either does not specify the disposition of the intellectual property rights arising from that sponsorship, or it permits the university and/or creator to retain or acquire such intellectual property rights, the university will originally retain the rights to such intellectual property.

3-6-4-2. Development by Creator

Ownership Provisions: When intellectual property is created with substantial use of university facilities provided by external or internal sponsorship, the university will originally retain the rights to the property, provided that it desires to commercially develop the property or to make it available to the public. If, however, the university elects not to commercially develop same or fails to show diligence in such development, the ownership rights to that property may be acquired by the creator. Intellectual property acquired by the creator in this fashion will be treated as in 3-6-3-1 above. This assignment of rights to the creator may be prohibited by the terms of an external sponsorship agreement with the university or by an internal university sponsorship declaration, but in such cases the creator must be notified in advance, as in Provisions 3-1 and 3-2.

Procedural Provisions: At the time the intellectual property is disclosed to the university's provost as required by Section 4-1, or at any time thereafter, the creator may request that the university decide whether it will commercially develop the intellectual property or execute an assignment of the intellectual property rights to the creator. Such a decision must be made within 120 (one hundred twenty) days of the request or the university automatically waives its rights in favor of the creator, and it must execute an assignment of these rights to the creator.

3-6-5. Consulting Agreements

Ownership Provisions: Work done by individuals as consultants to outside firms is presumed not to involve unreimbursed substantial use of university facilities, and the rights to intellectual property created under consulting agreements are retained by the outside firms or the individual as specified by the terms of the consulting agreement and the terms of Provision 3-6-2 above.

Procedural Provisions: Under university policy consulting work must not make substantial unreimbursed use of university facilities except by explicit prior agreement. Any member of the university community who is engaged in consulting work or in business is responsible for ensuring that provisions in his agreements are not in conflict with this policy of the university or with the university's commitments. The university's Innovation Transfer Office will, upon request, provide assistance in this respect. The university's rights and the individual's obligations to the university are in no way abrogated or limited by the terms of such agreements. Each creator of intellectual property should make his obligations to the university clear to those with whom he makes such agreements and should ensure that they are provided with a current statement of the university's intellectual property policy. Appropriate sample contract wording to cover various possible external consulting arrangements shall be available from the university provost.

4. General Procedures

4-1.

The creator of any intellectual property that is or might be owned by the university under this policy is required to make reasonably prompt written disclosure of the work to the university's provost, and to execute any document deemed necessary to perfect legal rights in the university and enable the university to file patent applications and applications for copyright registration when appropriate. This disclosure to the provost should be made at the time when legal protection for the creation is contemplated, and it must be made before the intellectual property is sold, used for profit, or disclosed to the public. Whenever legal protection for intellectual property is anticipated all persons engaged in such creative activity are encouraged to keep regular notebooks and records.

4-2.

Whenever the university undertakes commercial development it shall do so, if possible, in a fashion that provides for the widest possible dissemination, avoiding suppression of inventions from which the public might otherwise benefit, providing for non-exclusive licensing at reasonable royalties, and giving consideration to more favorable or royalty-free licensing to non-profit charitable institutions, minority businesses or enterprises in developing countries.

4-3.

The university's share of any proceeds under this policy will be used to reimburse the university for its expenses for commercial development of intellectual property. Any additional return to the university will be used to further the academic purposes of all the disciplines of the entire university.

5. Resolution of Disputes

This policy constitutes an understanding which is binding on the university and on the faculty, staff, and students upon whom it is effective according to the terms of Section 6 below, as a condition for participating in research programs at the university or for the use of university funds or facilities.

Any question of interpretation or claim arising out of or relating to this policy, or dispute as to ownership rights of intellectual property under this policy, will be settled by the following procedure:

- The issue must first be submitted to the university's Intellectual Property Adjudication Committee in the form of a letter setting forth the grievance or issue to be resolved. The committee will review the matter and then advise the parties of its decision within 60 days of submission of the letter.
- If any of the parties to the dispute is not satisfied with the committee's decision, the party may seek binding arbitration in Pittsburgh, Pennsylvania and in accordance with the Rules of the American Arbitration Association then in effect. Judgment upon the award rendered by the arbitrator(s) may be entered in any court having jurisdiction thereof. The arbitrator(s) will give some weight to the decision of the Intellectual Property Adjudication Committee in reaching a decision. The losing party of the arbitration hearing will pay for all costs of the arbitration unless the arbitrator(s) specifies otherwise.

The Intellectual Property Adjudication Committee will consist of a chair who is a member of the tenured faculty, four other members of the faculty, and four other members representing, respectively, the university administration, the technical staff, and the graduate and undergraduate student bodies. Initially, half of the members of the committee (including the chair) will be appointed for two-year terms of office, and the remaining half will be appointed for a one-year term. After one year new members of the committee will be appointed for two-year terms of office. The chair will be appointed by the chair of the Faculty Senate, with the advice and consent of the Faculty Senate Executive Committee, and the remaining eight members of the committee will be appointed by the president of the university or his designee. At all times at least one of the faculty members will have had significant practical experience with intellectual property development and exploitation. The faculty members appointed by the president of the university will be selected from a list of nominees prepared by the Faculty Senate or its designated committee and nominees with experience in intellectual property development will be identified as such by the Faculty Senate. The staff representative will be selected from a list of nominees prepared by Staff Council, and the administration representative will be named directly by the president of the university or his designee. The graduate student representative will be selected from a list of nominees prepared by the Graduate Student Organization. The undergraduate representative will be chosen from a list of nominees prepared by the Student Senate. The committee will use the guidelines set forth in this policy to decide upon a fair resolution of any dispute.

If possible, the committee will also provide on request informal advisory opinions to creators and the university indicating how it is likely to interpret the provisions of this policy as it applies to special cases.

6. Effective Date of Policy

This policy will become effective August 27, 1985. Once effective this policy will be binding on new faculty, administration, and staff when hired, and on graduate and undergraduate students when admitted. Current faculty and staff will also become bound by this policy when they sign new employment contracts as the result of the renewal of limited-term appointments or promotion. Other university personnel, including tenured faculty, and current staff and students may choose to become bound by this policy for future and pending intellectual property by voluntary written consent. Unless the creator and the university agree to a different arrangement, intellectual property that is already partially developed at the time this policy becomes effective will be treated according to the provisions of the patent policy by which the University creator is currently bound. Similarly, members of the university working under contracts signed before the effective date of this policy who do not choose to accept this policy will remain bound by the patent policies that already apply to them. With respect to intellectual property developed during the course of employment at the university, this policy shall continue to be binding on any person whose relationship with the university becomes terminated. The university should take all administrative steps necessary to ensure that employees and students sign, upon initial employment, registration or at other appropriate times, forms that indicate their acceptance of this policy.

7. Amendments of the Policy

Amendments of this policy may be proposed by the Faculty Senate, Staff Council or university administration. Proposed amendments must be approved by a two-thirds majority of votes in the Faculty Senate and subsequently approved by a simple majority of votes cast in a referendum administered by the Faculty Senate that is open to all members of the faculty as defined by this policy and to the exempt staff, provided that this majority constitutes at least 25% (twenty-five percent) of those eligible to vote. This referendum must be preceded by an opportunity for public discussion open to all interested faculty, administration, staff and students. Amendments that are supported by the faculty and staff must then be approved by the president of the university and adopted by the university trustees. Once adopted, amendments will become binding on new faculty, administration, and staff when hired, on existing faculty and staff when they sign new employment contracts, and on graduate and undergraduate students when admitted. Other university personnel, including tenured faculty, and current staff and students may choose to become bound by this policy for future and pending intellectual property by voluntary written consent. Intellectual property that is already developed or under development at the time that an amendment to the policy is ratified will not be bound by the terms of the amendment without the voluntary written consent of both the creator and the university.

Footnote:

[1] This document presumes the existence of a university office to facilitate technology transfer. Such an office would serve as a clearinghouse for contacts with outside partners, would perform patent and copyright tasks, and would develop an effective marketing capability.

Policy on Student Privacy Rights

www.cmu.edu/policies/student-and-student-life/privacy-rights-students.html (https://www.cmu.edu/policies/student-and-student-life/privacy-rights-students.html)

Policy Statement

Under the Family Educational Rights and Privacy Act (FERPA), you have the right to:

- inspect and review your education records;
- request an amendment to your education records if you believe they are inaccurate or misleading;
- request a hearing if your request for an amendment is not resolved to your satisfaction;
- consent to disclosure of personally identifiable information from your education records, except to the extent that FERPA authorizes disclosure without your consent; and
- file a complaint with the U.S. Department of Education Family Policy Compliance Office if you believe your rights under FERPA have been violated.

1. Inspection

What are education records?

Education records are records maintained by the university that are directly related to students. These include biographic and demographic data, application materials, course schedules, grades and work-study records. The term does not include:

- information contained in the private files of instructors and administrators, used only as a personal memory aid and not accessible or revealed to any other person except a temporary substitute for the maker of the record;
- University Police records;
- employment records other than work-study records;
- medical and psychological records used solely for treatment purposes;
- records that only contain information about individuals after they have left the university; and
- any other records that do not meet the above definition of education records.

How do I inspect my education records?

- Complete an Education Inspection and Review Request Form (http://www.cmu.edu/hub/registration/docs/review-record.pdf) [PDF] (https://

www.cmu.edu/hub/docs/review-record.pdf) and return it to The HUB in order to notify the University Registrar's Office.

- The custodian of the education record you wish to inspect will contact you to arrange a mutually convenient time for inspection, not more than 45 days after your request. The custodian or designee will be present during your inspection.
- You will not be permitted to review financial information, including your parents' financial information, or confidential letters of recommendation, if you have waived your right to inspect such letters.
- You can get copies of your education records from the office where they are kept for 25 cents per page, prepaid.

2. Amendment

How do I amend my educational records?

- Send a written, signed request for amendment to the University Registrar, Carnegie Mellon University, A19 Warner Hall, Pittsburgh, PA 15213. Your request should specify the record you want to have amended and the reason for amendment.
- The university will reply to you no later than 45 days after your request. If the university does not agree to amend the record, you have a right to a hearing on the issue.

3. Hearing

How do I request a hearing?

- Send a written, signed request for a hearing to the University Registrar, Carnegie Mellon University, A19 Warner Hall, Pittsburgh, PA 15213. The university will schedule a hearing no later than 45 days after your request.
- A university officer appointed by the Associate Vice President & Director of Enrollment Services who is not affiliated with your enrolled college will conduct the hearing.
- You may bring others, including an attorney, to the hearing to assist or represent you. If your attorney will be present, you must notify the university ten days in advance of the hearing so that the university can arrange to have an attorney present too, if desired.
- The university will inform you of its decision, in writing, including a summary of the evidence presented and the reasons for its decision, no later than 45 days after the hearing.
- If the university decides not to amend the record, you have a right to add a statement to the record that explains your side of the story.

4. Disclosure

Carnegie Mellon generally will not disclose personally identifiable information from your education records without your consent except for directory information and other exceptions specified by law.

What is directory information?

Directory information is personally identifiable information of a general nature that may be disclosed without your consent, unless you specifically request the university not to do so. It is used for purposes such as compiling campus directories.

If you do not want your directory information to be disclosed, you must notify the University Registrar's Office in writing within the first 15 days of the semester.

Notifying the University Registrar's Office covers only the disclosure of centralized records. Members of individual organizations such as fraternities, sororities, athletics, etc. must also notify those organizations to restrict the disclosure of directory information.

Carnegie Mellon has defined directory information as the following:

- your full name
- local/campus address and local/campus telephone number
- email User ID (Andrew ID) and address
    - Please note: Andrew User IDs cannot be completely suppressed from our electronic systems. While it may be possible to suppress the association of an individual's name with their user id, doing so may adversely impact the delivery of electronic mail or other electronic services.
- major, department, college
- class status (freshman, sophomore, junior, senior, undergraduate or graduate)
- dates of attendance (semester begin and end dates)
- enrollment status (full, half, or part time)
- date(s) of graduation
- degree(s) awarded
- sorority or fraternity affiliation

For students participating in intercollegiate athletics, directory information also includes:

- height, weight
- sport of participation

What are the other exceptions?

Under FERPA, Carnegie Mellon may release personally identifiable information from your education records without your prior consent to the following individuals or organizations:

- school officials with legitimate educational interests (“School officials” are Carnegie Mellon employees in administrative, supervisory, academic or support staff positions; Carnegie Mellon trustees; individuals and companies with whom the university has contracted, such as attorneys, auditors, or collection agencies; and individuals assisting school officials in performing their tasks. School officials have a “legitimate educational interest” if they need to review an education record in order to fulfill their professional responsibilities.);
- certain federal officials in connection with federal program requirements;
- organizations involved in awarding financial aid;
- state and local officials who are legally entitled to the information;
- testing agencies such as the Educational Testing Service, for the purpose of developing, validating, researching and administering tests;
- accrediting agencies, in connection with their accrediting functions;
- parents of dependent students (as defined in section 152 of the Internal Revenue Service Code);
- individuals or organizations in order to comply with a judicial order or subpoena (after making a reasonable effort to notify the student in advance of compliance so that the student can take protective action, except in cases where the university is legally required not to disclose the existence of the subpoena);
- appropriate parties in a health or safety emergency, if necessary to protect the health or safety of the student or other individuals;
- officials of another school in which the student seeks or intends to enroll;
- victims of violent crimes or non-forcible sexual offenses (the results of final student disciplinary proceedings);
- parents or legal guardians of students under 21 years of age (information regarding violations of university drug and alcohol policies);
- courts (records relevant to legal actions initiated by students, parents or the university); and
- individuals or organizations in order to comply with federal laws concerning sex offenders and other individuals required to register under section 170101 of the Violent Crime Control and Law Enforcement Act of 1994.

5. Complaints

If you believe the university has not complied with FERPA, you can file a complaint with the:

Family Policy Compliance Office, Department of Education, 400 Maryland Avenue, S.W. Washington, DC 20202-4605

Note: Your Carnegie Mellon GUID (global user identification) number is also designated as directory information under FERPA, but does not contain personally identifiable information and therefore cannot be used by itself to determine your identity or to access your records.

Policy on Restricted Research

www.cmu.edu/policies/research/restricted-research.html (https://www.cmu.edu/policies/research/restricted-research.html)

Universities have two primary purposes: to create knowledge and to disseminate knowledge. Carnegie Mellon University recognizes the importance of open intellectual communication within a research group, within the university, and within the larger community outside. Ideally, all units of the university would disseminate the results of research as quickly and as widely as possible. Some members or units of the university, however, desire to do research that may be difficult or impossible without restrictions or without access to classified or proprietary materials.

There exists, therefore, a tension between the university's goal of disseminating knowledge freely and the desire on the part of some of its members to conduct restricted research on important problems. The university intends to guarantee the academic freedom of all faculty members to do research in their own manner on topics of their own choosing, provided that such research is consistent with the overall purposes of the university.

This policy seeks to resolve the tension between the desire to participate in restricted research and the desire to maintain the open atmosphere of the university by confining restricted research to semi-autonomous units, which are not associated with any academic departments. It thereby establishes the principle that restricted research is inappropriate at Carnegie Mellon University except in the semi-autonomous units.

This policy does not attempt to anticipate all possible concerns about restricted research. In some cases, decisions will need to be made about particular research projects to which the application of particular policy guidelines are not clear. In choosing to accept or decline such projects, the university will weigh the potential of a project for generating and disseminating new knowledge for the benefit of society, against the project's potential for adversely affecting the climate for research conducted in a free and open environment. While this policy sets no explicit limits on the extent of classified research permitted in the semi-autonomous units, it is not the intent of the policy to encourage any unit of the university to engage in classified research as a primary ongoing activity. Indeed, it is expected that classified projects will never represent more than a small fraction of the total research effort in any unit.

Definitions

Research: all projects and investigations involving the creation of new knowledge of a theoretical or practical nature. The term “research” as used here encompasses both “research” and “development” as they are commonly defined.

Classified research: research, the free dissemination of the results of which is deemed to jeopardize national security. The federal government controls access to the environment in which such research is performed, restricts discussions about the work in progress to individuals with clearance and a “need to know,” and limits publication of research, results or access to data needed to verify results, for a specified period of time.

Proprietary research: research that results in intellectual property that is owned by entities other than Carnegie Mellon University. Such entities may wish to market products derived from inventions or ideas that are developed at the university. They might, therefore, desire to fund projects which restrict access to data and to discussions about work in progress to individuals with a “need to know,” and to seek, for a specified period of time, a delay in publication of research results or data needed to verify results. Such entities may also provide access to proprietary material, which researchers must agree not to include in publications.

Publication: oral or written dissemination.

Restricted research: includes all classified research, and any proprietary or other research that requires more than a six month delay in publication of the research results.

Semi-autonomous units: units of the university specifically so designated by the president, after consultation with the URC and the Faculty Senate, currently the Mellon Institute and the Software Engineering Institute.

Non-autonomous units: all university entities other than semi-autonomous units.

Restricted Research in Non-Autonomous Units

It is the policy of Carnegie Mellon that restricted research is inappropriate and, therefore, not permitted within its non-autonomous units.

It is also the policy of Carnegie Mellon not to permit involvement of students in projects which carry restrictions that may impede their progress toward a degree. Therefore, students should not be involved in contracts that require the delay of a student's publication of research results when such results are intended for use in obtaining academic credit, except that a sponsor may require a delay of thirty days for review of publications for removal of proprietary information that was provided by the sponsor for the conduct of the research.

Proprietary research is allowed within non-autonomous units provided it is subject to limitations (excluding students' publications as noted above) no more stringent than the following:

- A sponsor may request a delay of up to six months in publication so that steps may be taken to secure intellectual property rights to inventions or ideas developed under the contract.
- A sponsor may require a delay of thirty days for review of publications for removal of proprietary information which was provided for the conduct of the research.

Considerations for faculty/researchers:

The university recognizes that problems arise in both restricted research and research that is not itself restricted but that involves access to classified or propriety information or materials (hereinafter, restricted materials). Researchers may also have access to restricted materials when serving as consultants. Access to restricted materials gives rise to concerns about limitations on researchers' freedom to communicate. In such instances, researchers must exercise consider-able judgment to conduct their research in an open environment while protecting the restricted materials to which they have access. Researchers must also be aware that the university will judge their performance as researchers through their publications or through other scholarly products that arise from their research. Research that is restricted in dissemination, or not available for public review, cannot be considered in promotion or reappointment decisions or in evaluations of academic performance of any kind.

Considerations for faculty/researchers:

There are important concerns about the involvement of students in restricted research. It is necessary for students to publish their work in order to obtain degrees, course credit and professional recognition. Students rely to a large degree on their faculty advisor's judgment for guidance and advice. Research that is restricted in dissemination, or not available for public review, cannot be used for academic credit. Thus, before working on such research, a student must be notified in writing that work on this research may not be used for academic credit.

Restricted Research in Semi-Autonomous Units

The semi-autonomous units associated with Carnegie Mellon may conduct restricted research.

Faculty members may conduct restricted research in or in cooperation with semi-autonomous units only on a consulting basis or by means of a formal, internal leave of absence from their non-autonomous units.

Work that is restricted in any way may not be used for academic evaluations until it is released for publication, and then only with respect to future academic actions.

Students may occasionally be employed by the semi-autonomous units, provided that such employment does not interfere substantially with progress toward a degree. However, they must be made aware that work that is restricted cannot be used for academic credit. Work that was restricted and is later released for dissemination and review can be applied toward future academic credit. Students should be discouraged from working on restricted research in which dissemination may be delayed indefinitely.

Guidelines for all Units

Work by students on restricted research projects shall not be made a condition for admission or financial aid.

The principal investigator is responsible for informing all members of a project (faculty, staff and students) of any restrictions imposed on the dissemination of information related to the research. This must be done prior to the start of the project or prior to an individual joining an existing project.

Restrictions on access to university facilities due to the conduct of restricted research must be kept to a minimum. Access to and movement through the facilities in which restricted research is conducted must be consistent with standard university procedures.

The Provost's Office is responsible for obtaining signed documents from principal investigators on restricted research projects attesting that they are aware of all restrictions imposed on the research and that they have informed all participants of these restrictions.

The Office of Sponsored Research shall review all proposals and contracts prior to approval for conformity with these guidelines. Any that do not meet these guidelines will be referred to the University Research Council (URC) for review and recommendation of appropriate action to the provost.

To maintain a balance with the university's goals of broad dissemination of knowledge, the URC will conduct an annual review of all restricted research being conducted at the university. This review will be made based on a listing of all contracts that involve restricted research. This listing shall include the title and sponsor(s) of the research, name(s) of principal investigator(s), and the amount of funding of each contract.

The university community will be informed annually, through the URC's written report to the Faculty Senate and Student Senate, of the nature and overall impact of restricted research at Carnegie Mellon.

Existing sponsored research projects shall be allowed to continue under the terms of their present contract. However, renewal contracts must conform with this policy.

Student Activities Fee

www.cmu.edu/policies/student-and-student-life/activities-fee.html (https://www.cmu.edu/policies/student-and-student-life/activities-fee.html)

By action of the Board of Trustees, a required Student Activities Fee in addition to tuition is charged to all under-graduate students and graduate students who enroll for 19 units or more. Student Government is responsible for administering the fee and for using it only for the support of projects under the following guidelines:

1. Activities and facilities which can be described as meeting the reasonably predictable social, cultural, recreational, or welfare needs of college students.
2. Publications which can reasonably be presumed to serve the needs of the student community for communication, expressions of opinion, and the conduct of their business.
3. Such enterprises of an entrepreneurial nature undertaken by the student body as can reasonably be expected to serve as an instrument for meeting the needs described above.

All functions and services provided by the fees described above must be in accordance with Carnegie Mellon's policy of non-discrimination. In addition, no use of such fees may be intended to violate or circumvent the policies of the university or the laws of the land.

Final responsibility for establishing the amount of any required fee rests with the Board of Trustees, which will consider changes only upon requests of the Student Government and the officers of the university.

Note: Historically, the Student Government has dedicated a specific portion of graduate students' activities fees to the Graduate Student Assembly to be used at their discretion.

Policy on Temporary Emergency Closing of the University

www.cmu.edu/policies/safety-and-security/emergency-closing.html (https://www.cmu.edu/policies/safety-and-security/emergency-closing.html)

Policy Statement

Carnegie Mellon University has an important commitment to students, parents, sponsors, benefactors and the community. Accordingly, the university will make every attempt to operate normally during severe weather or other emergencies. This includes holding classes, conducting research programs, and operating facilities and services. The university will attempt to operate normally unless such operation represents a clear danger to students, staff or faculty.

There may be occasions when the university community is served best by suspending normal operations. In that event, only the president (or the president's designated representative) has the authority to close the university and to specify those persons or group of persons who are free to leave or refrain from coming to campus. Staff members who provide primary services, including certain members of Physical Plant, Dining Services and Security, may be asked to work.

Standard Operations

Unless the president announces that the university is closed, everyone is expected to be at work as usual. When the university is in session, faculty members are expected to meet their scheduled classes and other obligations. If a faculty member is unable to meet a scheduled class, he or she should notify the department office and arrange either for a qualified substitute or for a future make-up session.

If the university is open but a staff member is unable to come to work because of severe weather or other emergency, he or she should notify the supervisor as soon as possible. Staff members will be expected to make up lost time or use Paid Time Off (PTO), consistent with regular operating protocols.

Announcement of Closing

As soon as the president or designee determines that the university must be closed, University Relations will alert local radio and television stations. Also, announcements of closings will be posted on the Carnegie Mellon electronic bboard official.cmu-news.

Contact

Questions concerning this policy or its intent should be directed to the Office of the President at 412-268-2200.

Student Leaves & Returns

Student Leave Policy

www.cmu.edu/policies/student-and-student-life/student-leave.html (https://www.cmu.edu/policies/student-and-student-life/student-leave.html)

Students must sometimes interrupt their studies for a variety of reasons (financial, academic or personal). Students choosing to take a leave of absence must first contact their department advisor to discuss their plans while on leave to work out any conditions that may be necessary for a smooth return to Carnegie Mellon.

A student may leave Carnegie Mellon by either withdrawing from the university (this means leaving the university with no intention of returning) or by taking a leave of absence (this means leaving the university temporarily, with the firm and stated intention of returning).

A Leave of Absence Form must be completed by all students requesting a leave of absence. A Withdrawal Form must be completed by all students who are withdrawing. Notifying instructors or no longer attending classes does not complete the process. Forms and related documentation are available on The HUB website (https://www.cmu.edu/hub/registrar/leaves-and-returns/). Not completing the leave form results in tuition being charged to the midpoint of the semester or the last date the student attended an academically-related activity such as an exam, tutorial or study group, or the last day a student turned in a class assignment.

Students are required to fill out all information on the form, including all comment sections relating to reasons for their leave of absence. After completion of the form, students must take it to their home department and dean's office for appropriate signatures. The process of taking a leave will not be complete until all necessary signatures are on the leave form. Under certain circumstances, students may also need the Dean of Student Affairs to sign off on the leave form. International students who are here on a F1 or J1 visa must consult the Office of International Education for information on possible visa implications prior to going on leave.

Students on leave are not permitted to live in university housing, attend classes or maintain employment as students at Carnegie Mellon while their leave is in effect.

Doctoral candidates in ABD (All But Dissertation) status who wish to take a leave of absence should refer to the Doctoral Student Status policy (https://www.cmu.edu/policies/student-and-student-life/doctoral-student-status.html).

Leaves during the academic semester will take effect as of the date signed by the student's dean. After the Leave of Absence or Withdrawal Form is received by the University Registrar's Office, it will be reviewed for the appropriate tuition refunds (see T (p. 14)uition Adjustment Policy (p.)) and grade implications. The recording of student courses and grades for taking a leave in a semester follows the deadlines for semester or mini courses, as follows:

- On or before the university deadline to drop classes with W (withdrawal) grades: all courses or grades are removed.
- After the university deadline to drop classes but before the last day of classes: W (withdrawal) grades will be assigned to all classes. (W grades apply to all undergraduate students; and graduate students in the College of Engineering, Heinz College, Mellon College of Science, and the Tepper School of Business.)

- After the last day of classes: Permanent grades assigned by the instructor will be recorded.

Student Return Policy

www.cmu.edu/policies/student-and-student-life/return-student.html (https://www.cmu.edu/policies/student-and-student-life/return-student.html)

Students on leave wishing to return to Carnegie Mellon to resume their degree studies may do so under several conditions. In order to be considered for return from leave (https://www.cmu.edu/hub/registrar/leaves-and-returns/), a student must first obtain an Application for Return form from The HUB or their academic department. This application requires information from the student regarding the intended semester of return, current address information and information about their leave. This application must be submitted to their home department at least one month prior to the beginning of the semester.

Undergraduates may return within their same academic department within two years. After two years, students returning in the same academic department are subject to space constraints and academic performance review. Graduate students must negotiate their return with their home department and must follow their department policy.

The Application for Return requires approval of the student's academic department and dean. If a student's department chooses to deny the student's Application for Return, the student may appeal to their dean. Any constraints governing the student's eligibility to return will be specified directly on the application by the academic department and/or dean's office or the Office of Student Affairs.

Students who have taken courses elsewhere must submit an official transcript and course descriptions with their Application for Return. Transfer credit approval is determined by the academic department based on course level, performance and appropriateness to the student's curriculum requirements. Credit transfer is subject to college-specific policy. Failure to submit the necessary documents at the time of return will result in denial of transfer credit.

The process of returning is not completed until all necessary signatures on the Return form are obtained by the student and until all outstanding bills are paid. The University Registrar's Office will then notify the appropriate university offices of the student's return.

Tuition Adjustment Policy

www.cmu.edu/policies/student-and-student-life/tuition-fees-adjustment.html (https://www.cmu.edu/policies/student-and-student-life/tuition-fees-adjustment.html)

Application

This policy applies to withdrawals and leaves of absence by all students (graduate, undergraduate, non-degree) for all semesters (Fall, Spring, Summer 1, Summer 2, Summer All).

Official Date of Withdrawal/Leave of Absence

For students who notify the university of their intent to withdraw or take a leave of absence, the official date of withdrawal or leave of absence is the earliest of:

- the date the student began the withdrawal or leave of absence process;
- the date the student notified their home department;
- the date the student notified the associate dean of their college; or
- the date the student notified the Dean of Students.

For students who do not notify the university of their intent to withdraw or take a leave of absence, the official date of withdrawal or leave of absence is:

- the midpoint of the semester;
- the last date the student attended an academically-related activity such as an exam, tutorial or study group, or the last day a student turned in a class assignment.

Tuition Adjustment

Students who withdraw or take a leave of absence before completing 60% of the semester will be charged tuition based on the number of days completed within the semester. This includes calendar days, class and non-class days, from the first day of classes to the last day of final exams. Breaks that last five days or longer, including the preceding and subsequent weekends, are not counted. Thanksgiving and Spring Break are not counted.

There is no tuition adjustment after 60% of the semester is completed. No tuition is charged to a student who is administratively withdrawn. See The HUB website (https://www.cmu.edu/sfs/tuition/adjustment/) for the complete tuition assessment schedule for the current semester.

Housing, Dining Plan & Fee Adjustments

Housing charges are adjusted daily, beginning on check-in day and ending on the last day of final exams for the semester. Holiday breaks are included; however, the Winter Break period is not included.

Dining plan charges are adjusted per the bi-weekly period. PlaidCash is assessed based upon actual use.

There is no adjustment of the Transportation Fee, Technology Fee or Student Activity Fee.

Financial Aid Adjustment

Federal and institutional financial aid is adjusted on the same basis as tuition. A student earns 100% of their federal or institutional financial aid when 60% of the semester is completed.

State grants and non-federal outside scholarships are adjusted based upon the withdrawal policy of the agency awarding the funds.

Contact

Questions concerning this policy or its intent should be directed to The HUB at 412-268-8186.

Financial Aid Policy Statement

www.cmu.edu/policies/student-and-student-life/financial-aid-statement.html (https://www.cmu.edu/policies/student-and-student-life/financial-aid-statement.html)

University Academic Scholarship Renewals

Carnegie Mellon University awards academic scholarships as part of the first-year financial aid process. Each of these scholarships is renewable for four academic years of study (five for architecture) based upon the maintenance of a specific cumulative quality point average. The academic scholarship renewal criteria are included in the scholarship notification letter which is mailed to the student prior to the May 1 matriculation deadline.

Each scholarship recipient's cumulative quality point average is reviewed at the end of each academic year. If the student achieves the scholarship renewal criteria, then the scholarship is automatically renewed for the next academic year.

If the student does not meet the cumulative quality point average requirement for renewal, then they are given the opportunity to appeal. A merit scholarship appeal form and instructions are automatically sent to the student at the end of each academic year.

The student's completed appeal form is reviewed by Student Financial Services. Input from the Associate Dean of the student's college is also considered. The student is notified, in writing, of the decision. The decision may be to renew the scholarship for the entire academic year, renew the scholarship for one academic term, or to reject the appeal. If the appeal is rejected, a written explanation is provided to the student.

Undergraduate Tuition Exchange Programs

Carnegie Mellon University assesses the standard tuition charge for the undergraduate tuition exchange programs.

Since Carnegie Mellon assesses the tuition charge, the student can be considered for all forms of institutional, state, and federal aid for which the student may have eligibility with the exception of any student employment program.

Undergraduate Study Abroad Programs

Carnegie Mellon University does not assess the tuition charge for any of the Study Abroad Programs.

Since Carnegie Mellon does not assess the tuition charge, the student is not considered for any institutional grants and scholarships. However, Carnegie Mellon will consider any student participating in an approved Study Abroad Program for all state and federal student aid programs for which the student may have eligibility with the exception of any student employment program.

The U.S. Department of Education and Carnegie Mellon University define an approved Study Abroad Program as one which is part of a contractual agreement between Carnegie Mellon and the host institution. Additionally, courses taken in the Study Abroad Program must be accepted for transfer to Carnegie Mellon by the Dean of the student's college.

Undergraduate Sponsored Study Abroad Programs

Carnegie Mellon assesses full tuition charges and all applicable fees to students participating in an undergraduate sponsored study abroad program.

Undergraduate International Students

Documentation Eligibility (U.S. Citizenship or Eligible Non-citizen)

You must be a U.S. Citizen or permanent resident alien to receive federal student aid. If you are a U.S. Citizen, but were not born in the United States, valid documentation includes a copy of your passport or naturalization certificate.

If you are a U.S. permanent resident alien or refugee, acceptable forms of verification include a photocopy of both sides of your I-551 or I-551C card.

Undergraduate international students are ineligible to receive any federal or state student financial aid. Additionally, Carnegie Mellon does not award any institutional financial aid funds to undergraduate international students.

Undergraduate Course Meeting Policy

www.cmu.edu/policies/student-and-student-life/ug-course-meeting.html (https://www.cmu.edu/policies/student-and-student-life/ug-course-meeting.html)

No undergraduate classes, exams, academic, or artistic activities (including: extra help session, rehearsals, ROTC drill, make-up exams, etc.) are scheduled on weekdays between 4:40 p.m. and 6:40 p.m. Extra class time beyond those regularly scheduled must take place either before 4:40 p.m. or after 6:40 p.m.

Undergraduate Course Meeting Procedure

This policy is not intended to reduce the rigor or vigor of the academic or artistic programs, but to ensure that students have a period in which they are free to carry on co-curricular activities and athletics. Scheduling classes, exams, or other academic and artistic activities makes it very difficult for the students to meet these commitments. Since we are all concerned about the quality of life at the university, this time must be held for the students.

In planning the academic course schedule, the University Registrar's Office will review all courses to ensure that no academic or artistic courses be scheduled in this period. In addition, any requests to schedule additional or makeup course meetings, review and/or study sessions, teaching assistant office hours, or other course-related meetings, must take place either before 4:50 p.m. or after 6:50 p.m. This includes meetings in all university spaces, not just within University Registrar's Office-controlled classrooms.

As with any policy, there must be a means of making exceptions. Any academic or artistic activities which you feel must be scheduled between 4:50 p.m. and 6:50 p.m. must be cleared with the University Registrar. These requests must be in writing either as a memo or through email. All requests must include the course relationship, intent for the requested meeting, and the reason why the meeting cannot be held either before 4:50 p.m. or after 6:50 p.m.

Any further clarification of this policy can be addressed to the Vice Provost for Education.

University Services

Carnegie Mellon University provides many services to students to help them thrive on and off campus, and in and out of the classroom. The university's service-oriented departments and offices focus on executing critical administrative functions to provide daily services to students, families, the campus community, and visitors. Listed below are some of the services offered by the university.

Academic Advising

University Statement on Academic Advising

Carnegie Mellon University commits to support excellence in academic advising. Even with the university's diverse offerings, a cohesive academic advising approach can directly impact the educational success of every undergraduate and graduate student. High quality advising rests upon (1) robust central resources, (2) discipline specific variations at the college- and program-levels, (3) skilled academic advisors of all types, and (4) engaged, committed students.   By conceptualizing advising as an ecosystem, CMU creates an environment that fosters long-term outcomes that benefit students while studying at CMU as well as making a difference as lifelong alumni.

The Advising Ecosystem at CMU

Goals

The advising ecosystem centers attention on the growth and development of CMU students while they are enrolled and beyond.   Excellent advising is as varied as our disciplines and students; yet, centralized standards, systems, and resources must connect seamlessly so that students make well-informed decisions. Advisors are supported in their work allowing for professional growth, intellectual satisfaction, and institutional recognition.

The ideal advising experience at CMU should reflect qualities of the academic environment: integrated, collaborative, innovative and data-driven. From guiding the transition into the university, movement through the curriculum, and exploration of careers or post-graduate studies, the advising ecosystem supports students in utilizing resources and setting and achieving their goals.

The CMU advising ecosystem seeks to facilitate:

- Goal setting and planning
- Leveraging support network
- Accessing resources
- Understanding policies
- Planning for career and post-graduation

advising practice, tools, and strategies

In order to realize our vision of excellent advising, CMU invests in an advising ecosystem that includes a host of resources and strategies designed to engage and facilitate students' academic and personal development.

- Adequate advising staffing and resources within each department/program
- Advisor training and professional development`
- Intentional focus on student success
- Collaboration to support student success
- Implement technology
- Contribute to career planning goals

student engagement in advising

Based on research at the national level and years of experience working with CMU students, the CMU advising ecosystem is designed to facilitate student behaviors that are proven to lead to success at the university. By engaging with the broad range of advising resources and student success strategies, students are expected to exhibit these behaviors indicating that they are on the path to successfully complete their degree requirements and attain personal development goals.

- Set goals and plan
- Engage the CMU support network
- Access resources
- Know and follow the rules
- Oriented towards the future

STUDENT outcomes

By engaging with the advising at CMU advising, students have opportunities and resources to exhibit the success behaviors outlined above. By conceptualizing advising as an ecosystem, CMU is creating an environment that fosters these long-term outcomes that benefit students both while they are students at CMU as well as lifelong alumni.

As a result of being advised at CMU, students are able to:

- maintain good academic standing in the university,
- feel a sense of belonging and inclusion within the university and their department,
- have individual and supportive relationships with their advisors and professors,
- maintain adequate progress toward completing their degree,
- find employment or further education directly related to their education plan or degree program after graduation; and
- use the skills and knowledge they have gained at Carnegie Mellon University to advance their professional and personal goals after leaving the university.

Computing Services

Stan Waddell, *Vice President for Information Technology & Chief Information Officer*
Location: Cyert Hall 285
Phone: 412-268-4357
it-help@cmu.edu
www.cmu.edu/computing (http://www.cmu.edu/computing/)

Computing Services maintains and supports computing resources for the campus community, including the campus wired and wireless networks, public printing, computer labs, email and software catalog.

Visit the Computing Services (http://www.cmu.edu/computing/) website to explore the services available to you, including how to:

- secure your devices
- connect to the network
- collaborate with your group
- access software
- manage your email
- use public printers and computer labs.

For help with these services, contact the Computing Services Help Center at 412-268-4357 (HELP) or it-help@cmu.edu.

Disability Resources & Equal Opportunity

Catherine Getchell, *Director of Disability Resources*
Location: Margaret Morrison Plaza, A30, 5136 Margaret Morrison St., Pittsburgh, PA 15213
Phone: 412-268-6121
access@andrew.cmu.edu
www.cmu.edu/disability-resources (https://www.cmu.edu/disability-resources/students/)

Disability Resources provides responsive and reasonable accommodations to students who self-identify as having a disability, including physical, sensory, cognitive and emotional disabilities. Through our office, the university can provide guidance, support services and accommodations to ensure that all students, regardless of ability, have equal access to the world-class education, campus programs and activities offered by CMU. We work to ensure that qualified individuals receive reasonable accommodations as guaranteed by the Americans with Disabilities Act (ADA) and Section 504 of the Rehabilitation Act of 1973.

Students are also welcome to discuss concerns about support for disabilities with members of the admission staff, housing office and/or health/ counseling and psychological services. Upon enrollment, students with disabilities should contact the Office of Disability Resources to discuss their needs and to develop a Student Individual Accommodation Plan. Accommodations are made with the intent to maintain the academic integrity of each course and the academic program as a whole, while also meeting assessed needs.

Equal Opportunity / Affirmative Action Policy

Carnegie Mellon is committed to equal employment opportunity for all and to affirmative action. Diversity is a source of strength for Carnegie Mellon and affirmative action is one of the tools that we use to achieve and sustain diversity. All personnel actions are administered in accordance with the university's commitment to non-discrimination and in compliance with applicable federal, state and local laws, statutes, orders and regulations. View the University Policy on Equal Employment Opportunity / Affirmative Action (https://www.cmu.edu/policies/administrative-and-governance/equal-opportunity-affirmative-action-ada.html).

Honor Societies

Phi Beta Kappa Society

Carnegie Mellon shelters a chapter of the Phi Beta Kappa Society, sponsored by the three colleges (Dietrich College of Humanities and Social Sciences, Mellon College of Science, and the School of Computer Science) that comprise the University's “arts and sciences” equivalent. The chapter's name is “Upsilon of Pennsylvania,” and was formally installed in April of 1995.

Founded in 1776 at the College of William and Mary in Williamsburg, Va., Phi Beta Kappa is the nation's oldest honorary society, with chapters at 276 of the foremost institutions of higher education across the country. Almost all members are elected by the chapters from among candidates for degrees in liberal arts and sciences, usually from the top 10% of the graduating class.

Membership in Phi Beta Kappa key has become a universally recognized mark of academic achievement in the liberal arts and sciences. The key's venerable pointing finger proclaims for all to see the wearer's commitment to Phi Beta Kappa's ancient principles (represented in the three stars) — friendship, morality and learning. The society's name is formed by the first letters of the phrase *Philosophia Biou Kybernetes*, Philosophy (wisdom) is the Guide of Life. In line with the conviction that the test of education lies not in what people know but in what they are, the objectives of humane learning encouraged by Phi Beta Kappa include not merely knowledge but also intellectual honesty and tolerance, a broad range of intellectual interests and understanding.

The Carnegie Mellon chapter is active in sponsoring visiting speakers, on-campus roundtables that focus on current issues, community service activities, scholarship opportunities, student research involvement, and the like.

The Honor Society of Phi Kappa Phi

The Honor Society of Phi Kappa Phi has been an important presence on campus since 1933. Phi Kappa Phi, a national honor society that began in 1897 at the University of Maine, takes its name from the initial letters of its adopted motto, Philosophia Krateito Photon, “Let the love of wisdom rule humanity.” Phi Kappa Phi recognizes and honors persons of good character who have excelled in scholarship, in all fields of study. Members are nominated by their department or their school or college and then invited to join the society.

To be eligible, seniors must be in the top ten (10) percent of their class and juniors in the upper seven and one-half (7.5) percent of their class at the time of invitation. Graduate students, alumni, faculty and staff are also eligible for nomination. The chapter inducts new members once a year, each spring, and provides information to its members on all sorts of opportunities, including study abroad, internships, and graduate fellowships, recognition and awards.

Office of Undergraduate Research and Scholar Development

Undergraduate Research

Richelle Bernazzoli, *Director of Undergraduate Research and Scholar Development*
Location: Cyert Hall A64, 5000 Forbes Ave., Pittsburgh, PA 15213
Phone: 412-268-5702
Fax: 412-268-6159
Email: bernazz@andrew.cmu.edu
www.cmu.edu/uro (http://www.cmu.edu/uro/)

At Carnegie Mellon, undergraduates are building mobile robots, creating documentary films, investigating cultural trends, and developing new digital communication technology. These student researchers find themselves in the heart of the university intellectual community, where they discover the thrilling (and often messy) process of creating new knowledge.

We use a broad definition of research that includes appropriate activities in the arts and humanities, and social sciences, as well as the sciences and technical fields: "Research, scholarly, or artistic activities that lead to the production of new knowledge; to increased problem solving capabilities, including design and analysis; to original critical or historical theory and interpretation; or to the production of art or artistic performance."

The Office of Undergraduate Research and Scholar Development supports student research in every field of study. We give SURG grants (https://www.cmu.edu/uro/academic-research/SURG/) to cover research expenses; Fellowships (https://www.cmu.edu/uro/summer%20research%20fellowships/SURF/#surf) and Apprenticeships (https://www.cmu.edu/uro/summer%20research%20fellowships/sura/) for full-time summer research and part-time academic year research (https://www.cmu.edu/uro/academic-research/huray/); and Presentation Awards (https://www.cmu.edu/uro/PresAward/#pres) to support students presenting at academic conferences. In May of each year, we hold our campus-wide celebration of undergraduate research, the Meeting of the Minds (https://www.cmu.edu/uro/MoM/#MoM).

How can we help?

- **Advising:** We meet with students to discuss how best to move forward on their interests and engage in undergraduate research at Carnegie Mellon
- **Workshops:** We offer writing workshops each semester to assist students in the proposal writing process
- **Research Development:** Each of our programs comes with complementaryy workshop instruction in researcher development topics, such as communicating your research, building a research network, and understanding research design.

National and International Fellowships and Scholarships

Location: Cyert Hall A64, 5000 Forbes Ave., Pittsburgh, PA 15213
Phone: 412-268-9987
Fax: 412-268-6159
Email: fso-general@andrew.cmu.edu
www.cmu.edu/ (http://www.cmu.edu/uro/)fso (https://www.cmu.edu/fso/)

The Office of Undergraduate Research and Scholar Development works with current Carnegie Mellon undergraduate and graduate students, as well as alumni, in fulfilling their intellectual and professional goals by pursuing nationally competitive scholarships and fellowships. We promote awareness of external scholarship and fellowship opportunities, advising, writing support, overall management of the process, and interview preparation.

For information about fellowships and scholarships related to financial aid, please visit Student Financial Services (https://www.cmu.edu/sfs/financial-aid/) website.

What are fellowships and scholarships?

Fellowships and scholarships are competitive, merit-based monetary awards that support a wide range of purposeful activities. These include research, internships, projects, and study abroad.

Who is eligible?

Eligibility depends on the particular award. More detail is available in the descriptions and links to each award.

How do I get started?

Read through the award descriptions on our website (https://www.cmu.edu/fso/) and make a list of which you'd like to pursue. Then make an appointment (https://forms.gle/avfFZcSyt1ycoh9f8/) with a representative.

Student Academic Success Center

Renee Camerlengo, *Executive Director*

Location: Posner Hall, 1st and 2nd floors
Phone: 412-268-6823
www.cmu.edu/student-success (https://www.cmu.edu/student-success/)

The Student Academic Success Center focuses on creating spaces for students to engage in their coursework and approach to learning through many group and individual program options. The team supports student success by providing academic coaching, subject-specific tutoring, effective communication strategies, accommodations for students with disabilities, language support for multilingual learners and initiatives that coordinate holistic academic support. They also engage with faculty and with staff to improve the coordination and professional development for academic advisors.

Teacher Certification

Carnegie Mellon offers a teacher certification program in the school of music but does not offer a degree in education or teacher certification program in other academic areas. Students can take relevant classes through several departments on campus to develop skills and knowledge that will help them to prepare for a career in K-12 education. There are several pathways to a teaching career and interested students can reach out to the Leonard Gelfand Center (https://www.cmu.edu/gelfand/contact-us.html) to discuss opportunities and programs that can be pursued.

University Libraries

Keith Webster, *Helen and Henry Posner, Jr. Dean of University Libraries and Director of Emerging and Integrative Media Initiatives*
Location: Hunt Library, 4909 Frew St., Pittsburgh, PA 15213
Phone: 412-268-2444
www.library.cmu.edu (http://www.library.cmu.edu)

The University Libraries is your partner in discovery, here to get you what you need so you can move faster on the path to your goals. Offering access to extensive resources, study spaces, research support, and low-stakes learning opportunities, CMU's librarians enrich the student experience by providing support, expertise, tools, and training. You bring the inspiration, we'll find the information.

Access a Wealth of Information and Get Support at Every Stage of the Research Process

From the Libraries' home page (www.library.cmu.edu (http://www.library.cmu.edu/)):

- Find (https://www.library.cmu.edu/find/#catalog): The library catalog is your one-stop, no-cost shop for access to journals, books, newspapers, databases, technology, and tools. Search by course reserves if your instructor has reserved materials for your class.
- Get Research Help – Access topic-specific research guides (https://guides.library.cmu.edu/), connect with a research specialist (https://www.library.cmu.edu/services-overview/librarian/), or set up a consultation (https://www.library.cmu.edu/services-overview/research-assistance/#schedule) about a research tool or method. Help is available however you need it: in-person, online, via email or chat.
- Services Directory (https://www.library.cmu.edu/services/): Information on library services and support, from data and code (https://www.library.cmu.edu/services/data-code-support/) and GIS (https://www.library.cmu.edu/services/gis/) to Bloomberg Terminals open science (https://www.library.cmu.edu/services/open-cmu/), and open source (https://www.library.cmu.edu/services/ospo/).
- Workshops (https://www.library.cmu.edu/services/workshops/) – Curious about the command line, data visualization, arts entrepreneurship, or prompt engineering? Libraries workshops are open to all and cover these topics and much, much more.
- Distinctive Collections (https://www.library.cmu.edu/distinctive-collections/): Discover the unique and rare collections housed only at CMU, from first editions of Galileo and eighteenth-century calculating machines to records on Artificial Intelligence from pioneers such as Herbert Simon and Allen Newell.

University Police

Aaron V. Lauth, *Chief*
Location: 4551 Filmore Street, Pittsburgh, PA 15213
campuspd@andrew.cmu.edu
www.cmu.edu/police (http://www.cmu.edu/police/)

The Carnegie Mellon University Police Department provides police services 24 hours a day, seven days a week, 365 days a year. Police officers are responsible for patrolling all university owned or leased property. In addition to patrol, officers will respond and investigate crimes and other emergencies that are in progress or have already occurred.

The success of the Patrol Unit is largely dependent on the eyes and ears of the community it serves. Immediate notification facilitates a rapid response. All emergencies on campus, including fire and medical, should be reported immediately to University Police. If you see suspicious activity or a crime in progress, call the University Police immediately by calling 412-268-2323.

Students are responsible for their personal property as well as the property of groups to which they belong. Insurance against loss, theft, or damage to such property occurring in the residence hall or elsewhere on campus must be arranged for by students or their parents through an insurance agent.

University Police makes available on its website a wide range of information about the university's security practices. View more information about the shuttle and escort service, community outreach, current investigations, crime prevention and safety education, and other programs and services by visiting www.cmu.edu/police (https://www.cmu.edu/police/).

Carnegie Mellon University publishes an annual campus security and fire safety report describing the university's security, alcohol and drug, sexual assault and fire safety policies, and containing statistics about the number and type of crimes committed on the campus, and the number and cause of fires in campus residence facilities during the preceding three years. You can obtain a copy by contacting the Carnegie Mellon Police Department at 412-268-2323. The annual security and fire safety report also is available online at www.cmu.edu/police/annualreports (https://www.cmu.edu/police/annualreports/).

Athletics and Physical Education

Josh Centor, Associate Vice President of Student Affairs and Director of Athletics, Physical Education & Recreation
Location: Skibo Gymnasium, Tech and Frew Streets, Pittsburgh, PA, 15213
Phone: 412-268-1236
jcentor@andrew.cmu.edu
www.cmu.edu/athletics (http://www.cmu.edu/athletics/)

Intercollegiate Athletics

Carnegie Mellon emphasizes excellence in its intercollegiate athletic programs, as well as in its classrooms. The university strongly believes that academic and athletic excellence can successfully coexist. Intercollegiate athletics are important in student life and make a positive impact on the educational experience. Experience as a student-athlete additionally provides benefits in professional and social endeavors following graduation.

Carnegie Mellon sports teams have competed intercollegiately since the early 1900s. In the past 16 years, the program has experienced extensive success. The Tartans have won 92 conference championships and competed in over 165 national championships since 1976. This success has been achieved while meeting all of the academic requirements of demanding programs and without athletic scholarships.

In 1986, Carnegie Mellon became a charter member of the University Athletic Association (UAA), an eight-team league of similar institutions with regard to academic and athletic programs. The UAA, a national association which geographically reaches as far north as Massachusetts, as far south as Atlanta and as far west as St. Louis and Chicago, sponsors intercollegiate competition in 23 sports including 10 for men and 10 for women. UAA members include Brandeis University, Case Western Reserve University, Carnegie Mellon University, Emory University, New York University, the University of Chicago, the University of Rochester and Washington University in St. Louis.

Carnegie Mellon, like the other seven UAA members, is a member of the National Collegiate Athletic Association (NCAA). Its intercollegiate teams compete on the Division III level, which prohibits athletic scholarships and operates under the true meaning of amateurism. Student-athletes who play at the varsity level are students first and athletes second. All students, both athletes and non-athletes, are treated equally with regard to admission and financial aid policies. Carnegie Mellon fully supports a policy of equity in resources and opportunities for women and men.

The university fields competitive teams in 19 sports. The Tartans compete in football, men’s and women’s golf, men’s and women’s soccer, men’s and women’s cross-country, men’s and women’s tennis, women’s volleyball, men’s and women’s basketball, men’s and women’s swimming and diving, men’s and women’s indoor and outdoor track and field, and softball.

Carnegie Mellon’s intercollegiate programs have consistently produced winners. The men’s golf team won the university’s first national championship in 2023 after placing sixth in 2022 and fourth in 2021. At the conclusion of the 2022 season, senior William Knauth was named the recipient of the Byron Nelson Award for his achievement in the classroom, on the course, and in the community, and a finalist for the Jack Nicklaus National Player of the Year Award.

The Tartans’ football team has won 19 conference championships, the latest coming in 2022, had a string of 35 consecutive winning seasons from 1975-2009, and has appeared in the NCAA Division III Championship playoffs seven times. The Tartans have also played in seven ECAC Bowl games. In 1979, Carnegie Mellon was awarded the Lambert Trophy as the best small college team in the northeast. In 2019, senior defensive lineman Michael Lohmeier became the fifth Tartan named as a finalist for the William V. Campbell Trophy, an award that recognizes an individual as the absolute best scholar-athlete in the nation amongst all divisions.

The men’s cross country team won its most recent conference championship in 2021 and has had a student-athlete or team compete at nationals for 21 straight seasons. In 2022, the women’s cross country team made its fifth straight appearance and eighth overall at the national meet. The 1998 team placed fourth nationally, the highest in program history.

The volleyball team has made five trips to the NCAA Tournament in the past six seasons and reached their highest AVCA national ranking in program history when they held the sixth spot for two weeks during the 2017 season.

The women’s soccer team has appeared in the NCAA tournament nine of the last 10 years. In 2019, the Tartans advanced to the NCAA Division III Women's Soccer Championship semifinals becoming the first women's team in Carnegie Mellon history to reach the semifinals of an NCAA tournament.

The men’s soccer team has competed in postseason play 16 times since 2000, including 14 trips to the NCAA tournament. Jon Hall was named CoSIDA Men's Soccer Academic All-America of the Year in back-to-back years (2008 and 2009).

In 2015-16, the women’s basketball team advanced to the Sweet 16 of the NCAA tournament for the first time in school history. The following season, 2016-17, senior Lisa Murphy was selected as the Jostens Trophy award winner. The award is a symbol of excellence for the Division III student-athlete; it is an honor given to the top women's basketball player for their excellence on the court, in the classroom and in the community. The 2021-22 team returned the program to postseason play and won the Eastern College Athletic Conference (ECAC) Championship for the second time in program history.

The men’s basketball team had played in seven postseason tournaments since 2004-05 with the 2022-23 team playing in the ECAC Championship tournament after tying for fourth place in the UAA.

Kayvon Fatahalian, a freshman computer science major on the men’s tennis team, won the NCAA National Singles Title in 2000 with a sophomore Abhishek Alla claiming the ITA National Small College Championship title in 2013. The women’s tennis team also produced an ITA National Small College Champion when sophomore Amy Staloch won the singles title in 2006. The women’s program has played in the NCAA Tournament in 16 of the last 17 years while the men’s program has played in nine NCAA Tournaments, the latest in 2021.

Both men’s and women’s swimming and diving and track and field teams annually qualify a number of athletes for the national championships. Swimming has produced a combined nine national champions with the men’s team finishing 11th in 2023 and the women 15th. The men’s track and field team finished fourth at the 2022 NCAA Indoor Track and Field Championships with three athletes earning runner-up finishes in their respective events. In 2023, senior Liz Barre won the women’s program’s first indoor NCAA individual championship with a victory in the pentathlon while the men’s program won the UAA Outdoor Championship for the fifth time.

In the spring of 2018, the women’s golf team, competing in its fourth year of varsity competition, finished fifth at the NCAA Division III Championships. Then in 2020, the sixth year of the women's golf program, the Tartans landed at the top position in the final Division III national rankings by Golfstat. The number one ranking was the first for a women's team sport at Carnegie Mellon. The 2022 and 2023 team’s placed fourth at the NCAA Championships.

The inaugural season of softball was in 2019. The team has produced four all-region honorees and set five team and four individual records in the 2023 season.

Carnegie Mellon has accumulated 192 Academic All-America honors given out by the College Sports Information Directors of America (CoSIDA) since 1973. There have been 147 that have earned the honor since the 2004-05 season. The Tartans have also produced 22 NCAA Postgraduate Scholars since 2007-08, which is a scholarship that is awarded to student-athletes who excel academically and athletically and who are in their final year of intercollegiate athletics competition.

In 2019, Carnegie Mellon Unveiled its Inaugural Athletics Hall of Fame. In October, 17 individuals and one historic team were inducted into the inaugural class.

To provide excellence throughout the athletic programs, the department employs full-time coaches in all varsity sports. Intercollegiate competition begins with the first football and soccer games in early September and ends with the NCAA track and field, golf, tennis and softball championships in late May. Students with athletic skills in any of the above mentioned sports are welcome to become members of the team. Participation is open to all students.

Recreation

In addition to providing for its more formal programs and teams, Carnegie Mellon’s athletic facilities are available for use by individual students on an extensive seven-day per week schedule.

The Cohon University Center has facilities for swimming, basketball, volleyball, squash, and racquetball, as well as cardio and strength equipment. Gesling Stadium provides outdoor soccer, football and track facilities. Tennis courts, located between the University Center and Margaret

Morrison, are lighted for night play. Outside basketball courts are located near Donner Hall. During the school year, they are open for use by students, faculty and staff.

These facilities are available to students, faculty and staff who have a valid Carnegie Mellon ID card. For hours, contact the Athletic Office at 412-268-5635, or visit our website (http://athletics.cmu.edu/landing/index/).

Physical Education

The Department of Physical Education provides an elective program with an emphasis on personal fitness and lifetime recreation, thus preparing students for physical activity after the college years. Most classes are offered on a mini-course system with each class running seven weeks in length.

This program of more than 60 courses is designed for all students, from the beginner to those students who have already developed some skill. Courses include weight training, personal fitness, racquetball, tennis, golf, weight training, swimming, badminton, indoor cycling and yoga. The department offers a wide variety of diversity in our course offerings. Instruction is also provided in several team sports. Carnegie Mellon also provides courses for American Red Cross certification in the four levels of swimming and lifeguard training.

Intramural Sports

For those who seek another level of competition or just like to participate and have fun, the Intramural Program provides recreation and relaxation for all students, faculty and staff, regardless of the degree of their natural athletic skills. The university prides itself on an intramural program which annually has over 3,000 participants. Men and women, both graduate and undergraduate, compete in more than 20 different activities. Major sports include flag football, soccer, volleyball, floor hockey. basketball, and softball. A few of our popular tournaments are ultimate frisbee, dodgeball, tennis, and badminton.

Through participation in this program, students are able to keep physically fit, put to good use various learned skills, and develop leadership, team play and sportsmanship. Intramural activities, like all sports endeavors, contribute to physical development, good health, and a sound state of mind, while providing keen competition and team spirit. In addition, intramural sports possess an inherent flexibility that allows for a limited commitment of time in light of academic priorities. The intramural program permits students from all departments to meet and socialize on an informal basis.

Fitness and Wellness

The university is well aware that fitness is a vital contributor to an individual's well-being and productivity. For this reason the department is committed to providing the entire campus community with the opportunity and resources to keep fit for the new century.

The Fitness and Wellness program provides educational services, programs, workshops and seminars. The Group X program provides over 70 exercise classes per week ranging from yoga and pilates to zumba and indoor cycling. These classes are free for all full time CMU students, faculty and staff. Personal training sessions are available for cost and provide an opportunity to work one on one with a certified strength coach in our athletic facilities.

Faculty

GARY ALDRICH, Associate Head Track & Field Coach/Instructor – M.S., Slippery Rock University,Carnegie Mellon, 2006–

MICHAEL BELMONTE, Assistant Men/Women Tennis – History, Duquesne; Carnegie Mellon, 2010–

BRANDON BOWMAN, Head Men's Soccer Coach – B.S., Centre College; Carnegie Mellon, 2017–

JOSH CENTOR, Assistant Director of Athletics – B.A., Brandeis University,Carnegie Mellon, 2008–

ALAN DEGENNARO, Strength and Conditioning CoachCarnegie Mellon, 2011–

SARA GAUNTNER, Assistant Director of Athletics for Instructional Programs & Recreation & Aquatics Director/Instructor – M.S., Duquesne University,Carnegie Mellon, 2005–

ANDREW GIRARD, Head Men's and Women's Tennis Coach/Instructor – B.S., Michigan Tech University,Carnegie Mellon, 2003–

ALICIA GORMAN, Diving Coach, Director of Acquatics – B.S., University of Tennessee; Carnegie Mellon, 2017–

ANDREW HELMS, Assistant Football Coach – B.S., Carnegie Mellon University; Carnegie Mellon, 2017–

JACQUIE HULLAH, Head Women's Basketball CoachCarnegie Mellon, 2011–

KIM KELLY, Head Women's Volleyball Coach/Instructor – MBA, Mt. St. Mary's University,Carnegie Mellon, 2005–

MATTHEW KINNEY, Head Swimming and Diving Coach/Instructor – M.S., Western Illinois,Carnegie Mellon, 2007–

PATTYE STRAGAR, Operations Manager for Fitness and Aquatics/Instructor – B.S., Northwestern University; Carnegie Mellon, 2003–

YON STRUBLE, Head Men's Soccer Coach/Instructor – M.S., Georgia State; Carnegie Mellon, 2010–

TONY WINGEN, Head Men's Basketball Coach/Associate Athletic Director/ Instructor – M.Ed., Springfield College; Carnegie Mellon, 1990–

Department of Athletics and Physical Education Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

69-005 Intro to Fly Fishing

Fall and Spring: 3 units
This introductory class explores the fundamentals of fly fishing. Aimed at the novice fly angler, topics include equipment selection, knot tying, basic entomology and fly selection, reading the water, and where to fly fish in Western Pennsylvania. Fly casting, the most important aspect of fly fishing, is taught.

69-101 Racquetball

Fall and Spring: 3 units
This course is designed to aid in developing the fundamental skills involved in racquetball. Techniques, rules and strategy are stressed. It is hoped that the student will develop a reasonable level of proficiency to enable participation on a leisure-time basis.

Course Website: http://www.cmu.edu/athletic/

69-102 Weight Training

Fall and Spring: 3 units
This course is designed to provide the opportunity for the inexperienced student to learn the effectiveness of a carefully planned weight-training program as a method of body development and the contributing benefit to performance in many sports.

69-103 Advanced Recovery & Restoration

Spring: 3 units
This course is designed to provide the opportunity for the physically active student to learn the effectiveness of a carefully planned recovery and restoration techniques as a method of body development and the contributing benefit to performance in many sports.

69-104 Practical Application of Sports Nutrition for Competitive Athletes

Spring: 3 units
This course will cover the following topics: macronutrient overview, specific overview of fats, carbohydrates, and protein, vitamin and minerals, nutritional needs for strength/power and endurance athletes, pre/during/post training nutritional needs for strength/power and endurance athletes, and other topics. FOR UNDERGRAD STUDENTS ONLY.

69-105 Agility & Circuit Training

Spring: 3 units
This course is designed to train the entire body combining fitness and core body work. We will do jumping and agility exercises to increase explosiveness and foot speed. Circuit training will be used to strengthen your core, arm, and leg muscles and will provide a cardiovascular workout.

69-106 Intro to Recreation

Fall: 3 units
This is a basic level class for first-year students only. This class is designed to teach students various fitness and recreational activities available to them on campus.

69-107 Walking for Fitness

Fall: 3 units
THIS COURSE IS IN PERSON ONLY FALL 2021. This course is an aerobic conditioning activity. A fast paced walk that is less wear and tear on your joints than what a running program will do.

69-110 Personal Fitness

Fall and Spring: 3 units
THIS COURSE IS IN PERSON ONLY FALL 2021. This course will be a conditioning course prescribed partially by the individual with assistance from the instructor to insure that the desired results will be achieved or at least pursued correctly. Individual goals will be the main concern. Stretching, aerobics, weight training and nutrition will be discussed.

69-112 Fitness Fusion

Fall and Spring: 3 units
A fun power-packed workout designed to introduce all aspects of fitness. This class combines simple exercises including cardio endurance with dynamic balance and stabilization. The class will fuse fitness while maximizing the benefits offered by training with concise, innovative, and effective exercises for the whole body. Every few weeks another aerobic activity will be added. We will start slowly so you can experience progressions and advance your training. During the fusion of strength, core, and flexibility, we will use a variety of "toys" to enhance your fun and fitness while fusing the total package of mind, body, and spirit.

69-113 Beginning Karate

Fall and Spring: 3 units
Beginning Karate teaches traditional Tang Soo Do (Korean Karate) by Master C. S. Kim and assistant instructors with specific standards and goals designed to help each student maximize potential as an individual, as well as a martial artist. Students will learn stretching and basic stances as well as blocking, punching, kicking, knee and elbow strikes, and open-handed techniques such as knife-hands. Proper etiquette will also be taught.

69-114 Intermediate Karate

Fall and Spring: 3 units
Intermediate Karate teaches a higher level of the traditional martial arts with specific standards and goals designed to help each student maximize potential as an individual, as well as a martial artist. Through traditional Tang Soo Do (Korean Karate) taught by Master C. S. Kim and assistant instructors, you will find many opportunities to gain specific knowledge which will apply not only in your martial arts training, but also in the improvement of your daily quality of life.

69-120 Topics in Health and Physical Activity

Fall and Spring: 3 units
This course is a weekend seminar covering a variety of topics. Dates of the course will be TBD once instructor sets dates. This course is designed to expose students to a comprehensive overview of what it means to be healthy, including: stress management strategies, healthy eating habits, importance of sleep, and the benefits of various exercise methods. The course will be presented using both a traditional lecture style, and hands-on practice. A few outside speakers will be brought in to speak in their area of expertise. Students should come prepared to exercise.

69-129 Rape Agression Defense Systems (RAD)

Fall and Spring: 3 units
Self Defense for Women - is a course specifically designed to increase women's awareness of potential sexual assault and to provide physical techniques to respond to such an act. It is intended for women only because it is believed that the presence of males in class (other than instructors or other authorized persons) can alter the emotional and physical responses of women to class material and thereby hinder their ability to reach course objectives. It is of the utmost importance that women be able to maximize their opportunity to learn in the company of like-minded students. The core of the course is based upon the principles of the Rape Aggression Defense System (R.A.D.)which was conceived and developed by Larry N. Nadeau. His goal in developing R.A.D. is also its motto: "To develop and enhance the options of self-defense, so they may become viable considerations to the woman who is attacked." This course is composed of three sections: risk reduction principles, physical defense techniques, and simulation. Risk reduction principles include a thorough review of personal self-awareness and amp; the environment, whether in the home, neighborhood, or unfamiliar community. Physical defense techniques include the introduction to bodily strikes with hands, kicks with the feet, and defenses against grabs and amp; holds. Simulation is the activity that attempts to incorporate, via physical demonstration, all emotional and amp; physical techniques that have been taught through the acting out of scenarios involving instructors (padded/protected) as attackers, and students (padded/protected) responding to the assault.

69-130 Beginning Tennis

Fall and Spring: 3 units
This course is designed to familiarize the student with the rules of tennis and to develop the skills needed to become proficient for recreational play. During the first half of the course, all tennis strokes will be covered and reviewed in detail. The second half of the course will focus mostly on competitive games and match-play.

69-131 Volleyball

Spring: 3 units
This course is designed to familiarize the student with the rules of volleyball and to develop the skills needed to become proficient for recreational play.

69-132 Advanced Tennis

Fall: 3 units
This course will consist mainly of tennis drills and discussions related to singles, doubles, and match strategy. In addition to being able to successfully execute all tennis strokes, students should also already have significant tennis match experience.

69-134 Beginning Golf

Fall and Spring: 3 units
This course is designed to give the student all the skills necessary to play a satisfactory game of golf. The long game, the short game and putting are covered. It is a leisure time sport that is challenging and can be used by the student for the rest of his/her life.

69-135 Soccer Skills

Spring: 3 units
This course is designed to familiarize the student with the rules of soccer and to develop the skills needed to become proficient for recreational play.

69-136 Basketball Skills

Fall and Spring: 3 units
This course is designed to familiarize the student with the rules of basketball and to develop the skills needed to become proficient for recreational play.

69-137 Ultimate Frisbee

Fall: 3 units
This class is designed to teach basic Frisbee skills. This class is a great conditioning/cardio class with high energy. It is a fun team game to play.

69-139 Indoor Soccer Skills

Spring: 3 units
This course is designed to familiarize the student with the rules of soccer and to develop the skills needed to become proficient for recreational play.

69-140 Squash

Fall and Spring: 3 units
This course is designed to aid in developing the fundamental skills involved in squash. Techniques, rules and strategy are stressed.

69-141 Beginning Soccer

Spring: 3 units
This class is designed for beginner soccer players. This class will teach you soccer skills and techniques to become a better player.

69-142 Beginning Fencing

Spring: 6 units
This course will cover the basic skills needed for fencing with the foil. Footwork, attacks, and defenses will be practiced. Competition rules and strategies will be discussed. Students will fence each other and the instructor in almost every class.

69-143 Dodgeball

Spring: 3 units
This class is designed to teach the rules of dodgeball. The students will learn the national rules and play against classmates.

69-144 Diamond Sports

Spring: 3 units
This course is designed to familiarize the student with the rules of softball and wiffleball and to develop the skills needed to become proficient for recreational play. Students will play each other or the instructor in almost every class.

69-145 Beginning Softball

Fall and Spring: 3 units
Students will learn beginning softball skills-throwing, hitting, running

69-146 Team Handball

Fall: 3 units
Team Handball or European Handball - This is an introductory level class that will cover the basics of the sport including the rules, organization, and basic game play. Students will be expected to learn the rules and participate in play on a daily basis.

69-150 Beginning Swimming

Fall: 3 units
This basic course is designed to equip the non-swimmer with fundamental skills and knowledge to assure reasonable safety in, on or about the water. Areas covered include the basic swimming strokes, basic diving, safe and efficient entry into the water, and some elementary forms of rescue.

69-151 Introduction to Yoga

Fall and Spring: 3 units
THIS COURSE IS IN PERSON ONLY FALL 2021. This course is designed for the beginning yoga student who wants to gain a solid foundation of yoga poses and the benefits a yoga practice has to offer. The course is also for those who have experience in Yoga and want to practice and improve their basic skills.

69-153 Lifeguard Training

Spring: 3 units
This class is the American Red Cross Lifeguard Training course. Students who complete certification will be eligible to be employed as lifeguards. Attendance is required. There will be a fee from the American Red Cross- the instructor will share this with you upon completion of the course requirements.

69-155 Cardio Fitness/Sculpt

Fall and Spring: 3 units
A total body fitness class for men and women that incorporates stretching for flexibility, exercises for strength and movement to increase cardiovascular improvement.

69-156 First Aid/CPR

Spring: 3 units
A basic course in treatment and care of injuries in emergency situations. Topics will include legal liability, prevention of injuries, nutrition and cardiovascular conditioning. The course will conclude with theoretical and practical application of cardiopulmonary resuscitation. Upon completion of the course students will receive Red Cross Certification. There will be a fee for this class of $15.00. This fee will be deducted from the student's account.

69-157 Swimming Stroke Improvement

Fall: 3 units
This course is designed to provide the student with the opportunity to learn the elements of good swimming. A wide range of strokes, basic diving, safety, endurance, and versatility in the water will be covered for all students. Experienced swimmers will have the opportunity to perfect their strokes.

69-160 Swim-Fit

Fall and Spring: 3 units
Must be able to complete a 1000 yard swim (40 laps) prior to entering the class ; this is not a learn-to-swim class. Pre and post timed swims, deep water treading, lap swimming interval training. Average workout is around 2000 yards.

69-165 Cycling Core

Fall and Spring: 3 units
Indoor cycling classes are riding on a stationary bike while getting a great workout, experiencing several styles of training, and listening to music. All are welcome and #8212;beginner to advanced and #8212;you set the workout pace to various intensities. This course is for those participants who want to gain knowledge and experience of riding for endurance, speed work, race training, strength training, and/or visionary riding. Each class will be formatted to take the rider to their levels of advancement and #8212;beginner to advanced and #8212;all doing the same workout. Bikes are provided. No prior bike experience is necessary. No special footwear required and #8212;bike shoes are welcome and #8212;and tennis shoes at least are a must. Come along for the ride of a lifetime while having fun and getting into shape.

69-167 Beginning Ballroom Dance

Spring: 2 units
This class provides an overview of six American Style Ballroom Dances: Foxtrot, Waltz, Tango, Cha Cha, Rumba, Swing. Participants will learn three or four basic step patterns in each dance, the timing of each pattern, leading and following principles and the unique characteristics of each dance. At the end of this course, participants will be able to dance comfortably at a social dance. It is recommended that suede bottomed dance shoes be worn, but not required.

69-175 African-Brazil Dance

Fall: 2 units
This class incorporates African-Modern dance technique (specifically elements of Dunham and Horton technique) and applies it to dance movements from West Africa, Haiti, and /or Brazil. Students will build strength, alignment, and stamina while experiencing the joy of dancing to the exciting and mesmerizing music of these regions. Open to non-drama and drama majors.

69-176 Non-Majors Jazz

Spring: 3 units
This class is designed for those students who would like to continue their study in jazz but are not enrolled in the CFA department. They will learn the basics and progression movements in the area of jazz dancing. This is for all levels of participants.

69-195 Emergency Medical Technician 1

Fall and Spring: 12 units
The Emergency Medical Technician provides students with a basic knowledge of Emergency Medicine, and enables students to take the National Registry EMT Certification exam and become certified at the state and national level. This course is cross-enrolled through the Community College of Allegheny County (CCAC) and will require registration with CCAC on the first day of class. This will require a fee, which has yet to be determined. Due to state laws and classroom hours requirements, all lectures are mandatory with very few exceptions. This class will meet on around 2 Saturdays, which will be announced on the first day of class. This class is also offered in two parts. The first part (69-195) is offered during mini-2 and the second part (69-195) is offered during the full spring semester. You must attend both parts in order to be eligible to take the National Registry EMT Certification exam. Please email info@cmuems.org with any questions you might have.

Reserve Officers' Training Corps (ROTC)

Department of Aerospace Studies (Air Force ROTC)

Lt Col James Straub, *Detachment 730 Commander*
Location: University of Pittsburgh, 4200 Fifth Avenue, 2917 Cathedral of Learning
Phone: 412-624-6031
afdet730@pitt.edu
www.afrotc.pitt.edu (http://www.afrotc.pitt.edu)

The local AFROTC program is administered by the Department of Aerospace Science at the University of Pittsburgh. This program is available to undergraduate students at fourteen “cross-town” universities via enrollment through agreement with the University of Pittsburgh. Students must have at least six semesters (three full academic years) of school remaining to successfully complete AFROTC graduation requirements. Upon successful completion of university academic and ROTC requirements, students will earn a commission as a Second Lieutenant in the US Air Force.

Students will complete one or two years in the General Military Course (GMC) before competing for an enrollment allocation into a four-week summer leadership training program. After completion of the summer training program, students are enlisted into the Professional Officer Course (POC), where they will take on role leading anywhere from 10–50 of their fellow cadets in weekly activities. *Students are under NO contractual obligation to the Air Force until entering the POC or accepting an Air Force scholarship.* In addition to the academic portion of the curriculum, each student attends a weekly two-hour, hands-on “laboratory” that tests both their followership and leadership abilities amongst their peers. This lab is used to practice various leadership and management techniques and groom students into future military leaders. Three and three-and-a-half year scholarships are available to qualified students in certain areas of study. Most AFROTC scholarships cover tuition plus lab fees, books, plus each scholarship awardee receives a tax free monthly stipend that ranges between $300–500 per month.

Department of Military Science (Army ROTC)

William Perez, *Army ROTC, Three Rivers Battalion Scholarship and Enrollment Officer*
Location: University of Pittsburgh, 315 South Bellefield Avenue, Room 306
Phone: 412-624-6254
Fax: 412-624-7793
WRP14@pitt.edu

The Army Reserve Officers’ Training Corps (ROTC) program supporting Carnegie Mellon University is located at the University of Pitts-burgh. It exists to train the future officer leadership of the United States Army and offers opportunities and challenges that can put college students on the fast track to success in life. ROTC provides a combination of academics and important hands-on training, in addition to physical and mental challenges that will help students succeed in college and beyond. Through the training in ROTC, students will develop the confidence, self-esteem, motivation and leadership skills they will need regardless of their career plans.

The Four-Year Program

The traditional Four-Year program is divided into two parts. The Basic Course is taken in the freshman and sophomore years. There is no commitment for non-scholarship students at this level. Upon successful completion of the Basic Course, students are eligible for the Advanced Course, taken in the junior and senior years. At the beginning of the Advanced Course, students will decide whether or not they wish to become officers in the Army and enter into a formal contract. During the summer between the junior and senior years, students are required to attend the the Leader Development and Assessment Course (LDAC). Upon successful completion of a University degree and the Army ROTC program, students are commissioned into the United States Army as a Second Lieutenant.

The Two-Year Program

If the first two years of ROTC are not taken, students can attend the Leader’s Training Course (LTC) during the summer between the sophomore and junior year. This camp will qualify students to begin the Advanced Course in their junior year or in the first year of a two-year graduate program. Or, if students have served in the active duty military, attended a military academy for one year, participated in JROTC for three years or belong to a Army National Guard or Army Reserve unit, they already qualify for entrance into the Advanced Course.

The Alternative Entry Program

The Alternative Entry Program is designed for academic junior students with no prior qualifying military training but are otherwise qualified. This option allows students to contract into the Advanced Course without receiving placement credit for the basic course. Students accepted into this program must complete the Leader’s Training Course and the Leader Development and Assessment Course during the summer months.

Curriculum

Freshman Year		Units
30-101	Introduction to Military Leadership - Fall	5
30-102	Foundations of Leadership- Spring	5

Sophomore Year		Units
30-201	Leadership Dynamics and Application- Fall	5
30-202	Applications in Leadership and Combat Power- Spring	5

Junior Year		Units
30-301	Basic Leader Planning and Combat Operations- Fall	5
30-302	Advanced Leader Planning and Combat Operations- Spring	5
Leadership Development & Assessment Course (six-week required summer camp)		

Senior Year		Units
30-401	Progressive Leadership Theory and Applications- Fall	5
30-402	Transition to the Profession of Arms- Spring	5

Army ROTC Scholarships

Army ROTC offers four, three and two year full scholarships with additional annual allowances of $900 for books and a monthly stipend. High school, undergraduate and incoming two-year graduate students are eligible to apply. For application and information call ROTC at the University of Pittsburgh at (412) 624-6254/6197.

The Simultaneous Membership Program (SMP)

This program allows students to become members of the Army National Guard or the Army Reserves while enrolled in Army ROTC. Students in the Advanced Course who are SMP are paid for their Guard/Reserve training. The benefit of this program is that students in the Advanced Course are able to act as Army officers in their National Guard or Reserve unit, receiving valuable leadership experience.

Summer Programs

Leadership Development & Assessment Course
This 35-day camp is a requirement for all contracted students. Students attend the summer between their junior and senior year. Students are placed in various leadership positions throughout Camp and their skills and abilities will be tested and evaluated in preparation of a commission in the United States Army. All expenses are paid by the Army. Students are paid while attending.

Leader’s Training Course
This 35-day camp is taken as a prerequisite for entry into the Advanced Course if the Basic Course cannot be fulfilled. It is taken the summer before

the junior year. All expenses are paid by the Army. Students are paid while attending.

Army Adventure Training
ROTC students may participate in Airborne School, Air Assault School, Northern Warfare School and Mountain Warfare School the summer before the sophomore and junior year. These courses range from two to four weeks and students must arrive in top physical condition. All expenses are paid by the Army.

Extracurricular Activities

Rangers: Army ROTC students are eligible to participate in the Cadet Ranger Club. The Club conducts physically and mentally challenging extracurricular training to promote fitness, teamwork, self-confidence and fellowship. Training includes physical fitness, rappelling, rope bridging, tactics, hiking, climbing, weapons training and orienteering.
Scabbard & Blade: National Honor Society consisting of cadets/midshipmen from Army, Air Force and Naval ROTC.
Rho Tau Chi: Military fraternity established for the members of the various branches of ROTC. Purpose is to draw together cadets to increase communication and feelings of goodwill between the Cadet Corps and the community. Cadets participate in a variety of community service projects.
Color Guard: Dedicated group of Army ROTC cadets who train and perform to present the American flag and Army colors at football and basketball games and various community events.

Department of Naval Science (Naval ROTC)

Mike Danko, *ROTC and Veterans Affairs Coordinator*
Captain Michael Tomon, U.S.N., *Commanding Officer*
Location: 4615 Forbes Avenue
Phone: 412-268-5109
Fax: 412-268-6381
www.cmu.edu/nrotc (https://www.cmu.edu/nrotc/)

The Department of Naval Science was established 16 December 1987. Its mission is to prepare young men and women mentally, morally, and physically, and to instill in them the highest qualities of duty, honor, and loyalty, in preparation for leadership positions in the naval service.

Carnegie Mellon’s Naval Reserve Officers Training Corps (NROTC) is designed for young men and women who are seeking a challenging academic experience and who desire to serve their country as officers in the Navy or Marine Corps after graduation.

NROTC midshipmen lead the same campus life as other Carnegie Mellon students. They make their own arrangements for room and board, choose a preferred area of study and participate in extracurricular activities. Midshipmen wear civilian clothes to classes but wear uniforms one day of the week. NROTC students are active in all facets of university life; many are in positions of leadership in student government, on varsity and intramural sports teams, in campus clubs, and other student organizations. The NROTC program seeks students who are bright, ambitious, enthusiastic leaders whose lives are enriched by their education at Carnegie Mellon and by their involvement in NROTC.

Four-Year Scholarship Program

The four-year scholarship program provides full tuition and university fees, $750 for textbooks per year, uniforms, and a $250 per month tax-free subsistence allowance to students during their freshman year. This stipend then increases to $300 during their sophomore year, $350 for their junior year and $400 for their senior year. Midshipmen must complete the university-approved curriculum of their choice, including courses in calculus and calculus-based physics (Navy Option Only), and specified courses in naval science subjects. Paid summer training periods are also provided. Scholarships are awarded on the basis of a nationwide competition before the start of the freshman year. Midshipmen commissioned through the scholarship programs become officers in the Navy or Marine Corps and incur a four-year active duty obligation in a selected area of the naval service.

College (Non-Scholarship) Programs in NROTC
Qualified students may participate in NROTC as college program (non-scholarship) midshipmen and earn commissions in the Navy or Marine Corps Reserve upon graduation. The active duty obligation for this program is three years. Students receive all naval science textbooks and uniforms. Additionally, if awarded advanced standing during their junior and senior years, they receive a tax-free subsistence monthly allowance of $350 and $400 respectively. A paid summer training period is provided between the junior and senior year. College program students may compete for three- and two-year scholarships described in the following paragraph.

College Program Three- and Two-Year Scholarships
Three-year scholarships are available on a competitive basis to those qualifying college program (non-scholarship) NROTC students who have demonstrated leadership and academic excellence during their freshman or sophomore year and are nominated for the scholarship by the Professor of Naval Science. Scholarship benefits are identical to those provided by the four-year scholarship program. Active duty obligation is four years upon commissioning in a selected area of the naval service.

Two-Year National Scholarship Program
Sophomores who have not participated in the NROTC program may apply for a nationally competitive two-year NROTC scholarship. The two-year scholarship program provides the same benefits as the four-year program for a period of 20 months. Students must apply for this program no later than February of their sophomore year. Students selected for this program attend the Naval Science Institute during the summer before their junior year to complete required naval science course material.   A paid summer training period is provided between the junior and senior years. Commissionees incur a four-year active duty obligation upon graduation in a selected area of the naval service.

Curriculum

The sequence of naval science courses is the same for all officer candidates for the first three semesters. Midshipmen accepted into the Marine Corps option program will have curriculum variations starting with their third year. Additionally, some candidates may be required to complete courses in American military affairs, national security policy, English, mathematics, and/or the physical sciences. Descriptions of the course requirements for each candidate classification (scholarship/college program) may be obtained from the Department of Naval Science office.

All scholarship and college program students are required to attend a weekly 1.5 hour Naval Laboratory (32-100) where professional orientation, military drill, physical fitness, and leadership are emphasized. Guest speakers from the Fleet are frequent participants in these laboratories. Naval Science courses are open to all students. Since these are required courses for NROTC students, they will be given priority in enrollment. Remaining spaces will be filled through the normal university registration process.

Naval Professional Academic Courses

Freshman Year		Units
32-100	Naval Laboratory	3
32-101	Introduction to Naval Science	6
32-102	Seapower and Maritime Affairs	6

Sophomore Year		Units
32-200	Naval Laboratory	3
32-201	Leadership & Management	9
32-212	Navigation *	9

Junior Year		Units
32-300	Naval Laboratory	3
32-310	Evolution Of Warfare **	9
32-311	Naval Ship Systems I-Engineering *	9
32-312	Naval Ship Systems II-Weapons *	9

Senior Year		
32-400	Naval Laboratory	3
32-402	Leadership and Ethics	9
32-410	Amphibious Warfare/Operations & The Fundamentals of Maneuver Warfare **	9
32-411	Naval Operations and Seamanship *	9

Footnotes:
* Required of students in the Navy Option
** Required of students in the Marine Option
All other courses are required of all students in the program.

Naval ROTC Faculty

JEFF CORAN, Captain, USN – M.S., Rensselaer Polytechnic Institute; Carnegie Mellon, 2014–

ROTC Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

Aerospace Studies-ROTC Courses

31-101 Foundations of the United States Air Force

Fall: 3 units
AS100 is a survey course designed to introduce cadets to the United States Air Force and Air Force Reserve Officer Training Corps. Featured topics include: mission and organization of the Air Force, officership and professionalism, military customs and courtesies, Air Force officer opportunities, and an introduction to communication skills. Leadership Laboratory is mandatory for AFROTC cadets and complements this course by providing cadets with followership experiences.

31-102 Foundations of the United States Air Force

Spring: 3 units
AS100 is a survey course designed to introduce cadets to the United States Air Force and Air Force Reserve Officer Training Corps. Featured topics include: mission and organization of the Air Force, officership and professionalism, military customs and courtesies, Air Force officer opportunities, and an introduction to communication skills. Leadership Laboratory is mandatory for AFROTC cadets and complements this course by providing cadets with followership experiences.

31-105 Air Force Leadership Laboratory

All Semesters
The AS100 and AS200 Leadership Laboratory courses (LLABs) include a study of Air Force customs and courtesies, drill and ceremonies, and military commands. The LLAB also includes studying the environment of an Air Force officer and learning about areas of opportunity available to commissioned officers. The AS300 and AS400 LLABs consist of activities classified as leadership and management experiences. They involve the planning and controlling of military activities of the cadet corps, and the preparation and presentation of briefings and other oral and written communications. LLABs also include interviews, guidance, and information, which will increase the understanding, motivation, and performance of other cadets.

31-106 Air Force Leadership Laboratory

All Semesters
The AS100 and AS200 Leadership Laboratory courses (LLABs) include a study of Air Force customs and courtesies, drill and ceremonies, and military commands. The LLAB also includes studying the environment of an Air Force officer and learning about areas of opportunity available to commissioned officers. The AS300 and AS400 LLABs consist of activities classified as leadership and management experiences. They involve the planning and controlling of military activities of the cadet corps, and the preparation and presentation of briefings and other oral and written communications. LLABs also include interviews, guidance, and information, which will increase the understanding, motivation, and performance of other cadets.

31-107 Air Force Leadership Laboratory

All Semesters
The AS100 and AS200 Leadership Laboratory courses (LLABs) include a study of Air Force customs and courtesies, drill and ceremonies, and military commands. The LLAB also includes studying the environment of an Air Force officer and learning about areas of opportunity available to commissioned officers. The AS300 and AS400 LLABs consist of activities classified as leadership and management experiences. They involve the planning and controlling of military activities of the cadet corps, and the preparation and presentation of briefings and other oral and written communications. LLABs also include interviews, guidance, and information, which will increase the understanding, motivation, and performance of other cadets.

31-108 Air Force Leadership Laboratory

All Semesters
The AS100 and AS200 Leadership Laboratory courses (LLABs) include a study of Air Force customs and courtesies, drill and ceremonies, and military commands. The LLAB also includes studying the environment of an Air Force officer and learning about areas of opportunity available to commissioned officers. The AS300 and AS400 LLABs consist of activities classified as leadership and management experiences. They involve the planning and controlling of military activities of the cadet corps, and the preparation and presentation of briefings and other oral and written communications. LLABs also include interviews, guidance, and information, which will increase the understanding, motivation, and performance of other cadets.

31-201 The Evolution of Air and Space Power

Fall: 3 units
The AS200 course designed to examine general aspects of air and space power through a historical perspective. Utilizing this perspective, the course covers a time period from the first balloons and dirigibles to the space-age global positioning systems of the Persian Gulf War. Historical examples are provided to extrapolate the development of Air Force capabilities (competencies), and missions (functions) to demonstrate the evolution of what has become today's USAF air and space power. Furthermore, the course examines several fundamental truths associated with war in the third dimension: e.g. Principles of War and Tenets of Air and Space Power. As a whole, this course provides the cadets with a knowledge level understanding for the general element and employment of air and space power, from an institutional doctrinal and historical perspective. In addition, the students will continue to discuss the importance of the Air Force Core Values with the use of operational examples and historical Air Force leaders and will continue to develop their communication skills. Leadership Laboratory is mandatory for AFROTC cadets and complements this course by providing cadets with followership experiences.

31-202 The Evolution of Air and Space Power

Spring: 3 units
The AS200 course designed to examine general aspects of air and space power through a historical perspective. Utilizing this perspective, the course covers a time period from the first balloons and dirigibles to the space-age global positioning systems of the Persian Gulf War. Historical examples are provided to extrapolate the development of Air Force capabilities (competencies), and missions (functions) to demonstrate the evolution of what has become today's USAF air and space power. Furthermore, the course examines several fundamental truths associated with war in the third dimension: e.g. Principles of War and Tenets of Air and Space Power. As a whole, this course provides the cadets with a knowledge level understanding for the general element and employment of air and space power, from an institutional doctrinal and historical perspective. In addition, the students will continue to discuss the importance of the Air Force Core Values with the use of operational examples and historical Air Force leaders and will continue to develop their communication skills. Leadership Laboratory is mandatory for AFROTC cadets and complements this course by providing cadets with followership experiences.

31-301 Air Force Leadership Studies

Fall: 9 units
AS300 is a study of leadership, management fundamentals, professional knowledge, Air Force personnel and evaluation systems, leadership ethics, and the communication skills required of an Air Force junior officer. Case studies are used to examine Air Force leadership and management situations as a means of demonstrating and exercising practical application of the concepts being studied. A mandatory Leadership Laboratory complements this course by providing advanced leadership experiences in officer-type activities, giving students the opportunity to apply the leadership and management principles of this course.

31-302 Air Force Leadership Studies

Spring: 9 units
AS300 is a study of leadership, management fundamentals, professional knowledge, Air Force personnel and evaluation systems, leadership ethics, and the communication skills required of an Air Force junior officer. Case studies are used to examine Air Force leadership and management situations as a means of demonstrating and exercising practical application of the concepts being studied. A mandatory Leadership Laboratory complements this course by providing advanced leadership experiences in officer-type activities, giving students the opportunity to apply the leadership and management principles of this course.

31-401 National Security Affairs and Preparation for Active Duty

Fall: 9 units
AS400 examines the national security process, regional studies, advanced leadership ethics, and Air Force doctrine. Special topics of interest focus on the military as a profession, officership, military justice, civilian control of the military, preparation for active duty, and current issues affecting military professionalism. Within this structure, continued emphasis is given to refining communication skills. A mandatory Leadership Laboratory complements this course by providing advanced leadership experiences, giving students the opportunity to apply the leadership and management principles of this course.

31-402 National Security Affairs and Preparation for Active Duty

Spring: 9 units
AS400 examines the national security process, regional studies, advanced leadership ethics, and Air Force doctrine. Special topics of interest focus on the military as a profession, officership, military justice, civilian control of the military, preparation for active duty, and current issues affecting military professionalism. Within this structure, continued emphasis is given to refining communication skills. A mandatory Leadership Laboratory complements this course by providing advanced leadership experiences, giving students the opportunity to apply the leadership and management principles of this course.

Military Science-ROTC Courses

30-101 Introduction to Military Leadership

Fall: 5 units
In this course, students will be introduced to the fundamentals of Army leadership, management and basic military skills. The course emphasizes the Army's "Principles of Leadership" and familiarizes the student with rifle marksmanship, orienteering and map reading, rappelling, basic lifesaving skills and the wear of the Army uniform. In addition, students will enhance their time management, decision-making and physical fitness abilities. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided.

30-102 Foundations of Leadership

Spring: 5 units
This course is a continuation of the subjects and skills taught in 30101. In addition to extending the student's abilities in the areas of leadership, orienteering and map reading, lifesaving and other basic military concepts, the course also introduces the student to the employment of military units. Individual topics covered include the Army's emerging technological enhancements, the Army organization and structure and the wartime policies and principles. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided.

30-201 Leadership Dynamics and Application

Fall: 5 units
In this course, students will delve more deply ino the Army's leadership and management techniques, including the application of those techniques in faculty-supervised practical exercises. The course also seeks to enhance the student's abilities in orienteering and map reading, terrain analysis, advanced lifesaving techniques and physical fitness. Students are introduced to the values that define the United States Army as an American institution, and each student continues to enhance his or her physical development under the supervision of the faculty. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided.

30-202 Applications in Leadership and Combat Power

Spring: 5 units
This course continues the study of the topics covered in 30201 and focuses upon practical application of the leadership and management techniques learned in the fall semester. The student develops and applies advanced map reading, terrain analysis, problem-solving and decision-making skills in practical exercises. Additionally, the student is introduced to the Army's formal orders process, used to maneuver and sustain Army forces on the modern battlefield. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided.

30-301 Basic Leader Planning and Combat Operations

Fall: 5 units
This course offers an in-depth analysis and focused practical application of leadership and management techniques. The emphasis in the course is on leader development and the goal is to enhance the student's ability to perform effectively in a stressful decision-making environment. As such, time management, decision-making, advanced military skills, troop-leading procedures and advanced physical training are emphasized. The course requires participation in a demanding physical training program to prepare contracted students for the Army's R.O.T.C. Leader Development and Assessment Course (LDAC). Each student must participate in field training exercises and is expected to wear the Army uniform, which will be provided. Prerequisites: Class is open only to contracted students. Veterans with two or more years of service may enroll with approval.

30-302 Advanced Leader Planning and Combat Operations

Spring: 5 units
This course builds upon the foundation laid in the fall semester with the objective of fully preparing contracted students for participation in the Army's challenging R.O.T.C. Leader Development and Assessment Course (LDAC). The course extends and enhances the student's leadership, management, communication, fitness and basic military skills in preparing the student for commissioning as an officer in the United States Army. Practical exercises are used to reinforce all of the skills that the student has developed over the course of the military science instruction. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided. Prerequisites: Class is open only to contracted students. Veterans with two or more years of service may enroll with approval.

30-401 Progressive Leadership Theory and Applications

Fall: 5 units
This course is the first of two semester courses that serve as a capstone designed to transition the student from cadet to U.S. Army officer. Students are assigned to command and staff positions within the cadet battalion, corresponding to those found in United States Army units. Students perform the duties of the staff or command as assigned and interact with the other cadets as part of a functioning command organization. In addition to studying the operations and organizations of the U.S. Army, students are required to plan and execute the required training and activities in leading the underclasss cadets. A variety of topics of current interest are covered. Guest speakers are commonly invited to discuss their military experiences or their perspectives on military-related topics. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided. Prerequisites: Class is open only to contracted students.

30-402 Transition to the Profession of Arms

Spring: 5 units
This capstone course completes the transition from cadet to Army officer and concludes with the student's commissioning into the United States Army. During the semester, students continue to act in accordance with their assigned staff and command responsibilities and they prepare for their duties as a Lieutenant in the Army. This course covers personal and performance counseling, evaluation of subordinate leaders and team-building skills as well as military justice and discipline. Students bring to bear all of the skills and knowledge that they have accrued over the prior semesters in the Department of Military Science. Each student must participate in physical training, field training exercises and is expected to wear the Army uniform, which will be provided. Prerequisites: Class is open only to contracted students.

Naval Science - ROTC Courses

32-100 Naval Laboratory

Fall and Spring: 3 units
Military drill, physical fitness, and leadership seminars.

32-101 Introduction to Naval Science

Fall: 6 units
A general introduction to the naval profession and to concepts of Seapower. Instruction emphasizes the mission, organization, and warfare components of the Navy and Marine Corps. Included is an overview of officer and enlisted ranks and rates, training and education, and career patterns. The course also covers naval courtesy and customs, military justice, leadership, and nomenclature. This course exposes the student to the professional competencies required to become a naval officer.

32-102 Seapower and Maritime Affairs

Spring: 6 units
This course surveys US naval history from its European origins to the present with emphasis on major developments and the geopolitical forces shaping these developments. Also included is discussion of the theories and writings of naval historian and strategist Alfred Thayer Mahan. The course will finish by covering present day concerns in seapower and maritime affairs including the economic and political issues of merchant marine commerce, the law of the sea, the navy and merchant marine of the former Soviet Union (FSU), and a comparison of US and FSU maritime strategies to include the rise and decline of the Soviet Navy.

32-200 Naval Laboratory

Fall and Spring: 3 units
Military drill, physical fitness, and leadership seminars.

32-201 Leadership & Management

Fall: 9 units
This course is a comprehensive advanced-level study of organizational behavior and management. Topics include a survey of the management functions of planning, organizing, and controlling; an introduction to individual and group behavior in organizations; an extensive study of motivation and leadership. Major behavioral theories are explored in detail. Practical applications are explored by the use of experiential exercises, case studies, and laboratory discussions. Other topics developed include decision-making, communication, responsibility, authority and accountability.

32-212 Navigation

Spring: 9 units
An in-depth study of piloting and an introduction to celestial navigation theory. Students learn piloting skills including the use of charts, visual and electronic aids, and the theory and operation of magnetic and gyro compasses. Students develop practical skills in both piloting and celestial navigation. Other topics include tides, currents effects of wind and weather, plotting, use of navigation instruments, types and characteristics of electronic navigation systems, and the typical day's work in navigation. Also included is a study of the international and inland rules of the nautical road, relative motion, vector analysis theory, and relative motion problems.

32-300 Naval Laboratory

Fall and Spring: 3 units
Military drill, physical fitness, and leadership seminars.

32-310 Evolution Of Warfare

Fall: 9 units
This course is to provide the student with a very basic understanding of the art and concepts of warfare from the beginning of recorded history to the present day. The intent of the curriculum is to familiarize the student with an understanding of the threads of continuity and the interrelations of political, strategic, operational, tactical, and technical levels of war from the past, while bringing into focus the application of these same principles and concepts to the battlefields of today and the future.

32-311 Naval Ship Systems I-Engineering

Fall: 9 units
A detailed study of ship characteristics and types including ship design, hydrodynamic forces, stability, compartmentalization, propulsion, electrical and auxiliary systems, interior communications, ship control, and damage control. Included are basic concepts of the theory and design of steam, gas turbine, internal combustion, and nuclear propulsion. Shipboard safety and firefighting are also discussed.

32-312 Naval Ship Systems II-Weapons

Spring: 9 units
This course outlines the theory and employment of weapons systems. The student explores the processes of detection, evaluation, threat analysis, weapon selection, delivery, guidance and explosives. Fire control systems and major weapon types are discussed, including capabilities and limitations. The physical aspects of radar and underwater sound are described in detail. The facets of command, control, and communications are explored as a means of weapons system integration.

32-400 Naval Laboratory

Fall and Spring: 3 units
Military drill, physical fitness, and leadership seminars.

32-402 Leadership and Ethics

Spring: 9 units
The study of naval junior officer responsibilities. The course exposes the student to a study of ethics, decision making and responsibility as well as counseling methods, military justice administration, naval human resources management, directives and correspondence, naval personnel administration, material management and maintenance and supply systems. This capstone course in the NROTC curriculum builds on and integrates the professional competencies developed in prior course work and professional training.

32-410 Amphibious Warfare/Operations & The Fundamentals of Maneuver Warfare

Fall: 9 units
A historical survey of the development of amphibious doctrine and the conduct of amphibious operations. Emphasis is placed on the evolution of amphibious warfare in the twentieth century, especially during World War II. Focus is applied to four main themes: political/strategic situation, sea-to-land transitions, tactics ashore, and development of amphibious technology. Present day potential and limitations on amphibious operations, including the rapid deployment force concept, are explored.

32-411 Naval Operations and Seamanship

Fall: 9 units
Designed as an introduction to naval operations and shipboard evolutions, vessel behavior and characteristics in maneuvering, applied aspects of ship handling, and afloat communications. This course builds upon the information presented in Navigation 32-212, Engineering 32-311, and Weapons Systems 32-312. An understanding of the nautical rules of the road, relative motion and vector analysis are utilized in discussion regarding the conduct of naval operation to include formation tactics and ship employment. The student will also be introduced to the various components of naval warfare and their role in sea control and power projection missions within naval and joint operations.

Degrees Offered

With cutting-edge brain science, path-breaking performances, innovative start-ups, driverless cars, big data, big ambitions, Nobel and Turing prizes, hands-on learning, and a whole lot of robots, CMU doesn't imagine the future, we create it. Carnegie Mellon offers a wide range of programs in seven schools and colleges, and has consistently ranked high in a number of disciplines (https://www.cmu.edu/about/).

To browse the primary degrees offered , select a school or college below. For a list of minors, please see Undergraduate Options (p. 22).

College of Engineering

Interdepartmental

- M.S. in Energy Science, Technology and Policy
- M.S. in Energy Science, Technology and Policy (Applied Studies)
- M.S. in Energy Science, Technology and Policy and Integrated Study in Computer Science
- M.S. in Engineering and Technology Innovation Management

Biomedical Engineering

- B.S. in an engineering discipline with an additional major in Biomedical Engineering (p.)
- M.S. in Biomedical Engineering
- M.S. in Biomedical Engineering and Integrated Study in Computer Science
- Ph.D. in Biomedical Engineering
- Ph.D. in Biomedical Engineering and Engineering and Public Policy

Chemical Engineering

- B.S. in Chemical Engineering (p.)
- M. of Chemical Engineering
- M. of Chemical Engineering & Colloids, Polymers and Surfaces
- M.S. in Chemical Engineering
- M.S. in Chemical Engineering and Colloids, Polymers and Surfaces
- M.S. in Chemical Engineering and Integrated Study in Computer Science
- M.S. in Colloids, Polymers and Surfaces
- Ph.D. in Chemical Engineering

Civil and Environmental Engineering

- B.S. in Civil Engineering (p. 117)
- B.S. in Environmental Engineering (p.)
- M.S. in Advanced Infrastructure Systems
- M.S. in Civil Engineering
- M.S. in Civil and Environmental Engineering
- M.S. in Civil & Environmental Engineering and Integrated Study in Computer Science
- M.S. in Civil and Environmental Engineering/M. of Business Administration (jointly with the Tepper School of Business)
- M.S. in Computational Mechanics
- M.S. in Environmental Engineering
- M.S. in Environmental Management and Science
- Ph.D. in Advanced Infrastructure Systems
- Ph.D. in Civil Engineering
- Ph.D. in Civil and Environmental Engineering
- Ph.D. in Civil and Environmental Engineering and Engineering and Public Policy (jointly with the Department of Engineering and Public Policy)
- Ph.D. in Computational Mechanics
- Ph.D. in Environmental Engineering
- Ph.D. in Environmental Management and Science

Electrical and Computer Engineering

- B.S. in Electrical and Computer Engineering (p. 128)
- B.S. in Music and Technology (jointly with the Department of Music and the School of Computer Science)
- M.S. in Electrical and Computer Engineering
- M.S. in Electrical & Computer Engineering and Integrated Study in Computer Science
- M.S. in Software Engineering (Silicon Valley Campus)
- Master of Science in Software Engineering - Development Management (Silicon Valley Campus)
- Ph.D. in Electrical and Computer Engineering

Engineering and Public Policy

- B.S. in an engineering discipline with an additional major in Engineering and Public Policy (p. 145)
- B.S. in CFA, DC, MCS, or SCS and an additional major in Science, Technology and Public Policy (p. 146)
- M.S. in Engineering and Public Policy
- Ph.D. in Engineering and Public Policy
- Ph.D. in Engineering and Public Policy and an engineering discipline
- Ph.D. in Engineering & Public Policy and Language & Information Technologies
- Ph.D. in Engineering and Public Policy and Statistics (jointly with the Department of Statistics)

Information and Communication Technology

- M.S. in Information Technology (CMU Africa campus only)

Information Networking Institute

- M.S. in Information Networking
- M.S. in Information Security
- M.S. in Information Technology - Information Security
- M.S. in Information Technology - Mobility
- M.S. in Information Technology - Software Management

Materials Science and Engineering

- B.S. in Materials Science and Engineering (p. 159)
- M.S. in Additive Manufacturing
- M.S. in Computational Materials Science and Engineering
- M.S. in Materials Science
- M.S. in Materials Science and Engineering
- M.S. in Materials Science & Engineering and Integrated Study in Computer Science
- Ph.D. in Materials Science
- Ph.D. in Materials Science and Engineering

Mechanical Engineering

- B.S. in Mechanical Engineering (p. 171)
- M.S. in Computational Design and Manufacturing
- M.S. in Mechanical Engineering
- M.S. in Mechanical Engineering - Advanced Study
- M.S. in Mechanical Engineering - Research
- Ph.D. in Mechanical Engineering

College of Fine Arts

Architecture

- B. of Architecture (p. 217) (5-year program)
- B.A. in Architecture
- M. of Advanced Architectural Design
- M. of Architecture
- M.S. in Architecture
- M.S. in Building Performance and Diagnostics
- M.S. in Computational Design
- M.S. in Sustainable Design
- M.S. in Sustainable Design (Advanced Studies)
- M.S. in Sustainable Design (Applied Studies)
- M. of Tangible Interaction Design
- M. of Urban Design
- D. of Professional Practice in Advanced Architectural Design

- D. of Professional Practice in Architecture
- Ph.D. in Architecture
- Ph.D. in Building Performance and Diagnostics
- Ph.D. in Computational Design

Art

- B.F.A. in Art (p. 249)
- M.F.A. in Art

Design

- B. of Design (p. 268)
- M.A. in Design
- M. of Design in Design for Interactions
- M. of Design in Interaction Design
- M. of Professional Studies in Design for Interactions
- D. of Design
- Ph.D. in Communication De
- Ph.D. in Design

Drama

- B.F.A. in Drama (p. 288)
- M.F.A. in Costume Design
- M.F.A. in Costume Production
- M.F.A. in Directing
- M.F.A. in Dramatic Writing
- M.F.A. in Lighting Design
- M.F.A. in Scene Design
- M.F.A. in Sound Design
- M.F.A. in Stage and Production Management
- M.F.A. in Technical Direction
- M.F.A. in Video and Media Design

Music

- B.F.A. in Music (Composition) (p. 323)
- B.F.A. in Music Performance (p. 323) (various disciplines)
- B.S. in Music and Technology (p. 328) (jointly with the Department of Electrical and Computer Engineering and the School of Computer Science)
- M. Music in Composition
- M. Music in Music Education
- M. Music in Performance (various disciplines)
- M.S. in Music and Technology (jointly with the Department of Electrical and Computer Engineering and the School of Computer Science)

Dietrich College of Humanities and Social Sciences

Interdepartmental

- B.A./B.S.in Ethics, History, and Public Policy (p. 536) (jointly offered by the Departments of History and Philosophy)
- B.S. in Information Systems (p. 443)
- B.A. in Linguistics (p. 538) (jointly offered by the Departments of English, Languages, Cultures, and Applied Linguistics, Philosophy, and Psychology)
- B.S. in Neuroscience (p. 891) (jointly offered by the Department of Biological Sciences and the Center for the Neural Basis of Cognition)
- B.S. in Psychology and Biological Sciences (p. 539) (jointly offered by the Departments of Psychology and Biological Sciences)
- B.S. in Statistics and Machine Learning (p. 518) (jointly offered by the Department of Statistics and Data Science and the School of Computer Science)

CARNEGIE MELLON INSTITUTE FOR STRATEGY AND TECHNOLOGY

- B.S. in International Relations and Political Science
- B.S. in Political Science, Security, and Technology
- B.S. in Economics and Politics (p.   )
- M.S. in Security, Technology, and International Relations
- Master of Information Technology Strategy

Center for the Neural Basis of Cognition

- Ph.D. in Neural Computation
- Ph.D. in Neural Computation and Machine Learning
- Ph.D. in Neural Computation and Statistics

English

- B.A. in Creative Writing (p. 367)
- B.A. in Film and Visual Media (p. 368)
- B.A. in Literature and Culture (p. 370)
- B.A. in Professional Writing (p. 372)
- B.S. in Technical Writing (p. 373)
- M.A. in Global Communication and Applied Translation
- M.A. in Literary and Cultural Studies
- M.A. in Professional Writing
- M.A. in Rhetoric
- Ph.D. in Literary and Cultural Studies
- Ph.D. in Rhetoric

History

- B.A. in Global Studies (p. 415)
- B.A./B.S. in Social and Political History (p. 412)
- M.A. in History
- Ph.D. in History

Languages, Cultures, and Applied Linguistics

- B.A. in Chinese Studies (p.   )
- B.A. in French and Francophone Studies (p.   )
- B.A. in German Studies (p.   )
- B.A. in Hispanic Studies (p.   )
- B.A. in Japanese Studies (p.   )
- B.A. in Russian Studies (p.   )
- M.A. in Applied Second Language Acquisition
- M.A. in Second Language Acquisition
- Ph.D. in Second Language Acquisition

Philosophy

- B.A. in Philosophy (p. 455)
- B.S. in Logic and Computation (p. 454)
- M.A. in Philosophy
- M.S. in Logic, Computation and Methodology
- Ph.D. in Logic, Computation and Methodology
- Ph.D. in Philosophy
- Ph.D. in Pure and Applied Logic

Psychology

- B.A./B.S. in Psychology (p. 472)
- B.S. in Cognitive Science (p. 476)
- Ph.D. in Cognitive Neuroscience
- Ph.D. in Psychology
- Ph.D. in Psychology and Behavioral Decision Research (jointly with the Department of Social and Decision Sciences)

Social and Decision Sciences

- B.S. in Behavioral Economics (p. 492)
- B.S. in Decision Science (p. 494)
- B.S. in Policy and Management (p. 495)
- M.S. in Behavioral Decision Research
- M.S. in Social and Decision Sciences
- Ph.D. in Behavioral Decision Research
- Ph.D. in Behavioral Economics (jointly with Tepper School of Business)
- Ph.D. in Behavioral Marketing and Decision Research (jointly with Tepper School of Business)
- Ph.D. in Psychology and Behavioral Decision Research (jointly with the Department of Psychology)
- Ph.D. in Social and Decision Sciences

Statistics and Data Science

- B.S. in Statistics (p. 506)
- B.S. in Statistics (Mathematical Sciences Track) (p. 510)
- B.S. in Statistics (Statistics and Neuroscience Track) (p. 513)
- B.S. in Statistics and Machine Learning (p.) (jointly with the School of Computer Science)
- B.S. in Economics and Statistics (p. 533)
- M. of Statistical Practices
- Ph.D. in Neural Cognition and Statistics (jointly with the Center for the Neural Basis of Cognition)
- Ph.D. in Statistics
- Ph.D. in Statistics and Engineering and Public Policy (jointly with the Department of Engineering and Public Policy)
- Ph.D. in Statistics and Machine Learning (jointly with the Department of Machine Learning)
- Ph.D. in Statistics and Public Policy (jointly with the Heinz College)

Heinz College of Information Systems and Public Policy

Information Security

- M.S. in Information Security Policy and Management

Information Systems

- M. of Information Systems Management
- M. of Information Systems Management in Business Intelligence and Data Analytics
- Ph.D. in Information Systems and Management

Information Technology

- M.S. in Information Technology (Business Intelligence and Data Analytics)
- M.S. in Information Technology (IT Management)
- M.S. in Information Technology (Information Security and Assurance)
- M.S. in Information Technology (Software Design and Management)

Arts Management

- M. of Arts Management (jointly with the College of Fine Arts)
- M. of Arts Management (jointly with the College of Fine Arts) and J.D. (jointly with the University of Pittsburgh School of Law)

Entertainment Industry Management

- M. of Entertainment Industry Management (jointly with the College of Fine Arts)

Health Care Policy and Management

- M.S. in Health Care Analytics and Information Technology

Medical Management

- M. of Medical Management

Public Management

- M. of Public Management

Public Policy and Management

- M.S. in Public Policy and Management
- M.S. in Public Policy and Management (Data Analytics)
- M.S. in Public Policy and Management and M.B.A. (jointly with Tepper School of Business)
- M.S. in Public Policy and Management and J.D. (jointly with the University of Pittsburgh School of Law)
- M.S. in Public Policy and Management and M. of Divinity (jointly with the Pittsburgh Theological Seminary)
- Ph.D. in Economics and Public Policy (jointly with the Tepper School of Business)
- Ph.D. in Machine Learning and Public Policy (jointly with the School of Computer Science)
- Ph.D. in Public Policy and Management
- Ph.D. in Statistics and Public Policy (jointly with Dietrich College of Humanities and Social Sciences)

Mellon College of Science

Interdepartmental

- B.S. in Mathematical Sciences and Economics (jointly offered by the Department of Mathematical Sciences and the Undergraduate Economics Program)
- Ph.D. in Molecular Biophysics and Structural Biology

Biological Sciences

- B.A. in Biological Sciences (p. 571)
- B.S. in Biological Sciences (p. 568)
- B.S. in Biological Sciences/Neuroscience Track (p. 570)
- B.S. in Biological Sciences and Psychology (p. 571) (jointly with the Department of Psychology)
- B.S. in Neuroscience (p. 571) (jointly with the Department of Psychology)
- M.S. in Biological Sciences
- Ph.D. in Biological Sciences

Chemistry

- B.A. in Chemistry (p. 589)
- B.S. in Chemistry (p. 586)
- B.S. in Chemistry/Biological Chemistry Track (p. 591)
- M.S. in Chemistry
- M.S. in Colloids, Polymers, and Surfaces (jointly with the Department of Chemical Engineering)
- Ph.D. in Chemistry

Mathematical Sciences

- B.S. in Mathematical Sciences (p. 618)
- M.S. in Algorithms, Combinatorics, and Optimization
- M.S. in Mathematical Sciences
- M.S. in Computational Finance (jointly with the Department of Statistics, the H. John Heinz III College, and the Tepper School of Business)
- D.A. in Mathematical Sciences
- Ph.D. in Algorithms, Combinatorics, and Optimization
- Ph.D. in Mathematical Finance
- Ph.D. in Mathematical Sciences
- Ph.D. in Pure and Applied Logic (jointly with the Department of Philosophy and the School of Computer Science)

Physics

- B.A. in Physics (p. 644)
- B.S. in Physics (p. 642)
- M.S. in Physics
- Ph.D. in Applied Physics
- Ph.D. in Physics

School of Computer Science

ARTIFICIAL INTELLIGENCE

- B.S. in Artificial Intelligence (p. 674)

Computer Science

- B.S. in Computer Science (p. 683) (jointly with the Institute for Software Research)
- B.S. in Music and Technology (p. 328) (jointly with the Departments of Electrical and Computer Engineering and Music)
- M.S. in Computer Science
- M.S. in Computer Science - Foundational Studies
- M.S. in Computer Science - Research
- M.S. in Computer Science - Research Thesis
- M.S. in Computer Science (5th Year Scholars Program only)
- Ph.D. in Algorithms, Combinatorics and Optimization (jointly with the Department of Mathematical Sciences and Tepper School of Business)

- Ph.D. in Computer Science
- Ph.D. in Pure and Applied Logic (jointly with the Department of Mathematical Sciences and the Department of Philosophy)

Computational Biology Department

- B.S. in Computational Biology (p. 679)
- M.S. in Automated Science - Biological Experimentation
- M.S. in Computational Biology
- Ph.D. in Computational Biology

Human-Computer Interaction

- B.S. in Human-Computer Interaction (p. 688)
- M. of Human-Computer Interaction
- M. of Human-Computer Interaction (5th Year Scholars Program only)
- M. of Educational Technology & Applied Learning Sciences (jointly with the Dietrich College of Humanities and Social Sciences)
- M.S. in Product Management (jointly with Tepper School of Business)
- Ph.D. in Human-Computer Interaction

Institute for Software Research

- M. of Software Engineering in Embedded Systems
- M. of Software Engineering in Scalable Systems
- M. of Software Engineering in Software Engineering
- M.S. in Information Technology - Privacy Engineering
- Ph.D. in Societal Computing
- Ph.D. in Software Engineering

Language Technologies Institute

- M.S. in Artificial Intelligence and Innovation
- M.S. in Intelligent Information Systems
- M.S. in Intelligent Information Systems - Advanced Study
- M.S. in Language Technologies
- M. of Computational Data Science
- Ph.D. in Language and Information Technologies

Machine Learning

- M.S. in Machine Learning
- M.S. in Machine Learning (5th Year Scholars Program only)
- Ph.D. in Machine Learning
- Ph.D. in Machine Learning & Public Policy (jointly with the Heinz College)
- Ph.D. in Neural Computation and Machine Learning (jointly with Center for Neural Basis of Cognition)
- Ph.D. in Statistics and Machine Learning (jointly with the Dietrich College of Humanities and Social Sciences)

Robotics Institute

- B.S. in Robotics (http://coursecatalog.web.cmu.edu/schools-colleges/schoolofcomputerscience/robotics/)
- M.S. in Computer Vision
- M.S. in Robotics
- M.S. in Robotics (5th Year Scholars Program only)
- M.S. in Robotic Systems Development
- Ph.D. in Robotics

David A. Tepper School of Business

Business Administration

- B.S. in Business Administration (p. 847)

Economics

- B.A. in Economics (p. 867)
- B.S. in Economics (p. 868)
- B.S. in Economics and Mathematical Sciences (p. 869)

Industrial Administration

- M. of Business Administration (M.B.A.)
- M.B.A./M.S. in Public Policy Management (jointly with Heinz College)
- M.B.A./M.S. in Civil and Environmental Engineering (in association with Carnegie Institute of Technology)
- M.B.A. and J.D. in Law (jointly with the University of Pittsburgh Law School)
- M.B.A/M.S. in Health Care Policy Management (jointly with Heinz College)
- M.B.A/M.S in Software Engineering (jointly with the School of Computer Science)
- M.S. in Business Analytics
- M.S. in Computational Finance (jointly with Dietrich College, the Mellon College of Science, and Heinz College)
- M.S. in Product Management
- Ph.D. in Accounting
- Ph.D. in Algorithms, Combinatorics, and Optimization (jointly with the School of Computer Science and Department of Mathematical Sciences)
- Ph.D. in Economics
- Ph.D. in Finance
- Ph.D. in Information Systems
- Ph.D. in Management of Manufacturing and Automation (with Robotics Institute)
- Ph.D. in Marketing
- Ph.D. in Operations Management and Manufacturing
- Ph.D. in Operations Research
- Ph.D. in Organizational Behavior and Theory
- Ph.D. in Economics and Public Policy (jointly with Heinz College)
- Ph.D. in Strategy, Entrepreneurship, and Technological Change (jointly with the Department of Social and Decision Sciences, Heinz College, and the Department of Engineering and Public Policy)

University-Wide, Interdisciplinary, and Joint Degree Programs

Architecture-Engineering-Construction Management Program

- M.S. in Architecture-Engineering-Construction Management (jointly with the Department of Civil and Environmental Engineering and the School of Architecture)
- Ph.D. in Architecture-Engineering-Construction Management (jointly with the Department of Civil and Environmental Engineering and the School of Architecture)

BXA Intercollege Degree Programs

- B. of Computer Science and Arts (p.) (jointly with the School of Computer Science and the College of Fine Arts)
- B. of Engineering Studies and Arts (p. 899) (jointly with the College of Engineering and the College of Fine Arts)
- B. of Humanities and Arts (p.) (jointly with the Dietrich College of Humanities and Social Sciences and the College of Fine Arts)
- B. of Science and Arts (p.) (jointly with the Mellon College of Science and the College of Fine Arts)
- B.S. in an engineering discipline with an additional major in Engineering and Arts (p. 930) (jointly with the College of Engineering and College of Fine Arts)

Communication Planning and Information Design Program

- M. Design in Communication Planning and Information Design (jointly with the School of Design and the Department of English)

Computational Finance Program

- B.S. in Computational Finance (p. 881) (jointly with the Dietrich College of Humanities and Social Sciences, Heinz College, Mellon College of Science and Tepper School of Business)
- M.S. in Computational Finance (jointly with the Dietrich College of Humanities and Social Sciences, Heinz College, Mellon College of Science and Tepper School of Business)

Entertainment Technology Center

- M. of Entertainment Technology

information technology strategy

- Master of Information Technology Strategy (MITS) (https://www.cmu.edu/mits/) (jointly with the College of Engineering, School of Computer Science and the Carnegie Mellon Institute for Strategy and Technology)

Integrated Innovation Institute

- M. of Integrated Innovation for Products and Services
- M. of Integrated Innovation for Products and Services - Advanced Study
- M.S. in Software Management (Silicon Valley campus)

Science and Humanities Scholars Program

- B.A./B.S. in various disciplines (p.) (jointly with the Dietrich College of Humanities and Social Sciences and the Mellon College of Science)

Carnegie Mellon University in Qatar

Qatar Biological Sciences

- B.S. in Biological Sciences

Qatar Business Administration

- B.S. in Business Administration

Qatar Computer Science

- B.S. in Computer Science
- B.S. in Computational Biology

Qatar Information Systems

- B.S. in Information Systems

Schools/Colleges

The intersection of fields is a Carnegie Mellon University specialty. Renowned faculty at the university's seven schools/colleges explore side by side with students, collaborating on research, tackling society's biggest challenges and delivering work that matters. In addition to the hundreds of programs offered by the schools and colleges, CMU also offers dozens of interdisciplinary programs (p. 881), which are designed especially for students who want to work beyond just one discipline.

College of Engineering

William H. Sanders, Dr. William D. and Nancy W. Strecker Dean of the College of Engineering &
Professor, Electrical and Computer Engineering

Conrad Zapanta Ph.D, Associate Dean for Undergraduate Studies and Teaching Professor in Biomedical Engineering

Kurt Larsen, Assistant Dean for Undergraduate Studies

Treci Bonime, Assistant Dean for Undergraduate Studies

Location: ANSYS Hall, 2nd floor
https://engineering.cmu.edu

Carnegie Institute of Technology (CIT), the engineering college of the university, has three main activities - undergraduate education, graduate education, and research. Its continuing goal has been to maintain excellence in all these activities. The degree to which this goal has been achieved is attested to by the demand for its graduates, the success of its alumni, the quality of its students and faculty, the adoption elsewhere of its innovations, and the national and international recognition it receives in educational and research activities.

The college offers the degree of bachelor of science in chemical engineering, civil engineering, electrical and computer engineering, environmental engineering, mechanical engineering, and materials science and engineering.

An engineering student may also choose to pursue a minor in one of the CIT designated minor programs, or an additional major in engineering and public policy, biomedical engineering or engineering design, innovation & entrepreneurship. Engineering students can also design a minor, additional major or dual-degree programs with other non-engineering departments.

Educational Objectives

The overarching objective of our engineering curriculum is to provide our students an education that enables them to be productive and fulfilled professionals throughout their careers. Our more specific, measurable objectives for graduates of our engineering curriculum are the following:

- Graduates recognize that they acquired a high quality, rigorous technical education from the College of Engineering at Carnegie Mellon.
- Graduates, in addition to their technical knowledge, recognize that they have acquired a broader body of knowledge that allows them to understand the larger context of the problems that they must address during their career.
- Graduates use their technical foundation and their broader base of knowledge to be successful in a diverse collection of individual careers inside and outside of the engineering profession.

From its earliest days, Carnegie Institute of Technology (CIT) has considered undergraduate education to be the key element in the development of future leaders. In this regard, CIT has adopted a plan for education that is designed to equip students with the capacity to learn and to continue the process of self-education throughout their lives. The present curriculum incorporates this philosophy by providing the opportunity for both breadth in a number of engineering, science, humanities and fine arts areas as well as depth in a major area of concentration. To achieve these goals, our flexible curriculum has been designed to allow students to customize their program to suit their needs and to help each student acquire:

- A thorough and integrated understanding of fundamental knowledge in fields of a students' major interest and the ability to use this knowledge;
- Competence in the orderly way of thinking, which professionals and scientists have always used in reaching sound, creative conclusions, with the goal that after graduation the student can, by such thinking, reach decisions both as a professional and as a citizen;
- An ability to learn independently with scholarly orderliness, so that after graduation the student will be able to grow in wisdom and keep abreast of the changing knowledge and problems of the profession and the society in which he or she participates;
- The philosophical outlook, breadth of knowledge, and sense of values which will increase the student's understanding and enjoyment of life and enable each student to recognize and deal effectively with the human, economic, ethical and social aspects of professional problems; and
- The ability to communicate ideas to others in a comprehensive and understandable manner.

The curriculum encourages students to confront professional problems, accomplished through team and problem-oriented courses, as well as courses which emphasize design or individual projects. These classes stress creativity and independent thought and require the student to define the problem, propose a solution or a design in the presence of technical and socioeconomic constraints, to make judgments among alternative solutions, and to explore innovative alternatives to more conventional solutions.

First Year for Engineering Students

The Carnegie Mellon engineering education is based on engineering and science fundamentals that give students the skills to face new and challenging situations. The first year in engineering provides a broad foundation upon which students build a curriculum in their eventual major. Since students in CIT do not select a major until the end of the first year, all first year students share a common experience consisting of introductory courses in the engineering majors (one each semester), calculus, physics, other science courses which complements specific introductory engineering courses, and courses in the liberal arts, fine arts, business, and social sciences. This curriculum helps make an informed decision about a final major. Below is an examples of a standard schedule for a first-year engineering student.

Fall Semester	
Introductory Engineering Elective	12
Restricted Technical Elective	9-12
Differential and Integral Calculus	10
General Education	9
Computing @ Carnegie Mellon	3

Spring semester	
Introductory Engineering Elective	12
Restricted Technical Elective	10
Integration, Differential Equations, Approximation	10
General Education Course	9

Notes:

1. Each semester every CIT department offers its Introductory Engineering Elective. Every first year CIT student must select one such course each semester.

2. Each Introductory Engineering Elective requires a specific Restricted Technical Elective as given below. Restricted Technical Electives are foundational science courses relevant to engineering degrees.

Introductory Engineering Course	Restricted Technical Elective
Biomedical Engineering	**03-121**
Chemical Engineering	**09-105**
Civil & Environmental Engineering	**33-141**
Electrical & Computer Engineering	**15-110 or 15-112**
Engineering & Public Policy	**33-141**
Mechanical Engineering	**33-141**
Materials Science & Engineering	**33-141**

3. All students must complete 33-141 Physics I for Engineering Students by the end of the first year. Therefore, if a student chooses to take Introduction to Chemical Engineering (with 09-105 as a co-requisite) during one semester and Introduction to Electrical and Computer Engineering (with 15-110 as a co-requisite), the student must take 33-141 in place of the General Education requirement in the Spring semester of the first year and take the General Education course in a subsequent semester. Alternatively, a student entering the university with AP credit in a required first year course may substitute 33-141 in its place.

4. CIT students must complete the First-Year Writing requirement in their freshman year. View more information (p. 84).

General Education Programs

The environment in which today's engineering graduates will find themselves working is evolving rapidly. Technical innovation is becoming ever more critical to retaining a competitive edge. This is true for individuals, for firms and for nations. Start-ups, as well as established companies, have significant international opportunities but also face more competition in a global economy. Seizing these opportunities and dealing with the associated challenges requires an understanding of the global context in which engineers work, as well as understanding multi-disciplinary approaches to technological innovation across cultures.

The College of Engineering has developed General Education Requirements designed to ensure that our students are ready to work effectively in the global economy, and become the innovators and leaders of tomorrow.

CIT General Education Requirements

All undergraduate students must complete the First-Year Writing requirement — **the Department of English does not accept any Advanced Placement exemptions.** This requirement can be completed in two different ways:

Option 1: Enroll in one of two full-semester courses (9 units each)
76-101 Interpretation and Argument (Students for whom English is a second language may need to take 76-100 Reading and Writing in an Academic Context first. The English department will contact those students.)
76-102 Advanced First Year Writing: Special Topics: (by invitation only)

Option 2: Enroll in two of three half-semester "mini" courses* (4.5 units each)
76-106 Writing about Literature, Art and Culture:
76-107 Writing about Data
76-108 Writing about Public Problems

*Minis should be completed back-to-back within a single semester.

General Education Electives (3 total)

At least 27 units from any non-technical academic courses from the Dietrich College, College of Fine Arts, and the Tepper School of Business excluding those listed on the General Education Exclusions page (https://engineering.cmu.edu/education/undergraduate-programs/curriculum/general-education/exclusions.html). Courses from this list of non-technical courses outside of the Dietrich College or the College of Fine Arts (https://engineering.cmu.edu/education/undergraduate-programs/curriculum/general-education/non-dietrich-cfa-courses.html#undefined) may also be counted. **A maximum of 18 units of these units may be fulfilled via AP/IB/Cambridge exam credit.**

For category course lists reference the CIT General Education website (https://engineering.cmu.edu/education/undergraduate-programs/curriculum/general-education/).

General Education Categories

Students must complete each of the categories (descriptions of categories follow below). This is a 9-unit requirement. Any course taken on this list that is below 9 units must be combined with an additional course to total at least 9 units in order to complete this requirement.

Note that the units from one course cannot be split to count for two General Education categories (eg PPC and General Education Elective).

- **Innovation & Internationalization (I&I)**
  - 9 units from the I&I list of courses (which could be two 4.5 unit courses);
- **Peoples, Places, and Cultures (PPC)** [1]
  - 9 units from the PPC list; (Students can receive exemption through an approved study abroad program. These students would have three General Education Electives to complete instead of two.)
- **Social Analysis and Decision Making (SDM)**
  - 9 units from the SDM list of courses (which could be two 4.5 unit courses)
- **Writing and Expression (W&E)**
  - 9 units from the W&E list of courses (in addition to 76-101)

Experiential Learning (EL)

- 6 EL points by participating in a variety of approved activities in the following timeframe:
  - 2 points sophomore fall semester (39-210)
  - 2 points sophomore spring semester (39-220)
  - 2 points junior fall semester (39-310)

Category Descriptions

People, Places and Cultures (PPC)

PPC courses are designed to help you gain better understanding of the diversity of the world in which we live, and the way in which societal factors interact to shape that world.

Social Analysis and Decision Making (SDM)

SDM courses are focused on helping you to gain an understanding of different ways in which individuals and societies approach and make decisions.

Innovation and Internationalization (I&I)

I&I courses are intended to provide a broad perspective regarding the creation of pioneering ideas and their outcomes in a global context.

Experiential Learning (EL)

Being curious and constantly looking for inspiration are critical parts of lifelong learning. To be successful as an engineer and as a citizen, your education must not stop when you graduate from Carnegie Mellon. The EL requirement aims to encourage a habit of lifelong learning about innovation and the growing internationalization in engineering and, indeed of many other aspects of the modern world. The goal of this requirement is to help inspire the habits of being open to new ideas as successful, innovative engineers.

To do that, during both semesters of your sophomore year, and the first semester of your junior year, we require you to choose a few related activities that are not part of your formal course work. Examples could include:

- Attending approved seminars and then submitting a one page write up of your thoughts on what you heard;
- Holding an official leadership position (i.e., President, Vice President, Secretary, Treasurer) in a Carnegie Mellon sponsored organization

Additional Majors, Dual Degrees & Minors

A major is defined as a program that must be completed for the granting of a degree. Additional majors comprise a single degree with majors in two separate areas; for example, the degree of Bachelor of Science in Chemical Engineering and an additional major in English. Although the additional major requires the completion of two designated programs, they may have overlapping requirements that can be met simultaneously. The general principle used to measure eligibility for a College of Engineering additional major is that the major (core) requirements of both departments must be completed. Finally, although the student is formally enrolled as an undergraduate in one of the departments (the parent department, which is responsible for scheduling and other administrative actions for the student), the student should apply for the additional major through the second department and coordinate requirements with both departments.

The additional major is to be distinguished from a dual degree program, which results in two separate bachelor's degrees; for example, Bachelor of Science in Chemical Engineering and a Bachelor of Arts in English. The dual degree, though, requires a minimum of 90 units of work in addition to the units required for the first degree. The second degree may be earned in Bachelor of Science or Bachelor of Arts degree programs.

Requirements for students wishing to complete Additional Majors in CIT

*Note: This applies to **all** students.*

The student must satisfactorily pass all requirements of the regular and complete program (with the permissible exceptions) leading to a degree in CIT. The minimum number of units required for the additional major is the number required by the parent department or major.

The student takes and satisfactorily completes the courses specified by a second department, usually using elective space available in the first program.

The second department, on the basis of the specified number of courses plus the courses comprising the parent department's regular degree requirements, then certifies that the student has completed the requirements for a major in the second department.

Equivalent technical electives may be substituted at the discretion of the departments/colleges.

Non-technical courses in the curricula can be used to meet the requirements of the second major. But if the second major is not a Dietrich College department, the program must include a minimum of 72 units of General Education courses to meet CIT requirements for graduation.

Bachelor of Engineering Studies and Arts (BESA Program)

The Bachelor of Engineering Studies and Arts (BE (p. 894)SA) intercollege degree program (p. 894) combines the strengths of the College of Fine Arts (CFA) and the College of Engineering (ENG). This degree is tailored for students seeking to apply knowledge from duel fields to advance maker culture in novel and creative ways. Students choose their arts concentration from the following schools in CFA: Architecture, Art, Design, Drama or Music. Students choose their engineering studies concentration established by the College of Engineering. Options within the concentration include: biomedical engineering, chemical engineering, civil & environmental engineering, electrical & computer engineering, materials science & engineering or mechanical engineering.

The BESA curriculum has three main components: general education requirements, fine arts concentration requirements and engineering studies concentration requirements. Each student's course of study is structured so they can complete this rigorous program in four years.

Students receive extensive advising support. The academic advisors in the BXA Intercollege Degree Programs are the primary advisors and liaisons between CFA and ENG. Each student has two additional academic advisors: an advisor in the admitting school of CFA to guide their focus in the arts and an advisor in ENG to guide their focus in engineering studies. Please reference the Internal Transfer (https://www.cmu.edu/interdisciplinary/apply/internal-transfer.html) process.

Biomedical Engineering

The Biomedical Engineering additional major program (http://coursecatalog.web.cmu.edu/schools-colleges/collegeofengineering/departmentofbiomedicalengineering/#coursestext) takes advantage of curricular overlaps between Biomedical Engineering and traditional engineering majors, such that the additional major can be completed in four years with only a modest increase in course requirements. The requirements for Biomedical Engineering consist of the core, the tracks, and the capstone design course. The core exposes students to basic facets of biomedical engineering to lay a foundation. The tracks allow students to build depth in a specific aspect of biomedical engineering. The capstone design (https://www.cmu.edu/bme/Academics/undergraduate-programs/Resources/undergrad_design.html) engages students in teamwork to develop real-world applications. The additional major in Biomedical Engineering should be declared at the same time when declaring a traditional engineering major.

Student majoring in Biomedical Engineering must meet three sets of requirements: 1) Biomedical Engineering 2) Traditional engineering discipline 3) CIT General Education (http://www.cit.cmu.edu/current_students/services/general_education.html) sequence. The Quality Point Average (QPA) for courses that count toward the additional major must be 2.00 or higher. No course taken on a pass/fail or audit basis may be counted toward the additional major.

Engineering and Arts Additional Major

The Engineering and Arts (EA) additional major (p. 894) is intended for College of Engineering students who also have interest and talent in an arts concentration (architecture, art, drama or music) and goals that can only be accomplished at the intersection of those disciplines.

EA applications are considered every semester, with a deadline of mid-semester break for admission in the following semester. (See below for exceptions.) Along with the application, our additional major committee also considers prior semester grades and mid-semester grades for the semester of application. Decisions are sent out in advance of registration for the following semester.

The application includes an Essay of Interdisciplinary Intent, in which a student explains why they're interested in the two areas and why they want to combine them. This essay should be brief—500 words or fewer—and specific about both a student's background in the concentration areas and what their goals are for bringing them together.

Completing an additional major demands advanced planning and preparation to determine the most appropriate semester to take requirements. All students applying for EA must meet with their current Engineering advisor, the BXA director and an advisor in their target CFA area, as well as take preliminary coursework in their target area before submitting the application (https://www.cmu.edu/interdisciplinary/apply/additional-major.html).

Engineering Design, Innovation, and Entrepreneurship Additional Major (EDIE Program)

Overview

As humanity grapples with dilemmas of extraordinary complexity throughout the globe, our world needs engineers who are leaders and change makers. Our world needs engineers who seek to push the boundaries in their education, and carry their passion for technological innovation forward.

The Engineering Design, Innovation, and Entrepreneurship (EDIE) additional major will provide students the know-how to innovate products around that technology and deliver product solutions to the people who need them.

EDIE students will have expertise in technology and the ability to design, develop, and deliver economically viable solutions to the real-world challenges of today and tomorrow.

Curriculum Details

The EDIE additional major isn't just for students who want to create a startup—it will help to prepare hands-on, get-it-done leaders who are in demand in all sectors of society and industry, for-profit and not-for-profit. Given the applied focus of our curriculum, courses will equip our students with mindsets, skills, and capabilities to identify and shape opportunities and develop economically sustainable solutions.

Students in the EDIE additional major must also satisfy the core requirements of their primary major typically following the standard schedule of courses each semester. EDIE core requirements are fulfilled in addition to the course requirements of their primary major, mainly using various elective units. The side-by-side curriculum charts for each primary major show how the requirements for the stand-alone majors and the primary major plus EDIE additional major compare.

Course Requirements

Introductory Course
49-101 Engineering Design, Innovation and Entrepreneurship (12 units)

Engineering Design and Innovation Courses
49-305 Customer Discovery for Tech Innovation (4.5 units)
49-306 Engineering Design Methods & Tools (4.5 units)
49-405 Leading Engineering Innovation Teams (4.5 units)

Engineering Entrepreneurship Courses
49-205 Tech Venture Marketing for Engineers (4.5 units)
49-206 Tech Business Planning (4.5 units)
49-406 Tech Venture Formation (4.5 units)

Foundation Skills Courses
73-102 Principles of Microeconomics (9 units)
70-345 Business Presentations (9 units)

Home Department Engineering Design Capstone (12 units)

Please consult with your home engineering department to confirm the specific Engineering Design Capstone course(s) that apply to your primary engineering degree. 12 units will count towards your EDIE degree requirements.

49-420 EDIE Innovation Capstone Course (9 units)
49-421 EDIE Entrepreneurship Capstone Course (9 units)

Engineering and Public Policy

The EPP department (http://coursecatalog.web.cmu.edu/schools-colleges/collegeofengineering/departmentofengineeringandpublicpolicy/courses/) offers additional major B.S. degree programs with each of the five traditional engineering departments in the engineering college. The engineering additional major leads to a fully accredited engineering degree that prepares students for traditional technical career. EPP additional major engineers are not educated to be a different kind of engineer. Rather their education is intended to enable them to be better, more socially responsible engineers in the traditional technical fields.

Students who earn an additional major in Engineering and Public Policy at the undergraduate level do so in conjunction with a traditional engineering major. The elements of the EPP undergraduate program broaden the traditional scope of technical analysis to encompass an engineering solution's potential impact on society. Thus, our graduates have the same skills as their peers in traditional engineering majors, but with a broader societal perspective and additional analysis skills. This enables our graduates to understand the interface between technology and society and to help solve the complex, interdisciplinary systems problems facing our world, in their careers. Students will be able to work in a variety of career fields, including technical and non-technical, in industry, government, or elsewhere where these broad skills are needed.

Designated Minors for Engineering Students

Undergraduate students in the College of Engineering can elect to complete an interdisciplinary Designated Minor in addition to their primary major. Designated minors have been added to the curriculum to provide the student with technical elective content in areas related to the research expertise of our faculty. Students may select a designated minor from the following list:

- Audio Engineering
- Biomedical Engineering*
- Colloids, Polymers and Surfaces
- Electronic Materials
- Global Engineering
- Information Security, Privacy, and Policy*
- Material Science and Engineering
- Mechanical Behavior of Materials

* Also available for non-CIT students

Complete descriptions of the designated minors can be found at CIT Designated Minors (http://coursecatalog.web.cmu.edu/schools-colleges/collegeofengineering/undergraduatedesignatedminors/.html).

To declare a CIT Designated Minor, please contact the director listed for each minor.

Minors for Non-Engineering Students

Students in a non-engineering discipline can also declare certain CIT minors:

- Biomedical Engineering
- Engineering Studies
- Technology and Policy

A full listing of curriculum for these minors when taken by non-engineering students can be found at CIT Minors for Non-Engineering Students (p. 192).

Academic Standards

Grading Practices

For undergraduate grading regulations, please see Undergraduate Academic Regulations (p. 25).

CIT Dean's Honor List

Each semester, Carnegie Institute of Technology recognizes students who have earned outstanding academic records by naming them on the dean's honor list. The criterion for such recognition is a semester quality point average of at least 3.75 while completing at least 36 factorable units and earning no incomplete grades.

Transfer into CIT Departments

Undergraduate students admitted to colleges other than CIT who wish to transfer into a CIT department during their first year should consult with an advisor in the Undergraduate Studies Office in the CIT Dean's Office.

First-year students can apply for transfer after mid-semester grades for the spring semester have been posted. At that time, a decision will be based on availability of space and the student's academic performance.

CIT undergraduate students beyond the first year wishing to transfer into another CIT department may apply if they are in good academic standing and if there is room in the department of their choice. If the demand for any department exceeds the space available, then the department will admit students based on a comparative evaluation of all applicants at the end of each semester, up to the limit of available space.

Undergraduate students not in CIT who wish to transfer into a CIT department beyond the first year will be considered for transfer on a rolling space available/academic performance basis.

Criteria for all applicants include space in the department, good academic standing, and successful completion of or being currently enrolled in at least one introductory to engineering course (minimally the one of the target major), the appropriate science co-requisite, math (21-120, 21-122) and Physics 1 (33-141, 33-121, or 33-151).

Procedure for transfer of students from another university into CIT departments: A student first applies through the Office of Admission. If the Office of Admission believes the applicant is acceptable, the student's record is sent to the CIT Undergraduate Studies Office for evaluation and a decision on acceptance/rejection is made in consultation with the target department.

Academic Actions

In order to maintain good academic standing, CIT students must attain at least minimum quality point averages for each semester (as well as cumulatively) and also maintain adequate progress toward completing graduation requirements. Minimum QPA (quality point average) for good academic standing is 2.00. "Adequate academic progress towards graduation" generally means that students are successfully completing approximately 45-55 units per semester so that at the end of eight semesters they will have accumulated the minimum units required for graduation, have a cumulative QPA of at least 2.00, and have completed all degree requirements.

In addition to academic actions based on QPA, CIT students may be placed on warning, subsequent suspension or drop, if they do not demonstrate reasonable progress through the core curriculum of their major (e.g., not completing a core class after three attempts). Students are encouraged to consult with their academic advisor about any concerns with regard to lack of progress in their chosen major to determine if any course drop or withdrawal will lead to an action.

When a student fails to meet minimum performance criteria, it results in an academic action. Depending on the circumstances, one of the following actions is taken: academic warning, warning continued, suspension, or drop. These academic actions are recommended by the college's departments, based on the guidelines described below, and adjudicated by the CIT Undergraduate Studies Office. However, the sequence of the academic actions is not automatic in all cases. Decisions may be based on unique individual student performance and circumstances, and are not determined solely on the basis of grades and quality point averages.

Warning

A student is on academic warning when performance either for the semester or cumulatively fails to meet the minimum standard. The term of academic warning is one semester, and signifies to the student the college's insistence that academic performance return to at least the minimum acceptable level.

Students are removed from warning when adequate academic progress* toward completing graduation requirements is being made, and:

- First year students: if the second semester's QPA and fall/spring combined QPA is 2.00 or above
- Students in the third or subsequent semester of study: if the semester QPA and cumulative QPA (excluding the first year) are 2.00 or above

Warning Continued

A student on warning in their third or subsequent semester who earns at least a 2.00 semester QPA is continued on academic warning when cumulative performance (exclusive of first year) is below 2.00.

A first-year student on warning, who earns a semester grade point average above 2.00 but cumulative QPA is below 2.00 will be continued on warning.

Suspension

A first year student on warning, who earns a semester QPA below 2.00 will be suspended.

A student on warning in the third or subsequent semester, who earns a semester QPA below 2.00 will be suspended.

The typical period of academic suspension is two semesters (excluding summer), during which a student on academic suspension is expected to reflect on the circumstances leading up to the suspension, identify the issues that prevented achieving academic success, take actions that address these issues, demonstrate sufficient readiness to return to the university and successfully resume their studies.

Two months prior to the end of that suspension period, a student may petition to return to school (on final warning) by completing the following steps:

- Writing a formal petition, requesting to return and receiving permission in writing from the CIT associate dean for undergraduate studies.
- If approved for return, completing a Return from Leave of Absence form from Enrollment Services; and
- Providing transcripts if the student has been in a program at another college or university even though academic credit earned may not transfer back to Carnegie Mellon University unless prior approval from the associate/assistant dean is given. A maximum of two approved courses may be transferred.

Drop

Students who have been suspended and who fail to meet minimum standards in the subsequent semester(s) after they return to school on warning will be dropped from the College of Engineering.

Students who have been suspended or dropped and are not admitted to another program at the university are required to absent themselves from the campus (including residence halls, office labs, libraries, and Greek houses).

Graduation Requirements and degree certification

To be eligible to graduate, undergraduate students must complete all course requirements for their department with a cumulative Quality Point Average of at least 2.0 for all courses taken. For undergraduate students who enrolled at Carnegie Mellon as freshman and whose freshman grades cause the cumulative QPA to fall below 2.0, this requirement is modified to be a cumulative QPA of at least 2.0 for all courses taken after the freshman year. Note, however, the cumulative QPA that appears on the student's final transcript will be calculated based on all grades in all courses taken, including freshman year. Some departments may have additional QPA requirements in order to graduate. Students are encouraged to confirm all graduation requirements with their academic advisor.

1. All mathematics (21-xxx) courses **required*** for the engineering degree taken at Carnegie Mellon must have a minimum grade of C in order to be counted toward the graduation requirement for the BS engineering degree.

2. A minimum grade of C must be achieved in any required mathematics (21-xxx) course that is a pre-requisite for the next higher level required mathematics (21-xxx) course.

***Elective mathematics courses are not included in this policy**

Students must be recommended for a degree by the faculty of CIT.

A candidate must meet the residence requirement of having completed at least 180 units at Carnegie Mellon University.

Students must meet all financial obligations to the university before being awarded a degree.

Modification of Graduation Requirements: A student may seek permission to modify graduation requirements by petition to the CIT College Council.

Please reference the University's Degree Certification policy (http://coursecatalog.web.cmu.edu/aboutcmu/undergraduateacademicregulations/#degreecertificationtextcontainer). **For engineering students:**

All BS students are expected to complete the BS degree within the standard 8-semester timeline. Units cannot be double counted between BS and MS. Courses taken within the first 8 semesters will first be counted toward completing the BS requirements.

Students who plan to enter an MS program but are unable to complete the BS degree within the 8-semester timeframe can petition to extend their time as an undergraduate. This petition should be addressed to their undergraduate academic advisor and the CIT Undergraduate Dean's Office.

CIT Interdisciplinary Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

39-109 Grand Challenge Freshman Seminar: Climate Change

Fall and Spring: 9 units
Climate change is considered by many the most serious social, political, and environmental issue of the 21st century. As human activities increase the level of greenhouse gases in the atmosphere, scientists have established the reality of climate change and have estimated its impacts on human society and the natural world. Despite the scientific consensus on its existence, causes, and consequences, a substantial number of Americans and citizens of other countries still question these conclusions and a small but vocal group of doubters continue to challenge the science and scientific consensus on climate change. In spite of some social division over these issues, governments at local, national, and international levels have made concerted efforts to craft policies to address climate change. These policies have shifted over time as the information, attitudes, and technology associated with climate change have evolved. In this course, we will explore the challenges and complexities of climate change by investigating the subject from a variety of angles: scientific, political, rhetorical, cultural, economic, technological, and ethical. Over the course of the semester, well inquire: What is climate change? How do scientists know it is happening? Why is there public debate over it? What solutions are available? And what are the pros and cons of the different solutions?

39-135 DC Grand Challenge First-Year Seminar: Designing Better Human-AI Futures

Intermittent: 9 units
This course will explore the societal impacts of artificial intelligence (AI) based decision-making systems, especially focusing on the societal biases they may enhance or reduce. Students will gain a fundamental understanding of how these systems are designed and work, as well as the role of data in mitigating or enhancing biases. The course is multidisciplinary in nature and brings together social scientists, engineers, data scientists, and designers to tackle the grand challenge of dealing with issues of bias and fairness in Human-AI collaborative systems, ranging from the data that is used to train them, to their human creators that are responsible for deciding how they work and get used. Students will investigate policy, technology and societal elements aimed at reducing and mitigating the impact of AI biases that can negatively impact society, especially its vulnerable members.

39-210 Experiential Learning I

Fall and Spring
The engineer of the 21st century will need to operate effectively in many settings and often with a global perspective. Being curious and constantly looking for inspiration are critical for lifelong learning. This course, designed for all CIT sophomores, requires the student to choose and experience activities for development and growth that are not part of formal course work. Acceptable experiences are listed in the course syllabus on Canvas.

39-220 Experiential Learning II

Fall and Spring
The engineer of the 21st century will need to operate effectively in many settings and often with a global perspective. Being curious and constantly looking for inspiration are critical for lifelong learning. This course, designed for all CIT sophomores, requires the student to choose and experience activities for development and growth that are not part of formal course work. Acceptable experiences are listed in the course syllabus on Canvas.
Prerequisite: 39-210

39-245 Rapid Prototype Design

All Semesters: 9 units
This course provides an introduction to rapid design through virtual and physical prototyping. The class covers the engineering design process, problem solving methods, interdisciplinary team work, current industrial practice, and manufacturing process capabilities. The course emphasizes hands on learning. Sophomores have priority while registering for this course. Juniors and seniors will be put on the waitlist, then released once sophomores have registered.

39-250 CIT Undergraduate Projects

Fall
This course number is to be used for Fall CIT freshman research projects only. Student must complete a CIT Undergraduate Project Approval form (located in Scaife Hall 110) and submit for approval. The form must include a complete description and a signature approval from the research advisor/instructor. If the project is approved, the CIT Undergraduate Studies Office will add the course to the student's fall schedule.

39-251 CIT Undergraduate Projects

Spring
This course number is to be used for Spring CIT freshman research projects only. Student must complete a CIT Undergraduate Project Approval form (located in Scaife Hall 110) and submit for approval. The form must include a complete description and a signature approval from the research advisor/instructor. If the project is approved, the CIT Undergraduate Studies Office will add the course to the student's fall schedule.

39-310 Experiential Learning III

Fall and Spring
The engineer of the 21st century will need to operate effectively in many settings and often with a global perspective. Being curious and constantly looking for inspiration are critical for lifelong learning. This course, designed for all CIT juniors, requires the student to choose and experience activities for development and growth that are not part of formal course work. Acceptable experiences are listed in the course syllabus on Canvas.
Prerequisite: 39-220

39-402 Leadership Development Seminar

All Semesters: 9 units
This course is designed for CIT seniors and juniors committed to further developing their leadership skills and potential for sustained impact in the future. The course will be substantive and engaging, while less technically challenging, outright, than thought provoking, edifying, and enjoyable, ideally. The course will build on the foundation of six key leadership pillars, identified by CIT to hone a student's professional and personal development to serve others, and to seek out and nurture opportunities to heighten one's capacity as a person and leader who is: VISIONARY, with clear goals for yourself, your organizations and communities, and others in whose lives you are a part, including the broader society; ETHICAL, with core values and steadfastness in the face of competing objectives, and the resilience to deal with conflicts without moral compromise; ENGAGING, with empathy, attentive interpersonal attributes, outstanding formal and informal communication skills, and the capacity to inspire; TACTICAL, with an ability to operationalize big ideas and bring them to fruition, creating the ideal environment for individual and group success; TECHNICAL, based on your own high-level skill set and the ego strength for inclusion of others with complementary realms of expertise; REFLECTIVE, manifesting in the honest appraisal of personal and organizational success against metrics, and the ability to redirect based on assessment.

39-447 CIT Undergraduate Interdisciplinary Design Project

All Semesters
This course is to be used for undergraduate research projects involving a significant interdisciplinary design component. It can be added by permission only through collaboration with the student, project advisor, and the CIT Dean's Office. For projects that are not interdisciplinary in nature, students should refer to the research number specific to the department in which the research is being completed.

39-500 CIT Honors Research Project

All Semesters
Juniors who have an accumulated QPA of at least 3.5 receive an invitation to participate in the program. This course, open by invitation only, will provide the opportunity for close interaction with a faculty member through independent honors research in a number of disciplinary and interdisciplinary areas, as part of the CIT Honors Research Program. Students will work on their projects during their senior year, earning the equivalent of 18-24 units. Students are required to register for CIT Honor Research Project 39-500. To receive CIT College Honors, a student must complete at least 18 units in 39-500 on the same research topic and submit a 1-page executive summary of your research. Lastly, students must present their research findings at the Undergraduate Research Symposium, "Meeting of the Minds" in May. Although "Meeting of the Minds" is open to any undergraduate research initiatives occurring on campus, it is a requirement for College of Engineering Honors Research students.

Course Website: https://tinyurl.com/cithonorsresearch (https://tinyurl.com/cithonorsresearch/)

39-601 Special Topics: Additive Manufacturing Processing and Product Development

Fall: 12 units
Introduction to additive manufacturing (AM) processing fundamentals and applications using Solidworks 3-D CAD software and a variety of polymer and metal AM machines. Includes a brief history of AM processing, a review of and technical fundamentals of current AM processes, a study of the current AM market, and future directions of the technology. Lab Sessions will support an open-ended product development project. Lectures on metals AM will address current research impacting industry. Students will also perform a literature review of papers on the state of the art. Basic Solidworks knowledge required.

39-602 Additive Manufacturing and Materials

Fall and Spring: 12 units
This course will develop the understanding required for materials science and engineering for additive manufacturing. The emphasis will be on powder bed machines for printing metal parts, reflecting the research emphasis at CMU. The full scope of methods in use, however, will also be covered. The topics are intended to enable students to understand which materials are feasible for 3D printing. Accordingly, high power density welding methods such as electron beam and laser welding will be discussed, along with the characteristic defects. Since metal powders are a key input, powder-making methods will be discussed. Components once printed must satisfy various property requirements hence microstructure-property relationships will be discussed because the microstructures that emerge from the inherently high cooling rates differ strongly from conventional materials. Defect structures are important to performance and therefore inspection. Porosity is a particularly important feature of 3D printed metals and its occurrence depends strongly on the input materials and on the processing conditions. The impact of data science on this area offers many possibilities such as the automatic recognition of materials origin and history. Finally the context for the course will be discussed, i.e. the rapidly growing penetration of the technology and its anticipated impact on manufacturing.

39-603 Additive Manufacturing Laboratory

Spring: 12 units
Hands-on laboratory projects will teach students about all aspects of metals additive manufacturing (AM). Students will learn how to use SOLIDWORKS for part design, create and transfer design files to the AM machines, run the machines to build parts, perform post-processing operations, and characterize AM parts. Student will work in teams and complete three separate lab projects, each utilizing a different material system, part design, AM process/machine, post-processing steps and characterization methods. A major lab report and presentation will be required for each of the three lab projects. The course includes weekly lectures to complement the laboratory component. Priority for enrollment will be given to students who have declared the Additive Manufacturing Minor.
Prerequisites: 39-602 or 27-503 or 27-765 or 39-601 or 24-632

39-605 Engineering Design Projects

Fall: 12 units
In this project course, students work in multidisciplinary teams to design products or processes. The course is open to juniors, seniors and graduate students from all parts of the campus community. Each project is sponsored by an industry, government or non-profit partner, and is of real commercial interest to that partner. Students work directly with their partner throughout the semester to establish goals and requirements, evaluate their design as it progresses, and produce a final report, presentation, and, if appropriate, a prototype. Design reviews, held twice during the semester, give students a chance to present their preliminary designs and receive feedback and advice. In completing their designs, teams must consider not only the functionality of their designs, but also the look, feel, appearance, and societal impact. Skills built in this course will include: developing the product statement, establishing goals and constraints for the product, project management, and generating and evaluating design alternatives. As some projects may span multiple semesters with new groups of students, careful documentation of project work is emphasized. Students may take this course for either one or two semesters.

39-606 Engineering Design Projects

Spring: 12 units
In this project course, students work in multidisciplinary teams to design products or processes. The course is open to juniors, seniors and graduate students from all parts of the campus community. Each project is sponsored by an industry, government or non-profit partner, and is of real commercial interest to that partner. Students work directly with their partner throughout the semester to establish goals and requirements, evaluate their design as it progresses, and produce a final report, presentation, and, if appropriate, a prototype. Design reviews, held twice during the semester, give students a chance to present their preliminary designs and receive feedback and advice. In completing their designs, teams must consider not only the functionality of their designs, but also the look, feel, appearance, and societal impact. Skills built in this course will include: developing the product statement, establishing goals and constraints for the product, project management, and generating and evaluating design alternatives. As some projects may span multiple semesters with new groups of students, careful documentation of project work is emphasized. Students may take this course for either one or two semesters.

39-647 Special Topics in Design

All Semesters
This course is to be use for Interdisciplinary Engineering Design Independent Study. It can be added by permission only through collaboration with the student, Independent Study project advisor, and the CIT Dean's Office.

39-648 Rapid Prototyping of Computer Systems

Spring: 12 units
This course deals with rapid prototyping, manufacture, and applications of a new generation of wearable computers, with head-mounted display. The design of wearable computers is a multidisciplinary process including: Electronic design, mechanical design, software development, and human-computer interaction. Two classes of wearable computers will be further developed: embedded, custom designed VuMan series, and general purpose Navigator series. Electronic design includes the custom designed computer board, electronic interfacing, and power supply. Industrial designers and mechanical engineers team to design and manufacture with in-house facilities a variety of conformable/lightweight housings. A software development environment and user interface builders support software and application development. Current applications include: Global Position Sensing, Hypertext documents, speech recognition, wireless communications, and digital imaging.

Department of Biomedical Engineering

Keith E. Cook, Department Head and The David Edward Schramm Professor

Jana Kainerstorfer, Associate Department Head for Faculty and Graduate Affairs

www.cmu.edu/bme (http://www.cmu.edu/bme/)

Biomedical Engineering Overview

Biomedical Engineering education at Carnegie Mellon University reflects the belief that a top biomedical engineer must be deeply trained in both a traditional engineering practice and biomedical sciences. The unique additional major in Biomedical Engineering program leverages extensive collaborations with sister departments in the College of Engineering and with major medical institutions in Pittsburgh. This collaborative approach, combined with a rigorous engineering education, confers unique depth and breadth to the education of Biomedical Engineering graduates. The Biomedical Engineering department also offers an additional major in Biomedical Technology, which is open to all non-engineering students who want training beyond the Biomedical Engineering minor. The additional major curricula, demanding but readily feasible to complete in four years, are highly rewarding to motivated students.

Additional Major in Biomedical Engineering (BME) for Engineering Majors

Students who elect Biomedical Engineering as a major ***must also declare a major in one of the traditional engineering disciplines.*** The Biomedical Engineering additional major program takes advantage of curricular overlaps between Biomedical Engineering and primary Engineering majors, such that the additional major can be completed in four years with only a modest increase in course requirements. The requirements for Biomedical Engineering additional major program consist of the core, the tracks, and the capstone design course. The core exposes students to basic facets of biomedical engineering to lay a foundation. The tracks allow students to build depth in a specific aspect of biomedical engineering. The capstone design (https://www.cmu.edu/bme/Academics/undergraduate-programs/Resources/undergrad_design.html) project engages students in teamwork to develop real-world devices and technologies. *The additional major in Biomedical Engineering should be declared at the same time when declaring a traditional engineering major.*

Additional Major in Biomedical Technology (BMT) for Non-engineering Majors

The Biomedical Technology major is ***open to all non-engineering students***. Biomedical Technology is for students from non-engineering majors who want Biomedical Engineering training beyond the BME minor. The requirements for the Biomedical Technology additional major program consist of the core, the tracks, and the capstone design course. The core exposes students to basic facets of biomedical engineering to lay a foundation. The tracks allow students to build depth in a specific aspect of biomedical engineering. The capstone design (https://www.cmu.edu/bme/Academics/undergraduate-programs/Resources/undergrad_design.html) project engages students in teamwork to develop real-world applications. *The additional major in Biomedical Technology should be declared at the same time when declaring a primary major or by the second semester of the first year.*

Minor in Biomedical Engineering

The minor program is designed for students who desire exposure to biomedical engineering but may not have the time to pursue the Biomedical Engineering additional major. The program is ***open to students of all colleges*** and is popular among both engineering and science majors. In conjunction with other relevant courses, the program may provide a sufficient background for jobs or graduate studies in biomedical engineering. Students interested in a medical career may also find this program helpful.

Additional Major in Biomedical Engineering (BME) for Engineering Majors

PROGRAM REQUIREMENTS

Students who elect Biomedical Engineering (BME) as a major ***must also declare a major in one of the traditional engineering disciplines:*** Chemical Engineering, Civil Engineering, Electrical & Computer Engineering, Environmental Engineering, Materials Science & Engineering, or Mechanical Engineering. Students majoring in Biomedical Engineering must meet **three** sets of requirements: 1) Biomedical Engineering, 2) Primary Major, and 3) General Education. The Quality Point Average (QPA) for courses that count toward the additional major must be 2.00 or better. No course taken on a pass/fail or audit basis may be counted towards the additional major. *The additional major should be declared at the same time when declaring a primary major or by the second semester of the first year.*

Minimum units required for additional major (Core Courses + Track Electives): 93 - 102

Core Courses

All core courses are required.

		Units
03-121	Modern Biology	9
or 03-151	Honors Modern Biology	
42-101	Introduction to Biomedical Engineering	12
42-201	Professional Issues in Biomedical Engineering	3
42-202	Physiology	9
42-203	Biomedical Engineering Laboratory #	9
42-302	Biomedical Engineering Systems Modeling and Analysis	9
42-401	Foundation of BME Design *	6
42-402	BME Design Project	9
Total units of Core Courses		**66**

Also known as 03-206 for Health Professions Program (http://www.cmu.edu/hpp/) students.
* 42-401 serves as the precursor/pre-requisite for 42-402 BME Design Project.

Track Electives

Completion of ***one track*** is required. See **Tracks for BME/BMT Major** for Track Elective lists.

		Units
42-XXX	Required Elective from the selected track	9 - 12
XX-XXX	Required or Additional Elective from the selected track	9 - 12
XX-XXX	Required or Additional Elective from the selected track	9 - 12
Total units of Track Electives		**27-36**

Additional Major in Biomedical Technology (BMT) for Non-Engineering Majors

PROGRAM REQUIREMENTS

The Biomedical Technology (BMT) major is ***open to all non-engineering students***. The Biomedical Technology is for students from non-engineering majors who want Biomedical Engineering training beyond the BME minor. Students majoring in Biomedical Technology must meet **three** sets of requirements: 1) Biomedical Technology, 2) Primary Major, and 3) General Education. The Quality Point Average (QPA) for courses that count toward the additional major must be 2.00 or better. No course taken on a pass/fail or audit basis may be counted towards the additional major. *The additional major should be declared at the same time when declaring a primary major or by the second semester of the first year.*

Minimum units required for additional major (Core Courses + Track Electives): 84 - 93

Core Courses

All core courses are required.

		Units
03-121	Modern Biology	9
or 03-151	Honors Modern Biology	
42-101	Introduction to Biomedical Engineering	12
42-201	Professional Issues in Biomedical Engineering	3
42-202	Physiology	9
42-203	Biomedical Engineering Laboratory #	9
42-401	Foundation of BME Design *	6
42-402	BME Design Project	9
Total units of Core Courses		**57**

Also known as 03-206 for Health Professions Program (http://www.cmu.edu/hpp/) students.
* 42-401 serves as the precursor/pre-requisite for 42-402 BME Design Project.

Track Electives

Completion of ***one track*** is required. See **Tracks for BME/BMT Major** for Track Elective lists.

		Units
42-XXX	Required Elective from the selected track	9 - 12
XX-XXX	Required or Additional Elective from the selected track	9 - 12
XX-XXX	Required or Additional Elective from the selected track	9 - 12
Total units of Track Electives		**27-36**

Minor in Biomedical Engineering

Kristin Kropf, *Undergraduate Program and Alumni Relations Coordinator, Biomedical Engineering*
Email: kgaluska@andrew.cmu.edu
https://www.cmu.edu/bme/Academics/undergraduate-programs/minor.html

The minor program is designed for students who desire exposure to biomedical engineering but may not have the time to pursue the Biomedical Engineering additional major. The program is open to students of **all** colleges and is popular among both engineering and science majors. In conjunction with other relevant courses, the program may provide a sufficient background for jobs or graduate studies in biomedical engineering. Students interested in a medical career may also find this program helpful.

The Biomedical Engineering minor curriculum is comprised of three core courses and three electives. The Quality Point Average (QPA) for courses that count toward the minor must be 2.00 or better. No course taken on a pass/fail or audit basis may be counted towards the minor.

Students who have questions or are interested in declaring Biomedical Engineering minor should contact Kristin Kropf (kgaluska@andrew.cmu.edu).

PROGRAM REQUIREMENTS

Minimum units required for minor: 57

03-121	Modern Biology	9
or 03-151	Honors Modern Biology	
42-101	Introduction to Biomedical Engineering	12
42-202	Physiology	9
42-xxx	BME Elective I	9-12
42-xxx	BME Elective II	9-12
42-xxx	BME Elective III	9-12

A BME Elective is defined as one of the following:

1. One semester of 42-200 Sophomore BME Research Project, 42-300 Junior BME Research Project, 42-400 Senior BME Research Project or 39-500 Honors Research Project. The project must be supervised by a core or courtesy Biomedical Engineering faculty member and for 9 or more units. Research projects supervised by a courtesy Biomedical Engineering faculty member must have significant biomedical engineering relevance. Note that BME Research Project can only be count as one BME elective.
2. 42-203 BME Laboratory (or the cross-listed version 03-206 for students in the Health Professions Program). Please note that priority for enrollment in 42-203 or 03-206 will be given to students who have declared the Additional Major in Biomedical Engineering. If sufficient room in the course remains after all majors have been accommodated in a given semester, students who have declared the Biomedical Engineering Designated Minor will be given the next priority for enrollment. If space still allows, other students will be enrolled.
3. Any 42-xxx course with a course number greater than 42-300 and worth at least 9 units (excluding 42-300 and 42-400- see previous comment regarding BME Research Project).

Note that non-BME, track elective courses for BME major do not automatically qualify as BME minor electives. Students can petition the Biomedical Engineering Undergraduate Affairs Committee to count non-BME classes that have significant biological/medical *and* engineering contents towards the minor requirements. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Biomedical Engineering/Technology Tracks

Completion of one track is required. † Denotes tracks that are not offered to Classes of 2027+.

- Biomechanics (BMEC (p. 91))
- Biomedical Devices (BMDV (p. 92))
- Biomedical Signal and Image Processing (BSIP (p. 92))
- Neuroengineering (Neuro (p. 93))
- Tissue and Cell Biotherapeutics (TCB (p. 93))
- Biomaterials and Tissue Engineering (BMTE (p. 94)) †
- Cellular and Molecular Biotechnology (CMBT (p. 94)) †
- Self-Designed Biomedical Engineering (SBME (p. 94))

Biomechanics (BMEC) Track

OVERVIEW

The BMEC track addresses the application of solid or fluid mechanics to biological and medical systems. It provides quantitative understanding of the mechanical behavior of molecules, cells, tissues, organs, and whole organisms. The field has seen a wide range of applications from the optimization of tissue regeneration to the design of surgical and rehabilitation devices.

TARGETS

The BMEC track is ideally suited to the combined education of Biomedical Engineering and Mechanical Engineering or Civil & Environmental Engineering. Both provide the necessary foundation in the underlying physical principles and their non-Biomedical Engineering applications. This track may also appeal to students of Electrical & Computer Engineering who are interested in biomedical robotics. Education in biomechanics enables students to pursue careers in medical devices or rehabilitation engineering.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the BMEC Track must take must take the following combination of **three** courses:

- One (1) **Required** BMEC Elective
- Two (2) BMEC Electives (either **Required** or **Additional**)

BMEC ELECTIVES

Required BMEC Electives (must take at least one of the following)

42-649/24-664	Introduction to Biomechanics	12
42-648/	Cardiovascular Mechanics	12
42-645/24-655	Cellular Biomechanics	9
42-691/24-663	Biomechanics of Human Movement	12

Additional BMEC Electives

42-641	Rehabilitation Engineering	9
42-640/24-658	Image-Based Computational Modeling and Analysis	12
42-444	Medical Devices	9
42-696/24-665	Special Topics: Wearable Health Technologies	12
16-868	Biomechanics & Motor Control	12
16-879	Medical Robotics	12
42-x00	BME Research* or 39-500 CIT Honors Research Project* or 42-6XX Clinical Course (Surgery for Engineers/Precision Medicine/ICU Medicine)	9-12

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Sample schedules can be found on the BME Additional Major (https://www.cmu.edu/bme/Academics/undergraduate-programs/major.html) page on the BME website.

Biomedical Devices (BMDV) Track

OVERVIEW

The BMDV track studies design, construction, and testing of devices at the interface of medicine and engineering. The topics include biomedical sensors, actuators, diagnostic devices, therapeutic devices, instruments, systems, and fundamental topics of device material, device fabrication, and device interaction with biological cells, tissues and organs. The Biomedical Device track will prepare students for leaders in the biomedical device industry and for further education in graduate/medical schools.

TARGETS

The BMDV track will prepare students to be leaders in the biomedical device industry and for further education in graduate/medical schools. It is ideal for students interested in combining the education of Biomedical Engineering with Electrical and Computer Engineering, or with Mechanical Engineering, or with Materials Science & Engineering.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the BMDV Track must take must take the following combination of **three** courses:

- One (1) **Required** BMDV Elective
- Two (2) BMDV Electives (either **Required** or **Additional**)

BMDV ELECTIVES

Required BMDV Electives (must take at least one of the following)

42-660	Bioinstrumentation	12
42-678	Medical Device Innovation and Realization	12
42-693/18-469	Special Topics in Integrated Systems Technology: Micro/Nano Biomedical Devices	12
42-694	Engineering Principles of Medical Devices	9

Additional BMDV Electives

42-433	Neural Technology: Sensing and Stimulation	12
42-444	Medical Devices	9
42-611/27-709	Biomaterials	12
42-616/27-514	Bio-nanotechnology: Principles and Applications	9
42-630	Introduction to Neural Engineering	12
42-641	Rehabilitation Engineering	9
42-648/	Cardiovascular Mechanics	12
42-650	Introduction to Biomedical Imaging	9
42-652/18-416	Nano-Bio-Photonics	12
42-675	Fundamentals of Computational Biomedical Engineering	12
42-696/24-665	Special Topics: Wearable Health Technologies	12
16-467	Introduction to Human Robot Interaction	12
16-879	Medical Robotics	12
42-6XX	Clinical Course (Surgery for Engineers/ Precision Medicine/ICU Medicine)	9
42-X00	BME Research* or 39-500 CIT Honors Thesis	9

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Sample schedules can be found on the BME Additional Major (https://www.cmu.edu/bme/Academics/undergraduate-programs/major.html) page on the BME website.

Biomedical Signal and Image Processing (BSIP) Track

OVERVIEW

The BSIP track addresses biomedical phenomena based on the information embedded in sensor-detected signals, including digital images and nerve electrical pulses. Students in this track will gain an understanding of the technologies involved in acquiring signals and images, the mathematical principles underlying the processing and analysis of signals, and the applications of signal/image processing methods in basic research and medicine.

TARGETS

This track aligns most naturally with a combined education of Biomedical Engineering and Electrical & Computer Engineering, which lays a solid foundation in signal processing principles. This track prepares students for careers in medical imaging or smart prosthetics. It also interfaces with many clinical practices including radiology, neurology/neurosurgery, and pathology.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the BSIP Track must take the following combination of **three** courses:

- One (1) **Required** BSIP elective
- Two (2) BSIP Electives (either **Required** or **Additional**)

BSIP ELECTIVES

Required BSIP Electives (must take at least one of the following)

42-650	Introduction to Biomedical Imaging	9
42-668	"Fun"-damentals of MRI and Neuroimaging Analysis	9
42-631	Neural Data Analysis	12
42-632	Neural Signal Processing	12

Additional BSIP Electives

42-437	Biomedical Optical Imaging	9
42-640/24-658	Image-Based Computational Modeling and Analysis	12
42-656	Introduction to Machine Learning for Biomedical Engineers	9
42-660	Bioinstrumentation	12
42-675	Fundamentals of Computational Biomedical Engineering	12
16-725	(Bio)Medical Image Analysis	12

18-491	Digital Signal Processing [1]	12
42-x00	BME Research* or 39-500 CIT Honors Research Project* or 42-6XX Clinical Course (Surgery for Engineers/Precision Medicine/ICU Medicine)	9-12

[1] Students make take either 18-491 Fundamentals of Signal Processing OR 18-792 Advanced Digital Signal Processing (but not both)

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Sample schedules can be found on the BME Additional Major (https://www.cmu.edu/bme/Academics/undergraduate-programs/major.html) page on the BME website.

Neuroengineering (Neuro) Track

OVERVIEW

The Neuroengineering (Neuro) track uses engineering techniques to examine, understand, and apply the properties of complex neural systems. Areas of interest include the research and development of neuroengineering technologies for sensing, interfacing, imaging, and modulating the nervous systems. Examples of applications include brain-computer interfaces for use in paralysis, neural stimulation device design for sensory and motor prostheses and basic science research, and neural recording and imaging devices.

TARGETS

This track aligns most naturally with a combined education of Biomedical Engineering and Electrical & Computer Engineering, which lays a solid foundation in signal processing principles. This track prepares students for careers in brain-computer interfaces, neural stimulators, and neuroprosthetics.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the BMEC Track must take must take the following combination of **three** courses:

- One (1) **Required** Neuro Elective
- Two (2) Neuro Electives (either **Required** or **Additional**)

NEURO ELECTIVES

Required Neuro Electives (must take at least one of the following)

42-630	Introduction to Neural Engineering	12
42-631	Neural Data Analysis	12
42-632	Neural Signal Processing	12

Additional Neuro Electives

42-433	Neural Technology: Sensing and Stimulation	12
42-437	Biomedical Optical Imaging	9
42-641	Rehabilitation Engineering	9
42-650	Introduction to Biomedical Imaging	9
42-652/18-416	Nano-Bio-Photonics	12
42-656	Introduction to Machine Learning for Biomedical Engineers	9
42-660	Bioinstrumentation	12
42-783	Neural Engineering Laboratory	12
15-386	Neural Computation	9
18-370	Fundamentals of Control	12
18-460	Optimization	12

42-x00	BME Research* or 39-500 CIT Honors Research Project* or 42-6XX Clinical Course (Surgery for Engineers/Precision Medicine/ICU Medicine)	9-12

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Sample schedules can be found on the BME Additional Major (https://www.cmu.edu/bme/Academics/undergraduate-programs/major.html) page on the BME website.

Tissue and Cell Biotherapeutics (TCB) Track

Note: This track combines the Biomaterials and Tissue Engineering (BMTE) and Cellular and Molecular Biotechnology (CMBT) tracks together. Students entered CMU prior to Fall 2024 may switch to this track.

OVERVIEW

The TCB track addresses issues at the interface of materials science, biology and engineering. The topics include the interactions between materials and cells or tissues, the effects of such interactions on cells and tissues, the design of materials for biological applications, and the engineering of new tissues. It emphasizes fundamentals and applications of biochemistry, biophysics, cell biology, material science, and processes on the nanometer to centimeter size scale. Students in this track acquire an understanding of the molecular and cellular bases of life processes and build skills in quantitative modeling of biological mass transport, drug delivery, and live cell-based biotechnologies and in technologies that exploit the unique properties of biomolecules and materials in non-biological settings.

TARGETS

The TCB track is ideal for students interested in combining the education of Biomedical Engineering with Materials Science & Engineering or with Chemical Engineering. The track may also interest students in Mechanical Engineering and Environmental Engineering who have an interest in molecular aspects of Biomedical Engineering. It provides the necessary foundation in chemistry, molecular processing, and/or materials science. Students of this track may develop careers in biotechnology, tissue engineering, biopharmaceuticals, biosensors, drug delivery, and biological aspects of environmental engineering.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the TCB Track must take the following combination of **three** courses:

- One (1) **Required** TCB elective
- Two (2) TCB Electives (either **Required** or **Additional**)

TCB ELECTIVES

Required TCB Electives (must take one of the following)

42-611/27-709	Biomaterials	12
42-612/27-520	Tissue Engineering	12
42-615	Biomaterial Host Interactions in Regenerative Medicine	12
42-620	Engineering Molecular Cell Biology	12
42-624	Biological Transport and Drug Delivery	9

Additional TCB Electives

42-613/27-570	Polymeric Biomaterials	12
42-616/27-514	Bio-nanotechnology: Principles and Applications	9
42-626/06-634	Drug Delivery Systems	9
42-645/24-655	Cellular Biomechanics	9
42-667	Biofabrication and Bioprinting	12
42-695	Special Topics: Engineering Protein Therapeutics	12
42/06-722	Bioprocess Design	12
03-320	Cell Biology	9

06-685	Bioseparations and Bioprocess Analytical Technologies	12
42-x00	BME Research* or 39-500 CIT Honors Research Project* or 42-6XX Clinical Course (Surgery for Engineers/Precision Medicine/ICU Medicine)	9-12

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Biomaterials and Tissue Engineering (BMTE) Track

Note: This track is not offered to Classes of 2027+

OVERVIEW

The BMTE track addresses issues at the interface of materials science, biology and engineering. The topics include the interactions between materials and cells or tissues, the effects of such interactions on cells and tissues, the design of materials for biological applications, and the engineering of new tissues.

TARGETS

The BMTE track is ideal for students interested in combining the education of Biomedical Engineering with Materials Science & Engineering or with Chemical Engineering. Both provide the necessary foundation in chemistry and/or materials science. Students of this track may develop careers in biotechnology, tissue engineering, biopharmaceuticals, and medical devices that leverage materials properties.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the BMTE Track must take the following combination of **three** courses:

- One (1) **Required** BMTE elective
- Two (2) BMTE Electives (either **Required** or **Additional**)

BMTE ELECTIVES

Required BMTE Electives (must take one of the following)

42-611/27-709	Biomaterials	12
42-612/27-520	Tissue Engineering	12
42-615	Biomaterial Host Interactions in Regenerative Medicine	12
42-667	Biofabrication and Bioprinting	12

Additional BMTE Electives

42-613/27-570	Polymeric Biomaterials	12
42-616/27-514	Bio-nanotechnology: Principles and Applications	9
42-620	Engineering Molecular Cell Biology	12
42-624	Biological Transport and Drug Delivery	9
03-320	Cell Biology	9
42-x00	BME Research* or 39-500 CIT Honors Research Project* or 42-6XX Clinical Course (Surgery for Engineers/Precision Medicine/ICU Medicine)	9-12

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Sample schedules can be found on the BME Additional Major (https://www.cmu.edu/bme/Academics/undergraduate-programs/major.html) page on the BME website.

Cellular and Molecular Biotechnology (CMBT) Track

Note: This track is not offered to Classes of 2027+

OVERVIEW

The CMBT track emphasizes fundamentals and applications of biochemistry, biophysics, and cell biology, and processes on the nanometer to micrometer size scale. Students in this track acquire understanding of the molecular and cellular bases of life processes, and build skills in quantitative modeling of biological mass transport, drug delivery, and live cell-based biotechnologies and in technologies that exploit the unique properties of biomolecules in non-biological settings.

TARGETS

The CMBT track is ideally suited for the combined education of Biomedical Engineering and Chemical Engineering, which provides a strong core of chemistry and molecular processing principles. The track may also interest students of Mechanical Engineering, Materials Science & Engineering, or Civil & Environmental Engineering who have an interest in molecular aspects of Biomedical Engineering. The CMBT track prepares students for careers in bio/pharmaceutical, medical diagnostics, biosensors, drug delivery, and biological aspects of environmental engineering.

REQUIREMENTS

In addition to the Biomedical Engineering core courses, students in the CMBT Track must take the following combination of **three** courses:

- One (1) **Required** CMBT Elective
- Two (2) CMBT Electives (either **Required** or **Additional**)

CMBT ELECTIVES

Required CMBT Electives (must take at least one of the following)

42-620	Engineering Molecular Cell Biology	12
42-621	Principles of Immunoengineering and Development of Immunotherapy Drugs	9
42-624	Biological Transport and Drug Delivery	9

Additional CMBT Electives

42-616/27-514	Bio-nanotechnology: Principles and Applications	9
42-626/06-634	Drug Delivery Systems	9
42-645/24-655	Cellular Biomechanics	9
42/06-722	Bioprocess Design	12
03-320	Cell Biology	9
42-x00	BME Research* or 39-500 CIT Honors Research Project* or 42-6XX Clinical Course (Surgery for Engineers/Precision Medicine/ICU Medicine)	9-12

* The 42-x00 research project (42-200/300/400 Sophomore/Junior/Senior Biomedical Engineering Research Project OR 39-500 CIT Honors Research Project) must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

Some Special Topics and newly offered or intermittently offered courses may be acceptable as track electives. Students should consult with their BME advisors and petition the BME Undergraduate Affairs Committee for permission to include such courses as track electives. The course petition form can be found here (https://www.cmu.edu/bme/Academics/undergraduate-programs/advising.html#ug-course-petition).

Sample schedules can be found on the BME Additional Major (https://www.cmu.edu/bme/Academics/undergraduate-programs/major.html) page on the BME website.

Self-Designed Biomedical Engineering (SBME) Track

The SBME track is aimed at helping highly motivated students who have a strong sense of career direction that falls beyond the scope of regular Biomedical Engineering tracks. Students are allowed to design the "track" portion of the curriculum in consultation with the faculty. Example themes include medical robotics, embedded medical systems, or computational biomedical engineering.

REQUIREMENTS

In addition to the Biomedical Engineering core requirements, students must take **three** elective courses of at least 9 units each. These elective courses must form a coherent theme that is relevant to biomedical engineering. In addition, at least one of the elective courses must be judged by the Biomedical Engineering Undergraduate Affairs Committee to have substantial biological or medical content.

If undergraduate research is part of the SBME track, the research project must be on a BME topic that is aligned to the track, supervised or co-supervised by a BME faculty member, and conducted for 9 or more units of credit.

PETITION PROCEDURE

1. Students wishing to pursue a self-designed track should first consult with Kristin Kropf (https://engineering.cmu.edu/directory/bios/kropf-kristin.html) (Undergraduate Program and Alumni Relations Coordinator).
2. A SBME track proposal must be submitted electronically to Kristin Kropf (https://engineering.cmu.edu/directory/bios/kropf-kristin.html) at least three weeks prior to Pre-Registration during the spring of the sophomore year. The proposal must include:
   - The three courses of the designed track, including catalog descriptions and when these courses are expected to be taken.
   - A justification of how these courses form a coherent theme relevant to biomedical engineering and why the regular tracks do not relate to the proposed theme
   - Two alternative courses that may substitute for one of the proposed courses, in case the original course is not available.
3. Once approved by the Biomedical Engineering Undergraduate Affairs Committee, the student must sign an agreement listing the theme and the three courses comprising the SBME track.
4. In the event that issues beyond the student's control, such as course scheduling or cancellation, prevent the student from completing the approved course plan, the student may petition the Biomedical Engineering Undergraduate Affairs Committee to
5. Substitute a course with another course that fits the approved theme, OR
6. Complete one of the regular tracks (all classes)

Full-Time Faculty

ABBOTT, ROSALYN, Associate Professor of Biomedical Engineering – Ph.D., University of Vermont, 2011;

BARATI FARIMANI, AMIR, Assistant Professor, Mechanical Engineering and Biomedical Engineering – Ph.D., University of Illinois at Urbana-Champaign, 2015;

BARTH, ALISON L., Professor, Biological Sciences, and Biomedical Engineering – Ph.D., University of California, Berkeley, 1997;

BETTINGER, CHRISTOPHER J. , Professor of Biomedical Engineering and Materials Science & Engineering – Ph.D., Massachusetts Institute of Technology, 2008;

CAMPBELL, PHIL G. , Research Professor, Biomedical Engineering, Engineering Research Accelerator, Biological Sciences, and Materials Science & Engineering – Ph.D., The Pennsylvania State University, 1985;

CHALACHEVA, P. SANG, Assistant Teaching Professor of Biomedical Engineering – Ph.D., University of Southern California, 2014;

CHAMANZAR, MAYSAM , Dr. William D. and Nancy W. Strecker Career Development Associate Professor, Electrical and Computer Engineering, Biomedical Engineering – Ph.D., Georgia Institute of Technology, 2012;

CHASE, STEVEN M., Professor of Biomedical Engineering and Center for the Neural Basis of Cognition – Ph.D., Johns Hopkins University, 2006;

CHOSET, HOWIE, Professor, Robotics Institute, Biomedical Engineering, and Electrical & Computer Engineering – Ph.D., California Institute of Technology , 1996;

COHEN-KARNI, TZAHI (ITZHAQ), Professor of Biomedical Engineering and Materials Science & Engineering – Ph.D., Harvard University, 2011;

COOK, KEITH E., David Edward Schramm Professor and Department Head, Biomedical Engineering – Ph.D., Northwestern University, 2000;

DANDIN, MARC, Assistant Professor, Electrical & Computer Engineering and Biomedical Engineering – Ph.D., University of Maryland, 2012;

DOMACH, MICHAEL M., Professor, Chemical Engineering and Biomedical Engineering – Ph.D., Cornell University, 1983;

ERICKSON, ZACKORY, Assistant Professor, Robotics Institute and Biomedical Engineering – Ph.D., Georgia Institute of Technology, 2021;

FEDDER, GARY K., Howard M. Wilkoff Professor, Institute for Complex Engineering Systems, Biomedical Engineering, Electrical & Computer Engineering, Robotics Institute – Ph.D., University of California, Berkeley, 1994;

FEINBERG, ADAM W., Arthur Hamerschlag Career Development Professor; Professor of Biomedical Engineering and Materials Science & Engineering – Ph.D., University of Florida, 2004;

GALEOTTI, JOHN, Senior Systems Scientist, Robotics Institute and Associate Professor of Biomedical Engineering – Ph.D, Carnegie Mellon University, 2007;

GEYER, HARMUT, Associate Professor, Robotics Institute and Biomedical Engineering – Ph.D., Friedrich-Schiller-University of Jena, Germany, 2005 ;

GITTIS, ARYN, Associate Professor, Biological Sciences, and Biomedical Engineering – Ph.D., University of California, San Diego, 2008;

GRANDE GUTIÉRREZ, NOELIA, Assistant Professor, Mechanical and Biomedical Engineering – PhD, Stanford, 2019;

GROVER, PULKIT, Angel Jordan Associate Professor, Electrical & Computer Engineering, Center for Neural Basis of Cognition, and Biomedical Engineering – Ph.D., University of California, Berkeley, 2010;

HALILAJ, ENI, Assistant Professor, Mechanical Engineering and Biomedical Engineering – Ph.D., Brown University, 2015;

HAMMAL, ZAKIA, Systems Faculty, Robotics Institute; Assistant Research Professor, Biomedical Engineering – Ph.D.,

HE, BIN, Trustee Professor of Biomedical Engineering, Electrical & Computer Engineering, Neuroscience Institute – Ph.D., Tokyo Institute of Technology, 1988;

JUST, MARCEL, D.O. Hebb University Professor of Psychology and Biomedical Engineering Director, Center for Cognitive Brain Imaging – Ph.D., Stanford University, 1972;

KAINERSTORFER, JANA M., Professor and Associate Department Head for Faculty and Graduate Affairs, Biomedical Engineering – Ph.D., University of Vienna, 2010;

KASS, ROBERT, Maurice Falk Professor, Statistics, Department of Machine Learning, Center for the Neural Basis of Cognition, and Biomedical Engineering Interim co-Director, Center for the Neural Basis of Cognition – Ph.D., University of Chicago, 1980;

KELLY, SHAWN, Adjunct Associate Professor of Biomedical Engineering – Ph.D., Massachusetts Institute of Technology, 2003;

KUHLMAN, SANDRA, Associate Professor, Biological Sciences, and Biomedical Engineering – Ph.D., University of Kentucky, 2001;

LEDUC, PHILIP R., William J. Brown Professor of Mechanical Engineering, Biomedical Engineering, and Biological Sciences – Ph.D., Johns Hopkins University, 1999;

LEE, TAI SING, Professor, Computer Science, Center for the Neural Basis of Cognition and Biomedical Engineering – Ph.D., Harvard University, 1993;

MAJIDI, CARMEL, Associate Professor of Mechanical Engineering and Biomedical Engineering – Ph.D., University of California, Berkeley, 2007;

MOORE, AXEL, Assistant Professor, Biomedical Engineering – Ph.D., University of Delaware, 2017;

NIEPA, TAGBO H.R., Associate Professor, Biomedical Engineering and Chemical Engineering – Ph.D., Syracuse University, 2014;

OLSON, CARL, Professor, Center for the Neural Basis of Cognition and Biomedical Engineering – Ph.D., University of California, Berkeley, 1979;

OZDOGANLAR, BURAK , Ver Planck Professor, Mechanical Engineering and Biomedical Engineering – Ph.D., University of Michigan, 1999;

PALCHESKO, RACHELLE, Assistant Teaching Professor of Biomedical Engineering – Ph.D., Duquesne University, 2011;

PANAT, RAHUL, Russell V. Trader Associate Professor, Mechanical Engineering, Civil & Environmental Engineering, Materials Science & Engineering, and Biomedical Engineering – Ph.D., University of Illinois at Urbana-Champaign, 2004;

REN, XI (CHARLIE), Associate Professor of Biomedical Engineering – Ph.D., Peking University, 2011;

RIVIERE, CAMERON N., Associate Research Professor, Robotics Institute and Biomedical Engineering – Ph.D., Johns Hopkins University, 1995;

SCHNEIDER, JAMES W., Professor of Chemical Engineering and Biomedical Engineering – Ph.D., University of Minnesota, 1998;

SHIMADA, KENJI, Theodore Ahrens Professor, Mechanical Engineering and Biomedical Engineering – Ph.D., Massachusetts Institute of Technology, 1993;

SHINN-CUNNINGHAM, BARBARA, Director, Carnegie Mellon Neuroscience Institute Professor, Center for the Neural Basis of Cognition, Biomedical Engineering, Psychology, and Electrical & Computer Engineering – Ph.D., Massachusetts Institute of Technology, 1994;

SMITH, MATTHEW, Professor, Biomedical Engineering and Center for the Neural Basis of Cognition – Ph.D., New York University, 2003;

SYDLIK, STEFANIE, Professor of Chemistry and Biomedical Engineering – Ph.D., Massachusetts Institute of Technology, 2012;

SZAFRON, JASON, Assistant Professor, Biomedical Engineering – Ph.D., Yale University, 2020;

TAYLOR, REBECCA, Ph.D. – Associate Professor of Mechanical Engineering and Biomedical Engineering, Stanford University, 2013;

TILTON, ROBERT D. , Chevron Professor; Professor, Biomedical Engineering and Chemical Engineering – Ph.D., Stanford University, 1991;

TRUMBLE, DENNIS, Emeritus Research Professor, Biomedical Engineering and Center for the Neural Basis of Cognition – Ph.D., Carnegie Mellon University, 2010;

TUCKER, CONRAD, Director of CMU-Africa and Associate Dean for International Affairs-Africa, Professor of Mechanical Engineering, Biomedical Engineering, Machine Learning, and the Robotics Institute – PhD, MBA, University of Illinois, Urbana-Champaign, 2011;

VERSTYNEN, TIMOTHY, Associate Professor, Psychology, Center for the Neural Basis of Cognition and Biomedical Engineering – Ph.D., University of California, Berkeley, 2006;

WANG, YU-LI, Mehrabian Professor of Biomedical Engineering – Ph.D., Harvard University, 1980;

WASHBURN, NEWELL R. , Associate Professor of Biomedical Engineering, Chemistry, and Materials Science & Engineering – Ph.D., University of California, Berkeley, 1998;

WEBER, DOUGLAS J, Akhtar and Bhutta Professor, Mechanical Engineering, Neuroscience Institute and Biomedical Engineering – Ph.D., Arizona State University, 2001;

WEBSTER-WOOD, VICTORIA , Assistant Professor, Mechanical Engineering and Biomedical Engineering – Ph.D., Case Western Reserve University, 2017;

WHITEHEAD, KATHRYN A, Professor of Chemical and Biomedical Engineering – Ph.D., University of California, Santa Barbara, 2007;

WOOD, SOSSENA, Assistant Professor of Biomedical Engineering – Ph.D., University of Pittsburgh, 2018;

YTTRI, ERIC, Assistant Professor, Biological Sciences, Center for the Nneural Basis of Cognition, Biomedical Engineering – Ph.D., Washington University in St Louis, 2011;

YU, BYRON, Gerard G. Elia Career Development Professor of Biomedical Engineering and Electrical & Computer Engineering – Ph.D., Stanford University, 2007;

YU, KAI, Research Scientist of Biomedical Engineering – Ph.D., University of Minnesota, Minneapolis, 2018;

ZAPANTA, CONRAD M., Associate Dean of Undergraduate Studies, College of Engineering and Teaching Professor, Biomedical Engineering, – Ph.D., The Pennsylvania State University, 1997;

ZHANG, YONGJIE JESSICA, George Tallman Ladd and Florence Barrett Ladd Professor, Mechanical Engineering and Biomedical Engineering – Ph.D., University of Texas at Austin, 2005;

ZHAO, YONGXIN (LEO), Associate Professor, Biomedical Engineering and Biological Sciences – Ph.D., University of Alberta, 2014;

ZHENG, SIYANG, Professor, Biomedical Engineering and Electrical and Computer Engineering – Ph.D., California Institute of Technology, 2007;

Department of Biomedical Engineering Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes (https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/) *each semester for course offerings and for any necessary pre-requisites or co-requisites.*

42-101 Introduction to Biomedical Engineering

Fall and Spring: 12 units
This course will provide exposure to basic biology and engineering problems associated with living systems and health care delivery. Examples will be used to illustrate how basic concepts and tools of science and amp; engineering can be brought to bear in understanding, mimicking and utilizing biological processes. The course will focus on four areas: biotechnology, biomechanics, biomaterials and tissue engineering and biosignal and image processing and will introduce the basic life sciences and engineering concepts associated with these topics.

42-200 Sophomore BME Research Project

Fall and Spring
Research projects for sophomores under the direction of a regular or adjunct BME faculty member. Arrangements may also be made via the Associate Head of BME for off-campus projects provided that a regular or adjunct BME faculty member agrees to serve as a co-advisor. The nature of the project, the number of units, and the criteria for grading are to be determined between the student and the research advisor. The agreement should be summarized in a two-page project description with sign-off by the research advisor and a copy submitted for review and filing with the BME Department. A final written report of the results is required. Units may vary from 9 to 12 according to the expected time commitment, with one unit corresponding to 1 hour of research per week. One (but not more than one) semester of research, if registered for at least 9 units, may be counted as a restricted elective course toward the BME additional major.

42-201 Professional Issues in Biomedical Engineering

Fall and Spring: 3 units
This course exposes students to many of the issues that biomedical engineers face. It provides an overview of professional topics including bioethics, regulatory issues, communication skills, teamwork, and other contemporary issues. Outside speakers and case studies will describe real world problems and professional issues in biotechnology and bioengineering, and progress toward their solution.

42-202 Physiology

Fall and Spring: 9 units
This course is an introduction to human physiology and includes units on all major organ systems. Particular emphasis is given to the musculoskeletal, cardiovascular, respiratory, digestive, excretory, and endocrine systems. Modules on molecular physiology tissue engineering and physiological modeling are also included. Due to the close interrelationship between structure and function in biological systems, each functional topic will be introduced through a brief exploration of anatomical structure. Basic physical laws and principles will be explored as they relate to physiologic function. Prerequisite or co-requisite: 03-121 Modern Biology, or permission of instructor.
Prerequisites: 03-121 or 03-151

42-203 Biomedical Engineering Laboratory

Fall and Spring: 9 units
This laboratory course is designed to provide students with the ability to make measurements on and interpret data from living systems. The experimental modules reinforce concepts from 42-101 Introduction to Biomedical Engineering and expose students to four areas of biomedical engineering: biomedical signal and image processing, biomaterials, biomechanics, and cellular and molecular biotechnology. Several cross-cutting modules are included as well. The course includes weekly lectures to complement the experimental component. Pre-med students should register for 03-206. Priority for enrollment will be given to students who have declared the Additional Major in Biomedical Engineering.
Prerequisites: 42-101 and (03-121 or 03-151)

42-300 Junior BME Research Project

Fall and Spring
Research projects for juniors under the direction of a regular or adjunct BME faculty member. Arrangements may also be made via the Associate Head of BME for off-campus projects provided that a regular or adjunct BME faculty member agrees to serve as a co-advisor. The nature of the project, the number of units, and the criteria for grading are to be determined between the student and the research advisor. The agreement should be summarized in a two-page project description with sign-off by the research advisor and a copy submitted for review and filing with the BME Department. A final written report of the results is required. Units may vary from 9 to 12 according to the expected time commitment, with one unit corresponding to 1 hour of research per week. One (but not more than one) semester of research, if registered for at least 9 units, may be counted as a restricted elective course toward the BME additional major.

42-302 Biomedical Engineering Systems Modeling and Analysis

Fall and Spring: 9 units
This course will prepare students to develop mathematical models for biological systems and for biomedical engineering systems, devices, components, and processes and to use models for data reduction and for system performance analysis, prediction and optimization. Models considered will be drawn from a broad range of applications and will be based on algebraic equations, ordinary differential equations and partial differential equations. The tools of advanced engineering mathematics comprising analytical, computational and statistical approaches will be introduced and used for model manipulation.
Prerequisites: 21-260 or 18-202 or 06-262

42-400 Senior BME Research Project

Fall and Spring
Research projects for seniors under the direction of a regular or adjunct BME faculty member. Arrangements may also be made via the Associate Head of BME for off-campus projects provided that a regular or adjunct BME faculty member agrees to serve as a co-advisor. The nature of the project, the number of units, and the criteria for grading are to be determined between the student and the research advisor. The agreement should be summarized in a two-page project description with sign-off by the research advisor and a copy submitted for review and filing with the BME Department. A final written report of the results is required. Units may vary from 9 to 12 according to the expected time commitment, with one unit corresponding to 1 hour of research per week. One (but not more than one) semester of research, if registered for at least 9 units, may be counted as a restricted elective course toward the BME additional major.

42-401 Foundation of BME Design

Fall: 6 units
This course sequence introduces Biomedical Engineering students to the design of useful biomedical products to meet a specific medical need. Students will learn to identify product needs, how to specify problem definitions and to use project management tools. Methods to develop creativity in design will be introduced. The course sequence is comprised of two parts: 42-401 is offered in the Fall semester and provides the students the opportunity to form project teams, select and define a project, create a development plan, and complete an initial prototype. 42-402 is offered in the Spring semester is a full semester course and completes the plan that was developed in the fall semester. This course culminates in the completion of multiple prototypes, a poster presentation, and a written report.
Prerequisite: 42-101

42-402 BME Design Project

Spring: 9 units
This course sequence introduces Biomedical Engineering students to the design of useful biomedical products to meet a specific medical need. Students will learn to identify product needs, how to specify problem definitions and to use project management tools. Methods to develop creativity in design will be introduced. The course sequence is comprised of two parts: 42-401 is offered in the Fall semester and provides the students the opportunity to form project teams, select and define a project, create a development plan, and complete an initial prototype. 42-402 is offered in the Spring semester is a full semester course and completes the plan that was developed in the fall semester. This course culminates in the completion of multiple prototypes, a poster presentation, and a written report.

42-437 Biomedical Optical Imaging

Fall: 9 units
Biophotonics, or biomedical optics, is a field dealing with the application of optical science and imaging technology to biomedical problems, including clinical applications. The course introduces basic concepts in electromagnetism and light tissue interactions, including optical properties of tissue, absorption, fluorescence, and light scattering. Imaging methods will be described, including fluorescence imaging, Raman spectroscopy, optical coherence tomography, diffuse optical spectroscopy, and photoacoustic tomography. The basic physics and engineering of each imaging technique are emphasized. Their relevance to human disease diagnostic and clinical applications will be included, such as breast cancer imaging and monitoring, 3D retinal imaging, ways of non-invasive tumor detection, as well as functional brain imaging in infants. NOTE: 42-437 is intended for undergraduates only. Pre-requisite: 33-107 Physics II for Engineering Students or permission of the instructor.
Prerequisite: 33-142

42-444 Medical Devices

Fall: 9 units
This survey course is an introduction to the engineering, clinical, legal, regulatory and business aspects of medical device performance and failure. Topics covered include a broad range of successful medical devices in clinical use, as well as historical case studies of devices that were withdrawn from the market as a consequence of noted failures. In-depth study of specific medical devices will include cardiovascular, orthopedic, and neurological disciplines. We will study best practices employed in the clinical setting, principles governing the design processes, and modes of failure as a risk to the patient population. Additional lectures will provide fundamental topics concerning biomaterials used for implantable medical devices (metals, polymers, ceramics), biocompatibility, imaging, patient risks and mechanisms of failure (wear, corrosion, fatigue, fretting, etc.). The level of technical content will require junior standing for MCS and CIT students, a degree in science or engineering for non-MCS or non-CIT graduate students, or permission of the instructor for all other students.

42-447 Rehabilitation Engineering

Fall: 9 units
Rehabilitation engineering is the systematic application of engineering sciences to design, develop, adapt, test, evaluate, apply, and distribute technological solutions to problems confronted by individuals with disabilities. This course surveys assistive technologies designed for a variety functional limitations - including mobility, communication, hearing, vision, and cognition - as they apply to activities associated with employment, independent living, education, and integration into the community. This course considers not only technical issues in device development, but also the psychosocial factors and market forces that influence device acceptance by individuals and the marketplace. Open only to students with junior standing who have had at least one engineering class or by permission of instructor.

42-610 Introduction to Biomaterials

Spring: 9 units
Understanding the fundamentals of biomaterials structure-function relationships pertaining to material functions and to cell and tissue environments will be a prime goal. The course will be composed of lectures, readings, projects and technical writing assignments. The synthesis, characterization and functional properties of organic and inorganic biomaterials and the processes involved in their use in tissue engineering and regenerative medicine will be discussed. Fundamental issues related to the utility of biomaterials, including biomechanics, transport, degradability, biointerfaces and biocompatibility, stability, fate in the body will be covered, along with some of the basic approaches to characterization. Clinical applications for biomaterials and new directions in design and synthesis to achieve better biocompatibility will be emphasized.

42-611 Biomaterials

Spring: 12 units
This class serves as an overview of the landscape of biomaterial engineering and research. This course will cover the application of materials in biological environments, focusing on structure-processing-property relationships, engineering design principles, and how the biological environment affects the material properties. This course will focus on applications of a variety of materials that interface with biological systems including natural biopolymers, synthetic polymers, metals, and ceramics. Topics include considerations in molecular design of biomaterials, fundamentals of thermodynamic and kinetics relationships, the application of bulk and surface properties in the design of medical devices, and understanding tissue-biomaterials interactions. This course will discuss practical applications of materials in drug delivery, tissue engineering, biosensors, and other biomedical technologies. Students will be assessed with homework assignments and quizzes. At the end of the class, in teams, students will apply the concepts they have learned to write and present a focused review on a biomaterial design/concept that excites them.

42-612 Tissue Engineering

Spring: 12 units
This course will train students in advanced cellular and tissue engineering methods that apply physical, mechanical and chemical manipulation of materials in order to direct cell and tissue function. Students will learn the techniques and equipment of bench research including cell culture, immunofluorescent imaging, soft lithography, variable stiffness substrates, application/measurement of forces and other methods. Students will integrate classroom lectures and lab skills by applying the scientific method to develop a unique project while working in a team environment, keeping a detailed lab notebook and meeting mandated milestones. Emphasis will be placed on developing the written and oral communication skills required of the professional scientist. The class will culminate with a poster presentation session based on class projects. Pre-requisite: Knowledge in cell biology and biomaterials, or permission of instructor

42-613 Polymeric Biomaterials

Spring: 12 units
This course will cover aspects of polymeric biomaterials in medicine from molecular principles to device scale design and fabrication. Topics include the chemistry, characterization, and processing of synthetic polymeric materials; cell-biomaterials interactions including interfacial phenomena, tissue responses, and biodegradation mechanisms; aspects of polymeric micro-systems design and fabrication for applications in medical devices. Recent advances in these topics will also be discussed.

42-614 Stem Cell Engineering

Intermittent: 9 units
This course will give an overview over milestones of stem cell research and will expose students to current topics at the frontier of this field. It will introduce students to the different types of stem cells as well as environmental factors and signals that are implicated in regulating stem cell fate. The course will highlight techniques for engineering of stem cells and their micro-environment. It will evaluate the use of stem cells for tissue engineering and therapies. Emphasis will be placed on discussions of current research areas and papers in this rapidly evolving field. Students will pick a class-related topic of interest, perform a thorough literature search, and present their findings as a written report as well as a paper review and a lecture. Lectures and discussions will be complemented by practical lab sessions, including: stem cell harvesting and culture, neural stem cell transfection, differentiation assays, and immunostaining, polymeric microcapsules as advanced culture systems, and stem cell integration in mouse brain tissue. The class is designed for graduate students and upper undergraduates with a strong interest in stem cell biology, and the desire to actively contribute to discussions in the class.

42-615 Biomaterial Host Interactions in Regenerative Medicine

Intermittent: 12 units
This course will provide students with hands-on experience in investigating host responses to synthetic and naturally biomaterials used in regenerative medicine applications. Students will gain experience in the analysis of host responses to these biomaterials as well as strategies to control host interaction. Biomaterial biocompatibility, immune interactions, tissue healing and regeneration will be addressed. Students will integrate classroom lectures with laboratory skills evaluating host-material interactions in a laboratory setting. Laboratory characterization techniques will include cell culture techniques, microscopic, cytochemical, immunocytochemical and histological analyses. Prior knowledge in physiology is helpful.

42-616 Bio-nanotechnology: Principles and Applications

Fall: 9 units
Have you ever wondered what is nanoscience and nanotechnology and their impact on our lives? In this class we will go through the key concepts related to synthesis (including growth methodologies and characterizations techniques) and chemical/physical properties of nanomaterials from zero-dimensional (0D) materials such as nanoparticles or quantum dots (QDs), one-dimensional materials such as nanowires and nanotubes to two-dimensional materials such as graphene. The students will then survey a range of biological applications of nanomaterials through problem-oriented discussions, with the goal of developing design strategies based on basic understanding of nanoscience. Examples include, but are not limited to, biomedical applications such as nanosensors for DNA and protein detection, nanodevices for bioelectrical interfaces, nanomaterials as building blocks in tissue engineering and drug delivery, and nanomaterials in cancer therapy. This class is open for both undergraduate (junior/senior) and graduate students.

42-620 Engineering Molecular Cell Biology

Fall: 12 units
Cells are not only basic units of living organisms but also fascinating engineering systems that exhibit amazing functionality, adaptability, and complexity. Applying engineering perspectives and approaches to study molecular mechanisms of cellular processes plays a critical role in the development of contemporary biology. At the same time, understanding the principles that govern biological systems provides critical insights into the development of engineering systems. The goal of this course is to provide basic molecular cell biology for engineering students with little or no background in cell biology, with particular emphasis on integrating engineering concepts throughout the entire learning process of modern molecular and cellular biology. This course will prepare advanced undergraduate or graduate students with the essential knowledge and mindset for future research endeavors involving engineering biological systems at molecular and cellular levels. This course, besides introducing the fundamental biological knowledge, aims to enhance students' comprehension and appreciation of (1) how engineering approaches have led to our current understanding of molecular and cell biology; (2) what the available engineering approaches are that allow manipulation and even creation of biological systems at molecular, cellular and tissue levels; (3) what the current challenges are in molecular and cell biology that could be solved one day by engineering innovation. Course topics include the engineering of cellular components (DNA, RNA, protein, cell membrane, mitochondria, extracellular matrix) and cellular processes (metabolism, proliferation, cell death, tissue formation). Pre-requisites: None. Prior completion of 03-121 Modern Biology is suggested but not required.

42-621 Principles of Immunoengineering and Development of Immunotherapy Drugs

Fall: 9 units
This course will provide context for the application of engineering principles to modulate the immune system to approaches problems in human health. Basic understanding of the components and function of the innate and adaptive immune system. Students will leave with a basic understanding of immunology and of the engineering techniques used to develop and characterize immunotherapy systems. Where appropriate, we will discuss how immunoengineering fits into other disciplines of engineering such as mechanical, chemical, and materials science. Because the purpose of immunoengineering is disease treatment, we will discuss, the therapy pipeline, development of clinical trials and the FDA approval process. Immunotherapy will also be assessed within different disease contexts including cancer, infectious disease, allergies, prosthetics and implants, neuro and musculoskeletal disorders.

42-622 Bioprocess Design

Spring: 9 units
This course is designed to link concepts of cell culture, bioseparations, formulation and delivery together for the commercial production and use of biologically-based pharmaceuticals; products considered include proteins, nucleic acids, and fermentation-derived fine chemicals. Associated regulatory issues and biotech industry case studies are also included. The format of the course is a mixture of equal parts lecture, open discussion, and participant presentation. Course work consists of team-oriented problem sets of an open-ended nature and indivudual-oriented industry case studies. The goals of the course work are to build an integrated technical knowledge base of the manufacture of biologically based pharmaceuticals and U.S. biotechnology industry. Working knowledge of cell culture and modern biology, biochemistry and differential equations is assumed. Pre-requisite: 42-321 Cellular and Molecular Biotechnology or both 03-232 Biochemistry and 06-422 Chemical Reaction Engineering, or instructor permission.
Prerequisites: 03-232 or 42-321 or 06-422

42-623 Cellular and Molecular Biotechnology

Fall: 9 units
This course will provide students with an introduction to biotechnology in an engineering context. The focus will be on using microorganisms to prepare therapeutically and technologically relevant biochemicals. Topics to be covered include cellular and microbial metabolism, recombinant DNA methodologies, bioreactor design, protein separation and purification, and systems approaches to biotechnology. Prerequisites: (42-202 Physiology OR 03-121 Modern Biology OR 03-232 Biochemistry) AND (06-262 Mathematical Methods of Chemical Engineering OR 21-260 Differential Equations) OR permission of instructor.

42-624 Biological Transport and Drug Delivery

Spring: 9 units
Analysis of transport phenomena in life processes on the molecular, cellular, organ and organism levels and their application to the modeling and design of targeted or sustained release drug delivery technologies. Coupling of mass transfer and reaction processes will be a consistent theme as they are applied to rates of receptor-mediated solute uptake in cells, drug transport and biodistribution, and drug release from delivery vehicles. Design concepts underlying advances in nanomedicine will be described.

42-625 Surgery for Engineers

Spring: 9 units
This course explores the impact of engineering on surgery. Students will interact with clinical practitioners and investigate the technological challenges that face these practitioners. A number of visits to the medical center are anticipated for hands on experience with a number of technologies utilized by surgeons to demonstrate the result of advances in biomedical engineering. These experiences are expected to include microvascular surgery, robotic surgery, laparoscopic, and endoscopic techniques. Tours of the operating room and shock trauma unit will be arranged. If possible observation of an operative procedure will be arranged (if scheduling permits). Invited surgeons will represent disciplines including cardiovascular surgery, plastic and reconstructive surgery, surgical oncology, trauma surgery, minimally invasive surgery, oral and maxillofacial surgery, bariatric surgery, thoracic surgery, orthopedic surgery, and others. The Primary Instructor is Howard Edington, M.D., MBA System Chairman of Surgery, Allegheny Health Network. This course meets once a week for 3 hours. Several sessions will be held at the Medical Center, transport provided. Pre-requisite: Physiology 42-202 and one of the introductory engineering courses, 42-101, 06-100, 12-100. 18-100, 19-101, 24-101, or 27-100 Priority for enrollment is given to BME Graduate students and additional majors, followed by BME minors.
Prerequisites: 42-202 and (18-100 or 27-100 or 06-100 or 19-101 or 24-101 or 42-101 or 12-100)

42-626 Drug Delivery Systems

Fall and Spring: 9 units
The body is remarkable in its ability to sequester and clear foreign entities - whether they be "bad" (e.g. pathogens) or "good" (e.g. therapeutic drugs). This course will explore the design principles being used to engineer modern drug delivery systems capable of overcoming the body's innate defenses to achieve therapeutic effect. Specifically, we will study the chemistry, formulation, and mechanisms of systems designed to deliver nucleic acids, chemotherapeutics, and proteins across a variety of physiological barriers. Scientific communication plays a prominent role in the course, and students will have several opportunities to strengthen their communication skills through journal club presentations, proposal writing and constructive feedback. This is a graduate level course that is also open to undergraduate seniors.

42-630 Introduction to Neural Engineering

Spring: 12 units
Neural engineering sits at the interface between neuroscience and engineering, applying classical engineering approaches and principles to understand the nervous system and its function. Modern neural engineering techniques have been used to measure neural activity using tools based on light, electricity, and magnetism. The same tools for measurement can be redirected to modulate neural activity, and manipulate how an organism perceives, thinks, and acts. The course objectives are to familiarize students with a range of neural engineering approaches to investigating and intervening in the nervous system, emphasizing quantitative understanding and fundamental engineering concepts. The course will pair lectures and discussion with projects involving real neural data (Matlab-based exercises). Example projects could include finding visual responses in EEG data, or determining how groups of individual neurons interact based on spiking data. Overall, the goal is to give the student a deep understanding of select topics in neuroscience and the application of quantitative neural engineering approaches to these topics. This course is intended for advanced undergraduate and entering graduate students. Familiarity with linear algebra, signal processing, and introductory Matlab programming is helpful. This course is suitable for students coming from diverse backgrounds: (1) Students with non-engineering backgrounds seeking quantitative skills, and wanting to learn an engineering approach to neuroscience problems, and (2) students with engineering or other quantitative backgrounds who are seeking ways to apply their skills to scientific questions in neuroscience.

42-631 Neural Data Analysis

Fall: 12 units
The vast majority of behaviorally relevant information is transmitted through the brain by neurons as trains of actions potentials. How can we understand the information being transmitted? This class will cover the basic engineering and statistical tools in common use for analyzing neural spike train data, with an emphasis on hands-on application. Topics may include neural spike train statistics (Poisson processes, interspike intervals, Fano factor analysis), estimation (MLE, MAP), signal detection theory (d-prime, ROC analysis, psychometric curve fitting), information theory, discrete classification, continuous decoding (PVA, OLE), and white-noise analysis. Each topic covered will be linked back to the central ideas from undergraduate probability, and each assignment will involve actual analysis of neural data, either real or simulated, using Matlab. This class is meant for upper-level undergrads or beginning graduate students, and is geared to the engineer who wants to learn the neurophysiologist's toolbox and the neurophysiologist who wants to learn new tools. Those looking for broader neuroscience application (eg, fMRI) or more focus on regression analysis are encouraged to take 36-746. Those looking for more advanced techniques are encouraged to take 18-699. Prerequisites: undergraduate probability (36-225/227, or its equivalent), some familiarity with linear algebra and Matlab programming

42-632 Neural Signal Processing

Spring: 12 units
The brain is among the most complex systems ever studied. Underlying the brain's ability to process sensory information and drive motor actions is a network of roughly 10^11 neurons, each making 10^3 connections with other neurons. Modern statistical and machine learning tools are needed to interpret the plethora of neural data being collected, both for (1) furthering our understanding of how the brain works, and (2) designing biomedical devices that interface with the brain. This course will cover a range of statistical methods and their application to neural data analysis. The statistical topics include latent variable models, dynamical systems, point processes, dimensionality reduction, Bayesian inference, and spectral analysis. The neuroscience applications include neural decoding, firing rate estimation, neural system characterization, sensorimotor control, spike sorting, and field potential analysis. Prerequisites: 18-290; 36-217, or equivalent introductory probability theory and random variables course; an introductory linear algebra course; senior or graduate standing. No prior knowledge of neuroscience is needed.

42-638 Introduction to Biophotonics

Spring: 9 units
Biophotonics, or biomedical optics, is a field dealing with the application of optical science and imaging technology to biomedical problems, including clinical applications. The course introduces basic concepts in electromagnetism and light tissue interactions, including optical properties of tissue, absorption, fluorescence, and light scattering. Imaging methods will be described, including fluorescence imaging, Raman spectroscopy, optical coherence tomography, diffuse optical spectroscopy, and photoacoustic tomography. The basic physics and engineering of each imaging technique are emphasized. Their relevance to human disease diagnostic and clinical applications will be included, such as breast cancer imaging and monitoring, 3D retinal imaging, ways of non-invasive tumor detection, as well as functional brain imaging in infants. Pre-requisite: College level physics covering electromagnetism and optics or permission of the instructor.

42-639 Introduction to Neural Engineering

Intermittent: 12 units
Neural engineering sits at the interface between neuroscience and engineering, applying classical engineering approaches and principles to understand the nervous system and its function. Modern neural engineering techniques have been used to measure neural activity using tools based on light, electricity, and magnetism. The same tools for measurement can be redirected to modulate neural activity, and manipulate how an organism perceives, thinks, and acts. The course objectives are to familiarize students with a range of neural engineering approaches to investigating and intervening in the nervous system, emphasizing quantitative understanding and fundamental engineering concepts. The course will pair lectures and discussion with projects involving real neural data (Matlab-based exercises). Example projects could include finding visual responses in EEG data, or determining how groups of individual neurons interact based on spiking data. Overall, the goal is to give the student a deep understanding of select topics in neuroscience and the application of quantitative neural engineering approaches to these topics. This course is intended for advanced undergraduate and entering graduate students. Familiarity with linear algebra, signal processing, and introductory Matlab programming is helpful. This course is suitable for students coming from diverse backgrounds: (1) Students with non-engineering backgrounds seeking quantitative skills, and wanting to learn an engineering approach to neuroscience problems, and (2) students with engineering or other quantitative backgrounds who are seeking ways to apply their skills to scientific questions in neuroscience.

42-640 Image-Based Computational Modeling and Analysis

Spring: 12 units
Biomedical modeling and visualization play an important role in mathematical modeling and computer simulation of real/artificial life for improved medical diagnosis and treatment. This course integrates mechanical engineering, biomedical engineering, computer science, and mathematics together. Topics to be studied include medical imaging, image processing, geometric modeling, visualization, computational mechanics, and biomedical applications. The techniques introduced are applied to examples of multi-scale biomodeling and simulations at the molecular, cellular, tissue, and organ level scales.

42-641 Rehabilitation Engineering

Fall: 9 units
Rehabilitation engineering is the systematic application of engineering sciences to design, develop, adapt, test, evaluate, apply, and distribute technological solutions to problems confronted by individuals with disabilities. This course focuses on assistive technologies - technologies designed for use in the everyday lives of people with disabilities to assist in the performance of activities of daily living. The course surveys assistive technologies designed for a variety of functional limitations - including mobility, communication, hearing, vision, and cognition - as they apply to activities associated with employment, independent living, education, and integration into the community. This course considers not only technical issues in device development, but also the psychosocial factors and market forces that influence device acceptance by individuals and the marketplace. The class is designed for graduate students and upper undergraduates.

42-643 Microfluidics

Intermittent: 12 units
This course offers an introduction to the emerging field of microfluidics with an emphasis on chemical and life sciences applications. During this course students will examine the fluid dynamical phenomena underlying key components of "lab on a chip" devices. Students will have the opportunity to learn practical aspects of microfluidic device operation through hands-on laboratory experience, computer simulations of microscale flows, and reviews of recent literature in the field. Throughout the course, students will consider ways of optimizing device performance based on knowledge of the fundamental fluid mechanics. Students will explore selected topics in more detail through a semester project. Major course topics include pressure-driven and electrokinetically-driven flows in microchannels, surface effects, micro-fabrication methods, micro/nanoparticles for biotechnology, biochemical reactions and assays, mixing and separation, two-phase flows, and integration and design of microfluidic chips. Pre-requisites: 24-231 or 06-261 or 12-355 or instructor permission.

42-645 Cellular Biomechanics

Intermittent: 9 units
This course discusses how mechanical quantities and processes such as force, motion, and deformation influence cell behavior and function, with a focus on the connection between mechanics and biochemistry. Specific topics include: (1) the role of stresses in the cytoskeleton dynamics as related to cell growth, spreading, motility, and adhesion; (2) the generation of force and motion by moot molecules; (3) stretch-activated ion channels; (4) protein and DNA deformation; (5) mechanochemical coupling in signal transduction. If time permits, we will also cover protein trafficking and secretion and the effects of mechanical forces on gene expression. Emphasis is placed on the biomechanics issues at the cellular and molecular levels; their clinical and engineering implications are elucidated. 3 hrs. lec. Prerequisite: Instructor permission. Prerequisites: None. Corequisites: None. Cross Listed Courses: 24-655 Notes: None. Reservations:

42-648 Cardiovascular Mechanics

Spring: 12 units
The primary objective of the course is to learn to model blood flow and mechanical forces in the cardiovascular system. After a brief review of cardiovascular physiology and fluid mechanics, the students will progress from modeling blood flow in a.) small-scale steady flow applications to b.) small-scale pulsatile applications to c.) large-scale or complex pulsatile flow applications. The students will also learn how to calculate mechanical forces on cardiovascular tissue (blood vessels, the heart) and cardiovascular cells (endothelial cells, platelets, red and white blood cells), and the effects of those forces. Lastly, the students will learn various methods for modeling cardiac function. When applicable, students will apply these concepts to the design and function of selected medical devices (heart valves, ventricular assist devices, artificial lungs).

42-649 Introduction to Biomechanics

Fall: 12 units
The purpose of this course is to achieve a broad overview of the application of mechanics to the human body. This includes solid, fluid, and viscoelastic mechanics applied to single cells, the cardiovascular system, lungs, muscles, bones, and human movement. The physiology of each system will be reviewed as background prior to discussing mechanics applications within that system. Prior knowledge/experience in statics, fluid mechanics, and biology are helpful.

42-650 Introduction to Biomedical Imaging

Fall: 9 units
The field of medical imaging describes methods of seeing the interior of the human body, as well as visual representation of tissue and organ function. The materials covered in this course will give an overview of existing medical imaging devices used in a clinical and pre-clinical setting. The course presents the principles of medical imaging technologies, explaining the mathematical and physical principles, as well as describing the fundamental aspects of instrumentation design. Students will gain a thorough understanding of how these methods are used to image morphological and physiological features. Imaging methods will include Ultrasound, X-ray, computed tomography (CT), and magnetic resonance imaging (MRI), as well as optical methods. For each method, the fundamental imaging principles will be discussed, and examples of clinical applications will be presented. No prior knowledge of imaging methods is required.

42-652 Nano-Bio-Photonics

Spring: 12 units
Light can penetrate biological tissues non-invasively. Most of the available bio-optic tools are bulky. With the advent of novel nanotechnologies, building on-chip integrated photonic devices for applications such as sensing, imaging, neural stimulation, and monitoring is now a possibility. These devices can be embedded in portable electronic devices such as cell phones for point of care diagnostics. This course is designed to convey the concepts of nano-bio-photonics in a practical way to prepare students to engage in emerging photonic technologies. The course starts with a review of electrodynamics of lightwaves. The appropriate choice of wavelength and material platform is the next topic. Then optical waveguides and resonators are discussed. Resonance-based sensing is introduced followed by a discussion of the Figure of Merits (FOMs) used to design on-chip sensors. Silicon photonics is introduced as an example of a CMOS-compatible platform. On-chip spectroscopy is the next topic. The second part covers nano-plasmonics for bio-detection and therapy. The design methods are discussed, followed by an overview of nanofabrication and chemical synthesis, and then a discussion of applications. The last part of this course will be dedicated to a review of recent applications such as Optogenetic neural stimulation, Calcium imaging, Cancer Imaging and Therapy. Senior or graduate standing required. This course is cross-listed with 18416. Although students in 18-616 and 18-416 will share the same lectures and recitations, students in 18-616 will receive distinct course projects. Students in 18-416 and 18-616 will be graded on separate curves.

42-655 Biostatistics

Spring: 9 units
This course introduces statistical methods for making inferences in engineering, biology and medicine. Students will learn how to select the most appropriate methods, how to apply these methods to actual data, and how to read and interpret computer output from a commonly used statistical package. The topics covered are descriptive statistics; elementary probability; discrete and continuous random variables and their distributions; hypothesis testing involving interval (continuous and discrete) and categorical (nominal and ordinal) variables, for two and three or more treatments; simple and multiple linear regression; time-series analysis; clustering and classification; and time-to-event (survival) analysis. Students will also learn how to write the statistical component of a "Results" section for a scientific paper and learn about the limitations of the statistical analyses. Basic familiarity with probability and probability distribution preferred but not required.

42-656 Introduction to Machine Learning for Biomedical Engineers

Fall: 9 units
This course introduces fundamental concepts, methods and applications in machine learning and datamining. We will cover topics such as parametric and non-parametric learning algorithms, support vector machines, neural networks, clustering, clustering and principal components analysis. The emphasis will be on learning high-level concepts behind machine learning algorithms, and applying them to biomedical-related problems. This course is intended for advanced undergraduate and graduate students in Biomedical Engineering or related disciplines. Students should have experience with high-level programming language such as Python/Matlab, basic familiarity with probability, statistics and linear algebra, and should be comfortable with manipulating vectors and matrices.

42-660 Bioinstrumentation

Spring: 12 units
This course aims to build concepts and skills in electronics for the design and construction of instruments for biomedical applications. The course uses a flipped, fast-paced format to cover a range of electronic components and circuits, including resistors, capacitors, transistors, sensors, actuators, amplifiers, signal filters, and microcontrollers, through lectures, tutorials, weekly lab projects, and term projects. Students, with or without a background in electronics, will gain hands-on skills to build functional instruments for physiological measurements such as temperature, gas concentration, blood pressure, and EKG signals.

42-661 Surgery for Engineers

Spring: 9 units
This course explores the impact of engineering on surgery. Students will interact with clinical practitioners and investigate the technological challenges that face these practitioners. A number of visits to the medical center are anticipated for hands on experience with a number of technologies utilized by surgeons to demonstrate the result of advances in biomedical engineering. These experiences are expected to include microvascular surgery, robotic surgery, laparoscopic, and endoscopic techniques. Tours of the operating room and shock trauma unit will be arranged. If possible observation of an operative procedure will be arranged (if scheduling permits). Invited surgeons will represent disciplines including cardiovascular surgery, plastic and reconstructive surgery, surgical oncology, trauma surgery, minimally invasive surgery, oral and maxillofacial surgery, bariatric surgery, thoracic surgery, orthopedic surgery, and others. The Primary Instructor is Howard Edington, M.D., MBA System Chairman of Surgery, Allegheny Health Network. This course meets once a week for 3 hours. Several sessions will be held at the Medical Center, transport provided. Pre-requisite: Physiology 42-202 and one of the introductory engineering courses, 42-101, 06-100, 12-100. 18-100, 19-101, 24-101, or 27-100 Priority for enrollment is given to BME Graduate students and additional majors, followed by BME minors.
Prerequisites: 42-202 and (27-100 or 24-101 or 19-101 or 18-100 or 12-100 or 06-100 or 42-101)

42-663 Computational Methods in BME

Spring: 12 units
This goal of this course is to enable students with little or no programming background to solve simple computational problems in science and engineering. Emphasis will be placed on enabling students to use currently available numerical methods (rather than developing anew) to solve engineering problems. Upon completing the course, the successful student will be able to use basic knowledge regarding computer architecture, data types, binary arithmetic, and programming, to solve sample quantitative problems in engineering. Topics will include: solving linear systems of equations, model fitting using least squares techniques (linear and nonlinear), data interpolation, numerical integration and differentiation, solving differential equations, and data visualization. Specific example computations in each topic above will be drawn from problems in physics, chemistry, as well as signal and image processing, and biomedical engineering. Students will work independently in groups for a final project. Matlab will be used as the programming language/environment for this class, although different languages such as C, Java, and Python will be briefly discussed (time permitting). May count as practicum for practicum-option MS. Pre-requisite: Calculus, multivariate calculus, linear algebra, and differential equations

42-665 Brain-Computer Interface: Principles and Applications

Spring: 9 units
This course provides an introduction and comprehensive review of the concepts, principles and methods of Brain-computer interface (BCI) technology. BCIs have emerged as a novel technology that bridges the brain with external devices. BCIs have been developed to decode human intention, leading to direct brain control of a computer or device, bypassing the neuromuscular pathway. Bi-directional brain-computer interfaces not only allows device control, but also opens the door for modulating the central nervous system through neural interfacing. Using various recorded brain signals that reflect the "intention" of the brain, BCI systems have shown the capability to control external devices, such as computers and robots. Neural stimulation using electrical, magnetic, optical and acoustic energy has shown capability to better understanding of the brain functions and intervene with central nervous systems. This course teaches the fundamentals how a BCI system works and various building blocks of BCIs, from signal acquisition, signal processing, feature extraction, feature translation, neurostimulation, to device control, and various applications. Examples of noninvasive BCIs are discussed to provide an in-depth understanding of the noninvasive BCI technology. Open to seniors or graduate students in engineering or science programs, or upon instructor's approval (for exceptional juniors, e.g.).

42-666 Neuroengineering Practicum

Fall: 9 units
This course will examine topics and issues related to ethics, professional conduct, conflicts, plagiarism, copyright, authorship, research design considerations, IRB, IACUC, intellectual properties, review process, regulatory science and FDA process, professional presentations, and technical writing in neuroengineering. Students will discuss neuro-ethical implications of neural technologies and learn about the process of bringing such technologies to market, including intellectual property and FDA approval considerations. Students will discuss essential career development skills for a neuroengineering R and D career in academia and industry. An important component of the course is to develop students' communications skills including developing an effective research proposal, as well as effective oral presentations of the ideas developed in the proposal and technical report. The essentials for successful proposal writing will be discussed in case studies, in the form of fellowship applications. Each student will be required to develop a research proposal based upon students' own research or an emerging research topic in neuroengineering. Each student will also be required to develop a research statement on her/his own research interest. It is expected that students will improve her/his writing skills for proposal/research statement development with case studies, group discussions, and individualized feedbacks on students' own writing and presentation. This course will help students to develop practical skills addressing real world problems in neuroengineering.

42-667 Biofabrication and Bioprinting

Spring: 12 units
This laboratory course is designed to introduce students to and give them hands-on experience using methods that are used to fabricate scaffolds that are often used in tissue engineering, drug delivery, and some medical devices. Methods that will be taught include plastic FDM (filament deposition methods) to 3d print thermoplastic materials and molds for casting soft hydrogel materials, as well as 3d Bioprinting of soft hydrogel materials into a support bath material. This course will include a lecture component to introduce students to the concepts needed to design and fabricate the scaffolds. Lecture topics will include (but are not limited to): chemical and physical properties of biomaterials, CAD, and post-processing methods. There are no pre-requisite courses; however prior introductory lab experience is suggested.

42-668 "Fun"-damentals of MRI and Neuroimaging Analysis

Spring: 9 units
Neuroimaging gives us many ways to learn how the brain operates through various functions and disease states without having to perform any invasive surgery. This course will cover the methodology and analysis of structural magnetic resonance imaging (MRI) and functional MRI in humans and animals. Through lecture, discussion and analysis of sample data, students will understand the (A) history of MRI, (B) physics of MRI, (C) utilization with MRI and other devices used to interpret biological tissue, (D) how to design an fMRI experiment, and (E) analysis techniques in MRI. At the end of the course, students will have strong fundamental MRI and fMRI skillset and gain programming skills in MATLAB and learn other tools like SPM to process MRI and fMRI datasets in appropriate software packaging.

42-669 Energy Applications in Biology and Medicine

Spring: 12 units
This course covers a wide range of energy-based applications in biology and medicine, such as cancer treatments by cryosurgery (freezing), thermal ablation (heating), photodynamic therapy (light-activated drugs), and irreversible electroporation (a non-thermal electrical application). This course also covers thermal regulation in humans and other mammals, as well as cryopreservation (low-temperature preservation) of tissues and organs for the benefit of organ banking and transplant medicine. The course combines lectures and individual assignments relating to the underlying principles of engineering, with teamwork on open-ended projects relating to concurrent challenges at the convergence of engineering and medical sciences. The course plan assumes a mastery of the fundamentals of heat transfer at the undergraduate level.

42-670 Special Topics: Biomaterial Host Interactions in Regenerative Medicine

Intermittent: 12 units
Special Topics: This course will provide students with hands-on experience in investigating host responses to synthetic and naturally biomaterials used in regenerative medicine applications. Students will gain experience in the analysis of host responses to these biomaterials as well as strategies to control host interaction. Biomaterial biocompatibility, immune interactions, tissue healing and regeneration will be addressed. Students will integrate classroom lectures with laboratory skills evaluating host-material interactions in a laboratory setting. Laboratory characterization techniques will include cell culture techniques, microscopic, cytochemical, immunocytochemical and histological analyses. Prerequisite: junior or senior standing in Biomedical Engineering or consent of the instructor.

42-671 Precision Medicine for Biomedical Engineers

Fall: 9 units
This course explores the opportunities for engineers in precision medicine of complex medical disorders. Students will interact with clinical practitioners and investigate the technological challenges that face these practitioners. The course will focus on common complex conditions and diseases such as inflammatory bowel disease (IBD), pancreatitis, diabetes mellitus and obesity, rheumatoid arthritis, multiple sclerosis, pain syndrome and pharmacogenetics. Improvement in care of these conditions requires a reverse engineering approach, and new tools because of the complexity and unpredictability of clinical course and best treatments on a case-by-case basis. Currently, the cost of medications for these conditions in Pittsburgh alone is and gt;1 billion, with a large percent of patients receiving less than optimal treatment because of lack of precision medicine tools. The course includes introduction to medical genetics, biomarkers of disease, health records, disease modeling, outcome predictions, therapies, remote monitoring and smart applications. Special lectures on health economics and career opportunities are also planned. Each session will include didactic lectures, workshops and development of applications. Specific engineering topics which may be relevant to each of these specialties as well as topics which span many specialties (for example biodetectors, computational biology, bioinformatics, UI/UX, gaming ideas to connect patients to products, integrated applications) will be presented by various faculty members of the CMU biomedical engineering and other dept. and UPMC/UPitt faculty. Students will gain experience exploring genetic variants associated with common diseases, including the opportunity to explore their own DNA. Instructors: David C. Whitcomb, MD, PhD (UPMC) Philip Empey, PharmD, PhD (UPMC)

42-672 Fundamentals of Biomedical Imaging and Image Analysis

Spring: 12 units
This course introduces fundamentals of biological and medical imaging modalities and related image analysis techniques. It is organized into three units. The first unit introduces fundamental principles of biological imaging modalities, such as fluorescence microscopy, super-resolution microscopy, and electron microscopy. These modalities are used to visualize and record biological structures and processes at the molecular and cellular levels. The second unit introduces fundamental principles of imaging modalities, such as magnetic resonance imaging, x-ray computed tomography, and ultrasound. These modalities are used to visualize and record medical structures and processes at the tissue and organ levels. Recent developments in convergence of biological and medical imaging are briefly discussed. The third section introduces fundamentals of computational techniques used for analyzing and understanding biological and medical images, such as deconvolution, registration, segmentation, tracking, and pattern recognition. The introduction to these topics will draw on concepts and techniques from several related fields, including physics, statistics, signal processing, computer vision, and machine learning. As part of the course, students will complete several independent projects. Students will also have the opportunity to visit laboratories to see some of the actual biomedical imaging devices in action. Prerequisites: 18-290 Signals and Systems or permission of the instructor. Proficiency in basic programming is expected. Knowledge of image processing, computer vision, and/or MATLAB is helpful but not essential.

42-673 Special Topics: Stem Cell Engineering

Intermittent: 9 units
Special Topics: This course will give an overview over milestones of stem cell research and will expose students to current topics at the frontier of this field. It will introduce students to the different types of stem cells as well as environmental factors and signals that are implicated in regulating stem cell fate. The course will highlight techniques for engineering of stem cells and their micro-environment. It will evaluate the use of stem cells for tissue engineering and therapies. Emphasis will be placed on discussions of current research areas and papers in this rapidly evolving field. Students will pick a class-related topic of interest, perform a thorough literature search, and present their findings as a written report as well as a paper review and a lecture. Lectures and discussions will be complemented by practical lab sessions, including: stem cell harvesting and culture, neural stem cell transfection, differentiation assays, and immunostaining, polymeric microcapsules as advanced culture systems, and stem cell integration in mouse brain tissue. The class is designed for graduate students and upper undergraduates with a strong interest in stem cell biology, and the desire to actively contribute to discussions in the class.

42-674 Special Topics: Engineering for Survival: ICU Medicine

Intermittent: 9 units
Special Topics: Engineering for Survival: ICU Medicine The overall learning objective of this class is to expose students to acute care medicine and the fundamentals of acute illness. The lectures review the structure and function of different body systems. Typical modes of failure (disease) are then described and illustrated with examples using actual de-identified cases based on over 30 years of experiences in the intensive care unit (ICU) by Dr. Rosenbloom. Field trips are made to a local critical care and emergency medicine simulation facility at the University of Pittsburgh. An optional opportunity to participate in ICU rounds is also available. Requirements: Junior standing and higher

42-675 Fundamentals of Computational Biomedical Engineering

Fall: 12 units
This goal of this course is to enable students with little or no programming background to use computational methods to solve basic biomedical engineering problems. Students will use MATLAB to solve linear systems of equations, model fit using least squares techniques (linear and nonlinear), interpolate data, perform numerical integration and differentiation, solve differential equations, and visualize data. Specific examples for each topic will be drawn from different areas of biomedical engineering, such as bioimaging and signal processing, biomechanics, biomaterials, and cellular and biomolecular technology.

42-676 Bio-nanotechnology: Principles and Applications

Fall: 9 units
Have you ever wondered what is nanoscience and nanotechnology and their impact on our lives? In this class we will go through the key concepts related to synthesis (including growth methodologies and characterizations techniques) and chemical/physical properties of nanomaterials from zero-dimensional (0D) materials such as nanoparticles or quantum dots (QDs), one-dimensional materials such as nanowires and nanotubes to two-dimensional materials such as graphene. The students will then survey a range of biological applications of nanomaterials through problem-oriented discussions, with the goal of developing design strategies based on basic understanding of nanoscience. Examples include, but are not limited to, biomedical applications such as nanosensors for DNA and protein detection, nanodevices for bioelectrical interfaces, nanomaterials as building blocks in tissue engineering and drug delivery, and nanomaterials in cancer therapy. This class is open for both undergraduate (junior/senior) and graduate students.

42-678 Medical Device Innovation and Realization

Spring: 12 units
The increasing pace of medical discoveries and emerging technologies presents a unique and exciting time for medical devices. Medical devices range from biomaterials that stimulate the body to repair itself to drug eluting stints to robotic surgical systems. Because they seek to improve and prolong human health, there are unique requirements and challenges for medical device development compared to most other industries. This class will look at how medical device innovation is currently practiced as well as the drivers which govern it, such as the FDA, intellectual property, reimbursement, and funding. By the end of this course, students should be able to: (1) obtain a broad understanding of medical devices; (2) identify new product opportunities; (3) understand the drivers that affect medical device development; and (4) develop strategies to address those drivers within the overall medical device development plan.

42-681 Disease Models for Therapeutic Discovery

Spring: 9 units
One of the key challenges in the fields of tissue engineering and disease modelling is a disconnect between the use of robust bioengineering tools and our limited understanding of pathobiology. The future of these fields depends on biomedical engineers using their technical skill sets to study normal physiology and disease mechanisms. In this class, we will explore current state-of-the-art methods for creating tissue and disease models, including: 2D/3D tissue cultures, bioreactors, organs-on-a-chip, microfluidic models, disease-in-a-dish models (with discussions on coupling multiple tissue systems), animal models of disease, and CRISPR/CAS9. The first few weeks of the semester will focus on learning the state-of-the-art methods with 1 exam as an assessment. The rest of the class will focus on specific disease modules with journal reviews and experts sharing their research on disease models with the class. For assessment, students will read 1 journal article each week and provide a brief critique. In addition, they will write a grant and present to the class methods for creating a disease model of their choice. At the end of the class, students will be able to critically assess and design models of normal and pathobiological disease mechanisms. Prior knowledge of basic physiology is required.

42-682 Bioinstrumentation

Intermittent: 12 units
This course aims to build concepts and skills in electronics for the design and construction of instruments for biomedical applications. The course uses a flipped, fast-paced format to cover a range of electronic components and circuits, including resistors, capacitors, transistors, sensors, actuators, amplifiers, signal filters, and microcontrollers, through lectures, tutorials, weekly lab projects, and term projects. Students, with or without a background in electronics, will gain hands-on skills to build functional instruments for physiological measurements such as temperature, gas concentration, blood pressure, and EKG signals.

42-683 Introduction to Machine Learning for Biomedical Engineers

Fall: 9 units
This course introduces fundamental concepts, methods and applications in machine learning and datamining. We will cover topics such as parametric and non-parametric learning algorithms, support vector machines, neural networks, clustering, clustering and principal components analysis. The emphasis will be on learning high-level concepts behind machine learning algorithms, and applying them to biomedical-related problems. This course is intended for advanced undergraduate and graduate students in Biomedical Engineering or related disciplines. Students should have experience with high-level programming language such as Matlab, basic familiarity with probability, statistics and linear algebra, and should be comfortable with manipulating vectors and matrices.

42-684 Principles of Immunoengineering and Development of Immunotherapy Drugs

Fall: 9 units
This course will provide context for the application of engineering principles to modulate the immune system to approaches problems in human health. Basic understanding of the components and function of the innate and adaptive immune system. Students will leave with a basic understanding of immunology and of the engineering techniques used to develop and characterize immunotherapy systems. Where appropriate, we will discuss how immunoengineering fits into other disciplines of engineering such as mechanical, chemical, and materials science. Because the purpose of immunoengineering is disease treatment, we will discuss, the therapy pipeline, development of clinical trials and the FDA approval process. Immunotherapy will also be assessed within different disease contexts including cancer, infectious disease, allergies, prosthetics and implants, neuro and musculoskeletal disorders.

42-685 Biostatistics

Spring: 9 units
This course introduces statistical methods for making inferences in engineering, biology and medicine. Students will learn how to select the most appropriate methods, how to apply these methods to actual data, and how to read and interpret computer output from a commonly used statistical package. The topics covered are descriptive statistics; elementary probability; discrete and continuous random variables and their distributions; hypothesis testing involving interval (continuous and discrete) and categorical (nominal and ordinal) variables, for two and three or more treatments; simple and multiple linear regression; time-series analysis; clustering and classification; and time-to-event (survival) analysis. Students will also learn how to write the statistical component of a "Results" section for a scientific paper and learn about the limitations of the statistical analyses. Basic familiarity with probability and probability distribution preferred but not required.

42-687 AI Applications in BME

Spring: 12 units
This course provides hands-on experience in applying the fundamentals of artificial intelligence/machine learning (AI/ML) to problems in a variety of biomedical research areas and applications. Students will work in teams to design, develop, and evaluate an AI/ML system to achieve one or more of the following goals: identifying patterns in the data, modeling the input-output relationships and/or classifying data into distinct categories. The datasets for this course will be drawn from different BME-related areas provided by biomedical researchers, clinicians, and other publicly available sources. In addition to the project work, the course will discuss issues that are specific to the development and implementation of AI algorithms in medical settings. This includes FDA approval, human clinical trials, the Health Insurance Portability and Accountability Act, and medical ethics. This computational project-based course is available to any student who has completed Introduction to Machine Learning course.

42-688 Introduction to Neural Engineering

Intermittent: 12 units
Neural engineering sits at the interface between neuroscience and engineering, applying classical engineering approaches and principles to understand the nervous system and its function. Modern neural engineering techniques have been used to measure neural activity using tools based on light, electricity, and magnetism. The same tools for measurement can be redirected to modulate neural activity, and manipulate how an organism perceives, thinks, and acts. The course objectives are to familiarize students with a range of neural engineering approaches to investigating and intervening in the nervous system, emphasizing quantitative understanding and fundamental engineering concepts. The course will pair lectures and discussion with projects involving real neural data (Matlab-based exercises). Example projects could include finding visual responses in EEG data, or determining how groups of individual neurons interact based on spiking data. Overall, the goal is to give the student a deep understanding of select topics in neuroscience and the application of quantitative neural engineering approaches to these topics. This course is intended for advanced undergraduate and entering graduate students. Familiarity with linear algebra, signal processing, and introductory Matlab programming is helpful. This course is suitable for students coming from diverse backgrounds: (1) Students with non-engineering backgrounds seeking quantitative skills, and wanting to learn an engineering approach to neuroscience problems, and (2) students with engineering or other quantitative backgrounds who are seeking ways to apply their skills to scientific questions in neuroscience.

42-689 Introduction to Biomedical Imaging

Spring: 9 units
The field of medical imaging describes methods of seeing the interior of the human body, as well as visual representation of tissue and organ function. The materials covered in this course will give an overview of existing medical imaging devices used in a clinical and pre-clinical setting. The course presents the principles of medical imaging technologies, explaining the mathematical and physical principles, as well as describing the fundamental aspects of instrumentation design. Students will gain a thorough understanding of how these methods are used to image morphological and physiological features. Imaging methods will include Ultrasound, X-ray, computed tomography (CT), and magnetic resonance imaging (MRI), as well as optical methods. For each method, the fundamental imaging principles will be discussed, and examples of clinical applications will be presented. No prior knowledge of imaging methods is required.

42-690 BME in Everyday Life

Intermittent: 9 units
This course focuses on how biomedical engineering technologies are used in everyday life. The objective is to develop an understanding of the clinical need for these technologies, and past and current solutions to meet these clinical needs. Topics covered include artificial organs, tissue engineering, brain-control interfaces, and immunoengineering. For each medical condition being addressed, biology physiology, and anatomy concepts will be applied in the context of biomedical engineering technology. This course is suitable for non-engineering majors who have an interest in biomedical engineering.

42-691 Biomechanics of Human Movement

Spring: 12 units
This course provides an overview of the mechanical principles underlying human movement biomechanics and the experimental and modeling techniques used to study it. Specific topics will include locomotion, motion capture systems, force plates, muscle mechanics, musculoskeletal modeling, three dimensional kinematics, inverse dynamics, forward dynamic simulations, and imaging-based biomechanics. Homework and final class projects will emphasize applications of movement biomechanics in orthopedics, rehabilitation, and sports.
Prerequisites: 24-351 and 21-260

42-692 Special Topics: Nanoscale Manufacturing Using Structural DNA Nanotechnology

Fall: 12 units
This course provides an introduction to modern nanoscale manufacturing using structural DNAnanotechnology. This DNA-based approach to manufacturing has much in common with other fabrication methods in micro- and nano-engineering: computer aided design tools are necessary for device design and resulting structures can only be seen using advanced microscopy. However, instead of machining larger materials down to micro- and nanostructures, DNA origami is fabricated using a "bottom up" approach for self-assembling individual oligonucleotides into 2D and 3D nanostructures. Resulting structures can be designed to have novel mechanical and electrical properties and have applications as broad-ranging as medicine, biological computing, and energy systems. The course will include lectures, hands-on physical modeling, homework problems, 3D modeling of DNA origami using caDNAno and CANDO software, and student team projects and presentations.

42-693 Special Topics in Integrated Systems Technology: Micro/Nano Biomedical Devices

Fall: 12 units
Biomedical devices constantly call for innovations. Micro/nano fabrication not only miniaturizes devices and instruments, but also can enable new biomedical devices and significantly boost device performance. This course introduces fundamental micro/nano fabrication technologies and related materials of biomedical devices. The biomedical background and design principles of various biomedical devices will be presented. Both diagnostic and therapeutic devices will be discussed, including point-of-care diagnostic devices, biosensors, DNA sequencers, medical implants, prosthetic devices, drug delivery systems, medical robots, etc.

42-694 Engineering Principles of Medical Devices

Intermittent: 9 units
Medical devices are apparatuses widely used in diagnosis, treatment and prevention of human diseases. The invention and adoption of medical devices is one of the major driving forces for the revolution in modern healthcare. This course takes a systematic and quantitative approach for the design and implementation of medical devices. We will mainly focus on three major medical device categories: bioelectrical devices, biomechanical devices, and medical devices enabled by emerging technologies. For each category, domain knowledge and fundamental principles will be introduced, and detailed design, implementation, and performance analysis will be studied. Analytical equations and simulation tools will be used when appropriate. The course will prepare students with a solid foundation to further study, research, and work in medical device related fields. Pre-requisite or Co-requisite: 42-202 and (21-120 or 21-122 or 21-259) and (33-141 or 33-142) or permission of instructor

42-695 Special Topics: Engineering Protein Therapeutics

Intermittent: 12 units
The peptide/protein therapeutics market represents the fastest growing drug sector, addressing diseases that were incurable 20 years ago. These therapies are used to treat a broad range of disease states, including but not limited to cancer, metabolic, immunological, hematological, hormonal, genetic, and infectious diseases. The growth of these therapies is primarily driven by the increasing geriatric population and the growing prevalence of chronic diseases and the development of plasma-derived therapies, and also reflects advances in drug discovery. This course is meant to introduce peptide/protein therapeutic technologies to students with diverse backgrounds and will provide an understanding of the history, current state of the art and potential of these therapeutics. The course will consider major challenges associated with protein therapeutic including stability, immunogenicity, off-target effects, coformulation, and overcoming biological barriers, with a focus on clinical/commercial translation, considering not only manufacturing but delivery approaches, pharmacokinetic and pharmacological challenges.

42-696 Special Topics: Wearable Health Technologies

Spring: 12 units
This course will provide an overview of emerging wearable health technologies and give students hands-on experience in solving ongoing technical challenges. The wearable sensing field is experiencing explosive growth, with exciting applications in medicine. New lightweight devices will make it easier to monitor health conditions in real time, automatically import data into health informatics systems, and provide haptic feedback with humans in the loop. We will review several aspects of these technologies, including hardware, software, user experience, communication networks, applications, and big data analytics. Students will be paired with a company for a semester-long project that tackles timely computational challenges. Programing experience, in any language, is a pre-requisite.

42-697 Special Topics: Orthopaedic Tissue Mechanics

Spring: 9 units
In this course we will assess the composition, structure, function, failure, and repair of orthopaedic tissues, such as bone, cartilage, intervertebral disc, ligament, tendon, and meniscus. We will pay special attention to the analysis of composite materials, derivation of relevant analytical models, fitting of experimental data, and underlying assumptions. Students will have the opportunity to work in teams to assess seminal papers and explore unmet challenges in the field of orthopaedics. This course will prepare students who are interested in pursuing topics in the field of orthopaedics, rehabilitation, design of prosthetics, and tissue engineering. There are no prerequisites, but statics, dynamics, mechanics of materials, fluid mechanics, biomechanics, and biology are helpful.

42-713 Applied Nanoscience and Nanotechnology

Fall and Spring: 12 units
Have you ever wondered what is nanoscience and nanotechnology and their impact on our lives? In this class we will go through the key concepts related to synthesis (including growth methodologies and characterizations techniques) and chemical/physical properties of nanomaterials from zero-dimensional (0D) materials such as nanoparticles or quantum dots (QDs), one-dimensional materials such as nanowires and nanotubes to two-dimensional materials such as graphene. The students will then survey a range of applications of nanomaterials through problem-oriented discussions, with the goal of developing design strategies based on basic understanding of nanoscience. Examples include, but are not limited to, biomedical applications such as nanosensors for DNA and protein detection, nanodevices for bioelectrical interfaces, nanomaterials as building blocks in tissue engineering and drug delivery, and nano materials in cancer therapy. Pre-requisite: Graduate standing. College level chemistry or physical chemistry, and thermodynamics.

42-722 Bioprocess Design

Fall: 12 units
This course is designed to link concepts of cell culture, bioseparations, formulation, and delivery together for the commercial production and use of biologically-based pharmaceuticals; products considered include proteins, nucleic acids, and fermentation-derived fine chemicals. Associated regulatory issues and biotech industry case studies are also included. A fair knowledge of cell culture and fermentation operations is assumed.

42-733 Neural Technology: Sensing and Stimulation

Spring: 12 units
This course gives engineering insight into the operation of excitable cells, as well as circuitry for sensing and stimulation nerves. Initial background topics include diffusion, osmosis, drift, and mediated transport, culminating in the Nernst equation of cell potential. We will then explore models of the nerve, including electrical circuit models and the Hodgkin-Huxley mathematical model. Finally, we will explore aspects of inducing a nerve to fire artificially, and cover circuit topologies for sensing action potentials and for stimulating nerves. If time allows, we will discuss other aspects of medical device design. Students will complete a neural stimulator or sensor design project. Although students in 42-733 will share lectures and recitations with students in 42-433, students in 42-733 will receive some distinct homework assignments, distinct design problems, and distinct exams from the ones given to students in 42-433 and will be graded on a separate curve from students taking 42-433.

42-737 Biomedical Optical Imaging

Fall: 12 units
Biophotonics, or biomedical optics, is a field dealing with the application of optical science and imaging technology to biomedical problems, including clinical applications. The course introduces basic concepts in electromagnetism and light tissue interactions, including optical properties of tissue, absorption, fluorescence, and light scattering. Imaging methods will be described, including fluorescence imaging, Raman spectroscopy, optical coherence tomography, diffuse optical spectroscopy, and photoacoustic tomography. The basic physics and engineering of each imaging technique are emphasized. Their relevance to human disease diagnostic and clinical applications will be included, such as breast cancer imaging and monitoring, 3D retinal imaging, ways of non-invasive tumor detection, as well as functional brain imaging in infants.

42-772 Special Topics: Applied Nanoscience and Nanotechnology

Fall: 12 units
Have you ever wondered what is nanoscience and nanotechnology and their impact on our lives? In this class we will go through the key concepts related to synthesis (including growth methodologies and characterizations techniques) and chemical/physical properties of nanomaterials from zero-dimensional (0D) materials such as nanoparticles or quantum dots (QDs), one-dimensional materials such as nanowires and nanotubes to two-dimensional materials such as graphene. The students will then survey a range of applications of nanomaterials through problem-oriented discussions, with the goal of developing design strategies based on basic understanding of nanoscience. Examples include, but are not limited to, biomedical applications such as nanosensors for DNA and protein detection, nanodevices for bioelectrical interfaces, nanomaterials as building blocks in tissue engineering and drug delivery, and nano materials in cancer therapy. Pre-requisite: Graduate standing. College level chemistry or physical chemistry, and thermodynamics.

42-774 Special Topics: Introduction to Biophotonics

Fall: 12 units
Biophotonics, or biomedical optics, is a field dealing with the application of optical science and imaging technology to biomedical problems, including clinical applications. The course introduces basic concepts in electromagnetism and light tissue interactions, including optical properties of tissue, absorption, fluorescence, and light scattering. Imaging methods will be described, including fluorescence imaging, Raman spectroscopy, optical coherence tomography, diffuse optical spectroscopy, and photoacoustic tomography. The basic physics and engineering of each imaging technique are emphasized. Their relevance to human disease diagnostic and clinical applications will be included, such as breast cancer imaging and monitoring, 3D retinal imaging, ways of non-invasive tumor detection, as well as functional brain imaging in infants. Pre-requisite: Graduate standing. College level physics covering electromagnetism and optics or permission of the instructor.

42-783 Neural Engineering Laboratory

Intermittent: 12 units
Neural engineering applies classic engineering approaches and principles to understand the nervous system and its function. The measurement of neural activity involves a number of basic tools that have evolved over decades to sense the activity of neurons (individual neurons, populations of neurons and nerve fibers) or activity that is related to neurons (such as the oxygenation of blood in the brain). To intervene in the nervous system, a comparable set of tools have evolved to change neural activity locally or globally, on short and long time scales. The successful application of these methods to measure and manipulate neural activity requires both a basic science and engineering understanding of the principles behind their action, along with practical experience in applying them in real-world settings. This laboratory course will pair lectures with laboratory exercises to gain a deep understanding of the tools we use to measure and manipulate neural activity, as well as the analytic approaches to this data. It will involve both building and diagnosing recording hardware, experimental data collection, data analysis in Matlab or Python, and scientific writing. Overall, the goal is to provide students with a deep understanding of the methods for acquiring experimental data in neuroscience. Familiarity with signal processing and introductory Matlab or Python programming is helpful. This course is suitable for students from diverse backgrounds: (1) Students with experimental backgrounds seeking a range of hands-on experience in different experimental settings and a deeper understanding of different experimental methods, and (2) students with engineering and other quantitative backgrounds seeking exposure to experimental data collection methods and practices.

42-882 Tissue Engineering

Summer: 12 units
This course is currently only for those enrolled in the 3D Biofabrication and Bioprinting Certificate program. This course will train students in advanced cellular and tissue engineering methods that apply physical, mechanical and chemical manipulation of materials in order to direct cell and tissue function. Students will learn about the techniques and equipment of bench research including cell culture, immunofluorescent imaging, soft lithography, variable stiffness substrates, application/measurement of forces and other methods. Students will integrate classroom lectures and lab skills by applying the scientific method to develop a unique project while working in a team environment. Emphasis will be placed on developing the written and oral communication skills required of the professional scientist. The class will culminate with a poster presentation session based on class projects. Additionally, there will be a one week optional on campus experience for those who wish to practice hands-on cell culture skills but do not have access to facilities.

42-887 Biofabrication and Bioprinting

Spring: 12 units
This course is currently only for those enrolled in the 3D Biofabrication and Bioprinting Certificate program. This laboratory course is designed to introduce students to and give them hands-on experience using methods that are used to fabricate scaffolds that are often used in tissue engineering, drug delivery, and some medical devices. Methods that will be taught include plastic FDM (filament deposition methods) to 3d print thermoplastic materials and molds for casting soft hydrogel materials, as well as 3d Bioprinting of soft hydrogel materials into a support bath material. This course will include a lecture component to introduce students to the concepts needed to design and fabricate the scaffolds. Lecture topics will include (but are not limited to): chemical and physical properties of biomaterials, CAD, and post-processing methods. There are no pre-requisite courses; however prior introductory lab experience is suggested.

42-994 Special Topics: Technical Communication for Biomedical Engineers - Fellowship

Summer
This course is designed to teach graduate students in the Biomedical Engineering program principles of technical communication to solicit project support via NIH F31 Fellowship Application. Communication skills are foundational skillsets that will support biomedical researchers' technical goals and required regular practice to hone and enact throughout scientific careers. Students will work in a course setting, small peer review groups, and one-on-one with the instructor to complete their fellowship proposal. Students will also learn the standard components of advanced writing and revising tasks, including abstracts, literature reviews, reader reaction critiques, and a rhetorical approach to revision that support engineering work.

Department of Chemical Engineering

Carl Laird, Interim Department Head
Office: Doherty Hall 2100B
www.cheme.engineering.cmu.edu/ (http://
www.cheme.engineering.cmu.edu/)

Chemical Engineering is a broad discipline that combines chemistry, mathematics and physics with its own unique principles of *chemical engineering science* and *process systems engineering* to develop new products and manufacturing processes. Chemical engineering science refers to the material properties and models that help the chemical engineer understand and predict the transformation of chemical compounds at all stages of their conversion from raw materials to value added products. Process systems engineering provides methodologies for the systematic design, optimization, control, operation and analysis of a system of operations by which a product is manufactured, as well as the economic, safety, sustainability and environmental assessment of these processes.

Modern chemical engineering practice brings together a deep understanding of molecular properties and process design to not only develop more energy-efficient and sustainable manufacturing processes for currently existing products but also to develop new consumer and industrial products that provide enhanced functionality while making more efficient use of resources. As a result, the Chemical Engineering profession offers challenging and well-compensated careers in industries across the economy. Nearly all aspects of modern life use the products of chemical engineering. The pharmaceutical industry recruits chemical engineers to use their knowledge of chemical reaction engineering and separation processes to produce pure and effective pharmaceutical agents and drug delivery systems, and the biopharmaceutical industry attracts chemical engineers who can apply this expertise to biomanufacturing systems based on microbiology and biochemistry. In the chemical and energy sectors, chemical engineers develop catalysts and processes to improve yields in the production of commodity and specialty chemicals and fuels, and they develop new battery systems, fuel cells and biofuels to help build the renewable energy economy. Material manufacturers hire chemical engineers to develop large scale processes to synthesize polymers as resins for formulated products or as fabricated device components. The semiconductor industry seeks the chemical processing expertise of chemical engineers to manufacture chips, integrated circuits, and photovoltaic cells. Chemical engineers in the consumer products industries use their knowledge of chemical transformations to formulate and manufacture nearly all the products that people use in their everyday lives. Consulting companies seek chemical engineers for evaluation of the economic feasibility, environmental impact, and sustainability of industrial projects and to develop software for the design, analysis and operation of manufacturing processes. Finally, the curricular emphasis on the analysis and optimization of complex systems makes Chemical Engineering an excellent preparatory major for students interested in medical or business schools.

The Chemical Engineering curriculum develops deep problem solving skills through challenging, open-ended problems in chemical engineering science, process systems engineering, process system design and product design. Computing is integrated throughout the curriculum. The department supports extensive use of mathematical modeling and simulation software. Students in the Robert Rothfus Laboratory and Lubrizol Analytical Laboratory learn to use computerized data acquisition and control systems as they develop experimental tests of chemical engineering theory or process design alternatives. With its focus on complex chemical and biochemical processes, Chemical Engineering is a natural pairing with the Additional Major in Biomedical Engineering or the Biomedical Engineering minor. Chemical Engineering students pursue many different minors. It is particularly well aligned with the CIT Designated Minor in Colloids, Polymers and Surfaces and the University's Minor in Environmental and Sustainability Studies.

Program Educational Objectives and Student Outcomes

Program Educational Objectives

The Carnegie Mellon University Chemical Engineering Bachelor of Science degree program strives to produce graduates who:

- possess deep knowledge of chemical engineering fundamentals and the ability to combine them with advanced modeling and computational strategies to solve complex problems;
- strive for excellence in their professional activities, with a commitment to safety and ethical practices;
- understand the impact of their work in a global, economic, environmental, and societal context, which includes valuing the perspective of people with diverse backgrounds and experiences;
- are excellent communicators;
- excel both as leaders and as members of working teams; and
- are well prepared for immediate success in either professional employment or advanced education.

Learning Outcomes

Students who complete the Bachelor of Science in Chemical Engineering at Carnegie Mellon University will acquire:

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics;
2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors;
3. an ability to communicate effectively with a range of audiences;
4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts;
5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives;
6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions; and
7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

The department offers a number of special programs for students majoring in Chemical Engineering. In addition to the additional majors offered by the College of Engineering such as: Biomedical Engineering (BME), Engineering Design, Innovation & Entrepreneurship (EDIE), and Engineering & Public Policy (EPP), students may choose from a variety of minors in technical areas offered by the College of Engineering. Undergraduate research projects are also available in the areas of bioengineering, complex fluids engineering, environmental engineering, process systems engineering, and catalysis & surface science. The department offers the Chemical Engineering Summer Scholars (ChESS) program to support undergraduate research within the department. Students may participate in study abroad programs during their Junior year. In addition to the University Study Abroad programs, the department provides its own exchange programs with: RWTH Aachen in Germany, Imperial College in London, Great Britain, Universidad Nacional del Litoral in Argentina, and Yonsei University in Seoul, Korea. A summer exchange program in Dortmund, Germany is also available. Students may also participate in Practical Internships for Senior Chemical Engineering Students (PISCES), a one-year industrial internship program offered between the Junior and Senior years. Finally, qualified students may enroll in our Master of Chemical Engineering program. This degree is typically completed in the fifth year. However, depending on the number of advanced placement courses and course load at Carnegie Mellon, this degree could be awarded during the B.S. graduation, or after one additional semester.

Curriculum for Class of 2025 and Beyond

Minimum units required for B.S. in Chemical Engineering 391

The program in chemical engineering within the Department of Chemical Engineering is accredited by the Engineering Accreditation Commission of ABET, https://www.abet.org, under the commission's General Criteria and Program Criteria for Chemical, Biochemical, Biomolecular, and Similarly Named Engineering Programs.

First Year

Fall		Units
21-120	Differential and Integral Calculus	10

76-xxx	Designated Writing/Expression Course	9
99-101	Core@CMU	3
06-100	Introduction to Chemical Engineering	12
09-105	Introduction to Modern Chemistry I	10
		44

Spring		Units
21-122	Integration and Approximation	10
xx-xxx	Introductory Engineering Elective (other than ChE)	12
33-141	Physics I for Engineering Students	12
xx-xxx	General Education Course	9
		43

Second Year

Fall		Units
21-254	Linear Algebra and Vector Calculus for Engineers	11
06-223	Chemical Engineering Thermodynamics	12
06-222	Sophomore Chemical Engineering Seminar	1
09-106	Modern Chemistry II	10
xx-xxx	Computer Sci./Physics II *	10-12
xx-xxx	General Education Course	9
39-210	Experiential Learning I	0
		53-55

Spring		Units
06-261	Fluid Mechanics	9
06-262	Mathematical Methods of Chemical Engineering	12
09-221	Laboratory I: Introduction to Chemical Analysis	12
xx-xxx	Physics II/Computer Sci. *	12-10
xx-xxx	General Education Course	9
39-220	Experiential Learning II	0
		54-52

* Computer Science/Physics II: Students should complete 15-110 Principles of Computing or 15-112 Fundamentals of Programming and Computer Science as well as 33-142 Physics II for Engineering and Physics Students by the end of the Sophomore year. The recommended sequence is 33-141 /33-142 for engineering students, however, 33-151/ 33-152 will also meet the CIT Physics requirement.

For those students who have not taken 06-100 as one of the two Introductory Engineering Electives, 06-100 should be taken in the Fall Semester of the Sophomore year. The General Education Course normally taken during that semester may be postponed until the Junior year. These students should consult with their advisor as soon as possible.

At the end of the Sophomore year, a student should have completed the following required basic science and computer science courses:

09-105	Introduction to Modern Chemistry I	10
09-106	Modern Chemistry II	10
09-221	Laboratory I: Introduction to Chemical Analysis	12
15-110	Principles of Computing	10-12
or 15-112	Fundamentals of Programming and Computer Science	
33-141	Physics I for Engineering Students	12
33-142	Physics II for Engineering and Physics Students	12
99-101	Core@CMU	3

Third Year

Fall		Units
06-325	Numerical Methods and Machine Learning for Chemical Engineering	6
06-326	Optimization Modeling and Algorithms	6
06-322	Junior Chemical Engineering Seminar **	2
06-323	Heat and Mass Transfer	9
09-217	Organic Chemistry I	9-10
or 09-219	Modern Organic Chemistry	
06-310	Molecular Foundations of Chemical Engineering	9
xx-xxx	General Education Course	9
39-310	Experiential Learning III	0
		50-51

Spring		Units
06-361	Unit Operations of Chemical Engineering	9
06-363	Transport Process Laboratory	9
06-364	Chemical Reaction Engineering	9
xx-xxx	Advanced Chemistry Elective**/***	9
xx-xxx	Unrestricted Elective	9
xx-xxx	General Education Course	9
		54

Fourth Year

Fall		Units
06-421	Chemical Process Systems Design	12
06-423	Unit Operations Laboratory	9
xx-xxx	Unrestricted Elective	9
xx-xxx	Unrestricted Elective	9
xx-xxx	General Education Course	9
		48

Spring		Units
06-463	Chemical Product Design ****	9
06-464	Chemical Engineering Process Control	9
xx-xxx	Unrestricted Elective	9
xx-xxx	Unrestricted Elective	9
xx-xxx	General Education Course	9
		45

** For students pursuing Chemical Engineering with an Additional Major in Biomedical Engineering, the 06-322 Junior Chemical Engineering Seminar is replaced by 42-201 Professional Issues in Biomedical Engineering.
Students pursuing Chemical Engineering with an Additional Major in Engineering and Public Policy are waived from taking the Advanced Chemistry Elective. They will take 36-220.

*** **Advanced Chemistry Elective** may be any technical course offered by the Department of Chemistry for at least 9 units at the 200-level or above, or one of the following: 03-232 Biochemistry, 06-607 Physical Chemistry of Colloids and Surfaces, or 06-609/09-509 Physical Chemistry of Macromolecules. Students may petition the Undergraduate Committee to approve other chemistry-focused courses offered by other departments on a case-by-case basis.

**** The 06-463 Chemical Product Design requirement is waived for BME Additional Major students completing 42-401 Foundations of Biomedical Engineering Design (6 units, fall) AND 42-402 Biomedical Engineering Design Project (9 units, spring).

Notes:

1. In addition to the graduation requirement of an overall QPA of 2.0 (not counting the First Year), the Department of Chemical Engineering requires a cumulative QPA of 2.0 in all chemical engineering courses (all those numbered 06-xxx).
2. Minimum number of units required for graduation: 391.
3. All mathematics (21-xxx) courses required for the engineering degree taken at Carnegie Mellon must have a minimum grade of C in order to be counted toward the graduation requirement for the BS engineering degree.
4. A minimum grade of C must be achieved in any required mathematics (21-xxx) course that is a pre-requisite for the next higher level required mathematics (21-xxx) course.
5. Overloads are permitted only for students maintaining a QPA of 3.5 or better during the preceding semester.
6. Electives: To obtain a Bachelor of Science degree in Chemical Engineering, students must complete 06-100 and one other Introductory Engineering Elective. There are also five Unrestricted Electives.
7. Undergraduate Research: Independent research projects are available by arrangement with a faculty advisor. Many students conduct these research projects for elective credit by enrolling in 06-200, 06-300, or 06-400 (Sophomore, Junior, or Senior Research Projects) or 39-500 CIT Honors Research Project for eligible Seniors.

8. Advanced undergraduates may also take Chemical Engineering graduate courses (600 or 700 level).

Additional Major in Engineering and Public Policy (EPP)

Students may pursue an Additional Major in Chemical Engineering and EPP. This Additional Major is built around electives in Social Analysis, Probability and Statistics courses, and projects. Specific course choices should be discussed with the student's advisor and an EPP advisor.

Additional Major in Engineering Design, Innovation & Entrepreneurship (EDIE)

Students may pursue an Additional Major in Chemical Engineering and EDIE. Specific course choices should be discussed with the student's advisor and an EDIE advisor.

Additional Major in Biomedical Engineering (BME)

Students may pursue an Additional Major in Chemical Engineering and BME. Specific course choices should be discussed with the student's advisor and a BME advisor.

Minors with a B.S. in Chemical Engineering

Chemical Engineering students are eligible for any CIT Designated Minor. Those minors that are especially well suited to Chemical Engineers include: Additive Manufacturing, Audio Engineering, Biomedical Engineering, Colloids, Polymers & Surfaces, Electronic Materials, Global Engineering, Materials Science and Engineering and Mechanical Behavior of Materials. The minor requirements may be fulfilled with electives. Other minors, such as the Supply Chain Management minor in association with the Tepper School of Business or the Minor in Environmental and Sustainability Studies, are also available outside of CIT. These should be discussed with the student's advisor.

Colloids, Polymers and Surfaces Minor

Professor Robert Tilton, *Director of CPS Minor*
Location: Doherty Hall A207C

The sequence of courses in the Colloids, Polymers and Surfaces (CPS) designated minor provides an opportunity to explore the science and engineering of fine particles and macromolecules as they relate to complex fluids and interfacially engineered materials. These topics are very relevant to technology and product development in industries that manufacture pharmaceuticals, coatings and paints, pulp and paper, biomaterials, surfactants and cleaning products, cosmetics and personal care products, food, textiles and fibers, nanoparticles, polymer/plastics, composite materials.

Course Requirements

Minimum units required for minor: 45

This minor requires a total of five classes with a minimum of 45 units. The following four courses are mandatory:

06-609/09-509	Physical Chemistry of Macromolecules	9
06-607	Physical Chemistry of Colloids and Surfaces	9
06-426	Experimental Colloid Surface Science	9
06-466	Experimental Polymer Science	9

In addition, the student must take one CPS related elective course from the following list:

06-612	Formulation Engineering	12
06-610	Rheology and Structure of Complex Fluids	9
09-502	Organic Chemistry of Polymers	9
27-565	Nanostructured Materials	9
27-477	Introduction to Polymer Science and Engineering	9

Other CPS electives are possible but must be approved by the Director of the CPS minor, Professor Tilton

The Chemical Engineering curriculum develops deep problem solving skills through challenging, open-ended problems in chemical engineering science, process systems engineering, process system design and product design. Computing is integrated throughout the curriculum. The department supports extensive use of mathematical modeling and simulation software. Students in the Robert Rothfus Laboratory and Lubrizol Analytical Laboratory learn to use computerized data acquisition and control systems as they develop experimental tests of chemical engineering theory or process design alternatives. With its focus on complex chemical and biochemical processes, Chemical Engineering is a natural pairing with the Additional Major in Biomedical Engineering or the Biomedical Engineering minor. Chemical Engineering students pursue many different minors. It is particularly well aligned with the CIT Designated Minor in Colloids, Polymers and Surfaces and the University’s Minor in Environmental and Sustainability Studies.

Practical Internships for Senior Chemical Engineering Students (PISCES)

Chemical Engineering students may apply in the fall of their Junior year for a salaried, one-year PISCES internship with a partner company. Admitted students begin their internships after completion of the Junior year. Following the internship, students return to complete their Senior year. There are several advantages of a one full-year internship, including the opportunity to gain a breadth of professional experience that is not generally possible in a shorter program, more opportunity to make important contributions to the partner company, and the opportunity to complete Senior year courses in their normal sequence with no need for curriculum rearrangements. Interested students should consult with their advisor.

International Chemical Engineering Exchange Programs

Chemical Engineering students may apply during their Sophomore year to spend their Junior year at RWTH Aachen in Germany, Yonsei University in Seoul, Korea, Universidad Nacional del Litoral in Argentina, or at Imperial College in London, Great Britain. A summer exchange program in Dortmund, Germany is also available. These exchange programs provide a great opportunity for students to obtain international experience while taking courses very similar to those offered at Carnegie Mellon. Students considering any of these programs should consult with their advisor, and students considering the Aachen program in particular are advised to take at least one introductory German course before or during their Sophomore year.

Fifth Year Master of Chemical Engineering (MChE)

The CIT Integrated Masters/Bachelors (IMB) Degree program provides the opportunity for qualified undergraduate students to obtain a master's degree in Chemical Engineering with one or two extra semesters of study. The goal is to deepen our graduates' understanding of the fundamentals of chemical engineering, and to provide them with a broader set of professional skills or to expose them to other technical disciplines.

The MChE program is a 96 unit course work degree aimed at undergraduate students from Carnegie Mellon and candidates from other universities. No financial support is available. For Carnegie Mellon students, the degree typically would be completed in their fifth year. Depending on advanced placement and semester overloads, however, CMU students can complete the degree at the time of the B.S. graduation or with one additional semester. All students must have graduate status once they have completed their B.S. degree; beyond eight semesters, degree program students must have full-time graduate student status in at least one (e.g., their final) semester whether or not they have already completed their BS degree. Upon graduating from this program, students seek industrial positions or placement in graduate programs at other universities.

A minimum of five completed semesters in residence as an undergraduate student and an overall QPA of 3.0 is required for eligibility. Taking the GRE and recommendation letters are not required. The application fee is waived for currently-enrolled undergraduate Chemical Engineering students.

The MChE program differs from the MS program because the MChE program does not require a project report or thesis.

Faculty

SHELLEY ANNA, Vice Provost for Faculty and Professor of Chemical Engineering – Ph.D., Harvard University; Carnegie Mellon, 2003–

JOANNE BECKWITH MADDOCK, Assistant Teaching Professor of Chemical Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2022–

LORENZ T. BIEGLER, Covestro University Professor and Professor of Chemical Engineering – Ph.D., University of Wisconsin; Carnegie Mellon, 1981–

DAPHNE WUI YARN CHAN, Assistant Professor of Chemical Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2022-–

MICHAEL M. DOMACH, Emeritus, Professor of Chemical Engineering – Ph.D., Cornell University; Carnegie Mellon, 1983–

NEIL M. DONAHUE, Lord University Professor of Chemistry and Chemical Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2000–

ANDREW J. GELLMAN, Lord Professor of Chemical Engineering – Ph.D., University of California, Berkeley; Carnegie Mellon, 1992–

GABRIEL GOMES, Assistant Professor of Chemistry and Chemical Engineering – Ph.D., Florida State University; Carnegie Mellon, 2022–

HAMISH GORDON, Assistant Professor of Chemical Engineering – Ph.D., University of Oxford; Carnegie Mellon, 2022–

CHRYSANTHOS GOUNARIS, Professor of Chemical Engineering – Ph.D., Princeton University; Carnegie Mellon, 2013–

IGNACIO E. GROSSMANN, R. R. Dean University Professor of Chemical Engineering – Ph.D., Imperial College, University of London; Carnegie Mellon, 1979–

ANNETTE JACOBSON, Emeritus, Teaching Professor of Chemical Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1988–

COTY JEN, Assistant Professor of Chemical Engineering – Ph.D., University of Minnesota; Carnegie Mellon, 2018–

MYUNG S. JHON, Emeritus, Professor of Chemical Engineering – Ph.D., University of Chicago; Carnegie Mellon, 1980–

JOHN KITCHIN, Professor of Chemical Engineering – Ph.D., University of Delaware; Carnegie Mellon, 2006–

CARL LAIRD, Professor and Interim Department Head of Chemical Engineering – Ph.D., Carnegie Mellon; Carnegie Mellon, 2021–

ALEXANDRA NEWBY, Assistant Teaching Professor of Chemical Engienering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2024–

TAGBO NIEPA, Arthur Hamerschlag Associate Professor of Chemical Engineering – Ph.D., Syracuse University; Carnegie Mellon, 2023–

GRIGORIOS PANAGAKOS, Assistant Research Professor of Chemical Engineering – Ph.D., Technical University of Denmark; Carnegie Mellon, 2018–

ANNE SKAJA ROBINSON, Trustee Professor of Chemical Engineering – Ph.D., University of Illinois at Urbana-Champaign; Carnegie Mellon, 2019–

JAMES W. SCHNEIDER, Professor of Chemical Engineering – Ph.D., University of Minnesota; Carnegie Mellon, 1999–

DERIN SEVENLER, Assistant Professor of Chemical Engineering – Ph.D., Boston University; Carnegie Mellon, 2024–

PAUL J. SIDES, Emeritus, Professor of Chemical Engineering – Ph.D., University of California, Berkeley; Carnegie Mellon, 1981–

SUSANA C. STEPPAN, Emeritus, Associate Teaching Professor of Chemical Engineering – PhD, University of Massachusetts; Carnegie Mellon, 2004–

ROBERT D. TILTON, Chevron Professor of Chemical Engineering – Ph.D., Stanford University; Carnegie Mellon, 1992–

ANA INES TORRES, Assistant Professor of Chemical Engineering – Ph.D., University of Minnesota; Carnegie Mellon, 2022–

ARTHUR W. WESTERBERG, Emeritus, University Professor of Chemical Engineering – Ph.D., DIC, Imperial College, University of London; Carnegie Mellon, 1976–

KATHRYN WHITEHEAD, Professor of Chemical Engineering – Ph.D., University of California; Carnegie Mellon, 2012–

B. ERIK YDSTIE, Emeritus, Professor of Chemical Engineering – Ph.D., Imperial College, University of London; Carnegie Mellon, 1992–

Department of Chemical Engineering Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

06-100 Introduction to Chemical Engineering

Fall and Spring: 12 units
We equip students with creative engineering problem-solving techniques and fundamental chemical engineering material balance skills. Lectures, laboratory experiments, and recitation sessions are designed to provide coordinated training and experience in data analysis, material property estimation for single- and multi-phase systems, basic process flowsheet, reactive and non-reactive mass balances, problem solving strategies and tools, and team dynamics. The course is targeted for CIT First Year students.

06-150 First Year Research Project

Fall and Spring: 6 units
Research projects conducted by first year undergraduate students under the supervision of a Chemical Engineering faculty member. The nature of the project and the criteria for grading are to be determined between the student and the faculty supervisor. A final written report or an oral presentation of the results may be required. A commitment of six hours effort on the project per week is expected. Registration will be by permission only.

06-200 Sophomore Research Project

Fall and Spring
Research projects under the direction of the Chemical Engineering faculty. The nature of the project, the number of units, and the criteria for grading are to be determined between the student and the faculty supervisor. The agreement should then be summarized in a one-page project description for review by the faculty advisor of the student. A final written report or an oral presentation of the results is required.

06-222 Sophomore Chemical Engineering Seminar

Fall: 1 unit
This course provides an overview of the chemical engineering profession. It discusses the rationale for the curriculum, career paths, resume writing, written communication skills, and ethics, and also involves a project on the use and manufacture of chemicals.

06-223 Chemical Engineering Thermodynamics

Fall: 12 units
This course introduces students to thermodynamic state variables and the analysis of phase and chemical equilibrium in single- and multi-component chemical systems. Key topics include application of mass, energy and entropy balance equations to analyze processes with change of state and interconversion of energy between heat and work in open or closed systems; state property changes associated with phase change; equations of state to represent the pressure-volume-temperature relationship for pure materials and mixtures; Gibbs phase rule; phase equilibrium criteria; ideal and non-ideal mixtures; fugacity and prediction of pure liquid vapor pressure; fugacity and activity coefficients to predict multi-component vapor-liquid and liquid-liquid phase equilibrium; analysis of flash and other processes involving multi-component phase change; equilibrium constants and equilibrium conversions in chemically reacting systems.
Prerequisites: 06-100 and (33-141 or 33-151 or 33-121)

06-261 Fluid Mechanics

Spring: 9 units
The principles of fluid mechanics as applied to engineering, including unit operations, are discussed; examples include flow in conduits, process equipment, and commercial pipes, flow around submerged objects, and flow measurement. Microscopic mass and momentum balances are described, including the continuity and Navier-Stokes equations, and modern solution techniques will be explored. Microscopic flow structures will be determined for flow visualization. Boundary layer theory, turbulence, and non-Newtonian fluids are also discussed. A case-study project based on new technological advancements is also required.
Prerequisites: 21-254 and (33-151 or 33-121 or 33-141) and 06-223

06-262 Mathematical Methods of Chemical Engineering

Spring: 12 units
Mathematical techniques are presented as tools for modeling and solving engineering problems. Modeling of steady-state mass and energy balance problems using linear and matrix algebra, including Gaussian elimination, decomposition, and iterative techniques. Modeling of unsteady-state engineering problems using linear and nonlinear differential equations. Analytical techniques, including Laplace transforms, and numerical techniques for the solution of first-and higher-order differential equations and systems of differential equations arising in engineering models. Finally, the modeling of processes affected by chance and subject to experimental error; statistical and regression techniques within the context of experimental design and analysis of experimental data.
Prerequisites: 21-254 and 06-223

06-300 Junior Research Project

Fall and Spring
Research projects under the direction of the Chemical Engineering faculty. The nature of the project, the number of units, and the criteria for grading are to be determined between the student and the faculty supervisor. The agreement should then be summarized in a one-page project description for review by the faculty advisor of the student. A final written report or an oral presentation of the results is required.

06-310 Molecular Foundations of Chemical Engineering

Fall: 9 units
Students will learn to use the tools of molecular engineering that define the modern development of chemical engineering, using a combination of theory and computation. The theme throughout the course is the use of molecular engineering tools to specify alternative compositions and conditions for chemical engineering design. Applications will include the prediction of macroscopic transport properties and equations of state, and the ability to tune them via judicious specification of system composition; rate laws and rate constants for complex reacting systems, including multi-step heterogeneous and homogeneous reactions; and principles of non-covalent association and self-assembly in the context of sustainable chemical engineering product design. Students will investigate contemporary molecular engineering case studies focused on renewable energy, human health or solutions to environmental problems.
Prerequisites: 09-106 and 06-223

06-322 Junior Chemical Engineering Seminar

Fall: 2 units
This course discusses career choices for chemical engineers, professional practice, including alternate career paths, global industry, and graduate studies. It also emphasizes writing, interview skills, and oral presentations. Safety, environmental and ethical issues are illustrated in projects and via invited lectures.

06-323 Heat and Mass Transfer

Fall: 9 units
This course presents the fundamentals of heat and mass transfer, including steady-state and transient heat conduction and molecular diffusion, convection of heat and mass, and thermal radiation, with application to heat and mass transfer processes. Development of dimensionless quantities for engineering analysis is emphasized.
Prerequisites: 06-261 and (06-262 or 21-260) and (33-122 or 33-142 or 33-152)

06-325 Numerical Methods and Machine Learning for Chemical Engineering

Fall: 6 units
This course will focus on applying numerical methods and machine learning to chemical engineering problems. Students will learn how modern programming environments (on laptops and in the cloud) can run python code. Programming concepts such as defining functions and plotting quantities will be reviewed. Students will learn how to apply and debug numerical integration techniques to systems of ODEs. Solving systems of nonlinear equations and black-box optimization will be covered. Machine learning will be introduced starting with the statistics of linear and non-linear regression with regularization. Polynomial fitting and interpolation will be covered. With this base, students will learn how to apply machine learning techniques such as gaussian process regression and neural networks to regression tasks. A small project will be included near the end to encourage creative applications to chemical engineering problems.
Prerequisites: 06-262 and (15-112 or 15-110)

06-326 Optimization Modeling and Algorithms

Fall: 6 units
Formulation and solution of mathematical optimization problems with and without constraints. Objective functions are based on economics or functional specifications. Both discrete and continuous variables are considered.
Prerequisite: 06-262

06-361 Unit Operations of Chemical Engineering

Spring: 9 units
This course comprises many of the standard operations in chemical plants such as gas absorption, heat exchange, distillation and extraction. The design and operation of these devices is emphasized. A project dealing with a novel unit operation is also investigated.
Prerequisite: 06-323

06-363 Transport Process Laboratory

Spring: 9 units
Develop skills for proposing, designing, planning, implementing, interpreting, and communicating the results of experiments in fluid flow and heat and mass transfer. Oral and written reports are required.
Prerequisites: 06-261 and 06-323

06-364 Chemical Reaction Engineering

Spring: 9 units
Fundamental concepts in the kinetic modeling of chemical reactions, the treatment and analysis of rate data. Multiple reactions and reaction mechanisms. Analysis and design of ideal and non-ideal reactor systems. Energy effects and mass transfer in reactor systems. Introductory principles in heterogeneous catalysis.
Prerequisites: 06-323 and 06-310

06-400 Senior Research Project

Fall and Spring
Research projects under the direction of the Chemical Engineering faculty. The nature of the project, the number of units, and the criteria for grading are to be determined between the student and the faculty supervisor. The agreement should then be summarized in a one-page project description for review by the faculty advisor of the student. A final written report or an oral presentation of the results is required.

06-421 Chemical Process Systems Design

Fall: 12 units
Screening of processing alternatives. Computational strategies for preliminary material and energy balances in large chemical processes. Preliminary sizing of process equipment. Cost estimation, economics, and evaluation for chemical plants. Strategies for synthesizing energy networks and separation sequences. Preliminary design of a large industrial project.
Prerequisites: 06-364 and 06-361

06-423 Unit Operations Laboratory

Fall: 9 units
Open-ended laboratory projects illustrate the principles of unit operations in Chemical Engineering. In this course students select, with course staff review, current societal problems to which chemical engineering subject knowledge can be applied. Students work in teams to design and implement an experimental plan to evaluate proposed solutions. Teams must work together to identify constraints and relationships between the unit operations they work on. Students must document implementation feasibility (cost, scheduling, analytic capability, etc.) and clearly identify the criteria and methods for assessing experimental results. Oral and written reports are required.
Prerequisites: 06-361 and 06-364

06-426 Experimental Colloid Surface Science

Fall: 9 units
Laboratory exercises will deal with preparation and stabilization of colloids, flocculation, micellar aggregates, surface tension, contact angle, spreading and adsorption. Basic concepts will be related to practical problems of wetting, lubrication, foaming, adhesion, coatings and corrosion.
Prerequisites: 09-221 and 06-607

06-463 Chemical Product Design

Spring: 9 units
Computer-aided design of a chemical product. Course involves design of molecular structure, microstructure, or devices/processes that effect chemical change. This is a project-based course, for which an extensive report must be submitted.
Prerequisite: 06-421

06-464 Chemical Engineering Process Control

Spring: 9 units
This course presents basic concepts of process dynamics and feedback control. Included are selection of measurements and manipulated variables, definition of transfer functions, creation of block diagrams and closed loop configurations. The course also covers concepts of open loop and closed loop stability, and tuning of PID controllers.
Prerequisite: 06-325

06-466 Experimental Polymer Science

Spring: 9 units
Macromolecular behavior in bulk and in solution will be explored in experiments on tensile strength, elasticity, swelling of networks, solution viscosity, melt flow, and polymerization reactions. Particular reference will be made to aspects affecting production and fabrication of polymeric materials.
Prerequisites: 09-221 and (06-609 or 09-509)

06-606 Computational Methods for Large Scale Process Design & Analysis

Spring: 9 units
This course deals with the underlying computer-aided design techniques for steady-state and dynamic simulation, numerical solution and decomposition strategies for large systems of sparse nonlinear algebraic equations, stiff ordinary differential equations, strategies for mixed algebraic/differential systems and computer architectures for flowsheeting systems.
Prerequisites: 06-262 and 06-361

Course Website: http://numero.cheme.cmu.edu/course/06606.html

06-607 Physical Chemistry of Colloids and Surfaces

All Semesters: 9 units
Thermodynamics of surfaces; adsorption at gas, liquid, and solid interfaces; capillarity; wetting, spreading, lubrication and adhesion; properties of monolayers and thin films; preparation and characterization of colloids; colloidal stability, flocculation kinetics, micelles, electrokinetic phenomena and emulsions.

06-609 Physical Chemistry of Macromolecules

Fall: 9 units
This course develops fundamental principles of polymer science. Emphasis is placed on physio-chemical concepts associated with the macromolecular nature of polymeric materials. Engineering aspects of the physical, mechanical and chemical properties of these materials are discussed in relation to molecular structure. Topics include an introduction to polymer science and a general discussion of commercially important polymers; molecular weight; condensation and addition synthesis mechanisms with emphasis on molecular weight distribution; solution thermodynamics and molecular conformation; rubber elasticity; and the rheological and mechanical properties of polymeric systems. Students not having the prerequisite listed may seek permission of the instructor.

06-610 Rheology and Structure of Complex Fluids

Fall: 9 units
This course will cover the basic concepts of rheology and mechanical behavior of fluid systems. Both the experimental and theoretical aspects of rheology will be discussed. The basic forces influencing complex fluid rheology and rheology will be outlined and discussed; including excluded volume, van der Waals, electrostatic and other interactions. Methods of characterizing structure will be covered including scattering techniques, optical polarimetry and microscopy. Examples will focus on several types of complex fluids including polymer solutions and melts, gelling systems, suspensions and self-assembling fluids.

06-612 Formulation Engineering

Intermittent: 12 units
Students will learn the scientific and design principles needed for careers in complex fluid formulation-based industries such as consumer products, pharmaceuticals, paints, agrochemicals or lubricants. The essential science and engineering principles of colloids, surfactants, interfaces and polymer solutions will be introduced. Students will learn to use these principles in combination with experimental measurements and statistical design of experiments tools to design effective liquid product formulations within specified economic, material and even aesthetic constraints. The lecture portion of the course is complemented by weekly lab sessions where student teams will design, prepare, test and improve their own formulations for a commercial complex fluid product, such as a detergent or an ink, that meets performance goals within specified constraints.

06-614 Special Topics: Atmospheric Nanoparticles and Climate

Fall and Spring: 12 units
This course will examine the physicochemical properties of atmospheric nanoparticles and the chemical processes that form these particles. We will also cover basic techniques for characterizing atmospheric nanoparticles using fundamentals of aerosol physics and chemistry. The last portion of the course will explore how atmospheric nanoparticles affect the Earth's radiative budget and ultimately climate. Students will apply their atmospheric nanoparticle knowledge to determine the feasibility and effectiveness of various atmospheric geoengineering techniques proposed in literature. Though this course targets atmospheric nanoparticles, it is also broadly applicable to anyone interested applications of aerosolized nanoparticles. Prerequisites: undergraduate chemistry and physics

06-623 Mathematical Modeling of Chemical Engineering Processes

Fall: 12 units
Numerical approaches to solving problems relevant to chemical engineering applications. In this course, advanced mathematical topics relevant to chemical engineering will be used to solve complex problems. Topics include linear algebra, nonlinear equation solving, initial value and boundary value problems for solution of differential equations, numerical optimization, probability and stochastic methods. Significant focus will be placed on numerical rather than analytical solution to problems. Primary Software Package(s): Mathematical programming environment.

06-625 Chemical and Reactive Systems

Fall: 12 units
In this course process simulation software will be used to develop models of chemical and reactive systems. The models will be used to predict the performance of the system, as well as to probe how process modifications, e.g. process conditions, reactor types or sequences, etc. affect system performance. The effects of the underlying thermodynamic and kinetic databases of chemical properties on the performance predictions will be explored. Methods to incorporate new thermodynamic and kinetic data into chemical and reactive system simulations will be examined. Thermochemical and kinetic data for reactions will be estimated for use in process simulation software. Primary Software Package(s): Molecular modeling and process simulation software.

06-631 Air Quality Engineering

Fall: 12 units
The course provides a quantitative introduction to the processes that control atmospheric pollutants and the use of mass balance models to predict pollutant concentrations. We survey major processes including emission rates, atmospheric dispersion, chemistry, and deposition. The course includes discussion of basic atmospheric science and meteorology to support understanding air pollution behavior. Concepts in this area include vertical structure of the atmosphere, atmospheric general circulation, atmospheric stability, and boundary layer turbulence. The course also discusses briefly the negative impacts of air pollution on society and the regulatory framework for controlling pollution in the United States. The principles taught are applicable to a wide variety of air pollutants but special focus is given to tropospheric ozone and particulate matter. The course is intended for graduate students as well as advanced undergraduates. It assumes a knowledge of mass balances, fluid mechanics, chemistry, and statistics typical of an undergraduate engineer but is open to students from other scientific disciplines.
Prerequisites: 36-220 and 24-231 and 09-105

06-634 Drug Delivery Systems

Fall and Spring: 9 units
The body is remarkable in its ability to sequester and clear foreign entities - whether they be "bad" (e.g. pathogens) or "good" (e.g. therapeutic drugs). This course will explore the design principles being used to engineer modern drug delivery systems capable of overcoming the body's innate defenses to achieve therapeutic effect. Specifically, we will study the chemistry, formulation, and mechanisms of systems designed to deliver nucleic acids, chemotherapeutics, and proteins across a variety of physiological barriers. Scientific communication plays a prominent role in the course, and students will have several opportunities to strengthen their communication skills through journal club presentations, proposal writing and constructive feedback. This is a graduate level course that is also open to undergraduate seniors.

06-642 Data Science and Machine Learning in Chemical Engineering

Fall and Spring: 6 units
This class will examine topics related to data science and machine learning in chemical engineering. This includes topics in data visualization and modeling. The course will emphasize computational implementations of these topics with applications in chemical engineering. Students will need to be comfortable with scientific programming. Students who have taken 06-623 and/or 06-625 should have the skills needed in this class.

06-643 Creating Scientific Research Software

Fall and Spring: 6 units
This course will introduce students to topics in creating scientific research software. This will include using a shell, creating and using command-line utilities, using software editors, using version control systems, and creating and distributing software packages for scientific research.

06-663 Analysis and Modeling of Transport Phenomena

Spring: 12 units
Students will learn the basic differential equations and boundary conditions governing momentum, heat, and mass transfer. Students will learn how to think about these equations in dimensionless terms and will apply them to model physical and chemical processes. The primary mode for solving them will be numerical. Analytical results for classical problems of high symmetry also will be presented to serve as a basis for comparison and validation. Software: A finite element and computational transport tool.

06-665 Process Systems Modeling

Spring: 12 units
Simulation and optimization of complex flowsheets, synthesis of separation systems, planning and enterprise-wide optimization, process control and molecular design. Primary Software Package(s): Process Simulation software. Target Audience: first year masters students in chemical engineering Prerequisite skills: analytical and mathematical skills typical of an undergraduate engineering degree or technical degree.

06-679 Introduction to Meteorology

Fall and Spring: 12 units
Provide you with the basics of meteorology, with a focus on large-scale atmospheric motion. By the end of the class you will understand the basics of atmospheric dynamics, including horizontal and vertical motion, as well as the vertical structure of the atmosphere (atmospheric stability and boundary-layer dynamics). You will understand what makes weather happen and you will understand weather maps and charts. You will be able to critically watch the nightly weather forecast and you will be able to access available meteorological databases to make informed predictions of your own. Finally, you will understand atmospheric transport and boundary-layer dynamics, which will serve as a foundation for other coursework involving atmospheric transport and air-pollution if you are pursuing those topics more deeply.

06-685 Bioseparations and Bioprocess Analytical Technologies

Spring: 12 units
This course gives an introduction to key principles of bioseparations and process analytical technologies relevant to the manufacture of biopharmaceuticals. Transport modeling principles are applied to sedimentation/centrifugation, flocculation, and filtration of antibodies and plasmid DNA from raw cell culture. Polishing methods such as Protein A chromatography and size-exclusion chromatography are a particular focus. Chemical means to graft affinity ligands to commercial media are discussed along with in-line spectroscopic techniques. A molecular-level basis of light absorbance and fluorescence is established and the selection and conjugation of fluorophores to biomolecules of interest is presented. Means to assess the state of antibody aggregation and the proper folding of protein-based therapeutics are covered in the context of spectroscopic identification. Finally, the course will provide an overview of the diverse metrics needed for analysis of biomacromolecules as well as the variety of techniques used to analyze quality of produced materials by comparing cost, speed, accuracy and precision.

06-686 ST: Polymers for a Sustainable Future

Fall and Spring: 9 units
This course presents basic concepts of polymer science and discusses topics related to polymers and sustainability. Condensation, radical, ionic, emulsion, and ring-opening polymerizations, polymer behavior in solution and in the bulk will be explored in relation to material applications. We will touch on topics including chemistry of biomass and sustainable utilization of bio-based materials, along with polymers for sustainable technologies in renewable energy, water, and the environment.

06-702 Advanced Reaction Kinetics

Spring: 12 units
Advanced application of engineering and scientific principles to the study of complex chemical reaction systems. Catalytic and noncatalytic reactions in homogeneous and heterogeneous systems, fast reaction techniques, and isothermal and non-isothermal reaction design.

06-705 Advanced Chemical Engineering Thermodynamics

Fall: 12 units
Advanced application of the general thermodynamic method to chemical engineering problems. Second law consequences, estimation and correlation of thermodynamic properties, and chemical and phase equilibria.

06-707 Advanced Transport Phenomena

Fall and Spring: 12 units
An introduction to foundational concepts in mass, momentum, and energy transport. The governing equations for such transport phenomena in flowing fluids will be derived and then analyzed in a variety of scenarios, including unidirectional flows, lubrication theory, Stokes flow, and forced convection heat and mass transfer. The focus will be on problem formulation and solution using applied mathematical techniques. Throughout, the importance of developing a physical intuition for transport phenomena will be emphasized.

06-713 Mathematical Techniques in Chemical Engineering

Fall: 12 units
Selection, construction, solution, and interpretation of mathematical models applicable to the study of chemical engineering problems. Mathematical topics emphasized include divergence, curl and gradient operators, vector field theory, the solution of ordinary and partial differential equations by infinite series, separation of variables, Green's functions, regular and singular perturbations, and boundary-layer techniques.

06-714 Surfaces and Adsorption

Fall and Spring: 12 units
A survey of solid surfaces and gas-solid interactions. Topics include the structure and electronic properties of metal surfaces, the kinetics and thermodynamics of adsorption and desorption processes, and concepts in heterogeneous catalysis. The course emphasizes the application of recent experimental techniques in studying these problems.

06-722 Bioprocess Design

Fall and Spring: 12 units
This course is designed to link concepts of cell culture, bioseparations, formulation, and delivery together for the commercial production and use of biologically-based pharmaceuticals; products considered include proteins, nucleic acids, and fermentation-derived fine chemicals. Associated regulatory issues and biotech industry case studies are also included. A fair knowledge of cell culture and fermentation operations is assumed.

Department of Civil and Environmental Engineering

Burcu Akinci, Head
Location: Porter Hall 119-D
www.cmu.edu/cee (http://www.cmu.edu/cee/)

The role of civil and environmental engineers, in the broadest sense, is to apply science and technology to develop sustainable solutions to meet society's needs. Civil and environmental engineers plan, design, construct, operate, and maintain infrastructure used daily by the public and industry, such as buildings, transportation networks, water systems, and energy distribution systems. Civil and environmental engineers are at the forefront of technological developments to address the biggest societal challenges. They work to protect public health and the environment. Today's civil and environmental engineers are also called upon by government and industry to provide leadership on complex technical and societal issues such as demands for infrastructure improvement, remediation of former industrial sites for reuse, renewable energy, climate change adaptation, provision of safe drinking water, smart transportation systems, and sustainable development.

The department offers undergraduate degree programs leading to a B.S. in Civil Engineering or a B.S. in Environmental Engineering. The B.S. in Civil Engineering provides a broad exposure to the field and its sub-disciplines, including environmental engineering. The B.S. in Environmental Engineering offers the opportunity to focus primarily on environmental sciences and engineering. The two programs share a number of common courses.

The Civil Engineering and Environmental Engineering curricula emphasize fundamental understanding of the behavior of constructed facilities and the natural environment and the design of infrastructure through the application of the physical sciences, chemistry, biology, mathematics, and computing. In addition to providing a solid technical foundation, the programs emphasize the development of professional skills. We incorporate design and team experiences throughout the curriculum, and provide hands-on experience in laboratory and project courses. Students also have multiple opportunities to practice and improve their communication skills through reports, presentations, and team activities.

The curricula allow many opportunities for students to pursue areas of personal interest. Students may pursue a minor in one of the designated minor programs offered in the College of Engineering or elsewhere in the university or an additional major. Students may also choose to concentrate in a specialty area in civil or environmental engineering. Students are encouraged to participate in research with department faculty members, explore their chosen field through internships, and take advantage of opportunities to study abroad and be exposed to other cultures. Faculty mentors and the Director of Undergraduate Programs are available to discuss students' educational goals and help define a path to reach them.

The Department of Civil and Environmental Engineering offers a wide spectrum of opportunities for entry into the engineering profession, for graduate education in engineering, or entry into various other graduate and professional fields, including business, law, and medicine. Our curricula emphasize the development of scientific inquiry in the context of applications in civil and environmental engineering. For B.S. graduates who wish to enter the engineering profession directly in such specialties as structural engineering, construction engineering, computer-aided engineering, or environmental engineering, this approach to teaching allows application of the most advanced technological developments. Those who wish to pursue graduate study are prepared to engage in research on the highest level, either in traditional specialties or in emerging fields such as smart infrastructure, climate change adaptation, and micromechanics.

Program Educational Objectives: B.S. Civil Engineering

The Program Educational Objectives are broad statements that describe what graduates are expected to attain within a few years of graduation. The objectives of the Bachelor of Science in Civil Engineering program are to develop graduates who embody the following definitions:

- Graduates distinguish themselves within their organizations as individuals able to provide sustainable solutions to a wide range of conventional, cutting-edge, and emerging professional challenges related to one or more of the areas of the built, natural, and information environments.
- Graduates are innovative, proactive, and adaptive professionals, highly engaged in their professional communities; graduates are prepared to take on leadership positions within their organizations and communities.
- Graduates are able to contribute and collaborate on developing sustainable solutions to local and global problems; graduates are able to cross geographic, cultural, and traditional discipline boundaries in developing solutions; graduates are able to develop just and equitable solutions.

The Bachelor of Science in Civil Engineering program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org under the commission’s General Criteria and Program Criteria for Civil and Similarly Named Engineering Programs.

By the end of the B.S. program, students should have achieved the following student outcomes:

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics

2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors

3. an ability to communicate effectively with a range of audiences

4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts

5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives

6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions

7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies

The curriculum has been designed, and is periodically evaluated and refined, to provide students instruction and experiences that lead to the development of these abilities and skills.

Program Educational Objectives: B.S. Environmental Engineering

The Program Educational Objectives are broad statements that describe what graduates are expected to attain within a few years of graduation. The objectives of the Bachelor of Science in Environmental Engineering program are to develop graduates who embody the following definitions:

- Graduates distinguish themselves within their organizations as individuals able to provide sustainable solutions to a wide range of conventional, cutting-edge, and emerging professional challenges related to one or more of the areas of the built, natural, and information environments.
- Graduates are innovative, proactive, and adaptive professionals, highly engaged in their professional communities; graduates are prepared to take on leadership positions within their organizations and communities.
- Graduates are able to contribute and collaborate on developing sustainable solutions to local and global problems; graduates are able to cross geographic, cultural, and traditional discipline boundaries in developing solutions; graduates are able to develop just and equitable solutions.

By the end of the B.S. program, students should have achieved the following student outcomes:

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics

2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors

3. an ability to communicate effectively with a range of audiences

4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts

5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives

6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions

7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies

The Bachelor of Science in Environmental Engineering completed its first cycle of graduating students in May 2024 and will be formally evaluated by ABET in the fall of 2024. The program was designed in accordance with ABET general and program criteria. Accreditation would be applicable retroactively to the May 2024 graduates.

Curriculum: B.S. Civil Engineering

Minimum units required for B.S. in Civil Engineering 384

Students entering the College of Engineering declare a major near the end of the first year. First-year students take two introductory engineering courses as well as some restricted technical electives within the common foundation specified for first-year engineering students. By the end of the sophomore year, a Civil Engineering major is expected to have completed the Restricted Technical Electives in the following list and 12-100 Exploring CEE: Infrastructure and Environment in a Changing World.

Restricted Technical Electives		Units
09-101	Introduction to Experimental Chemistry	3
09-105	Introduction to Modern Chemistry I	10
or 09-111	Nanolegos: Chemical Building Blocks	
15-110	Principles of Computing	10
21-120	Differential and Integral Calculus	10
21-122	Integration and Approximation	10
21-259	Calculus in Three Dimensions	9
or 21-254	Linear Algebra and Vector Calculus for Engineers	
21-260	Differential Equations	9
33-141	Physics I for Engineering Students	12
33-142	Physics II for Engineering and Physics Students	12

Notes on Math Requirements

1. All mathematics (21-xxx) courses required for the engineering degree taken at Carnegie Mellon must have a minimum grade of C in order to be counted toward the graduation requirement for the BS engineering degree.
2. A minimum grade of C must be achieved in any required mathematics (21-xxx) course that is a pre-requisite for the next higher level required mathematics (21-xxx) course.

Sample Curriculum

This section shows the recommended four-year program of study for the BS in Civil Engineering following a typical path. The curriculum for transfer students, students with advanced placement credit, and students planning to study abroad will not follow the same path. Students need to consult the department for appropriate advising and formulation of a plan to complete the degree within eight semesters.

First Year

Fall		Units
12-100	Exploring CEE: Infrastructure and Environment in a Changing World	12
21-120	Differential and Integral Calculus	10
33-141	Physics I for Engineering Students	12
99-101	Core@CMU	3
xx-xxx	General Education Course	9
		46

Spring		Units
xx-xxx	Introduction to Engineering (other than CEE)	12
21-122	Integration and Approximation	10
33-142	Physics II for Engineering and Physics Students	12
09-101	Introduction to Experimental Chemistry	3
xx-xxx	General Education Course	9
		46

Sophomore Year

Fall		Units
12-200	CEE Challenges: Design in a Changing World	9
12-212	Statics	9
12-233	CEE Infrastructure Systems in Action	2
21-259	Calculus in Three Dimensions	9
or 21-254	Linear Algebra and Vector Calculus for Engineers	
15-110	Principles of Computing	10
xx-xxx	General Education Course	9
39-210	Experiential Learning I	0
		48

Spring		Units
12-231	Solid Mechanics	9
12-234	Sensing and Data Acquisition for Engineering Systems	4
12-271	Computation and Data Science for Civil & Environmental Engineering	9
21-260	Differential Equations	9
36-220	Engineering Statistics and Quality Control	9
xx-xxx	General Education Course	9
39-220	Experiential Learning II	0
		49

Junior Year

Fall		Units
12-301	CEE Projects: Integrating the Built, Natural and Information Environments	9
12-335	Soil Mechanics	9
12-355	Fluid Mechanics	9
12-356	Fluid Mechanics Lab	2
09-111	Nanolegos: Chemical Building Blocks	9
or 09-105	Introduction to Modern Chemistry I	
xx-xxx	Elective 1	9
39-310	Experiential Learning III	0
		47

Spring		Units
12-351	Environmental Engineering	9
27-357	Introduction to Materials Selection	6
12-371	Advanced Computing and Problem Solving in Civil and Environmental Engineering	9
12-333	Experimental & Sensing Systems Design and Computation for Infrastructure Systems	4
xx-xxx	Elective 2	9
xx-xxx	General Education Course	9
		46

Senior Year

Fall		Units
12-401	CEE Design	12
12-411	Project Management for Engineering and Construction	9
xx-xxx	Elective 3	9
xx-xxx	Elective 4	9
xx-xxx	General Education Course	9
		48

Spring		Units
xx-xxx	General Education Course	9
xx-xxx	General Education Course	9

xx-xxx	Elective 5	9
xx-xxx	Elective 6	9
xx-xxx	Elective 7	9
xx-xxx	Elective 8	9
		54

Notes on Electives

1. One elective must be in the basic sciences, from the following list:

03-121	Modern Biology	9
12-201	Geology	9
12-353	Environmental Biology and Ecology	9
Substitutions may be made only with the approval of the Department Head.		

2. One elective course is restricted to a 600-level or 700-level Civil Engineering course of at least 9 units, except 12-648 and 12-690. The combination of 12-644 and 12-645 may also be used, but no other combination is allowed.
3. **Students are encouraged to take multiple 12-6xx and 12-7xx courses to provide them with specific civil engineering domain depth in their field(s) of interest.**

Curriculum: B.S. Environmental Engineering

Minimum units required for B.S. in Environmental Engineering 384

Students entering the College of Engineering declare a major near the end of the first year. First-year students take two introductory engineering courses as well as some restricted technical electives within the common foundation specified for first-year engineering students. By the end of the sophomore year, an Environmental Engineering major is expected to have completed the Restricted Technical Electives in the following list and 12-100 Exploring CEE: Infrastructure and Environment in a Changing World.

09-105	Introduction to Modern Chemistry I	10
or 09-111	Nanolegos: Chemical Building Blocks	
15-110	Principles of Computing	10
21-120	Differential and Integral Calculus	10
21-122	Integration and Approximation	10
21-254	Linear Algebra and Vector Calculus for Engineers	11
21-260	Differential Equations	9
33-141	Physics I for Engineering Students	12
33-142	Physics II for Engineering and Physics Students	12

Notes on Math Requirements

1. All mathematics (21-xxx) courses required for the engineering degree taken at Carnegie Mellon must have a minimum grade of C in order to be counted toward the graduation requirement for the BS engineering degree.
2. A minimum grade of C must be achieved in any required mathematics (21-xxx) course that is a pre-requisite for the next higher level required mathematics (21-xxx) course.

Notes on Electives

1. **Students are encouraged to take multiple upper level courses to provide them with specific environmental engineering domain depth in their field(s) of interest.**

Specialty Areas in Civil Engineering

Students may select a set of civil engineering and other electives in the junior and senior years that enable them to concentrate in a specialty area, if they so desire. Some examples for grouping electives into specialty areas, together with representative course selections, are indicated below. Students can define other specialty area concentrations; discussion with a faculty mentor is encouraged. Specialty areas are not noted on the official transcript.

STRUCTURAL ENGINEERING

		Units
12-201	Geology	9
12-631	Structural Design	12
12-635	Structural Analysis	12
12-636	Geotechnical Engineering	9
21-241	Matrices and Linear Transformations	10
24-311	Numerical Methods	12
24-351	Dynamics	10

Computing in Civil Engineering

		Units
12-600	AutoCAD	3

12-623	Molecular Simulation of Materials	12
12-645	Smart Cities: Growth and Intelligent Transportation Systems	6
12-659	Special Topics: Matlab	6
24-451	Feedback Control Systems	12
24-650	Applied Finite Element Analysis	12
24-658	Image-Based Computational Modeling and Analysis	12

engineering and society

		Units
12-645	Smart Cities: Growth and Intelligent Transportation Systems	6
12-657	Water Resource Systems Engineering	9
24-291	Environmental Systems on a Changing Planet	9
48-371	City & Suburb: Housing in America after 1850	9
79-303	Pittsburgh and the Transformation of Modern Urban America	6
79-315	The Politics of Water in Global Perspective	9

Construction Management

		Units
12-600	AutoCAD	3
12-631	Structural Design	12
12-635	Structural Analysis	12
12-636	Geotechnical Engineering	9
48-380	Constructing Value(s): Economies of Design	6
70-311	Organizational Behavior	9
70-321	Negotiation and Conflict Resolution	9

NEXT-GENERATION BUILDING AND CONSTRUCTION

		Units
12-631	Structural Design	12
39-245	Rapid Prototype Design	9
48-530	Human-Machine Virtuosity	12
48-555	Introduction to Architectural Robotics	9

SMART CITIES

		Units
12-600	AutoCAD	3
12-612	Intro to Sustainable Engineering	9
12-631	Structural Design	12
12-635	Structural Analysis	12
12-636	Geotechnical Engineering	9
12-644	Intro to Transportation Systems Analysis	6
12-645	Smart Cities: Growth and Intelligent Transportation Systems	6
24-643	Energy Storage Materials and Systems	12

SMART BUILDINGS

12-600	AutoCAD	3
12-631	Structural Design	12
12-635	Structural Analysis	12
48-116	Introduction to Building Performance	9
48-315	Environmental Systems: Climate & Energy in Buildings	9
48-432	Environment II: Design Integration of Active Building Systems	9

MATERIALS

		Units
12-623	Molecular Simulation of Materials	12
24-643	Energy Storage Materials and Systems	12
27-201	Structure of Materials	9
27-202	Defects in Materials	9
27-215	Thermodynamics of Materials	12
27-301	Microstructure and Properties I	9
27-406	Sustainable Materials	9
27-503	Additive Manufacturing and Materials	9

Specialty Areas in Environmental Engineering

ENVIRONMENTAL ENGINEERING - WATER QUALITY

		Units
12-612	Intro to Sustainable Engineering	9
12-657	Water Resource Systems Engineering	9

ENGINEERING AND SOCIETY

		Units
12-645	Smart Cities: Growth and Intelligent Transportation Systems	6
12-657	Water Resource Systems Engineering	9
24-291	Environmental Systems on a Changing Planet	9
48-371	City & Suburb: Housing in America after 1850	9
79-303	Pittsburgh and the Transformation of Modern Urban America	6
79-315	The Politics of Water in Global Perspective	9
19-429	Climate Change Science and Solutions	9

ENVIRONMENTAL ENGINEERING - ENERGY

		Units
12-612	Intro to Sustainable Engineering	9
24-424	Energy and the Environment	9
24-292	Renewable Energy Engineering	9
24-628	Energy Transport and Conversion at the Nanoscale	12

ENVIRONMENTAL ENGINEERING - AIR QUALITY

		Units
12-612	Intro to Sustainable Engineering	9
12-651	Air Quality Engineering	9
24-425	Combustion and Air Pollution Control	9
19-429	Climate Change Science and Solutions	9

Additional Majors and Minors

Civil Engineering and Environmental Engineering students may pursue additional majors and minors in a variety of subjects, taking advantage of the free elective courses to satisfy the requirements for the major or minor. The College of Engineering has designated minors to promote flexibility and diversity among engineering students. Many Civil Engineering and Environmental Engineering undergraduates pursue designated minors in areas such as Architecture, Environmental and Sustainability Studies, or Global Engineering.

Internships and Co-Operative Education Program

Students in Civil Engineering and Environmental Engineering are encouraged to undertake professional internships during summer breaks. In addition, a cooperative internship program is possible for either Jan-Aug or May-Dec in the junior year. Students undertaking these 8-month professional internships would ordinarily graduate after an additional semester of study.

Integrated B.S./M.S. Program

Interested undergraduates may plan a course of study that leads to either the B.S. in Civil Engineering or the B.S. in Environmental Engineering as well as the M.S. in Civil and Environmental Engineering. This course of study will ordinarily require ten semesters, although advanced placement or other study may reduce this time. In the ninth semester of study, students must register in graduate status. Interested students should consult the Director of Undergraduate Programs for information about admission to the M.S. program.

Faculty

AMIT ACHARYA, Professor of Civil and Environmental Engineering – Ph.D., University of Illinois at Urbana - Champaign; Carnegie Mellon, 2000–

PETER ADAMS, Thomas Lord Professor of Engineering, Civil and Environmental Engineering and Engineering and Public Policy; Department Head of Engineering and Public Policy – PhD., California Institute of Technology; Carnegie Mellon, 2001–

BURCU AKINCI, Department Head and Paul P. Christiano Professor of Civil and Environmental Engineering – Ph.D., Stanford University; Carnegie Mellon, 2000–

MARIO BERGES, Professor of Civil and Environmental Engineering – Ph.D., Carnegie Mellon Univesity; Carnegie Mellon, 2010–

JACOBO BIELAK, P.E., Hamerschlag University Professor Emeritus of Civil and Environmental Engineering – Ph.D., California Institute of Technology, , P.E.; Carnegie Mellon, 1978–

SARAH J. CHRISTIAN, P.E., Associate Teaching Professor of Civil and Environmental Engineering – Ph.D., Stanford; Carnegie Mellon, 2015–

KAUSHIK DAYAL, Professor of Civil and Environmental Engineering – Ph.D., California Institute of Technology; Carnegie Mellon, 2008–

DAVID A. DZOMBAK, P.E., Hamerschlag University Professor Emeritus of Civil and Environmental Engineering – Ph.D., Massachusetts Institute of Technology, P.E.; Carnegie Mellon, 1989–

SARAH FAKHREDDINE, Assistant Professor of Civil and Environmental Engineering – PhD, Stanford; Carnegie Mellon, 2022–

SUSAN FINGER, Professor of Civil and Environmental Engineering; Associate Dean, Integrative Design Arts & Technology (IDeATe) – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 1989–

KATHERINE A. FLANIGAN, Assistant Professor of Civil and Environmental Engineering – PhD, University of Michigan; Carnegie Mellon, 2020–

JAMES H. GARRETT, JR. P.E., Provost – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1990–

KELVIN GREGORY, Professor and Executive Director of Undergraduate and Graduate Programs, Civil and Environmental Engineering – Ph.D., University of Iowa; Carnegie Mellon, 2006–

COREY HARPER, Assistant Professor of Civil and Environmental Engineering and Heinz College – PhD, Carnegie Mellon University; Carnegie Mellon, 2021–

CHRIS T. HENDRICKSON, Hamerschlag University Professor Emeritus of Civil and Environmental Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 1978–

GREGORY LOWRY, Walter J. Blenko, Sr. Professor of Civil and Environmental Engineering – Ph.D., Stanford University; Carnegie Mellon, 2002–

JOE MOORE, Assistant Teaching Professor – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2017–

DESTENIE NOCK, Assistant Professor of Civil and Environmental Engineering and Engineering and Public Policy – PhD, University of Massachusetts, Amherst; Carnegie Mellon, 2019–

FETHIYE OZIS, P.E., Associate Teaching Professor of Civil and Environmental Engineering – PhD, University of Southern California; Carnegie Mellon, 2022–

MATTEO POZZI, Professor of Civil and Environmental Engineering – Ph.D., University of Trento, Italy; Carnegie Mellon, 2012–

ZHEN (SEAN) QIAN, Professor of Civil and Environmental Engineering – Ph.D., University of California, Davis; Carnegie Mellon, 2015–

DAVID ROUNCE, Assistant Professor of Civil and Environmental Engineering – PhD, University of Texas at Austin; Carnegie Mellon, 2020–

CONSTANTINE SAMARAS, Professor of Civil and Environmental Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2014–

MITCHELL J. SMALL, H. John Heinz Professor Emeritus of Civil and Environmental Engineering and Engineering and Public Policy – Ph.D., University of Michigan; Carnegie Mellon, 1982–

PINGBO TANG, Associate Professor of Civil and Environmental Engineering – PhD, Carnegie Mellon University; Carnegie Mellon, 2020–

JEANNE VANBRIESEN, P.E., Duquesne Light Company Professor of Civil and Environmental Engineering and Engineering and Public Policy; Vice Provost for Faculty – Ph.D., Northwestern University; Carnegie Mellon, 1999–

GERALD J. WANG, Assistant Professor of Civil and Environmental Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2019–

Department of Civil and Environmental Engineering Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

12-100 Exploring CEE: Infrastructure and Environment in a Changing World

Fall and Spring: 12 units
Civil and Environmental Engineers (CEEs) engage in the planning, design, construction, operation, retrofit, demolition, and reuse of large-scale infrastructure that forms the backbone of all societies and economies. CEEs work at the dynamic interface of the built environment, information environment, and natural environment. Therefore, societal domains that require CEE expertise include smart cities and construction, sustainable energy and buildings, connected and automated transportation systems, resilient infrastructure, climate change mitigation and adaptation, and water management. Students will explore how sensing, data science, environmental science, life cycle systems and economic analysis, and infrastructure design are integrated to create a built environment that meets the needs of smart and connected communities while enhancing sustainability. Students work on team-based design-build projects that introduce principles from environmental, structural, construction engineering, and project management. Students learn technical skills as well as methods for management and design considerations that include uncertainty, economics, and ethics, for modern and future infrastructure.

12-200 CEE Challenges: Design in a Changing World

Fall: 9 units
Building upon design themes introduced in 12-100, in this course, students will be challenged to solve more complex problems related to conventional, cutting-edge, and emerging issues in Civil and Environmental Engineering and one or more of the areas of the built, natural, and information environments, such as smart cities. Students will gain an understanding of the effects of uncertainty, such as changing climate conditions. Through several team projects, students will explore the impact and management of tradeoffs, like constructability, sustainability, cost, and maintenance on design. They will learn to apply mathematics and science, advanced technologies, and computing to solve open-ended problems. Students will learn communication, project management, and design skills and practice the design process, from problem definition to constructed work.
Prerequisite: 12-100

12-201 Geology

Fall and Spring: 9 units
Introduction to physical geology; common rocks and rock-forming minerals and their chemical compositions/structure, physical properties, origins, and uses; geologic processes: surface and ground-water flow, volcanism, mountain-building, tectonics, glaciation, sedimentation, seismicity, and atmospheric and oceanic circulation.

12-212 Statics

Fall: 9 units
Introduction to vector mechanics; equivalent systems of forces; equilibrium of rigid bodies; free body diagram; distributed forces, hydrostatic forces, effective forces, centroids; applications to simple statically determinate trusses, beams, frames, cables and other physical systems; friction.

12-215 Introduction to Professional Writing in CEE

Fall: 9 units
The objective of the course is to prepare students for writing technical reports and essays assigned in CEE courses and laboratories, writing professional letters and reports for internships and professional positions, preparing documents in a team setting, delivering individual and team oral presentations, and transforming information for several types of audiences (scientific accommodation). The course focuses on document purpose, organization and style; basic editing techniques; scientific accommodation; plagiarism and proper paraphrasing and summarizing; evaluating, citing and referencing sources; team communication strategies; oral presentations; and proper use of tables, graphics, and other visual aids in documents and presentations. Course activities include in-class exercises, peer workshops, and homework assignments to illustrate examples of good and poor communication and to practice technical communication skills. Concurrent with lectures and class activities, students draft and revise individual and team technical reports and will give individual and team oral presentations.

12-221 Environmental Chemistry and Thermodynamics

Fall: 9 units
Environmental chemistry is foundational to the understanding of processes in natural and engineered systems. This course introduces environmental chemistry principles within the context of air and water systems. It focuses on the use of stoichiometry, thermodynamics, equilibrium, and kinetics to understand processes governing chemical and biological behaviors in natural and engineered systems. Topics in water include acid-base chemistry, the carbonate system, buffering, oxidation and reduction, mineral dissolution/precipitation, metal complexation, adsorption, and partitioning. Topics in air and climate to be discussed include atmospheric chemistry, air quality, combustion, aerosols, and climate science.
Prerequisites: 09-105 or 09-111

12-222 Environmental Chemistry Laboratory

Fall: 3 units
Students learn to conduct lab and field experiments relevant to environmental engineering and the understanding of natural and engineered systems. Exercises involve the collection and analysis of data from major domains of the environment (air, water, soil, sediments). Students learn to use state-of- the-art environmental analytical techniques. Students develop collaborative skills through team-based laboratory exercises and practice skills in written communication of laboratory results.

12-231 Solid Mechanics

Spring: 9 units
Understanding and calculating the deformation and eventual failure of solids is fundamental to the design of structures and materials for civil engineering applications ranging from structural analysis and design of buildings and bridges to the design of novel materials and structures optimized for specific functionality. This course provides students with an introduction to fundamental concepts and methods in solid mechanics. Topics covered include stress, strain, mechanical properties of materials, and geometric compatibility; response under axial loads, torsion, bending, transverse shear, and combined loadings; stress transformations and Mohr's circles, deflections of beams and shafts, and buckling of columns. Students will develop problem solving skills and apply these concepts to analyze deformable bodies.
Prerequisite: 12-212

12-233 CEE Infrastructure Systems in Action

Fall: 2 units
Civil and environmental engineering infrastructure is all around us. CEE infrastructure is integral to society's day-to-day operations, providing, for example, shelter, transportation, and clean drinking water. In this course, students will get a first-hand experience of civil and environmental engineering in action all around us. The course is comprised of lab sessions during which students will learn about and investigate infrastructure and phenomena in the built and natural environments on or near campus. Student coursework includes short assignments and reflections related to the lab experience.
Prerequisite: 12-100

12-234 Sensing and Data Acquisition for Engineering Systems

Spring: 4 units
Collecting and analyzing massive amounts of data is integral to understanding and managing the complexities of our infrastructure systems. Civil and environmental engineers need to select tools and to collect data to gain an understanding of the problems they are trying to solve. In this course, students will learn how to choose and use a range of measuring tools from simple hand tools to advanced sensors to collect data in laboratory-based and system-level studies, followed by data acquisition and processing. Experiment subjects will span the breadth of the fields including, for example, structural, geotechnical, environmental, and transportation engineering. The sensors and data will be used to assess not only an individual infrastructure component, but also infrastructure systems and networks. Students will complete planning activities for each of the experiments, conduct experiments, and acquire the resulting data from sensors and other measurements. Results and analysis will be submitted as part of a report or post-laboratory assignment.
Prerequisite: 12-212

12-271 Computation and Data Science for Civil & Environmental Engineering

Spring: 9 units
Computational science and computer applications play an important role in modern engineering practice and research. This course provides students with an introduction to the fundamentals of computation and data science using both deterministic and stochastic techniques. Topics include numerical methods for approximation, differentiation, integration, Monte Carlo simulation, quantifying error and uncertainty, regression, solving linear systems of equations and ordinary differential equations, root finding, and optimization; the use of several computing paradigms (numerical, symbolic, and spreadsheet) for enhancing engineering workflows with modeling and data, with an emphasis on identifying the appropriate tool for various engineering problems; the importance of and approaches for effective visual presentation of data; and the future of computer-based methods in engineering. Mathematical concepts from calculus, probability, and linear algebra are introduced as needed. Through application of these principles, students will develop the computational reasoning skills that are required to design and deploy computer-based solutions for a variety of problems in civil and environmental engineering.
Prerequisites: 21-120 Min. grade C and 33-141 and (15-110 or 15-112) and 21-122 Min. grade C

12-301 CEE Projects: Integrating the Built, Natural and Information Environments

Fall: 9 units
Civil and environmental engineers work at the interface of multiple disciplines, understanding and applying principles to evaluate and create. This course extends design skills from 12-100 and 12-200 to hands-on experiences with more integrated, interdisciplinary problem solving. Students explore the roles of diverse stakeholders, community engagement, and sustainability goals in CEE projects. Students integrate construction/structures, sensing, and sustainability through team-based projects, and apply communication, computation, and project management skills. Students develop an understanding of the professional, ethical, social, and economic aspects of engineering projects. The course combines formal instruction, field trips, teamwork, role-playing, and engagement with practicing experts involved with CEE projects.
Prerequisites: 12-271 and 12-200

12-333 Experimental & Sensing Systems Design and Computation for Infrastructure Systems

Spring: 4 units
Civil and environmental engineers must decide what information they need to collect, how to collect it, how to analyze the data and how to use that data to develop solutions for a changing world. Data are often incorporated into computational models to gain further insight and understanding of the problem and potential solutions. In this course, students will learn and develop different approaches to solve problems like field testing, laboratory experimentation, computer simulation, and data analytics. Students will design their own testing protocols and develop computer models to simulate situations that are difficult or expensive to sense in the real-world. Pre- and post-laboratory assignments or reports will be completed to document plans and to present an analysis of results.
Prerequisite: 12-356

12-335 Soil Mechanics

Fall: 9 units
Understanding the behavior of soils is essential for many applications within civil and environmental engineering from construction safety and structural integrity of buildings, to foundations, levees, groundwater remediation, landfill design, and erosion control. This course provides students with an introduction to fundamental concepts and methods in soil mechanics and geotechnical engineering. Topics covered in the course include physical, chemical and hydraulic characteristics and mineral composition of soils; stress-strain-strength relationships; permeability; consolidation; shear strength; and lateral earth pressure. Students will apply knowledge of these fundamentals to solve civil and environmental engineering problems related to soil deformation, stability, and groundwater flow.
Prerequisites: 12-231 and 33-142

12-351 Environmental Engineering

Spring: 9 units
Environmental engineering applies sustainability science, engineering principles, and systems approaches to protect the environment and human health. This includes protecting natural ecosystems and enhancing the quality of human life through environment-related policy development and technological innovation, and assessing the environmental impacts or benefits of infrastructure projects. This course provides a scientific and engineering basis for understanding and developing sustainable solutions for challenges in environmental and public health protection, especially in relation to urban water systems, with links to energy and climate. Topics covered include: sustainability; basic principles of water chemistry and microbiology; mass and energy balances; reactor theory and models; physical-chemical and biological processes; drinking water treatment; wastewater treatment; rivers, lakes, and ecosystems. Students will develop quantitative problem-solving skills for environmental engineering challenges. Students will also learn about and analyze current environmental and public health issues.
Prerequisites: 09-105 or 09-111

12-352 Environmental Engineering Lab

Spring: 3 units
Environmental engineering depends on many kinds of measurements as well as experimentation for monitoring and managing natural and engineered systems. In this course, students will design and conduct laboratory experiments that illustrate the fundamental principles of chemical, physical, and biological processes learned in environmental engineering. Topics include acid-base chemistry, carbonate chemistry, solids removal, and pathogen detection. Experiments include applications of methods to detect and quantify both inorganic and organic contaminants in water, and methods to remove contaminants from water. Students will also advance teamwork skills through group efforts and collaborative writing.

12-353 Environmental Biology and Ecology

Spring: 9 units
Profound changes are affecting our environment, including climate change, habitat loss, pollution, and invasive species. Understanding ecosystems and their inhabitants and functions is critical to engineering a sustainable future for humans. This course is an introduction to ecology and biology for environmental engineers. Ecology topics include the relationships among organisms and between organisms and their environment; and adaptations, populations, communities, and terrestrial and aquatic ecosystems.
Biology subjects will focus on microbiology, as bacteria are an analog for more-complex species. Microbiology topics include biological molecules, biochemical reactions, energetics, diversity of microbial metabolism, physiology, biofilms, biogeochemical cycles, and the degradation of pollutants.
Prerequisite: 03-121

12-355 Fluid Mechanics

Fall: 9 units
The flow of fluids is important in many civil and environmental engineering applications ranging from water infrastructure and coastal engineering to bridge design. This course provides students with an introduction to fundamental concepts and methods in fluid mechanics. Topics covered in the course include fluid properties; pressure, hydrostatics, and buoyancy; open systems and control volume analysis; conservation of mass and momentum for moving fluids; viscous fluid flows and flow in conduits; dimensional analysis and similitude; open channel flows; lift and drag on immersed bodies; and differential analysis. Through application of these concepts, students will develop problem-solving skills and formulate models necessary to study, analyze, and design fluid systems essential to good engineering practice of fluid mechanics. Civil Engineering undergraduates register for section A. Environmental Engineering undergraduates register for section B. All graduate students register for section C.
Prerequisite: 21-260 Min. grade C

12-356 Fluid Mechanics Lab

Fall: 2 units
An understanding of fluid mechanics is greatly enhanced by hands-on experimentation and experience with the physical concepts of fluid flows. In this course, students will develop an ability to conduct experiments, take measurements, and analyze and interpret data in fluid mechanics. Topics covered include measurement of fluid properties; static forces on immersed surfaces; continuity and energy; viscous pipe flow; and open channel flow. Students will foster teamwork skills and an ability to creatively develop independent ideas around the description of fluid mechanics through small-group work with experimental apparatus and individual reports on the acquired data.

12-371 Advanced Computing and Problem Solving in Civil and Environmental Engineering

Spring: 9 units
Building upon the fundamentals developed in 12-271, this course introduces students to advanced topics in computational problem solving that are critical for implementing and interpreting computational solutions in civil and environmental engineering practice. These topics include numerical methods (both deterministic and stochastic) for approximation, differentiation, and integration in high dimensions; topics in numerical linear algebra for data science (including applications of QR factorization, singular-value decomposition, and Cholesky factorization); an introduction to clustering, regression, and classification; an introduction to statistical sampling; an introduction to graph and network theory; topics in deterministic and stochastic optimization; an introduction to scripting and automation; numerical solutions of ordinary differential equations (including finite differences and basic finite-element analysis); and practices for effective visualization of large data sets. Each topic is presented with real-world civil and environmental engineering problems, in areas such as smart cities, transportation, energy, buildings, and hydrology. An emphasis is placed on identifying the appropriate computational method for any specific problem; additional emphasis is placed on developing computational thinking. This course culminates in a project, which requires students to synthesize their computational reasoning skills in order to solve a challenging civil and environmental engineering problem.
Prerequisite: 12-271

12-401 CEE Design

Fall: 12 units
This capstone design experience integrates knowledge and experience from technical and professional skills acquired in the civil engineering and environmental engineering project course sequence. Students apply the design process and knowledge from the core curriculum to design engineering solutions to real engineering problems. Students work in teams in a pre-professional environment to meet the challenges with which they are presented. Oral, written, and graphic communications both within teams and with external audiences are essential to successful completion of the projects. Students manage the design process as they work with community partners to co-design solutions during the semester-long project. Student teams work with community partners to define the engineering problem, including requirements and performance criteria, and to imagine and evaluate potential solutions. Teams produce models and calculations to assess performance with respect to requirements and performance criteria and detailed design deliverables to convey the recommended solution.
Prerequisite: 12-301

12-411 Project Management for Engineering and Construction

Fall: 9 units
Through planning and management, and optimization and allocation of materials and labor under time and financial constraints, project managers lead teams to achieve project goals. This course is an introduction to project management of engineering, construction, and operations of building facilities and civil infrastructure. This course emphasizes design, construction, and operation as an integrated process and examines various topics related to four core aspects of project management - time, cost, quality, and safety. Engineering and management cases from civil, construction, and infrastructure engineering domains will be examined. Topics covered include contracting issues, legal structures, project planning and scheduling, cash flows, cost estimation and financing of constructed facilities, labor productivity, material management, equipment utilization, cost control, monitoring, and accounting for construction. The course will introduce various software tools useful for implementation of these topics, including project scheduling and management tools, software for optimization and economic analysis, field operation analysis tools, and digital design and modeling tools. Civil engineering undergraduates register for section A. Environmental Engineering undergraduates register for section B. All graduate students register for section C.
Prerequisite: 12-301

12-451 Advanced Environmental Engineering

Spring: 9 units
Building on fundamental concepts from 12-221, 12-351, and 12-353, this course focuses on the physical, chemical, and biological processes controlling the quality of water, soil, air and #8212; and ultimately human and ecosystem health. Students will learn how these processes regulate the cycling of contaminants and nutrients in the environment. Key topics include material and energy balances, advective-dispersive transport with reacting solutes, and partitioning of contaminants and nutrients across different media. Students will also gain familiarity with (1) how regulatory agencies and decision-makers account for these processes in environmental protection efforts and (2) related challenges and opportunities around climate change.
Prerequisites: 12-355 and 12-353 and 12-351 and 12-221

12-471 Applied Data Analytics for Civil and Environmental Systems

Spring: 9 units
Building upon the fundamentals developed in 12-271 and 12-371, this course empowers students to leverage computing tools for big data. Topics include design of experiments; advanced topics in statistics and uncertainty quantification; an introduction to signal processing and Fourier theory; an introduction to classification, clustering, and other concepts from machine learning; and an introduction to parallel and distributed computing and sensing. Each topic is presented in the context of a specific set of engineering problems. An emphasis is placed on identifying computationally appropriate and efficient solutions. This course culminates in a collaborative project, enabling students to synthesize their computational and data science skills to solve a significant problem in civil and environmental systems
Prerequisite: 12-371

12-600 AutoCAD

Fall and Spring: 3 units
AutoCAD is mostly held online. The course provides an introduction to the fundamentals of computer-aided design (CAD)software. Students learn how to set up CAD projects using Autodesk's AutoCAD software. Topics include coordinates, lines, circles, arcs, zooms, snaps and grids, text, views, layers, plines, blocks, reference files, dimensioning, isometrics, 3D commands, surfaces, solids, and more. CAD standards for layers, plotting, and symbol libraries are also covered. The course includes development of a CAD project by each student.

12-612 Intro to Sustainable Engineering

Fall: 9 units
This course presents an overview of the concept of sustainability, including changing attitudes and values toward technology and the environment through the late twentieth and early twenty-first centuries. Relevant issues in sustainable engineering, including population growth, urbanization, energy, water, food and material resources are discussed. Tools for sustainable engineering are presented, including metrics of sustainability, principles of design for the environment, and use of material and energy balances in sustainable systems.

12-623 Molecular Simulation of Materials

Spring: 12 units
The purpose of this course is to expose engineering students to the theory and implementation of numerical techniques for modeling atomic-level behavior. The main focus is on molecular dynamics and Monte Carlo simulations. Students will write their own simulation computer codes, and learn how to perform calculations in different thermodynamic ensembles. Consideration will be given to heat transfer, mass transfer, fluid mechanics, mechanics, and materials science applications. The course assumes some knowledge of thermodynamics and computer programming. 4 hrs lec.

12-631 Structural Design

Spring: 12 units
Design of structural members for bending moment, shear force, axial force, and combined axial force and bending. Reinforced concrete, structural steel, and composite beam construction are considered. Buckling effects in columns, beams and local plate segments are treated. Serviceability limits such as deflection and cracking are addressed. Design projects include the determination of loads and the selection of system geometry.
Prerequisite: 12-231

12-635 Structural Analysis

Fall: 12 units
Classical and matrix-based methods of structural analysis; energy principles in structural mechanics. Basic concepts of force and displacement methods for analyzing redundant structural systems. Matrix methods utilizing the flexibility (force) and stiffness (displacement) concepts.
Prerequisite: 12-231

12-636 Geotechnical Engineering

Spring: 9 units
Behavior of geotechnical structures; engineering design of geotechnical structures considering failure modes; uncertainties; economic issues, required design formats and relevant code provisions; performance requirements for foundations, subsurface investigations; allowable stress and LRFD design approaches; reliability-based design; shallow foundations; deep foundations; retaining structures; reinforced concrete foundations.
Prerequisite: 12-335

12-644 Intro to Transportation Systems Analysis

Fall: 6 units
This course covers fundamentals of planning, design, and operation of roadway transportation. Topics covered include basic traffic flow theory, traffic signal design and evaluation, transportation planning, pricing of transportation systems, and basic data analytics techniques. It also teaches the basics of the travel behavior model to understand planning of public transit services. The objective is to develop the capability to: 1) understand the principles of transportation planning, transportation economics and system management; 2) analyze transportation systems with emerging mobility data; and 3) apply methodologies to solve transportation system problems and develop management strategies/policies.

12-645 Smart Cities: Growth and Intelligent Transportation Systems

Fall: 6 units
Cities all around the world are being built and re-invented as smart cities utilizing information systems and innovative applications of data analytics. One major smart cities component is transportation. The Intelligent Transportation Systems (ITS) industry is expected to grow at a rate of 19% per year and reach $5.5 Billion in annual investment by 2020. This shifting dynamic provides great opportunity for improved transportation safety and efficiency but also poses challenging information systems and public policy challenges. Furthermore, there are new opportunities for professional-school graduates outside of engineering schools for employment in transportation planning and policy. This course is supported by CMU's Traffic21 Initiative and Technologies for Safe and Efficient Transportation (T-SET) University Transportation Center. Classes will feature guest lectures provided by T-SET faculty and industry and government ITS professionals.

12-648 CEE Research Project

Fall and Spring
This course is designed to give students the opportunity to work on a research project under the direction of a faculty member in Civil and Environmental Engineering. A student in this course must write a proposal and submit progress reports to the advisor. The student must also make a presentation of the project results and submit a final report. To register for this course, a student must have the approval of the faculty member for both the research topic and the number of units.

12-651 Air Quality Engineering

Fall: 9 units
The course provides a quantitative introduction to the processes that control atmospheric pollutants and the use of mass balance models to predict pollutant concentrations. We survey major processes including emission rates, atmospheric dispersion, chemistry, and deposition. The course includes discussion of basic atmospheric science and meteorology to support understanding air pollution behavior. Concepts in this area include vertical structure of the atmosphere, atmospheric general circulation, atmospheric stability, and boundary layer turbulence. The course also discusses briefly the negative impacts of air pollution on society and the regulatory framework for controlling pollution in the United States. The principles taught are applicable to a wide variety of air pollutants but special focus is given to tropospheric ozone and particulate matter. The course is intended for graduate students as well as advanced undergraduates. It assumes a knowledge of mass balances, fluid mechanics, chemistry, and statistics typical of an undergraduate engineer but is open to students from other scientific disciplines.

12-657 Water Resource Systems Engineering

Spring: 9 units
Water Resource Systems Engineering combines hydrology, engineering, economics, and operations research to create tools and analyses that support decisions about large-scale water resource systems. The emphasis in this course will be on optimization methods, which are a core element of water systems analysis. Both water quantity and water quality problems will be covered.
Prerequisite: 12-355

12-659 Special Topics: Matlab

Fall: 6 units
This mini course is designed to be a practical introduction to engineering scientific computation. The topics of this class will include basic matrix computation, solving ordinary and partial differential equations, solving systems of linear equations, computing eigenvalues and eigenvectors, and basic signal processing and neural network techniques. Throughout the course, these scientific computation tools will be demonstrated using interactive scientific software called MATLAB.

12-690 CEE Independent Study

Fall and Spring
In-depth investigation of a special topic in Civil and Environmental Engineering under the direction of a faculty member. The subject of study is determined through discussion between the student and a faculty advisor. A student in this course must write a proposal about what they want to learn and how it can be evaluated. Approaches can include more in-depth examination of topics in the curriculum, study of topics not in the curriculum, a design project, or other investigation. To register for this course, a student must have the approval of the faculty member for both the subject and the number of units.

12-702 Fundamentals of Water Quality Engineering

Fall: 12 units
This course is a systematic overview of water quality engineering designed for students with no prior civil and environmental engineering background. Topics examined include physical, chemical, and biological characteristics of water; common water pollutants; basic water chemistry and microbiology; mass and energy balances and their use in reactor analysis; physical, chemical and biological processes affecting natural water quality and the use of these processes in water supply and wastewater management systems; and selected problems in surface water and groundwater quality management. A background in college-level general chemistry, physics, calculus, and differential equations is assumed.

12-704 Probability and Estimation Methods for Engineering Systems

Fall: 12 units
Overview of rules of probability, random variables, probability distribution functions, and random processes. Techniques for estimating the parameters of probability models and related statistical inference. Application to the analysis and design of engineered systems under conditions of variability and uncertainty.

12-712 Sustainable Engineering Principles

Fall: 12 units
This course presents an overview of the concept of sustainability, including changing attitudes and values toward technology and the environment through the late twentieth and early twenty-first centuries. Relevant issues in sustainable engineering, including population growth, urbanization, energy, water, food and material resources are discussed. Tools for sustainable engineering are presented, including metrics of sustainability, principles of design for the environment, and use of material and energy balances in sustainable systems. Publicly available data sets and computational models will be explored to assess sustainability. A team-based project is required.

12-714 Environmental Life Cycle Assessment

Spring: 12 units
Cradle-to-grave analysis of new products, processes and policies is important to avoid undue environmental harm and achieve extended product responsibility. This course provides an overview of approaches and methods for life cycle assessment and for green design of typical products and processes using the ISO 14040 family of standards. This includes goal and scoping definition, inventory analysis, life cycle impact assessment (LCIA), interpretation, and guidance for decision support. Process-based analysis models, input-output and hybrid approaches are presented for life cycle assessment. Example software such as MATLAB, Excel, and Simapro are introduced and used in assignments. A group life cycle assessment project consistent with the principles and tools of sustainability to solve real-world engineering problems is required.

12-720 Water Resources Chemistry

Fall: 12 units
This course provides a rigorous yet practical basis for applying the principles of physical chemistry to understanding the composition of natural waters and to the engineering of water and wastewater treatment processes. Topics covered include chemical equilibrium and kinetics; acid-base equilibria and buffering; solid precipitation and dissolution; oxidation and reduction reactions; adsorption on solids; and computer-aided problem solving. The primary objective of the course is to be able to formulate and solve chemical equilibrium models for complex aqueous systems. Knowledge of college-level general chemistry is assumed.

12-724 Biological Wastewater Treatment

Spring: 12 units
The exploitation of microbiological processes for environmental quality control is both historic and emergent. Engineered microbial systems have been used to treat wastewater for over 100 years, and they remain a critical component of modern operations. At the same time, new technologies are emerging to address modern challenges in the remediation and detoxification of hazardous chemicals and recovery of resources from waste. This course connects established principles of microbiology and engineering with empirical observations of complex microbial systems to develop quantitative tools for engineering biological systems. The course includes aerobic and anaerobic treatment perspectives as well as suspended growth and biofilm processes. Concepts are developed from a wastewater perspective but include applications in advanced, nutrient removal and resource recovery.

12-725 Fate, Transport & Physicochemical Processes of Orgnc Contaminants in Aqua Systms

Spring: 12 units
Examination of the major physical and chemical processes affecting the fate and treatment of organic compounds nanoparticles in aquatic systems. The emphasis is on anthropogenic organic compounds. The course will review some concepts from physical organic chemistry, and examine the relationships between chemical structure, properties, and environmental behavior of organic compounds. Chemical processes important to the fate, treatment, and biotransformation of specific organic compounds are addressed. Two laboratory sessions illustrate measurement techniques for organic compounds in water. 12-702 is a co- req for non environmental engineers or students who have not had and environmental engineering undergraduate course

12-726 Mathematical Modeling of Environmental Quality Systems

Spring: 12 units
Development and application of mathematical models for environmental systems. Material balance formulations and their solutions, computer implementation, model validation, uncertainty analysis, and use for projection and policy analysis. Applications to surface water, groundwater, atmospheric transport, indoor air pollution, and human exposure and risk.

12-740 Data Acquisition

Fall: 6 units
The intent of this course is to introduce students to the concepts, approaches and implementation issues associated with data acquisition for infrastructure systems. Students will be introduced to the types of data that is collected about infrastructure systems, excitation mechanisms, sensing technologies, data acquisition using sensors, signal pre-processing and post-processing techniques, and use of sensing in a variety of applications in construction and infrastructure management. Students will also gain experience with data acquisition hardware and software.

12-741 Data Management

Fall: 6 units
The intent of this course is to introduce students to database management systems and to knowledge discovery in database principles. Students will learn how to develop powerful tools for efficiently managing large amounts of civil engineering data so that it may persist safely over long periods of time. Students will be introduced to relational database systems and structured query languages. They will also be exposed to other existing data models. Students also will be introduced to data mining and analysis tools to discover patterns and knowledge from data.

12-746 Special Topics: Introduction to Python Prototyping for Infrastructure Systems

Fall: 6 units
This course uses the Python programming language to introduce fundamental programming approaches to students from civil and environmental engineering. No prerequisite required and students with no programming experience are recommended to take this course. This course will cover fundamental programming approaches, object-oriented programming concepts, graphical user interface design in Python, and file and database operation. Real-world examples from infrastructure management will be used in the class for demonstration and term project. Students will work individually and in teams to develop a series of applications that are potentially be used in real-world applications.

12-749 Climate Change Adaptation

Fall: 6 units
While the specific timing and magnitude of climate change impacts are uncertain, long-lived civil engineering infrastructure will need to be resilient to these potential impacts. Engineers designing for climate change adaptation require the tools to maximize resiliency and minimize cost for existing and proposed energy, transportation, water, urban and other types of infrastructure. Students successfully completing this course will understand how climate change affects civil infrastructure and how to quantitatively incorporate resilient designs and co-benefits under uncertainty. Students will use open data to examine current adaptation engineering challenges, quantify solutions, and communicate their technical recommendations through policy briefs. Prerequisites: Graduate standing or consent of instructor.

12-755 Finite Elements in Mechanics I

Fall: 12 units
The basic theory and applications of the finite element method in mechanics are presented. Development of the FEM as a Galerkin method for numerical solution of boundary value problems. Applications to second-order steady problems, including heat conduction, elasticity, convective transport, viscous flow, and others. Introduction to advanced topics, including fourth-order equations, time dependence, and nonlinear problems.Prerequisite: Graduate standing or consent of instructor.
Prerequisites: Graduate standing or consent of instructor.

Department of Electrical and Computer Engineering

Lawrence Pileggi, Coraluppi Head and Tanoto Professor

James Bain, Associate Head, Academic Affairs

Shawn Blanton, Associate Head, Research

Tamal Mukherjee, Associate Head, Students
www.ece.cmu.edu (http://www.ece.cmu.edu)

The field of electrical and computer engineering encompasses a remarkably diverse and expanding set of technologies, including embedded systems, intelligent physical systems, real-time software, distributed computing, mobile computing, cloud computing, digital signal processing, integrated circuits and electronics, computer architecture, intelligent robotic systems, computer-based control systems, telecommunications, computer networking, wireless communication systems, signal and information processing, multimedia systems, solid state physics and devices, microelectromechanical systems (MEMS), electromagnetic and electromechanical systems, and data storage systems. The extraordinary advances in these technologies during the last fifty years have impacted nearly every aspect of society and human activity. These advances have created new products and markets such as “smart” cars, cell phones and mobile computing systems, video games, and advanced medical systems for imaging, diagnosis, testing, and monitoring. These systems and products have served to enhance our quality of life and have also fueled the global economy. In short, the field of electrical and computer engineering has become central to society as we know it.

The Department of Electrical and Computer Engineering at Carnegie Mellon is actively engaged in education and research at the forefront of the existing and emerging technologies. Because of the diverse and broad nature of the field and the significant growth in knowledge in each of its sub areas, it is no longer possible for any single individual to know all aspects of electrical and computer engineering. Nevertheless, it is important that all electrical and computer engineers have a solid knowledge of the fundamentals with sufficient depth and breadth. Society is placing increasing demands on our graduates to apply their skills in new contexts. It is also placing increasing value on engineers who can cross traditional boundaries between disciplines and who can intelligently evaluate the broader consequences of their actions. Our curriculum is designed to produce world-class engineers who can meet these challenges.

Educational Outcomes and Objectives

The B.S. in Electrical and Computer Engineering is a broad and highly flexible degree program structured to provide students with a rich and comprehensive view of the profession. Minimal curriculum constraints enable every student to construct their own unique program of study that fits their professional goals. Students are encouraged to explore multiple areas of theory and application. Our program is accredited by the Engineering Accreditation Commission of ABET, https://www.abet.org (https://www.abet.org/), under the commission’s General Criteria and Program Criteria for Electrical, Computer, Communications, Telecommunication(s) and Similarly Named Engineering Programs. The Faculty of Electrical and Computer Engineering have adopted the following outcomes from ABET and have established the following objectives for the B.S. in Electrical and Computer Engineering curriculum:

Student Outcomes

1. An ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
2. An ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
3. An ability to communicate effectively with a range of audiences
4. An ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
5. An ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
6. An ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
7. An ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

ECE program Educational Objectives

The ECE program objectives are shown below. They represent our vision for what our students will be doing in their engineering careers five years after they have graduated. The principal behaviors we seek to foster in our students are *expertise*, *innovation* and *leadership*.
Our graduates will be:

Experts

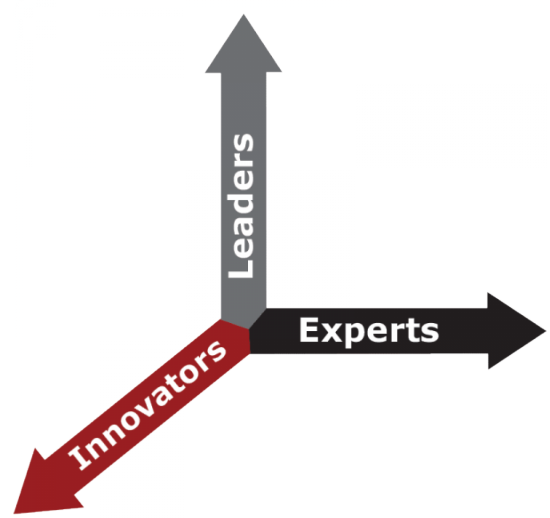
- They will solve problems by applying ECE fundamentals
- Their solutions will reflect depth of understanding in their sophistication.
- Their solutions will reflect breadth of understanding by drawing on multiple disciplines.

Innovators

- They will demonstrate creativity in their engineering practice.
- They will consider holistic systems-oriented approaches in their designs.
- They will think strategically in their planning and execution.

Leaders

- They will take initiative, and demonstrate resourcefulness.
- They will collaborate in multidisciplinary teams.
- They will be leaders in their organizations, their profession and in society.



Three dimensions of objectives for our graduates.

Curriculum Overview

The B.S. in Electrical and Computer Engineering is a broad and highly flexible ABET-accredited (http://www.abet.org) degree program offered on the Pittsburgh campus. It is structured to provide students with the smallest set of constraints consistent with a rich and comprehensive view of the profession. Students are encouraged and stimulated to explore multiple areas of theory and application from across the 5 principal undergraduate areas (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html) of Electrical and Computer Engineering. The sample curriculum (http://coursecatalog.web.cmu.edu/schools-colleges/collegeofengineering/departmentofelectricalandcomputerengineering/#samplecurriculumtext) highlights the flexibility of our curriculum while meeting the requirements listed below.

MINIMUM TOTAL UNITS REQUIRED FOR B.S. IN ELECTRICAL AND COMPUTER ENGINEERING 379

For detailed information and regulations of the curriculum along with the degree requirements and the most recent version of the ECE curriculum and course descriptions, please refer to the ECE Academic Guide (http://www.ece.cmu.edu/programs-admissions/bachelors/academic-guide/).

University Requirement

		Units
99-101	Core@CMU	3
		3

CIT Requirements (see CIT section of the catalog for specifics (p. 83)):

		Units
CIT General Education		72
21-120	Differential and Integral Calculus	10
21-122	Integration and Approximation	10
One other introductory engineering course (generally taken during the freshman year)		12
33-141	Physics I for Engineering Students	12
33-142	Physics II for Engineering and Physics Students	12
15-112	Fundamentals of Programming and Computer Science	12
		140

GENERAL TECHNICAL REQUIREMENTS:

		Units
Two Math/Science electives [1]		18
Probability Requirement		
21-325	Probability	9
or 36-219	Probability Theory and Random Processes	
or 36-225	Introduction to Probability Theory	
18-202	Mathematical Foundations of Electrical Engineering [2]	12
21-127	Concepts of Mathematics [3]	12
or 21-128	Mathematical Concepts and Proofs	
15-122	Principles of Imperative Computation [4]	12
		63

[1]The Math/Science Electives may be satisfied by any course in The Mellon College of Science or the Department of Statistics except for: 100-level courses in Mathematics or Statistics, and courses designed for non-science or engineering majors, such as (but not limited to) 03-132, 09-103, 09-104, 21-240, 21-257, 21-261, 21-350, 33-115, 33-120, 33-124, 33-106, 33-107, 36-200, 36-201, 36-202, 36-203, 36-207, 36-208, 36-209, 36-210, 36-247, 36-309, and 36-310. Mathematics courses of particular interest to students in ECE are: 21-228 Discrete Mathematics, 21-241 Matrices and Linear Transformations, 21-259 Calculus in Three Dimensions, and 21-260 Differential Equations.

[2]This course can also be substituted by a combination of two of the following courses: 21-241, 21-242, 21-254, 21-259, 21-260, 21-268. Note that the combined total will therefore be 18 units.

[3]Effective Fall 2022. Prior to Fall 2022, 21-127 was 10 units.

[4]Effective Summer 2023. Prior to Summer 2023, 15-122 was 10 units.

ECE COURSE requirements:

For detailed information and regulations along with the degree requirements and the most recent version of the ECE curriculum and course descriptions, please refer to the ECE Academic Guide (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html).

		Units
ECE CORE COURSES		
18-100	Introduction to Electrical and Computer Engineering	12

FREE ELECTIVES 52 units (typ)*

*For most students, the curriculum above will result in a remainder of 52 units of free electives to achieve the 379 required total units.

A Free Elective is defined as any graded course offered by any academic unit of the university. The large number of units without categorical constraints provides the student, in consultation with their Advisor or Mentor, with the flexibility to design a rich educational program.

Up to 9 units of Student Taught Courses (StuCo) and Physical Education courses, or other courses taken as Pass/Fail, may also be used toward Free Electives.

Transfer of courses from other premier universities may be accepted through submission of the Transfer Credit Request form on the CIT web page (https://xforms.andrew.cmu.edu/CITTransferCreditRequest/). Please see the CIT website (https://engineering.cmu.edu/education/academic-policies/undergraduate-policies/transfer-credit.html) for further information regarding the process.

Sample Curriculum

The table below shows a possible roadmap through our broad and flexible curriculum. The ECE Academic Guide (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html) provides further alternatives.

For First-Year requirements, please see the CIT section of the catalog for specifics (http://coursecatalog.web.cmu.edu/schools-colleges/collegeofengineering/#firstyearforengineeringstudentstext).

39-310 Experiential Learning III			

*Note on AP credit:

Students who have AP credit for **Calculus** and/or **Physics** courses are encouraged to take 21-127 and/or 18-202.

- 21-127 is recommended for students interested in the Hardware Systems (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html) or Software Systems (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html) areas.
- 18-202 is recommended for students interested in the Device Science and Nanofabrication (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html), Signals and Systems (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html), or Circuits (https://www.ece.cmu.edu/academics/bs-in-ece/academic-guide.html) areas. An alternative to 18-202 is to take **two** other math courses. ECE undergraduates commonly take one or more of: 21-241, 21-259, and 21-260.

Students who have AP credit for **Computer Science A** are encouraged to first take 21-127, then to take 15-122.

Academic Policies

Policy on ECE Coverage Courses with Fewer than 12 Units

The basic curriculum requirements for Area courses, Coverage and Capstone Design are stated in terms of courses rather than units. The nominal total of 60 units for these categories is determined by assuming that each course is 12 units. In the event that courses with fewer than 12 units are used to satisfy some or all of these requirements, additional courses from the ECE coverage lists must be taken until the total units in ECE courses beyond the core meets or exceeds 60 units. Any ECE coverage course is acceptable, and any excess units beyond the required 60 may be counted as free elective credit.

Prerequisite Grade Requirements

Many ECE courses require a prerequisite course or courses. In most cases, the minimum grade required in a prerequisite to proceed on to the next course is a C. All prerequisites are listed in the registration system.

QPA Requirement and Overload Policy

An overload is defined as any schedule with more than 54 units in one semester. A student will only be permitted to overload by 12 units if she or he achieved an overall QPA of at least 3.5 out of 4.0. If the student's overall QPA is below a 3.5, then the QPA of the previous semester for which he or she is registering will instead be utilized. If that QPA is at least a 3.5 then the student will be permitted to Overload.

Grade Policy for Math Courses

1. CIT states that all mathematics (21-xxx) courses required* for the engineering degree taken at Carnegie Mellon must have a minimum grade of C in order to be counted toward the graduation requirement for the BS engineering degree.

2. A minimum grade of C must be achieved in any required mathematics (21-xxx) course that is a prerequisite for the next higher level required mathematics (21-xxx) course.

3. In addition, ECE requires that 18-202 Mathematical Foundations of Electrical Engineering must be completed with a grade of C or better.

*Elective mathematics courses (like the math/science electives required for ECE) are not included in this policy

Pass/Fail policy

Up to 9 units of StuCo and/or Physical Education courses or other courses taken as Pass/Fail may be used toward Free Electives. ECE core courses may not be taken as pass/fail. ECE project-based courses (including capstone design courses) may not be taken pass/fail. No ECE requirements may be fulfilled using a pass/fail course (except for 99-10x and 18-200)

Other Graduation Requirements

To be eligible to graduate, undergraduate students must complete all course requirements for their program with a cumulative Quality Point Average of at least 2.0. For undergraduate students who enrolled at Carnegie Mellon as freshmen and whose freshman grades cause the cumulative QPA to fall below 2.0, this requirement is modified to be a cumulative QPA of at least 2.0 for all courses taken after the freshman year. Note, however, the cumulative QPA that appears on the student's final transcript will be calculated based on all grades in all courses taken, including freshman year. Students are encouraged to confirm all graduation requirements with their academic advisor.

CIT has the following requirement for graduation. “Students must complete the requirements for their specified degrees with a cumulative quality point average of 2.00 or higher for all courses taken after the freshman year [this is the CIT QPA on the Academic Audit]. In addition, a student is expected to achieve a cumulative quality point average of 2.00 in a series of core departmental courses.”

In ECE, this means that the student must complete 18-100 Introduction to Electrical and Computer Engineering, ECE Core, Area Courses, Coverage, and Capstone Design courses with a minimum QPA of 2.0 to graduate. When more than one possibility exists for meeting a specific requirement (e.g., Area Course), the courses used for calculating the ECE QPA will be chosen so as to maximize the QPA. Similarly, when an ECE course is retaken, the better grade will be used in the computation of the minimum QPA for the ECE QPA requirement to graduate.

Other Opportunities in ECE

ECE Cooperative Education Program

Our Cooperative Education Program invites students to gain valuable experience in employment that relates directly to their major and career goals. At the same time, it provides employers with opportunities to evaluate students as potential full-time employees, while having them complete meaningful projects. Participation in this program is voluntary, and obtaining a cooperative education assignment is competitive.

Due to federal restrictions on student work experiences, international students are not eligible for co-ops. Please visit the ECE CPT page (http://www.ece.cmu.edu/programs-admissions/bachelors/cpt.html) for information regarding international student internships.

The co-op experience

We require a minimum of eight months of co-op experience to identify the work experience as a co-op. Students must have minimally completed their sophomore year to qualify for application to a co-op and should connect with their Academic Advisor for information on how to apply. While on co-op assignment, students are participating in a recognized CIT educational program, retaining their full-time student status, akin to our students who study abroad in established exchange programs (such as EPFL) for one or two semesters. The Cooperative Education Program agreement may be discontinued if the employers do not provide the students with career-related work experience or if the students do not meet the accepted level of performance as defined by the employers.

Upon returning to Carnegie Mellon, the students are required to submit for approval the following two documents to the ECE Undergraduate Office: a three to five page technical report of the Co-Op work, and a one page assessment and evaluation of the Co-Op experience.

Students may obtain more detailed information through the ECE department (http://www.ece.cmu.edu/programs-admissions/bachelors/cooperative-education-program.html) or the Career and Professional Development Center (http://www.cmu.edu/career/).

Teaching Assistantships

Teaching Assistants are a vital part of successful ECE course delivery. All ECE students will receive an email each semester when applications open for the upcoming semester, typically around the date the Schedule of Classes is published. Students are encouraged to communicate with the faculty of any course(s) they are interested in supporting, who can discuss the course expectations and staffing needs. Please see the ECE Teaching Assistantship website (https://www.ece.cmu.edu/insider/teaching-opportunities.html) for further information regarding these opportunities and how to apply.

Integrated M.S./B.S. Degrees Program

The Integrated Master's/Bachelor's program (http://www.ece.cmu.edu/programs-admissions/integrated/) (otherwise known as the IMB program) is an exciting opportunity for students who excel academically to achieve not just a Bachelor's degree in ECE, but also a Master's degree--through our Professional MS degree program--without needing to apply separately. This means no application fee, and no need to take the GRE (Graduate Record Exam). In order to be awarded the MS degree in the IMB program, the student must also earn their BS degree, either simultaneously with the MS degree or at least one semester prior to the awarding of the MS degree. If a course is eligible for the MS degree but must be used to complete the BS degree, the BS degree takes priority over the MS degree.

If a student is at least a 2nd semester junior, has completed at least 270 units and has at least an overall 3.00 QPA, he or she is guaranteed admission into the Professional MS degree in ECE through the IMB program. To be officially admitted, the student must complete the IMB Program form.

If a student does not meet the exact overall 3.00 QPA requirement, he or she is eligible to petition for his or her admission into the IMB program during his or her senior year. Students may obtain the petition forms through a meeting with their assigned academic advisor.

Professional MS Degree Requirements:

Please see the ECE web site for the requirements for the Professional MS degree (https://www.ece.cmu.edu/academics/ms-ece/standard-program.html). For students in the ECE IMB program, all requirements for the Professional MS degree are in addition to the requirements for the BS in ECE. No requirements for the MS degree may be used in any way toward the BS degree, including minors, additional majors or dual degrees.

Transition to graduate status:

Policies regarding completion and certification of the BS degree can be found on the Office of Enrollment Management's Standard Degree Requirements & Degree Certification (https://www.cmu.edu/es/advising-resources/degree-certification.html) webpage. Once the BS degree is certified, a student will be in graduate status for the subsequent term of enrollment. If a student takes more than 8 semesters to complete the BS degree, then he or she must be in graduate status for at least one semester before graduating with the MS degree. Once a student's undergraduate degree has been certified, no more courses may then be applied toward the BS degree. This includes courses toward minors and additional majors, although students pursuing an undergraduate dual degree with another department may still continue to apply additional coursework toward that second degree. Students should consult with Enrollment Services to understand how entering graduate status will affect financial aid, and with their academic advisor to determine a course schedule.

Faculty

DAVID ALLSTOT, Distinguished Special Professor of Electrical and Computer Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 2023–

GEORGE AMVROSIADIS, Associate Research Professor of Electrical and Computer Engineering – Ph.D., University of Toronto, Canada; Carnegie Mellon, 2018–

JIM BAIN, Associate Department Head for Academic Affairs and Professor of Electrical and Computer Engineering and Materials Science Engineering; Associate Director, DSSC – Ph.D., Stanford University; Carnegie Mellon, 1993–

JAMES BARR VON OEHSEN, Research Professor of Electrical and Computer Engineering; Director, Pittsburgh Supercomputing Center (PSC) – Ph.D., Rutgers University ; Carnegie Mellon, 2023–

LUJO BAUER, Professor of Electrical and Computer Engineering – Ph.D., Princeton University; Carnegie Mellon, 2005–

THEO BENSON, Professor of Electrical and Computer Engineering – Ph.D., University of Wisconsin-Madison; Carnegie Mellon, 2022–

VIJAYAKUMAR BHAGAVATULA, U.A. and Helen Witaker Professor of Electrical and Computer Engineering, Affiliated Faculty, DSSC – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1982–

SHAWN BLANTON, Associate Department Head for Research; Joseph F. and Nancy Keithley Professor of Electrical and Computer Engineering – Ph.D., University of Michigan; Carnegie Mellon, 1995–

DAVID BRUMLEY, Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2008–

MARK BUDNIK, Teaching Professor of Electrical and Computer Engineering – Ph.D., Purdue University; Carnegie Mellon, 2021–

L. RICHARD CARLEY, Professor of Electrical and Computer Engineering; Affiliated Faculty, DSSC – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 1984–

MAYSAM CHAMANZAR, Dr. William D. and Nancy W. Strecker Career Development Associate Professor, Electrical and Computer Engineering – Ph.D., Georgia Institute of Technology; Carnegie Mellon, 2015–

JUSTIN CHAN, Assistant Professor of Electrical and Computer Engineering – Ph.D, University of Washington; Carnegie Mellon, 2024–

BEIDI CHEN, Assistant Professor of Electrical and Computer Engineering – Ph.D., Rice University; Carnegie Mellon, 2023–

VANESSA CHEN, Assistant Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2019–

YUEJIE CHI, Sense of Wonder Group Endowed Professor of Electrical and Computer Engineering – Ph.D., Princeton University; Carnegie Mellon, 2018–

MARC DANDIN, Assistant Professor of Electrical and Computer Engineering – Ph.D., University of Maryland, College Park; Carnegie Mellon, 2019–

HAKAN ERDOGMUS, Teaching Professor of Electrical and Computer Engineering; Carnegie Mellon University Silicon Valley – Ph.D., Université du Québec; Carnegie Mellon, 2014–

GIULIA FANTI, Assistant Professor of Electrical and Computer Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 2017–

GARY FEDDER, Howard M. Wilkoff Professor of Electrical and Computer Engineering; Co-Director MEMS, Affiliated Faculty DSSC – Ph.D., University of California at Berkeley; Carnegie Mellon, 1994–

FRANZ FRANCHETTI, Kavčić-Moura Professor of Electrical and Computer Engineering; Associate Dean for Research, College of Engineering and Director, Engineering Research Accelerator – Ph.D., Vienna University of Technology; Carnegie Mellon, 2005–

GREGORY R. GANGER, Jatras Professor of Electrical and Computer Engineering; Director, Parallel Data Lab – Ph.D., University of Michigan; Carnegie Mellon, 1997–

PHILLIP GIBBONS, Professor of Electrical and Computer Engineering and Computer Science – Ph.D., University of California at Berkeley; Carnegie Mellon, 2015–

VIRGIL GLIGOR, Professor of Electrical and Computer Engineering; Co-Director CyLab – Ph.D., University of California at Berkeley; Carnegie Mellon, 2008–

PULKIT GROVER, Angel Jordan Professor of Electrical and Computer Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 2013–

JAMES HOE, Professor of Electrical and Computer Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2000–

LIMIN JIA, Research Professor of Electrical and Computer Engineering; Affiliated Faculty, CyLab – Ph.D., Princeton University; Carnegie Mellon, 2013–

CARLEE JOE-WONG, Robert E. Doherty Career Development Professor of Electrical and Computer Engineering – Ph.D., Princeton University; Carnegie Mellon, 2016–

GAURI JOSHI, Associate Professor of Electrical and Computer Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2017–

SOUMMYA KAR, The Buhl Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2011–

GREGORY KESDEN, Teaching Professor of Electrical and Computer Engineering – MCS, Clemson University; Carnegie Mellon, 2017–

HYONG S. KIM, Drew D. Perkins Professor of Electrical and Computer Engineering; Director, CMU-Thailand – Ph.D., University of Toronto; Carnegie Mellon, 1990–

PHILIP J. KOOPMAN, Associate Professor of Electrical and Computer Engineering and Computer Science – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1989–

SWARUN S. KUMAR, Sathaye Family Foundation Career Development Professor of Electrical and Computer Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2016–

QING LI, Associate Professor of Electrical and Computer Engineering – Ph.D., Georgia Institute of Technology; Carnegie Mellon, 2018–

TZE MENG LOW, Associate Research Professor of Electrical and Computer Engineering – Ph.D., University of Texas at Austin; Carnegie Mellon, 2013–

BRANDON LUCIA, Kavčić-Moura Professor of Electrical and Computer Engineering – Ph.D., University of Washington; Carnegie Mellon, 2014–

KEN MAI, Principal Systems Scientist of Electrical and Computer Engineering – Ph.D., Stanford University; Carnegie Mellon, 2005–

THERESA MAYER, Vice President for Research; Professor of Electrical and Computer Engineering and Materials Science and Engineering – Ph.D., Purdue University; Carnegie Mellon, 2023–

CRAIG MILLER, Research Professor of Electrical and Computer Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2020–

M. GRANGER MORGAN, Professor of Electrical and Computer Engineering; Hamerschlag University Professor of Engineering and Public Policy – Ph.D., University of California at San Diego; Carnegie Mellon, 1974–

JOSÉ M. F. MOURA, Philip L. and Marsha Dowd University Professor of Electrical and Computer Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 1986–

TAMAL MUKHERJEE, Associate Department Head for Students and Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1996–

WILLIAM NACE, Teaching Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2008–

YORIE NAKAHIRA, Assistant Professor of Electrical and Computer Engineering – Ph.D., California Institute of Technology; Carnegie Mellon, 2020–

PRIYA NARASIMHAN, Professor of Electrical and Computer Engineering – Ph.D., University of California at Santa Barbara; Carnegie Mellon, 2001–

ROHIT NEGI, Professor of Electrical and Computer Engineering – Ph.D., Stanford University; Carnegie Mellon, 2000–

DAVID O'HALLARON, Professor of Electrical and Computer Engineering and Computer Science – Ph.D., University of Virginia; Carnegie Mellon, 1989–

SAMUEL PAGLIARINI, Special Professor of Electrical and Computer Engineering – Ph.D., Télécom Paris (now Institut Polytechnique de Paris), France; Carnegie Mellon, 2024–

BRYAN PARNO, Kavčić-Moura Professor of Electrical and Computer Engineering and Computer Science – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2017–

GIANLUCA PIAZZA, STMicroelectronics Professor of Electrical and Computer Engineering; Director, Nanofab – Ph.D., University of California at Berkeley; Carnegie Mellon, 2012–

LAWRENCE T. PILEGGI, Coraluppi Head and Tanoto Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1996–

CÉCILE PÉRAIRE, Teaching Professor of Electrical and Computer Engineering, Carnegie Mellon University Silicon Valley – Ph.D., École polytechnique fédérale de Lausanne, Switzerland; Carnegie Mellon, 2014–

GUANNAN QU, Assistant Professor of Electrical and Computer Engineering – Ph.D., Harvard University; Carnegie Mellon, 2021–

RAJ RAJKUMAR, George Westinghouse Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1992–

BARRY RAWN, Associate Teaching Professor of Electrical and Computer Engineering – Ph.D., University of Toronto; Carnegie Mellon, 2018–

ANTHONY ROWE, Siewiorek and Walker Family Professor of Electrical and Computer Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2009–

WILLIAM SANDERS, Dr. William D. and Nancy W. Strecker Dean, College of Engineering; Professor for Electrical and Computer Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2020–

WENTING ZHENG, Assistant Professor of Computer Science – Ph.D., University of California at Berkeley; Carnegie Mellon, 2021–

Department of Electrical and Computer Engineering Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

18-059 Introduction to Amateur Radio

Spring: 3 units
Amateur radio is a pursuit that encompasses equal parts technology, communication, and public safety. It began in the US with the Radio Act of 1912, which guaranteed use of the electromagnetic spectrum to the people, provided they demonstrated the requisite technical competence. These privileges have persisted to the present day, with a vibrant global community of radio amateurs (hams) utilizing the spectrum to tinker and experiment with wireless communications for satellites, drone control, low-power communication, radio astronomy, and so on! This course will introduce students to the history, art, and science of radio with emphasis on hands-on demonstrations and in-class projects, including soldering a low-power FM transmitter and building a directional antenna. Students will also self-study to pass an amateur radio licensing exam administered on campus, which unlocks the electromagnetic spectrum for personal, non-commercial use. Radio service for public safety is tightly woven into the cultural fabric of the Buggy tradition at Carnegie Mellon, and becoming licensed is the first step to getting involved! Topics covered include: Radio signal fundamentals; Basic electronics; Antennas; Radio wave propagation; Radio equipment; Norms and culture of amateur radio communication; Operating regulations and safety Anyone interested in becoming a licensed amateur radio user is welcome regardless of major or prior background!

18-090 Twisted Signals: Multimedia Processing for the Arts

Spring: 10 units
[IDeATe portal course] - This course presents an overview on manipulating and synthesizing sound, video, and control signals. Signals are the raw materials used in many forms of electronic art and design - electronic music, interactive art, video art, kinetic sculpture, and more. In these fields, signals are used to represent information about sound, images, sensors, and movement. By transforming and manipulating these types of signals, we are able to create powerful new tools for digital art, multimedia applications, music, responsive environments, video and sound installation, smart products, and beyond. In this course we will study Signal Processing from a practical point-of-view, developing tools that can be easily integrated into art-making using the graphical programming environment Max (a.k.a. Max/MSP/Jitter). We will present a survey of Signal Processing techniques used in the sonic and visual arts, and will discuss the mathematical theories underlying these techniques. Students will be encouraged to combine, modify, and extend working examples of software to create original digital artworks.

18-095 Getting Started in Electronics: An Experiential Approach

Fall and Spring: 9 units
Electronics are ubiquitous and have transformed life many times over. Building circuits as a hobby has been a reliable introduction to a career in engineering for many decades, providing essential context and motivation for the mathematics and analysis techniques developed in the canonical ECE curriculum. For those with little prior knowledge of electronics, building circuits provides useful context and practical skills that lead to success in the rigorous engineering core. For those pursuing other career paths, exploring electronics develops technical literacy that will supplement and enhance their pursuits. Nowadays, the growth of maker culture has provided a wealth of tools that make electronics more accessible than ever before. This class uses an experiential learning approach to develop skills in circuit design, prototyping, and debugging. Every lecture is integrated with a hands-on laboratory experiment, punctuating each lesson with physical inquiry. The course will be based on two experiential learning texts: Getting Started in Electronics by Forrest Mims III, which has launched many engineering careers since the 1980s, and the modern classic Make: Electronics by Charles Platt. Principles of analog circuits, digital circuits, microcontrollers, and measurement equipment will be explored one experiment at a time, through twice-weekly integrated lecture/circuit builds and once-weekly self-guided builds.

18-100 Introduction to Electrical and Computer Engineering

Fall and Spring: 12 units
The goals of this freshman engineering course are: * To introduce basic concepts in electrical and computer engineering in an integrated manner; * To motivate basic concepts in the context of real applications; * To illustrate a logical way of thinking about problems and their solutions, and; * To convey the excitement of the profession. These goals are attained through analysis, construction and testing of an electromechanical system (e.g., a robot) that incorporates concepts from a broad range of areas within Electrical and Computer Engineering. Some of the specific topics that will be covered include system decomposition, ideal and real sources, Kirchhoff's Current and Voltage Laws, Ohm's Law, piecewise linear modeling of nonlinear circuit elements, Ideal Op-Amp characteristics, combinational logic circuits, Karnaugh Maps, Flip-Flops, sequential logic circuits, and finite state machines. 3 hrs. lec., 1 hr. rec., 3 hr. lab.

18-200 ECE Sophomore Seminar

Fall: 1 unit
The class comprises of a series of lectures from our own faculty and alumni, Department and University staff, and student groups. Students are required to attend each lecture. The lectures are designed to serve the following purposes: 1. Introduce to students to the faculty member's research field and the most current world advancements in engineering and technology in that area; 2. Provide students a good understanding of our curriculum structure and the courses in various areas; 3. Present correlations between the present technological developments and our courses for each course area; 4. Introduce new undergraduate courses; 5. Advertise on-campus/off-campus research opportunities for undergraduate students and explain the corresponding research projects; 6. Motivate students with positive presentations on the importance of obtaining education and gaining self-learning ability; 7. Provide basic education on learning and working ethics.

18-202 Mathematical Foundations of Electrical Engineering

Fall and Spring: 12 units
This course covers topics from engineering mathematics that serve as foundations for descriptions of electrical engineering devices and systems. It is the corequisite mathematics course for 18-220, Fundamentals of Electrical Engineering. The topics include: 1.MATLAB as a robust computational tool, used to reinforce, enrich and integrate ideas throughout the course, including software exercises and projects in combination with homework assignments; 2.Complex Analysis, including rectangular and polar representations in the complex plane with associated forms of complex arithmetic, powers, roots and complex logarithms, complex differentiation, analytic functions and Cauchy-Riemann equations, complex Taylor series, complex exponential, sinusoidal and hyperbolic functions, and Euler's formula; 3.Fourier Analysis, including orthogonality of sinusoids, trigonometric and exponential forms of Fourier series, Fourier integrals and Fourier transforms; 4.Linear, Constant-Coefficient Differential Equations, including complex exponential solutions to homogeneous equations and particular solutions with polynomial and sinusoidal driving functions described by phasors; 5.Difference Equations, with emphasis upon their relationship to differential equations, and; 6.Linear Algebra and Matrices, including matrix arithmetic, linear systems of equations and Gaussian elimination, vector spaces and rank of matrices, matrix inverses and determinants, eigenvalue problems and their relationship to systems of homogeneous differential equations.
Prerequisite: 21-122 Min. grade C

18-213 Introduction to Computer Systems

All Semesters: 12 units
This course provides a programmer's view of how computer systems execute programs, store information, and communicate. It enables students to become more effective programmers, especially in dealing with issues of performance, portability and robustness. It also serves as a foundation for courses on compilers, networks, operating systems, and computer architecture, where a deeper understanding of systems-level issues is required. Topics covered include: machine-level code and its generation by optimizing compilers, performance evaluation and optimization, computer arithmetic, memory organization and management, networking technology and protocols, and supporting concurrent computation. NOTE: students must achieve a C or better in order to use this course to satisfy the pre-requisite for any subsequent Computer Science course.
Prerequisite: 15-122 Min. grade C

18-220 Electronic Devices and Analog Circuits

Fall and Spring: 12 units
This course covers fundamental topics that are common to a wide variety of electrical engineering devices and systems. The topics include an introduction to semiconductor devices and technology, DC circuit analysis techniques, operational amplifiers, energy storage elements, sinusoidal steady-state response, frequency domain analysis, filters, and transient response of first- and second-order systems. The laboratories allow students to use modern electronic instrumentation and to build and operate circuits that address specific concepts covered in the lectures, including semiconductor devices and sensors, layout, operational amplifiers, filters, signal detection and processing, power converters and circuit transients. 3 hrs. lec., 1 hr. rec., 3 hrs. lab.
Prerequisite: 18-100 Min. grade C

18-224 Special Topics in Chip Design

Spring: 12 units
Please refer to the ECE website for descriptions of each topic: https://courses.ece.cmu.edu/

18-240 Structure and Design of Digital Systems

Fall and Spring: 12 units
This course introduces basic issues in design and verification of modern digital systems. Topics include: Boolean algebra, digital number systems and computer arithmetic, combinational logic design and simplification, sequential logic design and optimization, register-transfer design of digital systems, basic processor organization and instruction set issues, assembly language programming and debugging, and a hardware description language. Emphasis is on the fundamentals: the levels of abstraction and hardware description language methods that allow designers to cope with hugely complex systems, and connections to practical hardware implementation problems. Students will use computer-aided digital design software and actual hardware implementation laboratories to learn about real digital systems. 3 hr. lec., 1 hr. rec., 3 hr. lab.
Prerequisite: 18-100 Min. grade C

18-290 Signals and Systems

Fall and Spring: 12 units
This course develops the mathematical foundation and computational tools for processing continuous-time and discrete-time signals in both time and frequency domain. Key concepts and tools introduced and discussed in this class include linear time-invariant systems, impulse response, frequency response, convolution, filtering, sampling, and Fourier transform. Efficient algorithms like the fast Fourier transform (FFT) will be covered. The course provides background to a wide range of applications including speech, image, and multimedia processing, bio and medical imaging, sensor networks, communication systems, and control systems. This course serves as entry and prerequisite for any higher level course in the fields of signal processing, communications, and control.

18-300 Fundamentals of Electromagnetics

Fall: 12 units
This course introduces electromagnetic principles and describes ways in which those principles are applied in engineering devices and systems. Topics include: vector calculus as a mathematical foundation for field descriptions, Maxwell's equations in integral and differential forms with associated boundary conditions as descriptions of all electromagnetic principles, quasistatic electric fields in free space and in materials, superposition for known charge sources, conduction and polarization, resistance and capacitance, charge relaxation, analytic and numerical methods for electric field boundary value problems, quasistatic magnetic fields in free space and in materials, superposition for known current sources, magnetization, inductance, magnetic diffusion, and analytic and numerical methods for magnetic field boundary value problems. 4 hrs. lec.
Prerequisite: 18-220 Min. grade C

18-310 Fundamentals of Semiconductor Devices

Spring: 12 units
This course replaced 18311 in Spring 2005. In this course you will receive an introduction to the operation and fabrication of the most important semiconductor devices used in integrated circuit technology together with device design and layout. At the end of the course you will have a basic understanding of pn diodes, bipolar transistors, and MOSFETs as well as some light emitting and light detecting devices such as photodiodes, LEDs and solar cells. You will also receive an introduction to the fundamental concepts of semiconductor physics such as doping, electron and hole transport, and band diagrams. In the laboratory you will learn how to lay out both bipolar and MOS devices and you will design small (2-3 transistor) circuits. The laboratory portion of the course emphasizes the relation between device design and layout and circuit performance. You will also experimentally evaluate the operation of amplifier and gate circuits fabricated with discrete devices. This course will give you an excellent understanding of the operation and fabrication of the devices which is necessary for high-performance analog and digital circuit design. 3 hrs. lec. (Note: the prerequisite is typically waived for MSE students who intend to pursue the Electronic Materials Minor.)
Prerequisite: 18-220 Min. grade C

18-320 Microelectronic Circuits

Spring: 12 units
18-320 introduces students to the fundamentals of microelectronic circuits. The course will emphasize the analysis and design of basic analog and digital integrated circuits in preparation for further study in analog, digital, mixed-signal, and radio-frequency integrated circuit design. Additionally, students will learn to design and analyze microelectronic circuits using industry standard computer aided design (CAD) software. Topics to be covered include: MOSFET fabrication and layout MOSFET models for analog and digital design Analysis and design of digital CMOS logic gates Analysis and design of clocked storage elements (e.g., flip-flops, latches, memory cells) Delay optimization of digital circuits Circuit topologies for arithmetic and logical functional units Analysis and design of single-stage MOS amplifiers Frequency response characteristics of single-stage amplifiers Differential amplifiers and simple operational amplifiers Analog filters using operational amplifiers The course includes a lab component which will give students hands-on experience in the design and implementation of analog and digital circuits. Labs will employ both design using discrete, SSI, and MSI parts, as well as using CAD design tools.
Prerequisite: 18-220 Min. grade C

18-330 Introduction to Computer Security

Fall and Spring: 12 units
Security is becoming one of the core requirements in the design of critical systems. This course will introduce students to the intro-level fundamental knowledge of computer security and applied cryptography. Students will learn the basic concepts in computer security including software vulnerability analysis and defense, networking and wireless security, and applied cryptography. Students will also learn the fundamental methodology for how to design and analyze security critical systems.
Prerequisite: 18-213 Min. grade C

18-334 Network Security

Spring: 12 units
Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to advance attacks on end systems. This course provides an in-depth study of network attack techniques and methods to defend against them. The course will cover topics spanning five broad themes: (1) infrastructure topics such as firewalls, network intrusion detection, secure routing protocols, and recent advances such as software-defined networking; (2)network attacks such as denial of service (DoS) and distributed denial-of-service (DDoS) attacks, worm and virus propagation; (3)analysis and inference topics such as network forensics and attack economics; (4) user related topics such as authentication, anonymity and censorship resilience; and (5) new technologies related to next-generation networks, and cellular and wireless networks. Students in 18-334 will share lectures and homeworks with students in 18-731. However, 18-731 will have additional requirements not shared by 18-334, including the requirement to produce scribe notes and to practice and demonstrate the ability to read and summarize scientific papers on the topics covered by the course.
Prerequisites: 18-330 Min. grade C or 15-330 Min. grade C

18-335 Secure Software Systems

Spring: 12 units
Poor software design and engineering are the root causes of most security vulnerabilities in deployed systems today. Moreover, with code mobility now commonplace and #8212;particularly in the context of web technologies and digital rights management and #8212;system designers are increasingly faced with protecting hosts from foreign software and protecting software from foreign hosts running it. This class takes a close look at software as a mechanism for attack, as a tool for protecting resources, and as a resource to be defended. Topics covered include the software design process; choices of programming languages, operating systems, databases and distributed object platforms for building secure systems; common software vulnerabilities, such as buffer overflows and race conditions; auditing software; proving properties of software; software and data watermarking; code obfuscation; tamper resistant software; and the benefits of open and closed source development. Students in 18-335 will share lectures and homeworks with students in 18-732. However, 18-732 has additional requirements not shared by 18-335, including the requirement to produce scribe notes and to practice and demonstrate the ability to read and summarize scientific papers on the topics covered by the course.
Prerequisites: (15-330 Min. grade C or 18-631 Min. grade C or 14-741 Min. grade C or 18-730 Min. grade C or 18-330 Min. grade C) and (15-213 Min. grade C or 18-613 Min. grade C or 15-513 Min. grade C or 14-513 Min. grade C or 18-213 Min. grade C)

18-340 Hardware Arithmetic for Machine Learning

Fall: 12 units
In this course, students explore the techniques for designing high-performance digital circuits for computation along with methods for evaluating their characteristics. We begin by reviewing number systems and digital arithmetic along with basic arithmetic circuits such as ripple-carry adders. From there, we move to more complex adders (carry-look-ahead, carry-skip, carry-bypass, etc.), multipliers, dividers, and floating-point units. For each circuit introduced, we will develop techniques and present theory for evaluating their functionality and speed. Other methods will be described for analyzing a circuit's power consumption, testability, silicon area requirements, correctness, and cost. In addition, we will utilize various CAD tools to evaluate the circuits described. Finally, advanced timing and clocking concepts will be investigated. For example, the notion of clock skew will be introduced and its impact on clock period for sequential circuits will be analyzed. We will also learn how to analyze and design asynchronous circuits, a class of sequential circuits that do not utilize a clock signal. Course projects focus on key arithmetic aspects of various machine learning algorithms including: K-nearest neighbors, neural networks, decision trees, and support vector machines. *Note: Although students in 18-340 and 18-640 will share lectures, labs, and recitations, students in 18-340 and 18-640 will receive different homework assignments, design projects, and exams. In some cases 18-640 students will also have different or additional lab sessions. The homework assignments, design projects, and exams that are given to the students registered for 18-640 will be more challenging than those given to the students registered for 18-340 in that they will have more complex designs, involve additional theoretical analysis, and have more stringent specifications (e.g., in area, power, performance, and robustness).
Prerequisite: 18-240 Min. grade C

18-341 Logic Design and Verification

Fall and Spring: 12 units
This course is a second level logic design course, studying the techniques of designing at the register-transfer and logic levels of complex digital systems using modern modeling, simulation, synthesis, and verification tools. Topics include register-transfer level systems (i.e., finite state machines and data paths), bus and communication system interfacing (such as a simplified USB interface), discrete-event simulation, testbench organization, assertion-based verification and functional coverage. Design examples will be drawn from bus and communication interfaces, and computation systems, emphasizing how these systems are designed and how their functionality can be verified. A modern hardware description language, such as SystemVerilog, will serve as the basis for uniting these topics. Quizzes, homeworks and design projects will serve to exercise these topics.
Prerequisite: 18-240 Min. grade C

18-344 Computer Systems and the Hardware-Software Interface

Fall: 12 units
This course covers the design and implementation of computer systems from the perspective of the hardware software interface. The purpose of this course is for students to understand the relationship between the operating system, software, and computer architecture. Students that complete the course will have learned operating system fundamentals, computer architecture fundamentals, compilation to hardware abstractions, and how software actually executes from the perspective of the hardware/software boundary. The course will focus especially on understanding the relationships between software and hardware, and how those relationships influence the design of a computer system's software and hardware. The course will convey these topics through a series of practical, implementation-oriented lab assignments.
Prerequisites: 18-213 Min. grade C and 18-240 Min. grade C

18-349 Introduction to Embedded Systems

Fall and Spring: 12 units
This practical, hands-on course introduces the various building blocks and underlying scientific and engineering principles behind embedded real-time systems. The course covers the integrated hardware and software aspects of embedded processor architectures, along with advanced topics such as real-time, resource/device and memory management. Students can expect to learn how to program with the embedded architecture that is ubiquitous in cell-phones, portable gaming devices, robots, PDAs, etc. Students will then go on to learn and apply real-time principles that are used to drive critical embedded systems like automobiles, avionics, medical equipment, the Mars rover, etc. Topics covered include embedded architectures (building up to modern 16/32/64-bit embedded processors); interaction with devices (buses, memory architectures, memory management, device drivers); concurrency (software and hardware interrupts, timers); real-time principles (multi-tasking, scheduling, synchronization); implementation trade-offs, profiling and code optimization (for performance and memory); embedded software (exception handling, loading, mode-switching, programming embedded systems). Through a series of laboratory exercises with state-of-the-art embedded processors and industry-strength development tools, students will acquire skills in the design/implementation/debugging of core embedded real-time functionality.
Prerequisites: 18-213 Min. grade C and 18-240 Min. grade C

18-351 Full-Stack Software Development for Engineers

Fall and Spring: 12 units
This course will introduce the principles, concepts, technologies, and practices of full-stack software development for creating end-to-end web applications using a classical client-server architecture and the model-view-controller pattern. Students will acquire basic front-end and back-end skills and learn how to apply modern development practices in the context of an individual hands-on project using the plain web stack for the front-end, TypeScript and a NoSQL database layer for the back-end, and other common libraries, light-weight frameworks, and tools as adjuncts. They will practice how to version-control the codebase, manage a small project, transform requirements expressed as user stories into working software in an incremental manner, maintain code quality, build their application on an integration server, and deploy it on the cloud. To enroll in this course, students must already be proficient in coding using multiple programming languages and familiar with the basics of algorithms, data structures, databases, and software design principles, including object-orientation. Each student will need their own laptop computer to use in the course.
Prerequisite: 15-122 Min. grade B

18-352 Software Engineering Essentials

Spring: 12 units
In this course, students will learn about and apply software engineering paradigms that have shaped the software industry over the past few decades. They will be exposed to fundamental disciplines of software engineering as well as central engineering practices that crosscut system, project, and user perspectives. They will iteratively analyze and implement user requirements in the presence of a customer proxy, and architect, design, implement, integrate, test, and deploy an evolving solution that balances multiple engineering and user constraints. The course is organized around a semester-long team project with frequent milestones, deliverables, demonstrations, and assessments. Newly introduced course topics are immediately applied to the team project. The team project starts right away and relies on several software technologies, tools, and stacks: prior knowledge of these elements is therefore paramount. To enroll, students must have substantial programming experience and be already familiar with these elements. This course can replace 18652 to satisfy a core requirement of ECEs MS-SE program.
Prerequisites: 18-351 Min. grade C or 17-437

18-358 Special Topics in Communications

Spring: 6 units
Please go to the ECE website to view "Special Topics in Communications" course descriptions.

Course Website: https://courses.ece.cmu.edu/

18-370 Fundamentals of Control

Fall: 12 units
This junior/senior-level undergraduate course introduces the fundamental principles and methodologies of classical feedback control of linear systems and its applications. Emphasis is on understanding physical principles in feedback systems, practical problem formulation and the analysis and synthesis of feedback control systems using frequency and time domain techniques. The covered material provides a foundation for further studies toward careers in motion control, automation, control electronics, robotics, systems science and engineering. The practical knowledge in this course represents necessary tools to design a broad variety of systems such as robots, servo and tracking systems, feedback circuits, phase-locked loops, and microelectromechanical systems. Topics include analytical, graphical and computer-aided techniques (MATLAB/Simulink) for analyzing, designing and realizing of feedback control systems; Laplace transforms and associated transfer function modeling; root-locus and frequency response (Bode plot) design; pole-zero synthesis techniques; analysis of trade-offs in performance: stability, transient response, steady-state error, disturbance rejection, and robustness; design and implementation of PID, lead-lag, and loop shaping compensators. If time permits, the course will include a cursory introduction to state space modeling, systems with delay and computer control systems.
Prerequisites: 18-290 Min. grade C or 24-352 Min. grade C

18-372 Fundamental Electrical Power Systems

Fall: 12 units
This course introduces the fundamentals in electric energy systems which will enable you to understand current issues and challenges in electric power systems ("smart grid") and what it takes for you to have a reliable electric power supply at your house. First, the general structure of an electric power system (current and future trends) will be introduced. This includes electric power plants (renewable and non-renewable); transmission and distribution; and consumers. Then, electric power is addressed from a mathematical point of view. The mathematical formulae for AC power and models for the above mentioned elements are derived which will enable you to calculate how much power is flowing over which lines on its way from the power plant to the consumer. Maintaining the balance between generation and consumption is important to avoid catastrophic blackout events. Hence, the notion of stability and available control concepts will be introduced.
Prerequisite: 18-220 Min. grade C

18-390 ECE CO-OP

All Semesters
The Department of Electrical and Computer Engineering at Carnegie Mellon considers experiential learning opportunities important educational options for its undergraduate students. One such option is cooperative education, which provides a student with an extended period of exposure with a company. To participate, students must work with their academic advisor to complete an ECE Co-op Approval form and submit for approval. Students must possess at least junior status and have an overall grade point average of 3.0 or above. All co-ops must be approximately 8 months in uninterrupted length. If the co-op is approved, the ECE Undergraduate Studies Office will add the course to the student's schedule. Upon completion of the co-op experience, students must submit a 1-2 page report of their work experience, and a 1-2 page evaluation from the company supervisor to the ECE Undergraduate Office. International students should also be authorized by the Office of International Education (OIE). More information regarding CPT is available on OIE's website.

18-399 Special Topics in Signal Processing

Intermittent: 3 units
Please refer to the ECE website to view "Special Topics in Signal Processing" course descriptions. http://www.ece.cmu.edu/courses/index.html (http://www.ece.cmu.edu/courses/)

18-401 Electromechanics

12 units
This course provides a broadly based introduction to interactions between mechanical media and electromagnetic fields. Attention is focused on the electromechanical dynamics of lumped-parameter systems, wherein electrical and mechanical subsystems may be modeled in terms of discrete elements. Interactions of quasistatic electric and magnetic fields with moving media are described and exemplified. Unifying examples are drawn from a wide range of technological applications, including energy conversion in synchronous, induction, and commutator rotating machines, electromechanical relays, a capacitor microphone and speaker, and a feedback-controlled magnetic levitation system. 4.5 hrs. rec.
Prerequisite: 18-300

18-402 Applied Electrodynamics

Spring: 12 units
This course builds upon the electric and magnetic field foundations established in 18-300 to describe phenomena and devices where electromagnetic waves are a central issue. Topics include: review of Maxwell's equations, propagation of uniform plane waves in lossless and lossy media, energy conservation as described by the Poynting Theorem, reflection and transmission with normal and oblique incidence upon boundaries, sinusoidal steady state and transients on 2-conductor transmission lines, modal descriptions of waveguides, radiation and antennas. 4 hrs. lec.
Prerequisite: 18-300

18-403 Microfabrication Methods and Technology

Fall: 12 units
This course is a laboratory-based introduction to the theory and practice of microfabrication. Lectures and laboratory sessions cover fundamental processing techniques such as photo-mask creation, lithographic patterning, thin film vacuum deposition processes, wet-chemical and dry-etching processes. This is primarily a hands-on laboratory course which brings students into the microfabrication facility and device testing laboratories. Students will fabricate electronic and opto-electronic devices such the metal-oxide-semiconductor (MOS) capacitor, the Schottky diode, the MOS transistor, the solar cell, and the light-emitting diode. An understanding of the operation of these building block devices will be gained by performing measurements of their electrical and opto-electronic characteristics. Emphasis is placed on understanding the interrelationships between the materials properties, processing, device structure, and the electrical and optical behavior of the devices. The course is intended to provide a background for a deeper appreciation of solid state electronic devices and integrated circuits. 2 lecture periods per week and a minimum of 4 laboratory hours.
Prerequisite: 18-310

18-411 Computational Techniques for Data Science and Engineering

Spring: 12 units
This course covers mathematical techniques that permit formulation of equations that often emerge out of engineering and science problems or experimental data in a manner that makes them computationally tractable for numerical solutions and analysis. Numerical approaches to solving engineering or science equations allow one to perform computer simulations that can often answer key questions without actual experimentation (which can be costly and time-consuming). The course is divided into two major modules. The first develops foundational background in modeling, computers, error analysis, linear algebra, regression, and curve fitting. To illustrate applications of the main concepts of the first module, we discuss how to use them in machine learning, specifically in deep learning. Students carry out a deep learning project of their choosing to sharpen their comprehension of both the mathematics behind deep learning, and the machine learning algorithms that enable the most common applications of deep learning. The second module builds on the first to develop skills in numerical differentiation and integration and continues with techniques for computational solution of ordinary and partial differential equations that arise from physical or engineering problems. Students learn how to set up these equations in a manner that allows numerical solutions to be obtained by either writing simple computer code or macros that interface with open-source Python code or commercially available software packages such as MATLAB or Mathematica.
Prerequisites: (15-110 Min. grade C or 15-112) and 21-120

18-416 Nano-Bio-Photonics

Spring: 12 units
Light can penetrate biological tissues non-invasively. Most of the available bio-optic tools are bulky. With the advent of novel nanotechnologies, building on-chip integrated photonic devices for applications such as sensing, imaging, neural stimulation, and monitoring is now a possibility. These devices can be embedded in portable electronic devices such as cell phones for point of care diagnostics. This course is designed to convey the concepts of nano-bio-photonics in a practical way to prepare students to engage in emerging photonic technologies. The course starts with a review of electrodynamics of lightwaves. The appropriate choice of wavelength and material platform is the next topic. Then optical waveguides and resonators are discussed. Resonance-based sensing is introduced followed by a discussion of the Figure of Merits (FOMs) used to design on-chip sensors. Silicon photonics is introduced as an example of a CMOS-compatible platform. On-chip spectroscopy is the next topic. The second part covers nano-plasmonics for bio-detection and therapy. The design methods are discussed, followed by an overview of nanofabrication and chemical synthesis, and then a discussion of applications. The last part of this course will be dedicated to a review of recent applications such as Optogenetic neural stimulation, Calcium imaging, Cancer Imaging and Therapy. Senior or graduate standing required. This course is cross-listed with 18616. Although students in 18-616 and 18-416 will share the same lectures and recitations, students in 18-616 will receive distinct course projects. Students in 18-416 and 18-616 will be graded on separate curves.
Prerequisite: 18-300 Min. grade C

18-420 Design, Integration, and Tapeout of IoT Systems

Fall: 12 units
This course provides a comprehensive exploration of the design concepts and methodologies involved in developing integrated circuits for Internet of Things (IoT) systems. Students will gain hands-on experience in designing and integrating essential blocks such as sensor front-ends, data converters, machine learning circuits, and wireless transmitters. Key concepts include an introduction to IoT system architectures, principles of sensor interfacing, analog-to-digital converters (ADCs), machine learning in IoT, RF front-end design considerations, an CMOS technology and design rules, overview of the tapeout process, and design exercises using industry-standard design tools. By bringing together individual blocks into a cohesive system, students will gain the skills and knowledge required to design, simulate, and tapeout a complete IoT system-on-chip by the end of this course. The course emphasizes a practical, project-based approach to ensure students are well-prepared for real-world challenges in IoT integrated circuit design. This course is crosslisted with 18620. ECE graduate students will be prioritized for 18620, and ECE undergraduate students will be prioritized for 18420. Although students in 18420 will share lectures with students in 18620, students in 18620 will undertake more complex projects.
Prerequisite: 18-220 Min. grade C

18-421 Analog Integrated Circuit Design

Fall: 12 units
Some form of analog circuit design is a critical step in the creation of every modern IC. First and foremost, analog circuits act as the interface between digital systems and the real world. They act to amplify and filter analog signals, and to convert signals from analog to digital and back again. In addition, high performance digital cell design (either high speed or low power) also invokes significant analog circuit design issues. The goal of this course is to teach students some of the methods used in the design and analysis of analog integrated circuits, to illustrate how one approaches design problems in general, and to expose students to a broad cross-section of important analog circuit topologies. The course will focus on learning design through carrying out design projects. Design and implementation details of wide-band amplifiers, operational amplifiers, filters and basic data converters will be covered. Example topics to be covered include transistor large- and small-signal device models, small-signal characteristics of transistor-based amplifiers, large-signal amplifier characteristics and nonidealities, operational amplifier design, basic feedback amplifier stability analysis and compensation, and comparator design. The course will focus primarily on analog CMOS, but some aspects of BJT design will be discussed. 18-290 and 18-320 or equivalent background material with permission of the instructor. Although students in 18-623 will share Lectures and Recitations with students in 18-421, students in 18-623 will receive distinct homework assignments, distinct design problems, and distinct exams from the ones given to students in 18-421 and will be graded on a separate curve from students taking 18-421.
Prerequisites: 18-290 Min. grade C and 18-320 Min. grade C

18-422 Digital Integrated Circuit Design

Fall: 12 units
This course covers the design and implementation of digital circuits in a modern VLSI process technology. Topics will include logic gate design, functional unit design, latch/flip-flop design, system clocking, memory design, clock distribution, power supply distribution, design for test, and design for manufacturing. The lab component of the course will focus on using modern computer aided design (CAD) software to design, simulate, and lay out digital circuits. The final project for the course involves the design and implementation to the layout level of a small microprocessor. Although students in 18-422 and 18-622 will share lectures, labs, and recitations, students in 18-422 and 18-622 will receive different homework assignments, design projects, and exams, and in some cases 18-622 students will also have different or additional lab sessions.
Prerequisites: 18-320 Min. grade C and 18-240 Min. grade C

18-427 Board-Level RF Systems for the Internet-of-Things

Fall: 12 units
In this age when everything is connected to the internet-of-things (IOT), students should understand how RF Transceivers and Antennas can allow such devices to be connected without wires. This class will give students the chance to learn about cellular and IOT devices and how they communicate using radio frequency (RF) signals. Students will gain an understanding of antenna design and operation, a high-level understanding of RF signal propagation, an introduction to RF Transceiver design and operation and an overview of multi-input multi-output (MIMO) RF operation. A Laboratory section is included in this class. In Lab, students will learn how to assemble printed circuit board (PCBs) using the Tech Spark facility. Early Lab sessions will demonstrate RF signals, antennas, and constructive and destructive RF interference. Students control the RF transceiver ICs by programming several different types of software defined radios (SDRs). Several different PCB antenna designs will be explored in the Lab sessions. Lab exercises will culminate with students building up an SDR-controlled RF transmitter driving a PCB antenna and using it to send data from one student to another using MI O beam steering to increase spectral reuse. Although students in 18-727 will share lectures and recitations with students in 18-427, students in 18-727 will receive distinct homework assignments and grading scale from students in 18-427. Specifically, the homework assignments for 18-727 will be more complex than the homework assignments for 18-427.
Prerequisites: 18-290 Min. grade B and 18-320 Min. grade B

18-435 Foundations of Blockchains

Fall: 12 units
In this course, students will learn the mathematical foundations of blockchains, including how to construct distributed consensus protocols and prove them secure, cryptography for blockchains, and mechanism design for blockchains. This course will take a mathematically rigorous approach. Students are expected to have mathematical maturity and be able to write formal mathematical proofs. Students may also be expected to implement some consensus or cryptographic algorithms. This course is crosslisted with 18635. ECE graduate students will be prioritized for 18635, and ECE undergraduate students will be prioritized for 18435. Although students in 18435 will share lectures with students in 18635, students in 18435 will receive distinct homework assignments, distinct programming projects, and distinct exams from the ones given to students in 18635. Specifically, the homework assignments, programming projects, and exams that are given to the 18635 students will be more challenging than those given to the 18435 students.
Prerequisites: 18-334 Min. grade C or 18-335 Min. grade C or 18-465 Min. grade C or 18-733 Min. grade C or (18-202 Min. grade C and 18-213 Min. grade C) or (18-202 Min. grade C and 15-513 Min. grade C) or (18-202 Min. grade C and 18-613 Min. grade C) or (14-513 Min. grade C and 18-202 Min. grade C)

18-441 Computer Networks

Intermittent: 12 units
The Internet has transformed our everyday lives, bringing people closer together and powering multi-billion dollar industries. The mobile revolution has brought Internet connectivity to the last-mile, connecting billions of users worldwide. But how does the Internet work? What do oft repeated acronyms like "LTE", "TCP", "WWW" or a "HTTP" actually mean and how do they work? This course introduces fundamental concepts of computer networks that form the building blocks of the Internet. We trace the journey of messages sent over the Internet from bits in a computer or phone to packets and eventually signals over the air or wires. We describe concepts that are common to and differentiate traditional wired computer networks from wireless and mobile networks. Finally, we build up to exciting new trends in computer networks such as the Internet of Things, 5-G and software defined networking. Topics include: physical layer and coding (CDMA, OFDM, etc.); data link protocol; flow control, congestion control, routing; local area networks (Ethernet, Wi-Fi, etc.); transport layer; and introduction to cellular (LTE) and 5-G networks. A final project asks you to a build a HTTP video server of your own. This course is cross-listed with 18-741 - both editions will share Lectures and Recitations. However, students in the two courses will receive different exams and will have a different project. The students in the two versions of the course will be graded on a separate curve.
Prerequisite: 18-213 Min. grade C

18-447 Introduction to Computer Architecture

Spring: 12 units
Computer architecture is the science and art of selecting and interconnecting hardware components to create a computer that meets functional, performance and cost goals. This course introduces the basic hardware structure of a modern programmable computer, including the basic laws underlying performance evaluation. We will learn, for example, how to design the control and data path hardware for a MIPS-like processor, how to make machine instructions execute simultaneously through pipelining and simple superscalar execution, and how to design fast memory and storage systems. The principles presented in the lecture are reinforced in the laboratory through the design and simulation of a register transfer (RT) implementation of a MIPS-like pipelined superscalar in Verilog. Learning to design programmable systems requires that you already have the knowledge of building RT systems, the knowledge of the behavior storage hierarchies (e.g., cache memories) and virtual memory, and the knowledge of assembly language programming.
Prerequisites: 18-240 Min. grade C and (18-213 Min. grade C or 15-213 Min. grade C) and (18-330 Min. grade C or 18-349 Min. grade C or 18-320 Min. grade C or 18-340 Min. grade C or 18-341 Min. grade C or 18-344 Min. grade C)

18-448 Special Topics in Embedded Systems

Intermittent: 12 units
Please refer to the ECE website for descriptions of each topic.

Course Website: https://courses.ece.cmu.edu/

18-452 Wireless Networking and Applications

Spring: 12 units
This course introduces fundamental concepts of wireless networks. The design of wireless networks is influenced heavily by how signals travel through space, so the course starts with an introduction to the wireless physical layer, presented in a way that is accessible to a broad range of students. The focus of the course is on wireless MAC concepts including CSMA, TDMA/FDMA, and CDMA. It also covers a broad range of wireless networking standards, and reviews important wireless network application areas (e.g., sensor networks, vehicular) and other applications of wireless technologies (e.g., GPS, RFID, sensing, etc.). Finally, we will touch on public policy issues, e.g., as related to spectrum use. The course will specifically cover: Wireless networking challenges Wireless communication overview Wireless MAC concepts Overview of cellular standards and LTE Overview of wireless MAC protocols WiFi, bluetooth and personal area networks, etc. Wireless in today's Internet: TCP over wireless, mobility, security, etc. Advanced topics, e.g., mesh and vehicular networks, sensor networks, DTNs, localization, sensing, etc. Although students in 18-750 will share Lectures and Recitations with students in 18-452, they will receive distinct homework assignments and exams from students in 18-452. The main project will also be different. The students in the two versions of the course will also be graded on a separate curve.
Prerequisites: 15-213 Min. grade C or 18-613 Min. grade C or 18-213 Min. grade C

18-453 Introduction to XR Systems

Fall: 12 units
Digitization of reality is at the cusp of widespread adoption; it also embodies a unique convergence of techniques that span the gamut of electrical and computer engineering. This course introduces students to augmented/virtual/mixed reality systems, or what is broadly referred to as extended reality (XR). The course covers hardware and software topics central to XR systems, namely, content capture, streaming, and display, looking at both commercial and research- grade systems. A course project will allow students to experience and innovate in this space.
Prerequisites: 18-213 Min. grade C or 18-290 Min. grade C

18-460 Optimization

Spring: 12 units
Many design problems in engineering (e.g., machine learning, finance, circuit design, etc.) involve minimizing (or maximizing) a cost (or reward) function. However, solving these problems analytically is often challenging. Optimization is the study of algorithms and theory for numerically solving such problems, and it underpins many of the technologies we use today. This course is an introduction to optimization. Students will: (1)learn about common classes of optimization problems, (2) study (and implement) algorithms for solving them, and (3) gain hands-on experience with standard optimization tools. We will focus on convex optimization problems, but will also discuss the growing role of non-convex optimization, as well as some more general numerical methods. The course will emphasize connections to real-world applications including machine learning, networking, and finance. The course will involve lectures, homework, exams, and a project. This course is crosslisted with 18660. Although students in 18460 will share lectures with students in 18660, students in 18460 will receive distinct homework assignments, distinct design problems, and distinct exams from the ones given to students in 18660. Specifically, the homework assignments, design problems and exams that are given to the 18660 students will be more challenging than those given to the 18460 students.
Prerequisites: (18-202 Min. grade C or 21-259 Min. grade C or 21-254 Min. grade C or 21-260 Min. grade C) and (36-219 Min. grade C or 36-225 Min. grade C or 36-218 Min. grade C or 21-325 Min. grade C) and 21-241 Min. grade C

18-461 Introduction to Machine Learning for Engineers

Fall and Spring: 12 units
This course provides an introduction to machine learning with a special focus on engineering applications. The course starts with a mathematical background required for machine learning and covers approaches for supervised learning (linear models, kernel methods, decision trees, neural networks) and unsupervised learning (clustering, dimensionality reduction), as well as theoretical foundations of machine learning (learning theory, optimization). Evaluation will consist of mathematical problem sets and programming projects targeting real-world engineering applications. This course is crosslisted with 18661. ECE graduate students will be prioritized for 18661, and ECE undergraduate students will be prioritized for 18461. Although students in 18461 will share lectures with students in 18661, students in 18461 will receive distinct homework assignments, distinct programming projects, and distinct exams from the ones given to students in 18661. Specifically, the homework assignments, programming projects, and exams that are given to the 18661 students will be more challenging than those given to the 18461 students.
Prerequisites: 18-202 Min. grade C and 21-127 Min. grade C and 15-122 Min. grade C and (36-218 Min. grade C or 36-219 Min. grade C or 36-225 Min. grade C or 21-325 Min. grade C)

18-462 Principles and Engineering Applications of AI

Spring: 12 units
This is a first-year graduate course in Principles and Engineering Applications of AI. The course will review the basic principles of AI. Some of the specific topics that will be covered are the following: 1) Intelligent Agents; 2) Single-Agents and Multi-Agent Systems (MAS); 3) Uncertain Knowledge and Reasoning (Probabilistic Reasoning and Probabilistic Reasoning over Time, Bayesian Networks, Dynamic Bayesian Networks, Hidden Markov Models, Kalman Filters, MCMC algorithms, etc.); 4) Learning; 5) Communicating, Perceiving, and Acting; 6) Robotics. The course will involve completing a set of challenging engineering applications of AI that will include: Medical applications, Video Games, Autonomous driving, Autonomous Robots, Finance and Economics, Military, Art, Advertising. Students should have a good background in basic probability theory, maturity in mathematical topics, and good programming skills. For seniors who would like to take the course but do not have the necessary prerequisites, instructor's permission will be required. Although students in 18462 will share lectures with students in 18662, students in 18462 will receive distinct homework assignments, distinct projects, and distinct exams from the ones given to students in 18662. Specifically, the homework assignments, projects, and exams that are given to the 18662 students will be more challenging than those given to the 18462 students.
Prerequisites: 18-751 Min. grade B or 36-218 Min. grade B or 36-219 Min. grade B

18-464 ULSI Technology Status and Roadmap for System on Chips and System in Package

Fall and Spring: 12 units
This course will provide the necessary background for the state-of-the art technologies utilized by the leading edge products covering full spectrum of market drivers from mobile platforms, microprocessors, game chips to the highest performance systems for enterprise solutions computing. We will present all key components of such systems, i.e., logic, analog/RF and embedded memories. Then we present the technology roadmap for the upcoming generations in terms of device architecture options for logic devices (FinFET, Nanowire and Tunnel FET) and memories (Phase Change Memory , Resistive RAM and Magnetic RAM/Spin-Transfer Torque RAM) from the device level all the way to the system level specifications. The last part of the class will be devoted to the system integration issues, namely 3-dimensional integration approaches. This course is designed for MS and PhD students from diverse areas: System/Hardware Design, Circuits and Devices/Nanofabrication and is aimed at bridging the gap among these areas.
Prerequisites: 18-422 or 18-320

18-465 Advanced Probability & Statistics for Engineers

Spring: 12 units
This course will help masters and undergraduate students to obtain the background necessary for excelling in courses and careers in machine learning, artificial intelligence, and related fields. We will cover basic concepts of probability prerequisite to understanding the material typically taught in a ML course. We will also cover slightly more advanced topics including Markov Chains, hypothesis testing, and maximum-likelihood estimation. The remaining part of the semester will be devoted to introducing machine learning concepts such as supervised/unsupervised learning, model identification, clustering, expectation maximization, etc. Students should be familiar with basic calculus, linear algebra. Although students in 18465 will share lectures with students in 18665, students in 18465 will receive distinct homework assignments, distinct projects, and distinct exams from the ones given to students in 18665. Specifically, the homework assignments, projects, and exams that are given to the 18665 students will be more challenging than those given to the 18465 students.

18-469 Special Topics in Integrated Systems Technology

Fall and Spring: 12 units
Please refer to the ECE website for topic descriptions.

Course Website: https://courses.ece.cmu.edu/

18-474 Embedded Control Systems

Spring: 12 units
This course introduces principles for design of embedded controllers. In applications ranging from airplanes, to automobiles, to manufacturing systems, embedded computers now close feedback loops that were previously closed by mechanical devices or by humans in the loop. This course emphasizes practical insight into the tools for modeling and simulating these dynamic physical systems, and methods for designing the real-time software for embedded computers to control them. Lectures cover relevant theory and background from real-time systems and control engineering, including event-based and clock-based sampling, switching control, PWM (pulse-width modulation), PID (proportional-integral-derivative) design, state-variable feedback, state estimation, and methods for setpoint control and trajectory tracking. Basic embedded computing, sensor, and actuator technologies are reviewed, including microcontrollers, DC motors and optical encoders. In the laboratory, students use commercial tools for simulation and automatic code generation to design and implement embedded control system experiments. 3 hrs. lecture, 3 hrs. lab.
Prerequisites: (15-213 or 18-213) and (18-396 or 18-290 or 18-370)

18-482 Telecommunications Technology and Policy for the Internet Age

Spring: 12 units
Modern telecommunications is the nervous system of society. The Internet and wireless communications have transformed every aspect of our modern life. This course provides a comprehensive introduction to basic principles of telecommunications technology and the legal, economic, and regulatory environment of today's networks. Topics covered include the fundamentals of communication network technologies, including video, voice, and data networks; the rising dominance of wireless networks; principles behind telecommunications regulation from common carrier law and natural monopoly to information diversity, privacy and national security; traffic differentiation on the Internet and the debate over network neutrality; universal service and the digital divide; mergers, antitrust, and the changing industrial structure of the communications sector. We will explore current topical questions such as the future of competition; the shift of entertainment video from cable and satellite to Internet delivery; how cloud computing concepts are transforming networks; and communications support for the Internet of Things. Comparison with European approaches to communications regulation. Special emphasis on how new technologies have altered, and are altered by, regulation. Junior, Senior or graduate standing required.
Prerequisite: 73-102

18-487 Introduction to Computer Security

Fall: 12 units
Security is becoming one of the core requirements in the design of critical systems. This course will introduce students to the intro-level fundamental knowledge of computer security and applied cryptography. Students will learn the basic concepts in computer security including software vulnerability analysis and defense, networking and wireless security, and applied cryptography. Students will also learn the fundamental methodology for how to design and analyze security critical systems. Anti-requisites: 18-631 and 18-730
Prerequisite: 18-213

18-490 Electroacoustics

Fall: 12 units
This course provides an introduction to physical, engineering, and architectural acoustics. The course begins with a review of the wave equation and some of its solutions that are relevant to the propagation of sound from planar and spherical sources, and from arrays of simple sources. Lumped-parameter electrical circuit analogies are developed to describe mechanical and acoustical systems, leading to a discussion of the constraints and tradeoffs involved in the design of loudspeakers, microphones, and other transducers. The characteristics of sound in regular and irregular enclosures will be developed and discussed in the context of the acoustical design for rooms and auditoriums. The interaction of sound and man is also discussed, with introductory lectures on auditory perception and the acoustics of speech production, with applications in the areas of efficient perceptually-based coding of music and speech, and virtual acoustical environments.
Prerequisites: 18-220 Min. grade C and 18-290 Min. grade C

18-491 Digital Signal Processing

Spring: 12 units
This course addresses the mathematics, implementation, design and application of the digital signal processing algorithms widely used in areas such as multimedia telecommunications and speech and image processing. Topics include discrete-time signals and systems, discrete-time Fourier transforms and Z-transforms, discrete Fourier transforms and fast Fourier transforms, digital filter design and implementation, and multi-rate signal processing. The course will include introductory discussions of 2-dimensional signal processing, linear prediction, adaptive filtering, and selected application areas. Classroom lectures are supplemented with implementation exercises using MATLAB. Students in 18491 and 18691 will share the same lectures and recitations. Nevertheless, students receiving credit for 18691 will be required to complete an additional capstone project at the end of the semester. Students in 18691 may have additional homework problems on a weekly basis.
Prerequisite: 18-290 Min. grade C

18-495 Speech Technology for Conversational AI

Intermittent: 12 units
This course provides both practical and theoretical knowledge on how we can leverage speech processing technologies to build a conversational AI system. The course encompasses speech recognition, speaker recognition, speech synthesis, speech enhancement, speech translation, spoken dialogue systems, speech foundation models, and other speech and audio processing tasks. In practical sessions, students will learn to build functional speech recognition and synthesis systems or utilize existing large speech and language models and integrate them to create a speech interface using existing toolkits. The course will also present details of algorithms, techniques, evaluation metrics, and limitations of state-of-the-art speech systems. This course is particularly designed for students who want to learn how to process actual data for real-world applications, applying AI and machine learning techniques while also being aware of the current technology limitations.
Prerequisite: 15-211 Min. grade B

18-499 Summer Internship

All Semesters
The Department of Electrical and Computer Engineering at Carnegie Mellon considers experiential learning opportunities important educational options for its undergraduate students. One such option is an internship, normally completed during the summer. Students do not need to officially register for an internship unless they want it listed on their official transcripts. ECE students interested in registering their internship for course credit on their transcript may request to be enrolled in this course. The ECE Undergraduate Office will add the course to the student's schedule, and the student will be assessed tuition for 3 units. This process should be used by international students interested in Curricular Practical Training (CPT) or by any other engineering undergraduate wishing to have their internship experience reflected on their official University transcript. International students should also be authorized by the Office of International Education (OIE). More information regarding CPT is available on OIE's website.

18-500 ECE Design Experience

Fall and Spring: 12 units
The ECE Design Experience is a capstone design course that serves to introduce students to broad- based, practical engineering design and applications through an open-ended design problem. Students will work with a team on a project of their choosing (subject to instructor approval) throughout the semester culminating with a final project presentation, report, and public demonstration. The projects will need to encompass a minimum of two ECE areas. Throughout the semester, teams will need to give both written and oral project proposals and periodic performance updates. Team-building experiences designed to educate students on group dynamics, resource management, deadline planning, Big-picture implications of engineering applications: societal, human, ethical, and long-term impact will be explored. Please note that the full prerequisite list of "All ECE Core Courses plus any two 18-xxx ECE Area Courses" is too long to be put into the registration system. As a result ALL students will be waitlisted for 18-500. Students will be registered once it has been confirmed they have completed the prerequisites, after final grades for the preceding semester.

18-540 Rapid Prototyping of Computer Systems

Spring: 12 units
This is a project-oriented course which will deal with all four aspects of project development; the application, the artifact, the computer-aided design environment, and the physical prototyping facilities. The class, in conjunction with the instructors, will develop specifications for a mobile computer to assist in inspection and maintenance. The application will be partitioned between human computer interaction, electronics, industrial design, mechanical, and software components. The class will be divided into groups to specify, design, and implement the various subsystems. The goal is to produce a working hardware/software prototype of the system and to evaluate the user acceptability of the system. We will also monitor our progress in the design process by capturing our design escapes (errors) with the Orthogonal Defect Classification (ODC). Upon completion of this course the student will be able to: generate systems specifications from a perceived need; partition functionality between hardware and software; produce interface specifications for a system composed of numerous subsystems; use computer-aided design tools; fabricate, integrate, and debug a hardware/software system; and evaluate the system in the context of an end user application. Senior standing is required. This course is crosslisted as 18745
Prerequisites: (18-491 Min. grade C or 18-370 Min. grade C or 18-320 Min. grade C) and (18-349 Min. grade C or 18-341 Min. grade C or 18-340 Min. grade C) and 18-213 and 18-220 and 18-240 and 18-290

18-555 Entrepreneurial Engineering Project

Fall and Spring: 12 units
In this course, Undergraduate (18555) and MS (18655) students participate in projects to develop exploratory designs of systems for a wide range of applications. Each project is unique to a team of students who will typically be paired with an external investment partner. All the projects will be designed, developed, and led by students. Entry into the course is by invitation from the faculty instructor (typically advised by the external investment partners). Student teams will be invited based on the alignment of their skill sets and experience with a set of posted projects. Teams may also be invited based on a student-initiated pitch of their own ideas and its alignment with external investor interest. Students interested in the course can indicate their interest, qualifications, and project ideas via instructions from departmental advisors or the course instructor. Grades will be assigned by the faculty instructor based on novelty and creativity of the project, engineering process, and weekly progress, not the ultimate success or failure of the project idea or originally proposed solution. Following completion of the course, the external investment partners and students can independently explore subsequent seed funding and/or licensing of successful ideas and projects.

18-570 Summer Undergraduate Student-Directed Projects

Summer
Student-directed projects may be available in the summer semester only, allowing a student to explore a topic of their choosing. Students are responsible for pursuing such an option with a faculty member. Enrollment in 18570 precludes earning pay or research credit and requires completing a directed study agreement.

18-578 Mechatronic Design

Spring: 12 units
Mechatronics is the synergistic integration of mechanism, electronics, and computer control to achieve a functional system. Because of the emphasis upon integration, this course will center around system integration in which small teams of students will configure, design, and implement a succession of mechatronic subsystems, leading to a main project. Lectures will complement the laboratory experience with comparative surveys, operational principles, and integrated design issues associated with the spectrum of mechanism, electronics, and control components. Class lectures will cover topics intended to complement the laboratory work, including mechanisms, actuators, motor drives, sensors and electronic interfaces, microcontroller hardware and programming and basic controls. During the first week of class, each student will be asked to complete a questionnaire about their technical background. The class will then be divided into multi-disciplinary teams of three students. During the first half of the class, lab assignments will be made every 1-2 weeks to construct useful subsystems based on material learned in lecture. The lab assignments are geared to build to the main project. This course is cross-listed as 16-778 and 24-778. Students in other departments may take the course upon availability of slots with permission of instructor. Non ECE students may take the course upon availability of slots with permission of the instructor.
Prerequisites: (18-348 and 18-320) or (15-313 and 18-348) or (18-370 and 18-348) or (18-370 and 18-349) or (18-349 and 15-313) or (18-349 and 18-320) or (18-370 and 18-320)

18-580 Undergraduate Projects

All Semesters
The Department of Electrical and Computer Engineering at Carnegie Mellon considers experiential learning opportunities to be important educational options for its undergraduate students. One such option is conducting an undergraduate-level project with a faculty member. Students may work on projects for pay or may register for units of 18580 if they want the course listed on their official transcript. To enroll, the student should first complete the online application for their project on the ECE Student Project Tracker website. Once the application has been submitted and approved by the faculty member on whose project the student is working, the ECE Advising Team will add the appropriate units to the student's schedule. Typically, credit is granted according to one hour of research per week is equal to one unit of credit

18-591 ECE Teaching Assistant Experience

Fall and Spring
Students must complete the online Teaching Assistant application to be considered for a position. TAs can expect to work 10-12 hours per week on average. See https://www.ece.cmu.edu/insider/teaching-opportunities.html for further information about applying for a Teaching Assistant position.

18-614 Microelectromechanical Systems

Fall: 12 units
This course introduces fabrication and design fundamentals for Microelectromechanical Systems (MEMS): on-chip sensor and actuator systems having micron-scale dimensions. Basic principles covered include microstructure fabrication, mechanics of silicon and thin-film materials, electrostatic force, capacitive motion detection, fluidic damping, piezoelectricity, piezoresistivity, and thermal micromechanics. Applications covered include pressure sensors, micromirror displays, accelerometers, and gas microsensors. Grades are based on exams and homework assignments. 4 hrs. lec.
Prerequisites: 18-320 Min. grade C or 24-351 Min. grade C or 18-300 Min. grade C or 18-310 Min. grade C

18-681 Power Electronics

Fall: 12 units
This course is aimed at developing Power Electronics expertise in Masters level students to develop knowledge and skills necessary for the formation of a power electronics engineer. Considerations of static and dynamic characteristics of power semiconductor devices including thermal management are followed by the analysis and design of principal types of power converters. Key applications are also considered so that the course provides a broad knowledge and skills in the field of power electronics in wide ranging applications. Assessment is based on assignments and examinations. It is assumed that students will have an understanding of electrical and amp; electronic principles, power systems, and electrical machines. Content includes: Power Semiconductor Devices Static and Dynamic Characteristics; Application of semiconductor devices and components in the medium to high voltage environment: Series and parallel operation, damping components; Spread of device characteristics, Thermal Management; Naturally commutated converters: Single phase and three phase up to 12 pulse, analysis and operation; Effect of supply side reactance; Grid applications; DC-DC Converters and energy storage: step up and step down operation, application to electric vehicles, battery management and PV systems; Self-commutated converters; Pulsewidth modulation; Multilevel converters; HVDC light; Voltage source converter based HVDC; AC to AC Converters: grid applications.

18-866 Off-Grid Electricity Systems

Spring: 6 units
Over one billion people in the world still lack access to electricity, many of them out of reach of the electricity grid in the near term. This course will explore the technologies and architectures used to provide electricity services in off-grid regions of the developing world. Basic system design principles will be discussed and applied. Students will use energy modeling software to characterize the performance and economic viability of off-grid electricity systems. In addition to studying off-grid technologies, the course will also explore the context in which these systems are deployed and their role in enabling development.

18-867 Applied Smart Grid Telecoms

Spring: 6 units
This course examines applications of standards for communications protocols in smart grids, covering relevant standards such as IEC61850 and DNP3. Participants will complete assignments based on real world examples that explore the implementation and limitations of smart grids telecommunications. Appropriate for communications engineers wanting to understand the power grid, and power engineers wanting to develop their applied knowledge of communications.

18-883 Special Topics in Energy Systems

Fall and Spring: 6 units
Please see the ECE website for a full course description describing the sections of this course. https://courses.ece.cmu.edu/

Department of Engineering and Public Policy

Peter Adams, Department Head

Deanna H. Matthews, Associate Department Head for Undergraduate Affairs

Location: Wean Hall 4101
www.cmu.edu/epp (http://www.cmu.edu/epp/)

The Department of Engineering and Public Policy (EPP) is a unique department that works on problems at the interface between technology and society. Society is largely responsible for setting the goals and framing the problems that engineers and scientists work on. However, technologies designed by engineers and scientists profoundly change the societies in which they operate. Technology has enabled a healthier, richer, and more productive society. At the same time, technology has contributed to the creation of many of the more serious problems our society faces. In order to do their jobs responsibly and well in today's world, engineers and scientists must develop an understanding of the interface between technology and society and a command of the skills necessary to work at that interface. Our undergraduate programs aim to educate young scholars to be interdisciplinary problem solvers.

The undergraduate degree programs of the Department of Engineering and Public Policy (EPP) have been designed to allow undergraduate students at Carnegie Mellon University to add this important interdisciplinary dimension to their traditional engineering or science education. Our additional major graduates, for the most part, will enter traditional engineering or science careers, but will carry with them a set of insights and skills that will help them to better deal with issues in technology and policy, and better exercise their ethical and social obligations as practicing professionals. Our program has a long history of 50+ years producing graduates with these critical skills, with alumni serving in all areas of industry and government.

Overview of Our Undergraduate Programs

The undergraduate additional major programs in EPP combine the strong foundation in mathematics and physical sciences, and the development of engineering or science skills with a rigorous preparation in the analysis of social and political problems. The curriculum includes subject matter which is not part of traditional technical or social science curricula, but which contains elements of each. Students complete courses in four core areas: economics, statistics, decision-making, and communication. Breadth is achieved through EPP Technology-Policy elective courses. Finally, students apply their skills in a project preparatory course and two interdisciplinary problem-solving projects. Problem areas for these projects are chosen from local, state, and national situations, and include such topics as climate change, energy systems, technological innovation, telecommunication issues, computer security and privacy, risk analysis and communication, among others. Students from several CMU colleges enroll in these projects courses exposing EPP additional majors to working in truly interdisciplinary situations. Examples of past project course topics (http://www.cmu.edu/epp/prospective/undergraduate/epp-project-courses/) and final reports are available.

Additional Major in Engineering and Public Policy

The EPP department offers an additional major in Engineering and Public Policy (EPP) for students completing an undergraduate degree in engineering from any of the five traditional engineering departments in the engineering college. The engineering additional major leads to a fully accredited engineering degree that prepares students for traditional technical careers. EPP additional major engineers are not educated to be a different kind of engineer. Rather, their education is intended to enable them to be better, more socially responsible engineers in the traditional technical fields.

Additional Major in Science, Technology, and Public Policy

The EPP department offers an additional major in Science, Technology and Public Policy (STPP) for students completing an undergraduate B.S. degree outside of the engineering college. This includes students in the Mellon College of Science, the School of Computer Science, Tepper School of Business, and select majors in the Dietrich College and College of Fine Arts. Similar to the additional major in Engineering and Public Policy, the additional major in Science, Technology and Public Policy is meant to broaden the perspectives on a student’s primary major and provide additional skills for future careers.

Minor in Technology and Policy

The department also offers a minor in Technology and Policy. The Technology and Policy minor exposes students to issues at the interface of science, technology, and society, and how interdisciplinary approaches are needed to solve complex problems.

Minor in Information Security, Privacy and Policy

The department offers a minor in Information Security, Privacy and Policy for all majors in partnership with the School of Computer Science. The Information Security, Privacy and Policy minor offers students an understanding of how to identify potential security and privacy risks and relevant legal and policy issues; a working understanding of security topics as they pertain to design, development and management of new information technologies.

Career Options with OUR Additional Majors

Students who select one of the our additional majors graduate with an accredited engineering degree or complete science degree, and thus have all of the options for traditional technical careers as their single major classmates. A large portion of our additional major students pursue traditional technical careers after graduation in areas such as product development, consulting, project management, etc.

The advantage of the additional major is the added set of skills and perspectives, which allow a graduate of the program to improve the quality, sensitivity, and social responsiveness of their work, and the work of their colleagues. Employers recognize these skills and often view our graduates as more attractive for a traditional engineering or technical position. Firms contact the EPP department every year to recruit EPP graduates because of their satisfaction with the knowledge and skills acquired by EPP students. In addition, the additional major also opens up options for careers in policy analysis in federal, state, and local government or in public policy consulting firms. Alumni pursue careers in a range of companies to deal with issues like government regulation of technological systems, climate change impacts, product liability and safety, environmental control, telecommunications policy, energy systems, financial investment, and the social impact of large technological systems.

Students also choose to continue their formal education, doing graduate work in engineering, the social sciences, law, or interdisciplinary programs.

Faculty Advisors

Faculty in several departments serve as advisors and information resources to students selecting the EPP undergraduate programs. Given the interdisciplinary perspective of EPP, students may find that a faculty member outside their traditional major can provide support and guidance with EPP-related courses and career paths. The EPP Associate Department Head for Undergraduate Affairs is Deanna Matthews. Dr. Matthews can provide general academic advice and guidance for all EPP undergraduates. Other faculty affiliated with the undergraduate programs in EPP are:

- Civil Engineering: Peter Adams, Destenie Nock
- Chemical Engineering: Peter Adams, Neil Donahue
- Economics/Business: Nicholas Muller, Marvin Sirbu, Phillip Yu
- Electrical and Computer Engineering: Jon Peha, Ramteem Sioshansi, Marvin Sirbu
- Engineering and Public Policy: Doron Cohen, Erica Fuchs, Paulina Jaramillo, Valerie Karplus, Deanna Matthews, Granger Morgan
- Institute for Strategy and Technology: Baruch Fischhoff
- Mechanical Engineering: Jeremy Michalek, Kate Whitefoot
- Material Science and Engineering: Jay Whitacre
- Software, Systems, and Society Department: Lorrie Cranor, Nicolas Christin, Sarah Scheffler

EPP Program Educational Objectives

The additional major in Engineering and Public Policy is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Students who earn an additional major in Engineering and Public Policy at the undergraduate level do so in conjunction with a traditional engineering major. The elements of the EPP undergraduate program broaden the traditional scope of technical analysis to encompass an engineering solution's potential impact on society. Thus, our graduates have all of the skills as their peers in traditional engineering majors, but with a broader societal perspective and additional analysis skills. This enables our graduates:

- to understand the interface between technology and society and
- to help solve the complex, interdisciplinary systems problems facing our world in their careers.

Students will be able to work in a variety of career fields, including technical and non-technical, in industry, government or elsewhere where these broad skills are needed.

EPP Student Outcomes

By the end of the combined B.S. programs in a traditional engineering program and the EPP program, students should have attained the following:

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
3. an ability to communicate effectively with a range of audiences
4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Course Requirements for the Additional Major in EPP

Minimum units for the additional major 106

Students pursuing an additional major in EPP must complete three sets of requirements: courses for the EPP additional major, courses for their traditional engineering major, and general education courses. The student should refer to the relevant sections of this catalog for the required courses in the traditional engineering major. The EPP additional major is designed to be completed with a traditional engineering major in the standard eight-semester time frame. However, additional units or course work may be required. Some courses for the EPP additional major may also satisfy requirements for traditional engineering courses or for general education courses.

Overview

Course		Units
19-101	Introduction to Engineering and Public Policy	12
19-201	Professional Issues in Engineering, Science, Technology and Public Policy	1
73-102	Principles of Microeconomics	9
36-220	Engineering Statistics and Quality Control	9
(or other approved statistics course)		
19-301	Decision Making Methods for Engineers and Scientists	9
or 19-469	Behavior, Decision and Policy	
or 84-369	Decision Science for International Relations	
or 88-223	Decision Analysis	
(or other approved decision science course)		
76-270	Writing for the Professions	9
(or other approved writing course)		
19-351	Applied Methods for Technology-Policy Analysis	9
19-451	EPP Projects I	12
19-452	EPP Projects II	12
Three EPP Technology-Policy Electives		min. 24

Introductory Courses

		Units
19-101	Introduction to Engineering and Public Policy	12
19-201	Professional Issues in Engineering, Science, Technology and Public Policy	1

The two introductory courses prepare students for the additional major experience through discussion and assessment of technology-policy interactions. 19-101 Introduction to Engineering and Public Policy may be taken as the second introductory engineering course for engineering students. 19-201 Professional Issues in Engineering, Science, Technology and Public Policy is required in addition to any corresponding seminar course in a student's traditional degree program.

Core Area Courses

73-102	Principles of Microeconomics	9
EPP Statistics elective - one of the following, or other approved course:		
36-220	Engineering Statistics and Quality Control	9
EPP Decision Science elective - one of the following, or other approved course (9 units minimum):		
19-301	Decision Making Methods for Engineers and Scientists	9
19-469	Behavior, Decision and Policy	9
84-369	Decision Science for International Relations	9
88-223	Decision Analysis	12
EPP Writing and Communications elective - one of the following, or other approved course		
76-270	Writing for the Professions	9

The four core area courses provide the foundational skills in the social sciences that are needed for robust analysis of policy problems. 73-102 Principles of Microeconomics fulfills a CIT General Education course. Students who receive a pre-requisite waiver for 73-102 may take a higher-level economics course as a substitute with approval.

CivE, EnvE, MechE, and MSE students will complete the statistics elective as part of their traditional engineering majors. ChemE students will substitute the statistics elective for the Advanced Chemistry Elective. ECE students, who have a required course in probability for their traditional engineering major are encouraged to take 36-226 Introduction to Statistical Inference to fulfill the EPP statistics requirement. Students should complete the statistics requirement by the end of sophomore year. A statistics course is a prerequisite for the EPP Decision Science elective.

The EPP Decision Science elective fulfills either the CIT General Education Social Analysis and Decision Making requirement or a CIT General Education free elective. The EPP Writing and Communications course fulfills the CIT General Education Writing and Expressions requirement.

Technology-Policy Electives

- At least 3 courses of EPP Technology-Policy electives (24 units minimum)

EPP Technology-Policy Electives include courses that belong to three categories. First, EPP Technology-Policy Electives include courses that synthesize engineering analysis and social analysis perspectives and apply them to problems with substantial societal and technological components. Specific areas of interest for these courses are (1) energy, resources, and the environment, (2) risk assessment, (3) technology innovation, (4) urban engineering, (5) information and communication technology, and (6) product engineering and design, among others. Second, EPP Technology-Policy Electives include courses that teach methods or analysis skills necessary for solving complex problems. Examples include mathematical or statistical courses related to optimization or estimation, or economics courses related to economic analysis. Finally, EPP Technology-Policy Electives include courses that provide technical background for policy relevant issues. These courses are fundamental for understanding our current engineering systems and how proposed changes can be implemented. Examples include courses on electricity systems, engine design, or atmospheric systems. A sample of courses for EPP Technology-Policy Electives is below, a full list of approved courses is available from the department.

19-211	Ethics and Policy Issues in Computing	9
19-303	Cryptocurrencies, Blockchains and Applications	Var.
19-403	Policies of Wireless Systems	12
19-411	Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech	9
19-425	Sustainable Energy for the Developing World	9

19-429	Climate Change Science and Solutions	9
19-433	Data Science for Technology, Innovation and Policy	9
19-608	Privacy Policy, Law, and Technology	12
19-668	Electric Vehicles: Technology, Economics, Environment and Policy	12

The majority of 19-xxx EPP departmental courses are considered EPP Technology-Policy Electives. Exceptions will be identified when the courses are offered. Courses that are required or used for core area courses for the additional major can not be used as electives. Courses from other departments also are acceptable as electives with approval. Students should work with their advisors to define areas of concentration or a selection of breadth courses for the EPP Technology-Policy Electives.

Students are required to take at least three EPP Technology-Policy electives for a minimum of 24 units. Units may be added in any combination, but a maximum of one 3-unit course is permitted. Up to 9 units of 19-550 Undergraduate Research may be used with approval. Students may not use a required course from their traditional engineering major for these elective units. However, students may use an elective course from their traditional major requirements to meet the requirements of both their traditional engineering major and an EPP Technology-Policy elective, but the units for the course will not be double-counted toward units required for their degree. Some EPP Technology-Policy elective courses may fulfill requirements for CIT General Education categories (e.g., 19-411 Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech is an I&I course), otherwise students use Free Elective units to complete this requirement.

Capstone Courses

		Units
19-351	Applied Methods for Technology-Policy Analysis	9
19-451	EPP Projects I	12
19-452	EPP Projects II	12

The capstone courses synthesize the technical skills and knowledge from a student’s traditional major with the social science skills and broad perspective of the EPP major.

19-351 Applied Methods for Technology-Policy Analysis is a preparatory course for EPP Projects sequence. 19-351 may be completed as a co-requisite of 19-451 EPP Projects I. The course fulfills CIT General Education elective units.

19-451 EPP Projects I and 19-452 EPP Projects II are technology/policy projects which deal with research and development of recommendations for solving actual and critical problems currently affecting society. The students, faculty, and graduate student managers for the project are drawn from EPP, Social and Decision Sciences, and the Heinz College, and other CMU departments, and hence bring different areas of expertise to the structuring and solution of the problem. The topics for EPP Projects are drawn from diverse areas such as environmental systems and resources, public transportation, urban engineering problems, energy and fuel utilization, the interaction of law and technology, strategic materials and vulnerability of supply, technical issues in national security, and problems in automation, robotics, and communication technology. Students use Free Elective units to complete this requirement. 19-452 EPP Projects II serves as the capstone engineering design course experience for additional majors.

Notes on EPP additional major requirements

Students should follow the suggested curriculum timelines for completing the math, science, and engineering course requirements of the traditional major with the exception of the statistics elective which should be taken as early as possible and no later then the end of sophomore year.

Some courses as noted above may be used to fulfill requirements of general education courses. Acceptable courses for the CIT General Education requirements are maintained by the CIT Dean's Office. Students must submit a plan during their first-semester as an EPP student (usually Fall sophomore year) for these general education courses demonstrating their relevance to EPP.

Students must complete the minimum number of units as required by their traditional major for graduation. In some cases, students completing the EPP additional major may need to complete additional units to meet all requirements for the traditional major and EPP additional major.

In addition to any other graduation requirements (e.g., regarding course work, minimum QPA, pass/fail course work, etc.) of the student's traditional disciplinary major, students must earn a minimum QPA of 2.0 in all courses required for the EPP major.

Side-by-side curriculum charts (http://www.cmu.edu/epp/prospective/undergraduate/epp-additional-major/curriculum-charts/) of the curricula for the traditional engineering majors alone versus the traditional engineering majors with the EPP additional major can assist students in determining the course requirements and scheduling needed to complete the degree requirements.

A proposed semester plan is below. Students work with their advisors to determine the best sequence of courses given the varied requirements in the traditional engineering majors.

Course	Semester
19-101 Introduction to Engineering and Public Policy	**First-year Spring**
73-102 Principles of Mircoeconomics	**First-year Fall or Spring**
19-201 Professional Issues in Engineering, Science, Technology and Policy	**Sophomore Fall**
EPP Statistics Elective	**Sophomore Fall or Spring**
EPP Writing and Communications Elective	**Sophomore Fall or Spring**
EPP Decision Science Elective	**Junior Fall**
19-351 Applied Methods for Technology-Policy Analysis	**Junior Spring**
3 EPP Technology-Policy Electives	**Junior and/or Senior year**
19-451 / 19-452 EPP Projects I and II	**Senior Fall and Spring**

Course Requirements for the Additional Major in STPP

Minimum units required for additional major 106

Students pursuing an additional major in STPP must complete three sets of requirements: courses for the STPP additional major, courses for their traditional disciplinary major, and general education courses. The student should refer to the relevant sections of this catalog for the required courses in the traditional disciplinary major. The STPP additional major is designed to be completed with a traditional disciplinary major in the standard eight-semester time frame. However, additional units or course work may be required. Some courses for the STPP additional major may also satisfy requirements for traditional disciplinary majors or for general education courses.

Introductory Courses

		Units
19-101	Introduction to Engineering and Public Policy	12
19-201	Professional Issues in Engineering, Science, Technology and Public Policy	1

The two introductory courses prepare students for the additional major experience through discussion and assessment of technology-policy interactions. 19-101 Introduction to Engineering and Public Policy may qualify as a general education course in some majors. 19-201 Professional Issues in Engineering, Science, Technology and Public Policy is required in addition to any corresponding seminar course in a student’s traditional degree program.

Core Area Courses

73-102	Principles of Microeconomics	9
Statistics course — one of the following:		
36-220	Engineering Statistics and Quality Control	9
36-226	Introduction to Statistical Inference	9
or other approved statistics course		
STPP Decision Science course — one of the following:		
19-301	Decision Making Methods for Engineers and Scientists	9
19-469	Behavior, Decision and Policy	9
84-369	Decision Science for International Relations	9
88-223	Decision Analysis	12
88-302	Behavioral Decision Making	9
or other approved decision science course		
STPP Writing and Communications course — one of the following:		
76-270	Writing for the Professions	9

76-271	Introduction to Professional and Technical Writing	9
or other approved writing and communications course		

The four core area courses provide the foundational skills in the social sciences that are needed for robust analysis of policy problems. For students in SCS and MCS, the economics, decision science, and writing course selections may qualify as general education courses, and the statistics elective may qualify for a math/science requirement. For students in DC and CFA, some core area requirements may be fulfilled by traditional program requirements or general education courses. Students should consult with their advisors in both programs to assure that courses are meeting requirements and providing appropriate depth of content. Students who receive a pre-requisite waiver for 73-102 may complete a higher-level economics course as a substitute with approval.

Technology-Policy Electives

3 courses	**24 minimum units**

STPP Technology-Policy Electives include courses that belong to three categories. First, STPP Technology-Policy Electives include courses that synthesize technical analysis and social analysis perspectives and apply them to problems with substantial societal and technological components. Specific areas of interest for these courses are (1) energy, resources, and the environment, (2) risk assessment, (3) technology innovation, (4) urban engineering, (5) information and communication technology, and (6) product development and design, among others. Second, STPP Technology-Policy Electives include courses that teach methods or analysis skills necessary for solving complex problems. Examples include mathematical or statistical courses related to optimization or estimation, or economics courses related to economic analysis. Finally, STPP Technology-Policy Electives include courses that provide technical background for policy relevant issues. These courses are fundamental for understanding our current technical systems and how proposed changes can be implemented. Examples include courses on electricity systems, telecommunication systems, engine design, or atmospheric systems. A sample of courses for STPP Technology-Policy Electives is below, a full list of approved courses is available from the department.

19-211	Ethics and Policy Issues in Computing	9
19-303	Cryptocurrencies, Blockchains and Applications	Var.
19-403	Policies of Wireless Systems	12
19-411	Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech	9
19-421	Emerging Energy Policies	9
19-425	Sustainable Energy for the Developing World	9
19-429	Climate Change Science and Solutions	9
19-433	Data Science for Technology, Innovation and Policy	9
19-608	Privacy Policy, Law, and Technology	12
19-668	Electric Vehicles: Technology, Economics, Environment and Policy	12

The majority of 19-xxx EPP departmental courses are considered STPP Technology-Policy Electives. Exceptions will be identified when the courses are offered. Courses that are required or used for core area courses for the additional major can not be used as electives. Courses from other departments also are acceptable as electives with approval. Students should work with their advisors to define areas of concentration or a selection of breadth courses for the STPP Technology-Policy Electives.

Students are required to take at least three STPP Technology-Policy electives for a minimum of 24 units. Units may be added in any combination, but a maximum of one 3-unit course is permitted. Up to 9 units of 19-550 Undergraduate Research may be used with approval. Students may not use a required course from their traditional disciplinary major for these elective units. However, students may use an elective course from their traditional major requirements to meet the requirements of both their traditional engineering major and an STPP Technology-Policy elective, but the units for the course will not be double-counted toward units required for their degree. Some STPP Technology-Policy elective courses may fulfill general education requirements for traditional major programs.

Capstone Courses

19-351	Applied Methods for Technology-Policy Analysis	9
19-451	EPP Projects I	12
19-452	EPP Projects II	12

The capstone courses synthesize the technical skills and knowledge from a student’s traditional major with the social science skills and broad perspective of the STPP additional major.

19-351 Applied Methods for Technology-Policy Analysis is a preparatory course for the EPP Projects sequence. 19-351 may be completed as a co-requisite of 19-451 EPP Projects I.

19-451 EPP Projects I and 19-452 EPP Projects II are technology/policy projects which deal with research and development of recommendations for solving actual and critical problems currently affecting society. The students, faculty, and graduate student managers for the project are drawn from the EPP and STPP programs, Social and Decision Sciences, and the Heinz College, and other CMU departments, and hence bring different areas of expertise to the structuring and solution of the problem. The topics for EPP Projects are drawn from diverse areas such as environmental systems and resources, public transportation, urban engineering problems, energy and fuel utilization, the interaction of law and technology, strategic materials and vulnerability of supply, technical issues in national security, and problems in automation, robotics, and communication technology. These capstone courses may qualify as capstone experience courses or general education courses in some major programs.

Notes on STPP additional major requirements

Students should follow the suggested curriculum timelines for completing the course requirements of their primary major program where necessary and will work with both their primary program advisor and the STPP advisor to assure that requirements for both degrees are met.

Students must complete the minimum number of units as required by their primary major for graduation. In some cases, students completing the STPP additional major may need to complete additional units to meet all requirements for the primary major and STPP additional major.

In addition to any other graduation requirements (e.g., regarding course work, minimum QPA, pass/fail course work, etc.) of the student's primary major, students must earn a minimum QPA of 2.0 in all courses required for the STPP additional major.

Integrated B.S./M.S. Programs

B.S. integrated with M.S. in Engineering and Public Policy

CMU undergraduate students, regardless of whether they complete an undergraduate additional major in EPP or STPP or not, may plan a course of study that leads to completing both their undergraduate B.S. degree and an MS in Engineering and Public Policy. This course of study will ordinarily require two additional semesters of study beyond that required for an undergraduate degree, although advanced placement or other study may reduce this time. Some coursework towards the MS may be completed during the student's senior year, however no courses taken may count for both a BS program and the MS in EPP. Students interested in the program should contact their advisor for details on the application process and course requirements. See the EPP website for more information about the MS in EPP program requirements (https://www.cmu.edu/epp/prospective/ms-in-epp/) including curriculum.

Minors in Engineering and Public Policy

MINOR IN TECHNOLOGY AND POLICY

The department offers a minor in Technology and Policy. This minor allows students to sample the EPP requirements and develop exposure and awareness to issues at the interface of science, technology, and society.

Pre-requisites: Students should have prerequisite knowledge in economics (73-102 Principles of Microeconomics or similar level economics course) and statistics (36-202 Methods for Statistics & Data Science or similar level statistics course) in order to pursue the Technology and Policy Minor.

Course Requirements		Units
19-101	Introduction to Engineering and Public Policy	12
19-301	Decision Making Methods for Engineers and Scientists (or other approved Decision Science course)	9
or 19-351	Applied Methods for Technology-Policy Analysis	
19-451	EPP Projects I	12
xx-xxx	Two EPP Technology-Policy Electives	18

EPP Technical Electives include courses that address problems at the society-technology interface and the means of analyzing these issues. A list of qualifying Technology-Policy electives is available from the EPP Department. Example Technology-Policy electives include:

19-211	Ethics and Policy Issues in Computing	9
19-303	Cryptocurrencies, Blockchains and Applications	Var.
19-403	Policies of Wireless Systems	12
19-411	Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech	9
19-425	Sustainable Energy for the Developing World	9
19-429	Climate Change Science and Solutions	9
19-433	Data Science for Technology, Innovation and Policy	9
19-534	Usable Privacy and Security	9

Students must earn a cumulative QPA of 2.0 in all courses taken for the minor. Required courses taken for a student's primary major may not be counted toward the Technology and Policy Minor. Elective courses for a student's primary major or courses fulfilling general education requirements may be counted, however.

Details of this program are provided in the discussion of CIT minors; see Technology and Policy Minor Description (p.).

MINOR IN INFORMATION SECURITY, PRIVACY AND POLICY

Lujo Bauer, Director

Interdisciplinary minor offered by both CIT and SCS

There is a growing demand for security and privacy experts, and increasing interest among CMU undergraduates in taking security and privacy courses. Security and privacy expertise is an asset in a variety of careers outside, not just in computer science, but also in areas that include business, management, and law. In addition, the policy side of security and privacy is becoming increasingly important and employers are interested in hiring people with an understanding of relevant policy issues, especially in the privacy and security area.

This minor is for undergraduate students across the university who are interested in policy issues related to security and privacy, including those who are planning careers in security/privacy as well as those who plan to focus their careers in other areas. The curriculum has been designed to accommodate students from any major as long as they have taken at least one introductory-level college programming course (such as 15-110 or 15-112).

After completing this minor, students will have a good understanding of how to identify potential security and privacy risks and relevant legal and policy issues; a working understanding of security topics such as cryptography, authentication, and Internet security protocols; as well as broad knowledge of several security- and privacy-related areas as they pertain to the design, development, deployment and management of technologies in a variety of practical contexts (e.g., Web, mobile, Internet of Things, social media, crypto currencies).

Admission

Students are not required to apply to enroll in this minor to start the required courses. However, they are encouraged to consult with the minor director on their elective course selection. In addition, students doing the independent study option must get approval from the minor director prior to enrolling in their independent study course. Finally, students must contact the minor director to certify their completion of the minor.

Curriculum

Students are required to take five courses to complete this minor with a minimum of 48 units.

INTRODUCTORY SECURITY COURSE

17-331	Information Security, Privacy, and Policy	12

Students who have taken 15-213 Introduction to Computer Systems may substitute 15-330 Introduction to Computer Security/18-330 Introduction to Computer Security

PRIVACY AND POLICY COURSE

17-333	Privacy Policy, Law, and Technology	9

Students may substitute 12-unit version of this course: 19-608, 17-733, or 95-818.

PRIVACY ELECTIVES

Complete a minimum of 9 units:		Units
19-534/17-334/05-436	Usable Privacy and Security	9
19-602/17-702	Current Topics In Privacy Seminar	3
17-731	Foundations of Privacy	12

TECHNOLOGY AND POLICY ELECTIVES

Complete a minimum of 9 units:		Units
19-211	Ethics and Policy Issues in Computing	9
17-562	Law of Computer Technology	9
19-101	Introduction to Engineering and Public Policy	12
19-402	Telecommunications Technology and Policy for the Internet Age	12
19-403	Policies of Wireless Systems	12
19-639	Policies of the Internet	12
84-387	Remote Systems and the Cyber Domain in Conflict	9

Crosslisted courses are also allowed.

ADDITIONAL APPROVED ELECTIVE

Students must complete an additional elective of 9 units or more. Students may choose an additional privacy elective or technology policy elective from the list above, or the one of the following security electives:

15-316	Software Foundations of Security and Privacy	9
15-356	Introduction to Cryptography	12
19/17-303	Cryptocurrencies, Blockchains and Applications	Var.
19-534/17-334	Usable Privacy and Security	9
18-334	Network Security	12
18-335	Secure Software Systems	12
18-435	Foundations of Blockchains	12

*Course 18-733 Applied Cryptography is also an approved security elective.

Students who have the necessary prerequisites may choose any approved elective from the SCS or ECE security and privacy undergraduate concentration. Check with the minor program director to determine which category of elective each course will fulfill.

Students should be careful to choose electives for which they have appropriate prerequisites. New elective options are expected as more courses are offered. Students may petition to count a course not on this list as an elective. Students should request permission *before* taking a course that is not on this list. Students may not count multiple electives that overlap substantially.

Optional Project: Subject to approval by the minor director, students may optionally count towards one of the elective requirements 9 units of an independent study or research project course in the security or privacy area, under the supervision of a faculty member in any department. In order to receive credit towards the minor, students must submit a brief project proposal to their project advisor and to the minor director and have it approved prior to conducting the project. Depending on the topic of the project, the minor director may approve credits counting towards privacy electives, technology policy electives, security electives, or some combination of these. Students may work individually, with other undergraduates, or as part of project teams with graduate students or research staff. Students involved in a group project must identify specific project components for which they are responsible. In addition, they must submit a final project report to their project advisor and the minor director that includes a literature review and describes the work they completed. Students working on a group project must each submit their own final report, which should also situate their contribution in the context of the larger project. Note, students are expected to work approximately 1 hour per week for each unit of project in which they are enrolled (e.g. 9 units = 9 hours/week of project work).

Double Counting: At most 2 of the courses used to fulfill the minor requirements may be counted towards any other undergraduate major or minor program. This rule does not apply to courses counted for general education requirements.

Notes on EPP Undergraduate/ Graduate Level Courses

Many courses taught by the department (19-XXX courses) are offered to undergraduate and graduate students. These "dual level" courses are offered in two formats:

- Some courses are taught under both an undergraduate and graduate number. An example is 19-403 Policies of Wireless Systems, also offered as 19-713. In these types of courses, students who sign up under the 700-level (graduate) course number may be expected to perform the same coursework at a higher level, and/or complete additional coursework, compared to 400-level students. Undergraduates who choose to take the course under the graduate number will be also be expected to work at the higher expectation/coursework level.

- Other courses are taught under a 600 level number. An example is 19-668 Electric Vehicles: Technology, Economics, Environment and Policy. These courses may be taken by undergraduates as a senior level course, or by graduate students as a graduate level course. As with dual number courses, graduate level students or undergraduates taking the course for graduate credit may be required to perform coursework at a higher level and/or complete additional coursework. Undergraduates who are taking a 600 level course for graduate credit should identify this fact to both the course instructor and to their EPP department advisor.

Students who have questions about the requirements of a specific EPP 400/700, or 600 level course, should contact the course instructor. Some courses have pre-requisites which may be waived for students given prior background.

Faculty

PETER ADAMS, Thomas Lord Professor of Civil and Environmental Engineering and Engineering and Public Policy / Department Head, Engineering and Public Policy; Professor of Civil and Environmental Engineering / Engineering and Public Policy – Ph.D., Caltech; Carnegie Mellon, 2001–

TIMOTHY BROWN, Professor of Engineering and Public Policy; Director of Research, Carnegie Mellon University Africa – Ph.D., California Institute of Technology; Carnegie Mellon, 2013–

KATHLEEN M. CARLEY, Professor, Software and Societal Systems / Engineering and Public Policy / Social and Decision Sciences / Heinz College of Information Systems and Public Policy / Tepper School of Business – Ph.D., Harvard University; Carnegie Mellon, 1984–

NICOLAS CHRISTIN, Department Head, Software and Societal Systems Department; Professor, Engineering and Public Policy / Software and Societal Systems / CyLab – Ph.D., University of Virginia; Carnegie Mellon, 2005–

DORON COHEN, Assistant Professor, Engineering and Public Policy – PhD, Technion – Israel Institute of Technology; Carnegie Mellon, 2024–

CHRISTOPHE COMBEMALE, Assistant Research Professor, Engineering and Public Policy – PhD, Carnegie Mellon University; Carnegie Mellon, 2023–

LORRIE FAITH CRANOR, Director and Bosch Distinguished Professor in Security and Privacy Technologies, CyLab; FORE Systems Professor, Engineering and Public Policy / Software and Societal Systems – D.Sc., Washington University, St. Louis; Carnegie Mellon, 2003–

NEIL M. DONAHUE, Thomas Lord Professorship in Chemistry; University Professor of Chemical Engineering / Chemistry / Engineering and Public Policy – Ph.D., MIT; Carnegie Mellon, 2000–

PEDRO FERREIRA, Professor, Heinz College of Information Systems and Public Policy / Engineering and Public Policy – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2010–

BARUCH FISCHHOFF, Howard Heinz University Professor, Professor of Engineering and Public Policy / Carnegie Mellon Institute for Strategy and Technology – Ph.D., Hebrew University; Carnegie Mellon, 1987–

ERICA R. H. FUCHS, Professor of Engineering and Public Policy – Ph.D., MIT; Carnegie Mellon, 2007–

PAULINA JARAMILLO, Professor of Engineering and Public Policy and CMU Africa – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2007–

VALERIE KARPLUS, Professor of Engineering and Public Policy – PhD, MIT; Carnegie Mellon, 2020–

RAMAYYA KRISHNAN, Dean, Heinz College of Information Systems and Public Policy; William W. and Ruth F. Cooper Professor of Management Science and Information Systems, Heinz College / Engineering and Public Policy – Ph.D., University of Texas at Austin; Carnegie Mellon, 1987–

DEANNA MATTHEWS, Teaching Professor and Associate Department Head for Undergraduate Affairs, Engineering and Public Policy – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2001–

JEREMY J. MICHALEK, Professor of Mechanical Engineering / Engineering and Public Policy – Ph.D., University of Michigan; Carnegie Mellon, 2005–

M. GRANGER MORGAN, Hamerschlag University Professor of Engineering, Engineering and Public Policy / Electrical and Computer Engineering / Heinz College of Information Systems and Public Policy – Ph.D., University of California, San Diego; Carnegie Mellon, 1974–

NICHOLAS MULLER, Lester and Judith Lave Professor of Economics, Engineering, and Public Policy, Tepper School of Business / Engineering and Public Policy – Ph.D., Yale University; Carnegie Mellon, 2017–

DESTENIE NOCK, Assistant Professor, Civil and Environmental Engineering/ Engineering and Public Policy – PhD, University of Massachusetts, Amherst; Carnegie Mellon, 2019–

JON M. PEHA, Professor of Engineering and Public Policy – Ph.D., Stanford University; Carnegie Mellon, 1991–

SARAH SCHEFFLER, Assistant Professor, Software and Societal Systems / Engineering and Public Policy – PhD, Boston University; Carnegie Mellon, 2024–

RAMTEEN SIOSHANSI, Professor, Engineering and Public Policy – Ph.D, University of California, Berkeley; Carnegie Mellon, 2023-–

MARVIN A. SIRBU, Professor, Engineering and Public Policy / Industrial Administration – Sc.D., MIT; Carnegie Mellon, 1985–

ESWARAN SUBRAHMANIAN, Research Professor, Engineering Research Accelerator/ Engineering and Public Policy – Ph.D., Carnegie Mellon University; Carnegie Mellon, 1984–

JEANNE VANBRIESEN, Duquesne Light Company Professor, Professor of Civil and Environmental Engineering / Engineering and Public Policy – Ph.D., Northwestern University; Carnegie Mellon, 1999–

JAY WHITACRE, Trustee Professor in Energy, Materials Science and Engineering / Engineering and Public Policy – Ph.D., University of Michigan; Carnegie Mellon, 2007–

KATE WHITEFOOT, Associate Professor of Mechanical Engineering / Engineering and Public Policy – Ph.D., University of Michigan; Carnegie Mellon, 2016–

PHILLIP YU, Associate Teaching Professor and Executive Director of Master's Programs, Engineering and Public Policy – PhD, Tufts University; Carnegie Mellon, 2023–

Emeriti Faculty

JAY APT, Professor, The Tepper School of Business/Engineering and Public Policy, Emeritus – Ph.D, Massachusetts Institute of Technology; Carnegie Mellon, 2000-–

ALFRED BLUMSTEIN, J. Erik Jonsson University Professor of Urban Systems and Operations Research; Professor of The H. John Heinz III College / Engineering and Public Policy, Emeritus – Ph.D., Cornell University; Carnegie Mellon, 1969–

ELIZABETH CASMAN, Associate Research Professor of Engineering and Public Policy, Emeritus – PhD, The Johns Hopkins University; Carnegie Mellon, 1997–

PAUL FISCHBECK, Professor, Social and Decision Sciences / Engineering and Public Policy – PhD, Stanford; Carnegie Mellon, 1990–

JAMES GOODBY, Distinguished Service Professor, Emeritus – A.B., Harvard ; Carnegie Mellon, 1989–

MICHAEL GRIFFIN, Research Professor of Engineering and Public Policy, Emeritus – PhD, University of Rhode Island; Carnegie Mellon, 2000–

CHRISTOPHER T. HENDRICKSON, Hamerschlag University Professor of Civil and Environmental Engineering / Engineering and Public Policy / Heinz College of Information Systems and Public Policy, Emeritus – PhD, MIT; Carnegie Mellon, 1978–

DAVID A. HOUNSHELL, David M Roderick Professor of Technology and Social Change; Professor of Social and Decision Sciences / Engineering and Public Policy, Emeritus – Ph.D., University of Delaware; Carnegie Mellon, 1991–

MARIJA ILIC, Professor of Electrical and Computer Engineering / Engineering and Public Policy, Emeritus – D.Sc., University of Washington, St. Louis; Carnegie Mellon, 2002–

INDIRA NAIR, Vice Provost for Education, Carnegie Mellon University; Professor of Engineering and Public Policy, Emeritus – PhD, Northwestern University; Carnegie Mellon, 1978–

EDWARD S. RUBIN, The Alumni Chair Professor of Environmental Engineering and Science; Engineering and Public Policy/Mechanical Engineering, Emeritus – Ph.D, Stanford University; Carnegie Mellon, 1969–

MITCHELL J. SMALL, The H. John Heinz III Professor of Environmental Engineering, Civil and Environmental Engineering/ Engineering and Public Policy, Emeritus – Ph.D, University of Michigan; Carnegie Mellon, 1982–

SAROSH TALUKDAR, Professor of Electrical and Computer Engineering / Engineering and Public Policy, Emeritus – Ph.D., Purdue University; Carnegie Mellon, 1974–

JOEL A. TARR, Richard S. Caliguiri University Professor of Urban and Environmental History and Policy, History/Engineering and Public policy/ Heinz College of Information Systems and Public Policy, Emeritus – Ph.D, Northwestern University; Carnegie Mellon, 1967–

ROBERT M. WHITE, University Professor of Electrical and Computer Engineering / Engineering and Public Policy, Emeritus – Ph.D., Stanford University; Carnegie Mellon, 1993–

Department of Engineering and Public Policy Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

19-101 Introduction to Engineering and Public Policy

Fall and Spring: 12 units
This course examines interactions between technology and society, and the related processes of public and private decision-making. Classes involve a mix of lecture, discussion, and hands-on activities where students tackle interdisciplinary issues with both quantitative and qualitative methods. Students complete individual and group assignments that build skills in analysis and communication relevant for future careers. Past project topics include: using drone imaging to assess algal blooms in Lake Erie, incorporating renewable electricity generation on campus, reducing credit card fraud through data analytics, and creating standards for additive manufacturing of critical airplane parts.

19-201 Professional Issues in Engineering, Science, Technology and Public Policy

Fall: 1 unit
The course provides an overview of the academic and professional domain of technology-centered policy. Content includes career exploration, networking practice, ethics and professional responsibilities, academic advising, alumni speakers, and other topics as relevant. Intended for sophomores enrolling in the Engineering and Public Policy (EPP) Additional Major and the Science, Technology and Public Policy (STPP) Additional Major.

19-211 Ethics and Policy Issues in Computing

Spring: 9 units
Should autonomous robots make life and death decisions on their own? Should we allow them to select a target and launch weapons? To diagnose injuries and perform surgery when human doctors are not around? Who should be permitted to observe you, find out who your friends are, what you do and say with them, what you buy, and where you go? Do social media and personalized search restrict our intellectual horizons? Do we live in polarizing information bubbles, just hearing echoes of what we already know and believe? As computing technology becomes ever more pervasive and sophisticated, we are presented with an escalating barrage of decisions about who, how, when, and for what purposes technology should be used. This course will provide an intellectual framework for discussing these pressing issues of our time, as we shape the technologies that in turn shape us. We will seek insight through reading, discussion, guest lectures, and debates. Students will also undertake an analysis of a relevant issue of their choice, developing their own position, and acquiring the research skills needed to lend depth to their thinking. The course will enhance students' ability to think clearly about contentious technology choices, formulate smart positions, and support their views with winning arguments.

19-213 The American Railroad: Decline and Renaissance in the Age of Deregulation

Intermittent: 6 units
Railroads in the USA are often considered as a subject for nostalgia or public sector failure, an image largely based on passenger service. However, the USA's private sector freight rail industry is considered a model for the world as the result of its renaissance following deregulation in 1980. This is a "stealth" industry whose history and economics are both intertwined and complex. Students will gain a basic understanding of the industry's history and economics and its role in the national transportation network, with special attention to the past half-century. In addition, students will participate in small group research projects in particular areas of special interest - for example, economic history, industry and safety culture, network economics, utility regulation or transportation policy.

19-301 Decision Making Methods for Engineers and Scientists

Fall: 9 units
This course covers various economic, statistical, and decision analysis techniques used for examining complex decisions where technology, society, and policy interconnect. Topics covered include: estimation techniques, benefit-cost analysis, decision trees, dealing with uncertainty, risk perception and analysis, survey design and implementation, utility theory, heuristics and biases in inference and prediction, methods for combining information from different sources and dealing with conflicting objectives.
Prerequisites: 19-250 Min. grade C or 36-219 Min. grade C or 36-220 Min. grade C or 36-217 Min. grade C

19-303 Cryptocurrencies, Blockchains and Applications

Spring: 9 units
Note: Previously offered as 19-355. Cryptocurrencies such as Bitcoin have gained large popularity in recent years, in no small part due to the fantastic potential applications they could facilitate. This course will first provide an overview of the technological mechanisms behind cryptocurrencies and distributed consensus and distributed ledgers ("blockchains"), introducing along the way the necessary cryptographic tools. It will then focus on more advanced blockchain applications, such as "smart contracts," that is, contracts written as code. Finally, the course will also introduce some of the legal and policy questions surrounding cryptocurrencies. Prerequisites: Introduction to Computer Systems or equivalent strongly recommended

19-351 Applied Methods for Technology-Policy Analysis

Spring: 9 units
This course synthesizes concepts from economics, statistics, decision analysis, and other humanities and social science areas as they relate to analysis of technology and public policy issues. Students will focus on applying skills, tools, and techniques of social science to critically examine issues of current importance to society that have engineering systems at the core, and how public policy can be informed by the results of these analyses. Students will discover the relationship between formulating research questions considering a wide range of perspectives (e.g., political, ethical, social, economic, and legal aspects) and implementing the appropriate research methods for answering them. The course will emphasize interpretation and communication of analysis results in written and oral presentation, especially to non-technical audiences. As a precursor to the EPP Project courses, the course also prepares EPP juniors for structuring real-world problems into a feasible work plan, and to deal with revising work plans as work proceeds.

19-402 Telecommunications Technology and Policy for the Internet Age

Intermittent: 12 units
Modern telecommunications is the nervous system of society. The Internet and wireless communications have transformed every aspect of our modern life. This course provides a comprehensive introduction to basic principles of telecommunications technology and the legal, economic, and regulatory environment of today's networks. Topics covered include the fundamentals of communication network technologies, including video, voice, and data networks; the rising dominance of wireless networks; principles behind telecommunications regulation from common carrier law and natural monopoly to information diversity, privacy and national security; traffic differentiation on the Internet and the debate over network neutrality; universal service and the digital divide; mergers, antitrust, and the changing industrial structure of the communications sector. We will explore current topical questions such as the future of competition; the shift of entertainment video from cable and satellite to Internet delivery; how cloud computing concepts are transforming networks; and communications support for the Internet of Things. Comparison with European approaches to communications regulation. Special emphasis on how new technologies have altered, and are altered by, regulation. Junior, Senior or graduate standing required.
Prerequisites: 73-102 and 73-100

19-403 Policies of Wireless Systems

Intermittent: 12 units
This course will address public policy issues related to wireless systems. It investigates policies related to a wide variety of emerging wireless systems and technologies, including current and next-generation cellular systems, wifi and white space devices, emerging methods of accessing spectrum, communications systems for emergency responders (firefighters, police, emergency medical services), current and next-generation television, and satellite communications. This can include the government role in facilitating the creation of infrastructure, in advancing competition among broadcasters and communications service providers, in using scarce spectrum efficiently, in promoting public safety and homeland security, and in protecting privacy and security. Because these are inherently interdisciplinary issues, the course will include detailed discussions of technology, economics, and law, with no prerequisites in any of these areas. Senior or graduate standing required.

19-411 Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech

Fall: 9 units
Science and Innovation Leadership for the 21st Century introduces students to the fundamental principles surrounding global competitiveness and technological change in the 21st century. The course is broken into three sections. The first section introduces students to competing economic, sociological, and political science theories on the structures supporting technological change. The second section presents the contemporary literature on technological change. The concluding section leverages lessons from the preceding two sections to evaluate national innovation systems, and the factors that lead to national comparative advantage. Students should leave the class able to reflect competently on what the existing literature tells us about the factors influencing global technology competitiveness, and on how modern changes in the structures supporting innovation as well as technology itself may be changing the rules of the game for firms and for nations. The course is open to undergraduate juniors, seniors and amp; graduate students.

19-421 Emerging Energy Policies

Intermittent: 9 units
Interested in what's happening in energy policy and how to analyze potential policy options in response? Focusing on current hot topics in energy policy, students will learn the basic principles of public policy analysis and underlying techniques such as program evaluation, cost benefit analysis, life cycle analysis, prince analysis, and risk analysis as well as the variety of policy mechanisms available. Class time will include a combination of faculty and guest speaker lectures, discussion of issues, videos, and problem solving. Students will review and edit Wikipedia entries on an energy policy topic of their choice, and then analyze policy options resulting in an executive summary or paper on that topic. While the course has no prerequisites, students should feel comfortable with scientific and technical topics. Upon completion of this course, students should have a deeper and more strategic understanding of the opportunities and challenges associated with emerging energy policies. Open to seniors. Open to juniors with permission only.

19-425 Sustainable Energy for the Developing World

Fall and Spring: 9 units
This course examines the current state of the energy system in developing countries and the challenges these countries will face in sustainably meeting their energy needs in the 21st century. The following are examples of questions and issues we will cover throughout the semester. What is the current status of the energy system in the developing world? What is the role of energy in supporting economic growth and alleviating poverty? What are the future energy needs of developing countries? What are the challenges developing countries will face as they build/improve their energy systems? What technologies are available to meet the energy challenges in the developing world?

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-427 Special Topics: Energy Innovation and Entrepreneurship

Fall: 9 units
Want to be an energy innovator, business entrepreneur, social entrepreneur, or intrapreneur? Students in this class will learn the fundamentals of energy innovation and entrepreneurship, and how innovation and entrepreneurship in energy differs from that in other fields. Students will then develop a business and non-market strategy for an idea of their own, or in response to a real-world challenge proposed by a business, industry, or a non-governmental organization. The resulting strategy can, if students wish, be submitted for student competitions that typically take place each spring throughout the United States.

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-428 Special Topics: Market Engineering and Applications

Intermittent: 9 units
An introduction to market-engineering concepts and applications to contemporary market-design problems such as resource allocation, information aggregation, and decentralized control. Concepts apply theory of linear algebra, optimization and statistics. Course reservations for Seniors; and Juniors with permission. Application areas include: - energy systems, - environmental management (e.g., cap-and-trade systems), - wildlife management (e.g., fishing licenses), - oil-development leases, - exchanges for organ transplants, - information markets, and - matching systems for medical-residency programs.

19-429 Climate Change Science and Solutions

Fall and Spring: 9 units
This course consists of four parts. The first part will provide a primer for those who are curious about the physical mechanisms by which climate is determined, and by which climate change occurs. The treatment of these mechanisms will not be overly quantitative, and no knowledge of meteorology or atmospheric science is needed. College-level physics, as well as basic calculus and basic chemistry, is, however, needed. The second part will describe the projected consequences of climate change, as well as those that are already occurring. This part will also familiarize students with how societies might adapt to these changes. The third part will explore (and critique) some of the tools that decision-makers use to quantify and compare the damages caused by these consequences. The final part of the course will discuss some of the technologies that could be used to prevent dangerous climate change.

19-433 Data Science for Technology, Innovation and Policy

Intermittent: 9 units
Students will learn how to use R to collect, organize, and analyze data in technology, innovation, and policy-related domains. The focus will be on the practical issues faced when conducting data analyses, correctly implementing and interpreting statistical models, and summarizing results for clients and research purposes.

19-440 Combustion and Air Pollution Control

Intermittent: 9 units
Formation and control of gaseous and particulate air pollutants in combustion systems. Basic principles of combustion, including thermochemical equilibrium, flame temperature, chemical kinetics, hydrocarbon chemistry, and flame structure. Formation of gaseous and particulate pollutants in combustion systems. Combustion modifications and postcombustion technologies for pollutant control. Relationship between technology and regional, national, and global air pollution control strategies. The internal combustion engine and coal-fired utility boiler are used as examples.

19-451 EPP Projects I

Fall and Spring: 12 units
Students work in multidisciplinary teams (engineers and scientists, humanities and social scientists, public policy and management graduates) on a cutting edge project topic with very little in the way of pre-digested analysis or solutions. Topics include both technical and social dimensions, multiple constraints on the solutions, and require multi-dimensional analyses. Students are given a general goal, and are expected to discover existing knowledge on the topic, and to research existing technologies and relevant policies. Using this background and their technical and social analysis education as appropriate, students then create new knowledge on the subject and analyzing technology impacts, policy alternatives, or other relevant options as topics necessitate. This knowledge is communicated to an external advisory panel, selected from experts and constituencies of importance to the issue through formal presentations and a written report. #19451 is the first of two EPP Projects course experiences for EPP additional majors, students taking EPP Projects I are learning how to use their skills from prior EPP courses in solving complex, unstructured problems and developing skills for effective project completion.

19-452 EPP Projects II

Fall: 12 units
Students work in multidisciplinary teams (engineers and scientists, humanities and social scientists, public policy and management graduates) on a cutting edge project topic with very little in the way of pre-digested analysis or solutions. Topics include both technical and social dimensions, multiple constraints on the solutions, and require multi-dimensional analyses. Students are given a general goal, and are expected to discover existing knowledge on the topic, and to research existing technologies and relevant policies. Using this background and their technical and social analysis education as appropriate, students then create new knowledge on the subject and analyzing technology impacts, policy alternatives, or other relevant options as topics necessitate. This knowledge is communicated to an external advisory panel, selected from experts and constituencies of importance to the issue through formal presentations and a written report. The second of two EPP Projects course experiences for EPP additional majors, EPP Projects II is the capstone course. Students apply their skills and knowledge from EPP Projects I, demonstrating project framing, decomposition, and developing analyses. Students in this second course are expected to be course leaders, assisting students taking the course for the first time in navigating project communications and tasks.

19-469 Behavior, Decision and Policy

Intermittent: 9 units
Behavioral science can inform policy making in three ways: (a) improving two-way communication between the public and policy makers; (b) creating policies that make realistic assumptions about human behavior; (c) disciplining the expert judgment needed to analyze risks. The course will introduce and discuss the technical and ethical foundations of behavioral research and risk analysis, setting them in their historical, social, and political context. It will apply them to a wide variety of technology-related policies, including energy (e.g., conservation, nuclear power), environment (e.g., climate, pollution), health (e.g., vaccines, COVID-19), national security (e.g., terrorism, intelligence analysis), and others, including ones proposed by students. Students will acquire a critical perspective on policies in their lives, society, and profession. The course is open to juniors, seniors, and graduate students, who have not taken 84369/84669.

19-500 Directed Study in EPP: Undergraduate

All Semesters
Students may do undergraduate research as one course for EPP technical elective credit, with an EPP faculty member, or on an approved project with a faculty member from another department. The research credits must be pre-approved by your advisor, and should result in a written product, one copy of which should be sent to EPP.

19-534 Usable Privacy and Security

Spring: 9 units
There is growing recognition that technology alone will not provide all of the solutions to security and privacy problems. Human factors play an essential role in these areas, and it is important for security and privacy experts to have an understanding of how people will interact with the systems they develop. This course is designed to introduce students to a variety of usability and user-interface problems related to privacy and security and to give them experience in understanding and designing studies aimed at helping to evaluate usability issues in security and privacy systems. The course is suitable both for students interested in privacy and security who would like to learn more about usability, as well as for students interested in usability who would like to learn more about security and privacy. Students will also work on a group project throughout the semester. The course is open to all students who have technical backgrounds. The 12-unit course numbers (17-734, 5-836, 19-734) are for PhD students and masters students. Students enrolled in these course numbers will have extended homework assignments and will be expected to play a leadership role in a group project that produces a paper suitable for publication. The 9-unit course numbers (17-334, 5-436, 19-534) are for undergraduates and masters students (if permitted by their program).

19-550 Undergraduate Research

Intermittent
Students may do undergraduate research as one course for EPP technical elective credit, with an EPP faculty member, or on an approved project with a faculty member from another department. The research credits must be pre-approved by your advisor, and should result in a written product, one copy of which should be sent to EPP.

19-602 Current Topics In Privacy Seminar

Fall and Spring: 3 units
In this seminar course students will discuss recent papers and current public policy issues related to privacy. Privacy professionals from industry, government, and non-profits will deliver several guest lectures each semester.

19-603 Data Science for Technology, Innovation and Policy

Intermittent: 12 units
Students will learn how to use R to collect, organize, and analyze data in technology, innovation, and policy-related domains. The focus will be on the practical issues faced when conducting data analyses, correctly implementing and interpreting statistical models, and summarizing results for clients and research purposes.

19-605 Engineering Privacy in Software

Spring: 12 units
Privacy harms that involve personal data can often be traced back to software design failures, which can be prevented through sound engineering practices. In this course, students will learn how to identify privacy threats due to surveillance activities that enhance modern information systems, including location tracking, behavioral profiling, recommender systems, and social networking. Students will learn to analyze systems to identify the core operating principles and technical means that introduce privacy threats, and they will learn to evaluate and mitigate privacy risks to individuals by investigating system design alternatives. Strategies to mitigating privacy risk will be based on emerging standards and reliable privacy preference data. Students will have the opportunity to study web-, mobile- and cyber-physical systems across a range of domains, including advertising, healthcare, law enforcement and social networking. In addition, students will know how, and when, to interface with relevant stakeholders, including legal, marketing and other developers in order to align software design with privacy policy and law.

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-608 Privacy Policy, Law, and Technology

Fall: 12 units
This course focuses on policy issues related to privacy from the perspectives of governments, organizations, and individuals. We will begin with a historical and philosophical study of privacy and then explore recent public policy issues. We will examine the privacy protections provided by laws and regulations, as well as the way technology can be used to protect privacy. We will emphasize technology-related privacy concerns and mitigation, for example: social networks, smartphones, behavioral advertising (and tools to prevent targeted advertising and tracking), anonymous communication systems, big data, and drones. This is part of a series of courses offered as part of the MSIT-Privacy Engineering masters program. These courses may be taken in any order or simultaneously. Foundations of Privacy (Fall semester) offers more in-depth coverage of technologies and algorithms used to reason about and protect privacy. Engineering Privacy in Software (Spring semester) focuses on the methods and tools needed to design systems for privacy. This course is intended primarily for graduate students and advanced undergraduate students with some technical background. Programming skills are not required. 8-733, 19-608, and 95-818 are 12-unit courses for PhD students. Students enrolled under these course numbers will have extra assignments and will be expected to do a project suitable for publication. 8-533 is a 9-unit course for undergraduate students. Masters students may register for any of the course numbers permitted by their program. This course will include a lot of reading, writing, and class discussion. Students will be able to tailor their assignments to their skills and interests. However, all students will be expected to do some writing and some technical work.

19-617 Infrastructure Management

Intermittent: 12 units
This course takes a broad view of infrastructure systems to include physical infrastructure and information networks. The course will consider the need to protect these critical infrastructures from both degradation as well as malicious attacks. Infrastructure management generally depends on public-private partnerships to ensure long-term viability. We will look at relevant academic literature on the topics of infrastructure needs and requirements. We will explore the use of automated sensing and computer network systems to facilitate management.

19-624 Emerging Energy Policies

Intermittent: 12 units
Interested in what's happening in energy policy and how to analyze potential policy options in response? Focusing on current hot topics in energy policy, students will learn the basic principles of public policy analysis and underlying techniques such as program evaluation, cost benefit analysis, life cycle analysis, prince analysis, and risk analysis as well as the variety of policy mechanisms available. Class time will include a combination of faculty and guest speaker lectures, discussion of issues, videos, and problem solving. Students will review and edit Wikipedia entries on an energy policy topic of their choice, and then analyze policy options resulting in an executive summary or paper on that topic. While the course has no prerequisites, students should feel comfortable with scientific and technical topics. Upon completion of this course, students should have a deeper and more strategic understanding of the opportunities and challenges associated with emerging energy policies. Open to seniors. Open to juniors with permission only.

19-625 Sustainable Energy for the Developing World

Fall and Summer: 12 units
This course examines the current state of the energy system in developing countries and the challenges these countries will face in sustainably meeting their energy needs in the 21st century. The following are examples of questions and issues we will cover throughout the semester. What is the current status of the energy system in the developing world? What is the role of energy in supporting economic growth and alleviating poverty? What are the future energy needs of developing countries? What are the challenges developing countries will face as they build/improve their energy systems? What technologies are available to meet the energy challenges in the developing world?

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-627 Special Topics: Energy Innovation and Entrepreneurship

Fall: 12 units
Want to be an energy innovator, business entrepreneur, social entrepreneur, or intrapreneur? Students in this class will learn the fundamentals of energy innovation and entrepreneurship, and how innovation and entrepreneurship in energy differs from that in other fields. Students will then develop a business and non-market strategy for an idea of their own, or in response to a real-world challenge proposed by a business, industry, or a non-governmental organization. The resulting strategy can, if students wish, be submitted for student competitions that typically take place each spring throughout the United States.

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-629 Climate Change Science and Solutions

Fall and Spring: 12 units
This course consists of four parts. The first part will provide a primer for those who are curious about the physical mechanisms by which climate is determined, and by which climate change occurs. The treatment of these mechanisms will not be overly quantitative, and no knowledge of meteorology or atmospheric science is needed. College-level physics, as well as basic calculus and basic chemistry, is, however, needed. The second part will describe the projected consequences of climate change, as well as those that are already occurring. This part will also familiarize students with how societies might adapt to these changes. The third part will explore (and critique) some of the tools that decision-makers use to quantify and compare the damages caused by these consequences. The final part of the course will discuss some of the technologies that could be used to prevent dangerous climate change.

19-639 Policies of the Internet

Fall: 12 units
This course will address public policy issues related to the Internet. This may include policy issues such as network neutrality and the open Internet, Internet governance and the domain name system (and the role of the United Nations), copyright protection of online content, regulation of indecency and pornography, universal access to Internet and Internet as a "human right", government surveillance of the Internet, Internet privacy and security, and taxation of electronic commerce. It will also teach some fundamentals of Internet technology. Because these are inherently interdisciplinary issues, the course will include detailed discussions of technology, economics, and law, with no prerequisites in any of these areas. Senior or graduate standing required.

19-640 Dynamic Network Analysis

Spring: 12 units
Who knows who? Who knows what? Who communicates with whom? Who is influential? How do ideas, diseases, and technologies propagate through groups? How do social media, social, knowledge, and technology networks differ? How do these networks evolve? How do network constrain and enable behavior? How can a network be compromised or made resilient? Such questions can be addressed using Network Science. Network Science, a.k.a. social network analysis and link analysis, is a fast-growing interdisciplinary field aimed at understanding simple and amp; high dimensional networks, from both a static and a dynamic perspective. Across an unlimited application space, graph theoretic, statistical, and amp; simulation methodologies are used. An interdisciplinary perspective on network science is provided, with an emphasis on high-dimensional dynamic data. The fundamentals of network science, methods, theories, metrics and amp; confidence estimation, constraints on data collection and amp; bias, and key research findings and amp; challenges are examined. Illustrative networks discussed include social media based (e.g., twitter), disaster response, organizational, semantic, political elite, crises, terror, and amp; P2P networks. Critical procedures covered include: basic centralities and metrics, group and community detection, link inference, network change detection, comparative analytics, and big data techniques. Applications from business, science, art, medicine, forensics, social media and amp; numerous other areas are explored. Key issues addressed: Conceptualization, measurement, comparison and amp; evaluation of networks. Identification of influential nodes and hidden groups. Network emergence, evolution, change and amp; destabilization. Graduate course taught every other year. Prerequisite: Undergraduate-level statistics course or instructor permission. Linear algebra is recommended. Students are encouraged to bring and amp; use their own data, or to use provided data.

19-654 Regulation of Internet Edge Platforms

Fall: 6 units
Social media, search and e-commerce platforms are under attack all over the world: antitrust lawsuits, complaints about "fake news," partisan bias, and disinformation on social media, calls to remove liability protections for platforms that post user-provided content, to regulate content and online marketplaces. In this course we will examine competing economic and policy approaches to the treatment of these platforms. We will examine where these companies fit in the Internet ecosystem; how these firms make money (e.g. targeted advertising); traditional principles of antitrust and their application to multi-sided platforms; issues of Free Speech versus Disinformation on social networks, and how these firms differ from traditional media; and a comparison of proposals for structural versus behavioral regulation. Readings will be drawn from technical, economic, legal and policy sources. Students will be encouraged to contrast competing approaches to these issues via in-class debates and written assignments.

19-658 Corporate Venturing & Innovation

Intermittent: 6 units
: Startups aren't the only career destination for aspiring and experienced entrepreneurs - large, established companies need entrepreneurs more than ever to help them avoid the risk of being disrupted. The future survival of many large companies is in the hands of entrepreneurs who understand both technology and business - learn the skills you will need to engage corporate executives on the topic of corporate venturing. This course is created to help entrepreneurs design corporate venturing programs for large companies who want to avoid being disrupted by innovative and more nimble startups *How can you convince corporate executives to invest in corporate venturing capabilities? *How can you be successful as an entrepreneur inside a large company that is set on its ways? *How can a large company compete with faster and more nimble startups by building their own?

19-659 Economic Regulation of Networked Industries

Fall: 6 units
Economic Regulation of Networked Industries; This course will examine principles of economic regulation of networked industries such as gas, electricity, water and telecommunications, including economic justifications for price regulation (e.g. natural monopoly); alternative approaches to price regulation (Rate of Return, Price Caps), cost allocation and pricing in multiproduct industries (e.g. Ramsey prices); tariff design (single and multipart tariffs, capacity charges, peak load pricing); regulation in the presence of competition (cross subsidy and predatory pricing; access pricing); and institutional issues in regulatory agencies (design of independent regulatory agencies, incorporation of public input, public choice theory, regulatory capture).
Prerequisite: 73-102

19-664 Special Topics: Advancing Low Carbon Transition in Industry

Intermittent: 12 units
As a widely used and globally traded product, steel is essential to modern life, but its production is highly energy intensive and accounts for roughly 8% of global greenhouse gas emissions. This project course will work with a major U.S. and Pittsburgh-based steel producer to assess technology pathways for the decarbonization of their organization. Students will learn and apply engineering economic approaches as well as perspectives from organizational processes and business strategy to analyze and compare decision alternatives. Skills to be acquired include deep understanding of industrial processes and decarbonization technologies, engineering cost and real options analysis, business strategy and organization, the role of public policy, and project workflow management and presentation skills. The course will involve regular interaction with the executive sponsor and technical lead, as well as experts on steelmaking technology and climate policy, with high potential for impact.

19-666 Energy Policy and Economics

Intermittent: 6 units
This course will begin with a review of microeconomic concepts and tools necessary for analysis of the topics covered in the class. The course will explore how past energy technology policies and choices are intertwined with pathways of economic development, social impacts, macroeconomic measurement and performance. This course will explore how a wide variety of policy mechanisms- technology policy, utility regulation and restructuring, emissions policies, multilateral interventions and agreements, and corporate strategies-can shape energy use and the environmental impacts of energy systems. Study examples will draw from both developed and developing countries.

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-668 Electric Vehicles: Technology, Economics, Environment and Policy

Intermittent: 12 units
In this course, students will read academic literature, government documents, and popular press to develop a broad understanding of the technology, economic, environmental and policy dimensions of electric vehicles. Topics may include (1) TECHNOLOGY: Battery technology, design, application, degradation and innovation; electric vehicle technologies and designs; the electric power grid; (2) ECONOMICS: cost; consumer behavior; infrastructure; electricity dispatch; automotive externalities; the Gruenspecht effect; (3) ENVIRONMENT: life cycle assessment; air pollution; greenhouse gas emissions; marginal grid emission factors; renewables; vehicle to grid; hydrogen; (4) POLICY: effectiveness, efficiency, uncertainty and equity; short-run versus long-run effects; fleet standards; incentives; mandates; policy interactions; intellectual property; and policies in the US, China, EU, Japan, and local jurisdictions. Fundamentals covered at an introductory level to support readings may include time value of money, economies of scale, social welfare analysis, externalities, valuation of reduced mortality risk; choice modeling, regression, life cycle assessment, optimization, game theory, and other topics. Fluency with algebra and calculus is assumed.

19-669 Behavior, Decision and Policy

Intermittent: 12 units
Behavioral science can inform policy making in three ways: (a) improving two-way communication between the public and policy makers; (b) creating policies that make realistic assumptions about human behavior; (c) disciplining the expert judgment needed to analyze risks. The course will introduce and discuss the technical and ethical foundations of behavioral research and risk analysis, setting them in their historical, social, and political context. It will apply them to a wide variety of technology-related policies, including energy (e.g., conservation, nuclear power), environment (e.g., climate, pollution), health (e.g., vaccines, COVID-19), national security (e.g., terrorism, intelligence analysis), and others, including ones proposed by students. Students will acquire a critical perspective on policies in their lives, society, and profession. The course is open to juniors, seniors, and graduate students, who have not taken 84369/84669.

19-670 Quantitative Entrepreneurship: Analysis for New Technology Commercialization

Spring: 12 units
This course provides engineers with a multidisciplinary mathematical foundation for integrated modeling of engineering design, manufacturing, and enterprise planning decisions for commercializing new technologies and products. Topics include economics in product design, manufacturing and operations modeling and accounting, consumer choice modeling, survey design, conjoint analysis, optimization, model integration and interpretation, and professional communication skills. Students will apply theory and methods to a team project for a new product or emerging technology, developing a business plan to defend technical and economic competitiveness. This course assumes fluency with multivariable calculus, linear algebra, and probability theory.

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-671 Tech Start-up: Market Discovery

Spring: 6 units
The first three years of a technology start-up are the most critical; when the company's DNA or trajectory is set. Too few entrepreneurs appreciate this fact and, as a result, many start without the essential skills talents and capabilities needed to set the company on a successful path. Some of these entrepreneurial skills can only be learned through starting and growing a business while others can be learned. This course attempts to bridge the challenging gap between learning and doing entrepreneurship. We introduce you to an essential skill of market discovery or learning to create, develop and evaluate your concept of your business. Is my idea a real innovation? Is it also a business or a product or neither? How do I know how big the market is for my product? What are the technology market and competitive risks in my idea and how do I assess them? Can I compete? Can I sell it? How? When? Where? Students will have the opportunity to apply their newfound practical skills gathered in part from lectures from experienced entrepreneurs and investors to case studies role-playing and solving actual problems of local tech businesses. The best way to learn entrepreneurship is by doing, which is why this course will use 'true-to-life' scenarios as the anchor for the course. The class will be divided into 4 teams will focus on a company that is either (1) a student idea for new start-up, (2) an existing start-up (ideally local) or (3) a hypothetical start-up proposed/conceived by the students, the professor or both

19-672 Special Topics: Tech Start-up: Building Your Own Company

Fall: 6 units
(Session 2) - The first year or two of a tech start-up set the trajectory and character of that company for years to come. Too few entrepreneurs appreciate this reality and, as a result, many carry forward misperceptions and misconceptions about creating and building a successful tech company that set it on the path for failure. This class attempts to remedy that challenge by exposing the student the practical reality of building a team and funding a start-up team. This class should help the student answer (or know how to find the answer) to the following questions: How do I find manage and evaluate a start-up team Do I have the skill motivation and ability to be a tech entrepreneur? Can I build a company from scratch (really?)? Should I be the CEO Sales Account Manager VP of Engineering or something else altogether? How much money do I raise and where and when do I raise it? Students will have the opportunity to apply their newfound practical skills gathered in part from lectures from experienced entrepreneurs and investors to case studies.

19-680 E&TIM Seminar on Innovation Management in Practice

Intermittent: 6 units
A definition of innovation is the combination of technology and commercialization to deliver social and economic value. Corporations utilize innovation to establish a competitive advantage and to differentiate in the marketplace. Public policy makers view innovation as a critical driver for economic development. This course will cover the fundamentals of innovation, and the many challenges associated with it. How are opportunities identified? What are the strategies used, and how can they then be implemented? What roles are played by processes, technologies, and the business environment, as well as by individuals in organizations? This course will include active classroom discussions and readings from the innovation literature to reinforce concepts, develop critical thinking and hone analysis skills.

19-682 The Strategy and Management of Technological Innovation

Intermittent: 12 units
Welcome to the dynamic and transformative realm of "Strategy and Management of Technological Innovation". This course is designed to equip learners with the acumen and practical skills necessary to navigate the rapidly evolving landscape of technology-driven innovation. We will delve deep into the intricacies of conceiving, nurturing, and strategically deploying technological innovations to achieve sustainable competitive advantage. We will emphasize the practical aspects of innovation strategy and management through an extensive array of case studies and real-life examples. Learners will delve into the nuances of go-to-market strategies for new innovations, master the art of sustaining innovation, and explore how disruptive strategies can reshape industries. By the end of this course, learners will be equipped with a robust strategic toolkit, rooted in real-world examples, that will empower them to lead and drive technological innovation within their organization(s), regardless of stage or industry.

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-684 Engineering and Technology Innovation Management in Practice

Intermittent: 6 units
In this course, we will apply the fundamentals of innovation principles and practices to sponsored projects from corporations. You will work in teams to address the sponsors' objectives, using concepts such as six levers of innovation, seven innovation rules, design roadmapping, etc. Working closely with the sponsor is required so engaging in an appropriate professional manner is expected. Moreover, understanding how to approach team projects, manage team dynamics, and developing presentation skills will also be a part of the curriculum. The course is a culmination of utilizing your learnings from the ETIM program to address customers' needs.

19-685 Engineering Optimization without Project

Intermittent: 9 units
This course introduces students to 1) the process of formally representing an engineering design or decision-making problem as a mathematical problem and 2) the theory and numerical methods needed to understand and solve the mathematical problem. Theoretical topics focus on constrained nonlinear programming, including necessary and sufficient conditions for local and global optimality and numerical methods for solving nonlinear optimization problems. Additional topics such as linear programming, mixed integer programming, global optimization, and stochastic methods are briefly introduced. Model construction and interpretation are explored with metamodeling and model reformulation techniques, study of model boundedness, constraint activity, and sensitivity analysis. Matlab is used in homework assignments for visualization and algorithm development, and students apply theory and methods to a topic of interest in a course project. Fluency with multivariable calculus, linear algebra, and computer programming is expected. Students who are unfamiliar with Matlab are expected to learn independently using available tutorials and examples provided. 4 hrs lecture Prerequisites: None 19785 and 24785: 12-units including the team-based engineering optimization project 19685 and 24685: 9-units excluding the project

19-687 Managing Research, Development and Innovation

Intermittent: 6 units
This course considers key issues and trade-off in R and amp;D strategy and organization, paying attention to dynamic competitive contexts where technology plays a key role. These topics are treated assuming the perspective of the decision maker. It addresses typical problems of large, medium and small firms having a structured R and amp;D and operating businesses where R and amp;D is the source of competitive advantages. Although we will heavily focus on R and amp;D, emphasis is placed on viewing R and amp;D as a part (although, a key part) of the process of technological innovation; therefore, as an activity to be strongly and appropriately integrated with other functions to make innovation successful.

19-688 Tech Start Up: Market Discovery & Building Your Own Company

Intermittent: 12 units
The first year or two of a tech start-up set the trajectory and character of that company for years to come. Too few entrepreneurs appreciate this reality and, as a result, many carry forward misperceptions and misconceptions about creating and building a successful tech company that set it on the path for failure. This class attempts to remedy that challenge by exposing the student the practical reality of building a team and funding a start-up team. This class should help the student answer (or know how to find the answer) to the following questions: How do I find, manage and evaluate a start-up team? Do I have the skill, motivation and ability to be a tech entrepreneur? Can I build a company from scratch (really?)? Should I be the CEO Sales Account Manager VP of Engineering or something else altogether? How much money do I raise and where and when do I raise it? Students will have the opportunity to apply their newfound practical skills gathered in part from lectures from experienced entrepreneurs and investors to case studies. Previously this course was offered as two mini's #19671 and #19672

19-689 Finance for Innovation Management

Intermittent: 6 units
In this course, there will be three main elements all focused around the innovation decision-making process: Basic financial concepts Business case development by innovation project managers. Tools and processes used in innovation decision-making With respect to financial concepts, the course will provide an introduction of the basic financial concepts that corporations use to capture their financial performance including the following: Basic financial statement information income statement / balance sheet / meanings / interpretations / analysis of financial statements/determination of cash flow / annual reports, etc. Performance metrics, ROI, Debt to Equity ratio, EPS, NOPAT, EBITDA, Liquidity, Days outstanding, other appropriate measures The intention of this introduction is to provide future project managers with a sufficient understanding of the financial information that is typically used in building a business case to make innovation decisions both in a corporate setting and in a more entrepreneurial setting. With respect to actual innovation decision-making, the course will examine the various tools and techniques that are used by (1) corporations to make investment decisions in specific R and amp;D projects and (2) entrepreneurial organizations to make investments and gt; decisions in new technical projects. This course will address a number of commonly used decision tools such as: (1) Discounting / Net Present Value calculations (NPV), IRR / Payback Period / ROIC / etc.; (2) Decision and Risk Analysis methodologies; and (3) Portfolio management Finally, the course will develop an understanding of the differences between how corporations and how entrepreneurial firms use these tools, examine the implications of financial analysis techniques on R and amp;D decision-making, and will examine some of the suggested fallacies and the limitations of financial analysis of innovation management.

19-690 M.S. Project

Fall and Spring
For E and amp;TIM and EPP MS students only, with faculty approval.

19-693 Managing and Leading Research and Development

Intermittent: 12 units
This course will provide an insider's look at issues in industrial research and development laboratories that future industrial R and amp;D personnel are likely to face.

Course Website: http://www.ece.cmu.edu/courses/items/18703.html

19-695 Internship Practicum

Summer
Experiential learning opportunities are important educational options for undergraduate and graduate students. One such option is an internship, or practicum. If an internship is an explicit part of an academic program or is supervised by a faculty member, this course number may be used. Please consult the supervising faculty member concerning grading options and the appropriate number of units. NOTE: Special Permission required to register for this course

19-701 Introduction to the Theory and Practice of Policy Analysis

Intermittent: 12 units
This course reviews and critically examines a set of problems, assumptions and analytical techniques that are common to research and policy analysis in technology and public policy. Topics covered include the difference between science, trans-science and policy analysis, policy problems formulated in terms of utility maximization, issues in the valuation of intangibles, uncertainty in policy analysis, selected topics in risk analysis, limitations and alternatives to the paradigm of utility maximization, issues in behavioral decision theory, issues related to organizations and multiple agents, and selected topics in policy advice and policy analysis for the federal government. The objective is to look critically at the strengths, limitations and underlying assumptions of key policy research and analysis tools and problem framing and sensitize students to some of the critical issues of taste, professional responsibility, ethics, and values that are associated with policy analysis and research.

19-702 Quantitative Methods for Policy Analysis

Intermittent: 12 units
Economic framework for identifying and analyzing investment and operation options facing agencies and firms, (both in theory and in practice); economic efficiency, utilization, pricing, and investment; and multi-objective evaluation.

19-703 Applied Data Analysis 1

Intermittent: 6 units
Students will gain a basic understanding of the estimation, interpretation, and diagnostic assessment of the most widely used statistical models in the social sciences. This includes: graphical and inferential statistics, multiple regression with interactions, logistic regression, multi-level models, and panel data. Assignments include six data analysis projects in R. 19703 is part 1, 19704 is part 2.

19-704 Applied Data Analysis 2

Intermittent: 6 units
Students will gain a basic understanding of the estimation, interpretation, and diagnostic assessment of the most widely used statistical models in the social sciences. This includes: graphical and inferential statistics, multiple regression with interactions, logistic regression, multi-level models, and panel data. Assignments include six data analysis projects in R. 19703 is part 1, 19704 is part 2.
Prerequisite: 19-703

19-705 Workshop Applied Policy Analysis

Intermittent: 6 units
This workshop course is about learning how to structure messy un-structured policy problems. It is designed to provide experience in setting up, analyzing, and writing about policy problems of the type that are used in the EPP Part B qualifying exam. Over the course of the semester, the class works through six or seven policy case problems. Much of the work is done in small groups. The principal focus is on integrating the qualitative and quantitative aspects of the problems and on identifying and practicing general problem-solving strategies. Remote option is only with permission of instructor. Students are expected to attend in person.

19-711 Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech

Fall: 12 units
Science and Innovation Leadership for the 21st Century introduces students to the fundamental principles surrounding global competitiveness and technological change in the 21st century. The course is broken into three sections. The first section introduces students to competing economic, sociological, and political science theories on the structures supporting technological change. The second section presents the contemporary literature on technological change. The concluding section leverages lessons from the preceding two sections to evaluate national innovation systems, and the factors that lead to national comparative advantage. Students should leave the class able to reflect competently on what the existing literature tells us about the factors influencing global technology competitiveness, and on how modern changes in the structures supporting innovation as well as technology itself may be changing the rules of the game for firms and for nations. The course is open to undergraduate juniors, seniors and amp; graduate students.

19-713 Policies of Wireless Systems

Intermittent: 12 units
This course will address public policy issues related to wireless systems, and to the Internet. It begins by investigating policies related to a wide variety of emerging wireless systems and technologies, including wifi computer networks, broadband to the home, broadcast radio and television, and satellite communications. This can include the government role in facilitating the creation of infrastructure, in advancing competition among broadcasters and communications service providers, in managing spectrum, and in protecting privacy and security. The course will then address Internet policy issues, which can include Internet governance and the domain name system, taxation, privacy and security, and intellectual property. Because these are inherently interdisciplinary issues, the course will include detailed discussions of technology, economics, and law, with no prerequisites in any of these areas. Note: ECE students must take this course under #18-650 only

19-714 Environmental Life Cycle Assessment

Spring: 12 units
Cradle-to-grave analysis of new products, processes and policies is important to avoid undue environmental harm and achieve extended product responsibility. This course provides an overview of approaches and methods for life cycle assessment and for green design of typical products and processes using the ISO 14040 family of standards. This includes goal and scoping definition, inventory analysis, life cycle impact assessment (LCIA), interpretation, and guidance for decision support. Process-based analysis models, input-output and hybrid approaches are presented for life cycle assessment. Example software such as MATLAB, Excel, and Simapro are introduced and used in assignments. A group life cycle assessment project consistent with the principles and tools of sustainability to solve real-world engineering problems is required.
Prerequisites: (12-706 or 12-421) and 12-712

Course Website: https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5 (https://cmu.box.com/s/zjvqn8ne12sjwqmtvev2w49s78ij5sm5/)

19-717 Sustainable Engineering Principles

Fall: 12 units
This course presents an overview of the concept of sustainability, including changing attitudes and values toward technology and the environment through the late twentieth and early twenty-first centuries. Relevant issues in sustainable engineering, including population growth, urbanization, energy, water, food and material resources are discussed. Tools for sustainable engineering are presented, including metrics of sustainability, principles of design for the environment, and use of material and energy balances in sustainable systems. Publicly available data sets and computational models will be explored to assess sustainability. A team-based project is required.

19-726 Mathematical Modeling of Environmental Quality Systems

Spring: 12 units
Development and application of mathematical models for environmental systems. Material balance formulations and their solutions, computer implementation, model validation, uncertainty analysis, and use for projection and policy analysis. Applications to surface water, groundwater, atmospheric transport, indoor air pollution, and human exposure and risk.

19-728 Special Topics: Market Engineering and Applications

Intermittent: 12 units
An introduction to market-engineering concepts and applications to contemporary market-design problems such as resource allocation, information aggregation, and decentralized control. Concepts apply theory of linear algebra, optimization and statistics. Application areas include: - energy systems, - environmental management (e.g., cap-and-trade systems), - wildlife management (e.g., fishing licenses), - oil-development leases, - exchanges for organ transplants, - information markets, and - matching systems for medical-residency programs. All students are automatically placed on the wait list, EPP and ESTP students will be given first priority to enroll in the course. You will be notified once you are enrolled.

19-751 Air Quality Engineering

Intermittent: 12 units
The course provides a quantitative introduction to the processes that control atmospheric pollutants and the use of mass balance models to predict pollutant concentrations. We survey major processes including emission rates, atmospheric dispersion, chemistry, and deposition. The course includes discussion of basic atmospheric science and meteorology to support understanding air pollution behavior. Concepts in this area include vertical structure of the atmosphere, atmospheric general circulation, atmospheric stability, and boundary layer turbulence. The course also discusses briefly the negative impacts of air pollution on society and the regulatory framework for controlling pollution in the United States. The principles taught are applicable to a wide variety of air pollutants but special focus is given to tropospheric ozone and particulate matter. The course is intended for graduate students as well as advanced undergraduates. It assumes a knowledge of mass balances, fluid mechanics, chemistry, and statistics typical of an undergraduate engineer but is open to students from other scientific disciplines.

19-785 Engineering Optimization

Fall: 12 units
This course introduces students to 1) the process of formally representing an engineering design or decision-making problem as a mathematical problem and 2) the theory and numerical methods needed to understand and solve the mathematical problem. Theoretical topics focus on constrained nonlinear programming, including necessary and sufficient conditions for local and global optimality and numerical methods for solving nonlinear optimization problems. Additional topics such as linear programming, mixed integer programming, global optimization, and stochastic methods are briefly introduced. Model construction and interpretation are explored with metamodeling and model reformulation techniques, study of model boundedness, constraint activity, and sensitivity analysis. Matlab is used in homework assignments for visualization and algorithm development, and students apply theory and methods to a topic of interest in a course project. Fluency with multivariable calculus, linear algebra, and computer programming is expected. Students who are unfamiliar with Matlab are expected to learn independently using available tutorials and examples provided. 4 hrs lecture Prerequisites: None 19785 and 24785: 12-units including the team-based engineering optimization project 19685 and 24685: 9-units excluding the project

19-819 A/B Testing, Design, and Analysis

Spring: 6 units
This course looks at how to use A/B testing to measure causal effects in online platforms in the era of big data analytics. We aim at answering questions such as how does the demand for a product change when the price does or the ratings do? How can we anticipate how sales and profits change if the firm changes its business strategy? Facebook, Google, Amazon and similar firms ask and answer questions of this kind everyday using their large online platforms. This course introduces fundamental concepts to correctly ask this type of question. We study frameworks to measure causal effects and we discuss their pros and cons. Every tool is discussed in the context of a specific example that students work on using real world datasets. Significant effort is placed on understanding how to design randomized experiments (aka A/B tests) to measure causal effects. We also discuss the most common challenges that arise when trying to design such experiments in the wild and in network settings. The concepts and tools discussed in this course are general in nature and can be applied in settings other than online platforms such as energy, transportation and education. The examples in class will be mostly drawn from our own work at the Heinz College on the media industry. Lectures are 3 hours long. In the first half of each lecture we go over concepts behind A/B tests and what to do when A/B tests are unavailable. The discussion is based on the ideas and intuition behind these concepts. In the second half of each lecture we go over specific examples and #8212; we study the associated datasets and the code used to analyze them properly. Student evaluation is based on five weekly homeworks and a brief term project to be developed in teams. Instructor: Pedro Ferreira, www.andrew.cmu.edu/user/pedrof Pre-requisites: Knowledge of R or STATA. A class in statistics and regression analysis or permission of the instructor.

19-867 Decision Analytics for Business and Policy

Intermittent: 12 units
This course introduces modeling frameworks and computational tools to address complex, ill-defined, large-scale decision-making problems that arise in policy and business. Using a combination of lecturing, case studies and class discussions, it covers advanced methods of decision-making under uncertainty in four major areas: large-scale optimization, discrete event simulation, stochastic optimization and queuing theory. The application of such methods are drawn from a variety of real-world settings in a variety of domains such as transportation, energy, information systems, health care, supply chain management, etc. Participants are expected to take active learning roles in the computational application of the materials presented in class using the R programming language and the CPLEX optimization solver. A term project simulates realistic and challenging professional situations where new solutions need to be developed, implemented and communicated. The prerequisite is an introductory course in Operations Research, such as Management Science I and II or Decision-Making under Uncertainty. The learning objectives of this course fall into the following categories learning advanced quantitative modeling and solution algorithms from the fields of Operations Research and Management Science (OR/MS) applying OR/MS methods systematically to model complex decision-making problems faced in practice implementing simulation and optimization methods with large-scale datasets using state-of-the-art software evaluating the challenges and trade-offs in quantitative modeling and computation communicating technical models and results effectively based on the context and the audience
Prerequisites: 90-760 and 90-722 and 90-819

Department of Materials Science and Engineering

Elizabeth Dickey, Head
Location: Wean Hall 3327
materials.cmu.edu (http://materials.cmu.edu)

Materials Science & Engineering (MSE) is an engineering discipline that applies the tools of basic and applied sciences and engineering to the manufacture and application of materials and devices. The four broad classes of Materials to which this paradigm is applied are metals, polymers, ceramics, and composites. Essentially every technology (historical, modern, and future) depends on materials development and innovation.

The overarching paradigm of MSE is to determine and to exploit the connection between processing, structure, and properties of materials to engineer materials that fit the performance criteria for specific applications, which are useful for the technological needs of our society. In addition to this product specific knowledge, MSE is concerned with the implications of materials production and their sustainable use on the environment and energy resources.

Graduates of the MSE department are pursuing careers in an expanding spectrum of companies, national laboratories, and universities. Their activities cover a wide range of materials related endeavors that include microelectronics, energy production and storage, biomedical applications, aerospace, information technology, nanotechnology, manufacturing and materials production. Many of our undergraduate alumni choose to attend graduate school; they are accepted into the top Materials graduate schools in the country.

The standard curriculum of the department provides fundamental training for all materials science and engineering areas (see www.cmu.edu/engineering/materials/undergraduate_program/curriculum (http://www.cmu.edu/engineering/materials/undergraduate_program/curriculum/)). The core courses provide understanding and training on tools for working with the (atomic) structure of materials that governs their properties, the thermodynamic relationships that govern the stability of materials, and the rates at which changes take place in materials. Students complete their learning with a capstone design experience in the final year, which integrates their materials knowledge and training with engineering team skill development. To supplement the core course program, students may also participate in the current research programs of the faculty and conduct undergraduate research projects as part of their program of study.

While the core program is focused on the understanding of the internal or surface structure of materials in order to predict and engineer their properties, it is a flexible program that allows students to focus within a chosen material class, whether it is ceramics, semiconductors, metals, composites, magnetic or optical materials, bio-materials or polymers. The program also permits the option of cross concentration in the one or more of the areas of application such as electronic materials*, engineering design*, environmental engineering*, additive manufacturing*, mechanical behavior of materials*, biomedical engineering**, and engineering and public policy**, is also available. (*= Designated Minor, **= Additional Major). Our curriculum is designed to provide a strong foundation in fundamental knowledge and skills that provide an excellent base for our graduates planning to continue on to graduate studies. For our graduates who seek employment in industry, the program provides the foundation on which a graduate can build his/her domain specific knowledge. For students that develop or seek opportunities in other disciplines after graduation, the MSE curriculum provides a modern liberal education combined with the engineering rigors, i.e. one that inculcates upon a thoughtful, problem-solving approach to professional life. It is thus the goal of our education to provide a global and modern education in Materials Science and Engineering to support our graduates during their careers in materials industries or as a foundation for further studies in any of the leading global institutions of graduate education.

Accreditation

The Materials Science and Engineering Program is accredited by the Engineering Accreditation Commission of ABET, https://www.abet.org, under the commission's General Criteria and the Program Criteria for Materials(1), Metallurgical(2), Ceramics(3) and Similarly Named Engineering Programs.

Program Educational Objectives

Graduates with a B.S. degree from the Materials Science and Engineering program will, within a few years after graduation

(1) attain success in a professional position and/or a top graduate school that builds upon their MSE background

(2) exhibit professionalism and leadership in contemporary, interdisciplinary engineering practice based on materials, while accounting for the impact of their profession on an evolving, global society

(3) contribute to innovative designs of technological systems using principles of materials science and engineering

(4) make effective contributions as an individual, team member, and/or a leader to effect global, economic, environmental, and/or societal impact

Student Outcomes

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics

2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors

3. an ability to communicate effectively with a range of audiences

4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts

5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives

6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions

7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Curriculum

Minimum units requrired for B.S. in Materials Science & Engineering	381

Standard Program

Freshman Year

Fall		Units
21-120	Differential and Integral Calculus	10
27-100	Engineering the Materials of the Future *	12
99-101	Core@CMU	3
xx-xxx	General Education Course	9
33-141	Physics I for Engineering Students	12
		46

Spring		Units
21-122	Integration and Approximation	10
xx-xxx	Second Introductory Engineering Course	12
33-142	Physics II for Engineering and Physics Students	12
76-101	Interpretation and Argument	9
		43

Sophomore Year

Fall		Units
27-201	Structure of Materials	9
27-210	Materials Engineering Essentials	6
27-215	Thermodynamics of Materials	12
09-105	Introduction to Modern Chemistry I **	10
21-254	Linear Algebra and Vector Calculus for Engineers	11
15-110	Principles of Computing	10
or 15-112	Fundamentals of Programming and Computer Science	
39-210	Experiential Learning I	0
		58

Spring		Units
27-202	Defects in Materials	9
27-216	Transport in Materials	9
27-217	Phase Relations and Diagrams	12
21-260	Differential Equations	9
39-220	Experiential Learning II	0
xx-xxx	General Education Course	9
		48

Junior Year

Fall		Units
27-301	Microstructure and Properties I	9
27-xxx	MSE Restricted Elective [1]	9
xx-xxx	Free Elective [1]	9
33-225	Quantum Physics and Structure of Matter or	9
or 09-217	Organic Chemistry I	
or 03-121	Modern Biology	
xx-xxx	General Education Course	9
39-310	Experiential Learning III	0
		45

Spring		Units
27-367	Selection and Performance of Materials	6
27-305	Introduction to Materials Characterization	6
xx-xxx	General Education Course	9
27-xxx	MSE Restricted Elective [2]	9
27-xxx	MSE Restricted Elective [3]	9
xx-xxx	Free Elective [2]	9
36-220	Engineering Statistics and Quality Control	9
		57

Senior Year

Fall		Units
27-401	MSE Capstone Course I	6
27-xxx	MSE Restricted Elective [4]	9
xx-xxx	Free Elective [3]	9
xx-xxx	General Education Course	9
xx-xxx	General Education Course	9
		42

Spring		Units
27-402	MSE Capstone Course II	6
27-xxx	MSE Approved Technical Elective	9
xx-xxx	Free Elective [4]	9
xx-xxx	Free Elective [5]	9
xx-xxx	General Education Course	9
		42

* The Materials in Engineering course 27-100 may also be taken in the spring semester, and must be taken before the end of the sophomore year (the H&SS Elective in the Sophomore Spring may be moved to later in the program to accommodate the 27-100 course).

** These courses must be taken before the end of the sophomore year, but need not be taken in the same order or semester as listed above.

All mathematics (21-xxx) courses required for the engineering degree taken at Carnegie Mellon must have a minimum grade of C in order to be counted toward the graduation requirement for the BS engineering degree.

Notes on the Curriculum

Academic Advising

Paige Houser is the academic advisor for all MSE students.

Quality Point Average

In addition to the College requirement of a minimum cumulative quality point average of 2.00 for all courses taken beyond the freshman year, the Department requires a quality point average of 2.00 or higher in courses taken in the MSE department. Students may repeat a course to achieve the QPA requirement. Only the higher grade will be used for this departmental calculation.

MSE Approved Technical Elective

Students are required to take at least 9 units of approved technical electives. Students may take a course from another CIT department to fulfill this requirement or choose an additional 9 units of MSE Restricted Electives. Courses on the exclusion list **cannot** be counted as a technical elective. Students who are pursuing an additional major or minor within CIT should check with their academic advisor regarding double counting of this course.

Courses on this list cannot be counted as a technical elective		Units
06-426	Experimental Colloid Surface Science	9
06-466	Experimental Polymer Science	9
12-201	Geology	9
18-202	Mathematical Foundations of Electrical Engineering	12
18-300	Fundamentals of Electromagnetics	12
24-311	Numerical Methods	12
42-202	Physiology	9
42-610	Introduction to Biomaterials	9

MSE Restricted Electives

Each student in the program must take at least 36 units of MSE restricted electives. Up to 18 units of MSE research can count toward the restricted electives.

All 27-3xx, 27-4xx, 27-5xx, 27-6xx (with the exception of) and 27-7xx level and cross listed courses will fulfill the MSE Restricted Elective Requirement along with the following non-MSE courses:

Non-MSE courses that count as restricted electives		Units
06-609	Physical Chemistry of Macromolecules	9
09-509	Physical Chemistry of Macromolecules	9
12-411	Project Management for Engineering and Construction	9
12-631	Structural Design	12
18-310	Fundamentals of Semiconductor Devices	12
24-262	Mechanics II: 3D Design	10
24-341	Manufacturing Sciences	9
42-667	Biofabrication and Bioprinting	12

Integrated B.S./M.S. Program

Undergraduates who excel academically have the unique opportunity to receive simultaneously or sequentially both B.S. and M.S. degrees from the department. The primary purpose of the Integrated Master and Bachelor (IMB) Degree Program is to provide students with superior breadth and depth in technical material, which will better prepare them for careers in industry. Students interested in pursuing the IMB Degrees are encouraged to begin taking some of the required graduate courses before their last year. The MSE department offers two M.S. degrees: one in Materials Science and Engineering (MSE), a coursework degree, and one in Materials Science (MS), a coursework + research degree. The IMB Degree Program to obtain an M.S. in MSE (MS) degree normally requires two (three to four) additional full academic semesters of coursework (coursework + research) beyond the B.S. Degree Requirements (normally eight academic semesters). Experience has shown that students complete the IMB program in eight to ten full academic semesters after enrolling at CMU.

Degree Requirements

IMB students can be enrolled in either the M.S. in MSE (coursework) or the M.S. in MS (coursework + research) degree programs, depending on their preference.
Students must meet the requirements of either the M.S. in MSE or the M.S. in MS degree programs, as well as any specially stated rules below.

Eligibility

The IMB Program is available to all undergraduates who maintain a cumulative QPA of 3.0 or better, including the freshman year and the years in which they are enrolled in the IMB. Exceptions can be made by the Department on the basis of other factors, including extenuating (e.g., medical) circumstances, improvement in grades, strong recommendation letters, etc.
Students become eligible to apply to the program during the spring semester of their junior year (5th semester), or the semester in which they accumulate 280 or more units, whichever is earlier.

Enrollment

Students interested in the IMB program are not required to follow the formal application process for acceptance into the MSE graduate program. There is no requirement to provide a formal application, application fee, GRE scores, recommendation letters, official transcripts, or a statement of purpose. Interested students are encouraged request acceptance into the program by contacting the MSE academic advisor by email prior to the middle of the semester in which they become eligible.

Requirements to Enroll as a Graduate Student

If a student takes more than 8 semesters to complete both the B.S. and M.S. in MSE (coursework), then he or she must be a graduate student for at least one full-time 14-week academic semester (Fall or Spring) before graduating, whether or not they have already completed their B.S. degree.

Students should refer to the College of Engineering and University policies regarding enrollment status.

Tuition Assistance

When a student is a full-time graduate student through the IMB program, the department is able to provide some tuition assistance through optional Teaching Assistantships.

Faculty

CHRISTOPHER BETTINGER, Professor – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2010–

MICHAEL BOCKSTALLER, Professor – Ph.D., Max-Planck Institute for Polymer Research; Carnegie Mellon, 2005–

ITZHAQ COHEN-KARNI, Professor – Ph.D., Harvard University; Carnegie Mellon, 2013–

AHARON INSPEKTOR, Adjunct Faculty, Materials Science and Engineering – Ph.D., Technion Israel Institute of Technology; Carnegie Mellon, 2019–

Department of Materials Science and Engineering Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

27-052 Introduction to NanoScience and Technology

Summer: 9 units
This course is offered within Carnegie Mellon's Advanced Placement Early Admissions (APEA) program. The course is primarily intended to provide an introduction to nanoscience and technology to a wide audience of students at the advanced high school to incoming freshmen level. The course goals are twofold: (1) to provide students with a holistic view of the objectives, opportunities and challenges of the emerging field of nanotechnology and 2) to sensitize students at an early stage of their career to the relevance of the connections among the traditional disciplines as a vital element to the progress in interdisciplinary areas such as nanotechnology. The course will cover: Introduction and fundamental science; Preparation of nanostructures; Characterization of nanostructures; Application examples, Social and ethical aspects of nanotechnology. Admission according to APEA guidelines.

27-100 Engineering the Materials of the Future

Fall and Spring: 12 units
Materials form the foundation for all engineering applications. Advances in materials and their processing are driving all technologies, including the broad areas of nano-, bio-, energy, and electronic (information) technology. Performance requirements for future applications require that engineers continue to design both new structures and new processing methods in order to engineer materials having improved properties. Applications such as optical communication, tissue and bone replacement, fuel cells, and information storage, to name a few, exemplify areas where new materials are required to realize many of the envisioned future technologies. This course provides an introduction to how science and engineering can be exploited to design materials for many applications. The principles behind the design and exploitation of metals, ceramics, polymers, and composites are presented using examples from everyday life, as well as from existing, new, and future technologies. A series of laboratory experiments are used as a hands-on approach to illustrating modern practices used in the processing and characterization of materials and for understanding and improving materials' properties.

27-201 Structure of Materials

Fall: 9 units
This course covers the fundamentals of crystallography and diffraction. Topics covered include: the periodic table of the elements, bonding in different classes of materials, Bravais lattices, unit cells, directions and planes, crystal geometry computations, direct and reciprocal space, symmetry operations, point and space groups, nature of x-rays, scattering in periodic solids, Bragg's law, the structure factor, and the interpretation of experimental diffraction patterns. 24 crystal structure types of importance to various branches of materials science and engineering will be introduced. Amorphous materials, composites and polymers are also introduced. This course includes both lectures and laboratory exercises.
Prerequisite: 21-122 Min. grade C

27-202 Defects in Materials

Fall: 9 units
Defects have a fundamental influence on the properties of materials, including deformation, electrical, magnetic, optical, and chemical properties, as well as the rates of diffusion in solids. As such, by the controlling the population of intrinsic and extrinsic defects, one can tailor the properties of materials towards specific engineering applications. The objective of this course, which includes classroom and laboratory sessions, is to define approaches to quantifying the populations and properties of defects in crystals. The course will be divided into three sections: point defects, dislocations, and planar defects. The formation of point defects and their influence on diffusion, electrical, and magnetic properties will be considered. The properties and characteristics of dislocations and dislocation reactions will be presented, with a focus on the role of dislocations in deformation. The crystallography and energetics of planar defects and interfaces will also be described, with a focus on microstructural evolution at high temperatures. Time permitting, volume defects or other special topics are also discussed.
Prerequisites: (27-215 or 27-201) and (21-120 Min. grade C or 21-122 Min. grade C)

27-210 Materials Engineering Essentials

Fall: 6 units
This course approaches professional skill holistically, having materials science and engineering students understand that being a professional includes having competencies and responsibilities that are personal, organizational and professional.
Prerequisites: 21-120 Min. grade C or 21-122 Min. grade C

27-211 Structure of Materials (Minor Option)

Fall: 6 units
This course is identical to 27-201, but without the 3-unit lab component.

27-212 Defects in Materials (Minor Option)

Spring: 6 units
THIS IS FOR THE MSE MINOR ONLY: Defects have a fundamental influence on the properties of materials, including deformation, electrical, magnetic, optical, and chemical properties, as well as the rates of diffusion in solids. As such, by the controlling the population of intrinsic and extrinsic defects, one can tailor the properties of materials towards specific engineering applications. The objective of this courseis to define approaches to quantifying the populations and properties of defects in crystals. The course will be divided into three sections: point defects, dislocations, and planar defects. The formation of point defects and their influence on diffusion, electrical, and magnetic properties will be considered. The properties and characteristics of dislocations and dislocation reactions will be presented, with a focus on the role of dislocations in deformation. The crystallography and energetics of planar defects and interfaces will also be described, with a focus on microstructural evolution at high temperatures. Time permitting, volume defects or other special topics are also discussed.

27-215 Thermodynamics of Materials

Fall: 12 units
The first half of the course will focus on the laws of thermodynamics and the inter-relations between heat, work and energy. The concept of an equilibrium state of a system will be introduced and conditions which must be satisfied for a system to be at equilibrium will be established and discussed and the concepts of activity and chemical potential introduced. The second half of the course will focus on chemical reactions, liquid and solid solutions, and relationships between the thermodynamics of solutions and binary phase diagrams.

27-216 Transport in Materials

Spring: 9 units
This course is designed to allow the student to become familiar with the fundamental principles of heat flow, fluid flow, mass transport and reaction kinetics. In addition, the student will develop the skills and methodologies necessary to apply these principles to problems related to materials manufacture and processing. Topics will include thermal conductivity, convection, heat transfer equations, an introduction to fluid phenomena viscosity, etc., Newtons and Stokes Laws, mass momentum balances in fluids, boundary layer theory, diffusion and absolute reaction rate theory. Where appropriate, examples will be taken from problems related to the design of components and the processing of materials.
Prerequisites: 27-210 and 27-215

27-217 Phase Relations and Diagrams

Spring: 12 units
Stability of structures. Hume-Rothery rules. Free energy-composition curves with applications to binary and ternary phase diagrams. Quantitative concepts of nucleation and growth with examples from solidification. Development of microstructures in various classes of phase diagram under near-equilibrium conditions. Atomic mechanisms of solid state diffusion and approach to equilibrium through diffusion.
Prerequisites: 27-215 and 27-201

27-227 Phase Relations and Diagrams (Minor Option)

Spring: 9 units
This course is identical to 27-217, but without the 3-unit lab component.

27-301 Microstructure and Properties I

Fall: 9 units
The objective of this course is to convey some of the essential concepts in materials science and engineering that relate properties (strength, toughness, formability, elasticity, magnetism, thermal expansion, for example) to the microstructure (crystal structure, dislocation structure, grain size, atoms in solids solution, precipitate characteristic, cellular materials). These relationships will be illustrated in terms of idealized materials and actual materials used in many applications. The course contains both lectures and laboratory exercises. The labs will include studies of recrystallization, the effect of microstructure on the properties of wood and the effect of microstructure on the mechanical behavior of a low ally steel, 4140.
Prerequisites: 27-217 and 27-216

27-305 Introduction to Materials Characterization

Spring: 6 units
The course introduces the modern methods of materials characterization, including characterization of microstructure and microchemistry of materials. A classroom component of the course will introduce the wide array of methods and applications of characterization techniques. Basic theory will be introduced where needed. Students will then be instructed in the use of several instruments such as AFM, SEM, and EDS, using a hands-on approach. All instruments are part of the existing lab facilities within MSE and CIT. The methods learned in this course will serve the student during several other higher level courses, such as the Senior level MSE Capstone Course (27-401).
Prerequisite: 27-301

27-306 Special Topics: Processing Of Materials

Fall: 9 units
Processing of a material greatly influences its structure (i.e., crystal structure, phases, and microstructure) and therefore its properties and performance. The objective of this course is to introduce the fundamentals of materials processing that apply to metals, ceramics, and polymers. With a unified approach, various processing routes from melt and powder processing to additive manufacturing will be discussed. Finally, this course will include hands-on, in-class fabrication of diverse shaped objects using 3D printers and filaments of polymers and polymer composites of fibers and ceramic particles that will allow exploration and application of material processing knowledge.

27-357 Introduction to Materials Selection

Spring: 6 units
In this course we follow the design-led approach to evaluate possible materials. In this approach, we start with a property (or combination of properties) which are relevant to a particular design, and then consider what classes of materials and what specific materials meet the design criteria. The logical path is hence from application to material. We shall give attention to materials fundamentals (such as grains and bonding) where these are relevant and useful to understanding differences between different materials - such as why the elastic modulus of steel cannot be changed by heat treatment or alloying, whereas the strength can be changed a great deal.

27-367 Selection and Performance of Materials

Spring: 6 units
This course teaches the selection methodologies for materials and processes for satisfaction of a design goal. Topics such as performance under load, shape effects, material properties (intrinsic and as influenced by processing) are discussed and applied so as to determine the fitness of use of materials for applications. Expanded topics include economics, codes and standards, environmental and safety regulations, professional ethics and life cycle analysis where applicable. The course incorporates a project where virtual teams work to provide material selection for a specific application problem.
Prerequisites: 27-301 and 27-100

27-401 MSE Capstone Course I

Fall: 6 units
This is the first of 2 course that together fulfill the Capstone requirement. This capstone course introduces the student to the methodology used for projects and teams based research as practiced in the Materials Science and Engineering workplace. This is a project course that requires the knowledge relationship among processing, structure, and performance to address an important contemporary problem in materials science and engineering. Student taking this course will work in a team environment to complete a design project to resolve scientific and engineering issues relating to materials. Research topics will be selected from a list of material problems or research concepts generated from companies or academia - industry research partnerships. This course will establish the research goals, review applicable research methodologies, introduce project management skills and discuss ethical concepts as teams assemble and set their research directions. On the topic selected, the work product is a report that provides clear definition of the problem being addressed, sets out a methodology for the research, includes a literature review, and reports early experimentation results and provides recommendations for future work.
Prerequisites: 27-367 and (27-305 or 27-205) and 27-301

27-402 MSE Capstone Course II

Spring: 6 units
This is the spring extension of 27-401. Teams or team members that have the industry agreement and that wish to continue their research project may do so in this course. As with 27-401, all research is expected to be original, and proper scientific ethics, and methodologies are enforced for the research and reports. Team participation and communication is an important issue and the presentation and reports must be technical and professional in structure. The course requires full project management and accounting for the research being conducted. On the topic selected, the work product is a report that provides clear definition of the problem being addressed, a methodology for the research, literature review, experimentation and reporting of findings, conclusions based on findings, and recommendations for future work.
Prerequisite: 27-401

27-406 Sustainable Materials

Fall and Spring: 9 units
This course is intended to instill a sense of how materials properties and performance are conceived and brought to market specifically under sustainability constraints arising from the increasing demand of materials, Students will be introduced to the global nature of materials and will explore the global influences on the materials supply and value chains. The student will explore issues through the framework of the materials lifecycle including resource availability, manufacturing choices, and disposable options for materials in light of their use and selection for application. As a result, the student will be able to make more informed material selection or be able to use this information to identify critical research directions for future material development.

27-410 Computational Techniques in Engineering

Spring: 12 units
This course develops the methods to formulate basic engineering problems in a way that makes them amenable to computational/numerical analysis. The course will consist of three main modules: basic programming skills, discretization of ordinary and partial differential equations, and numerical methods. These modules are followed by two modules taken from a larger list: Monte Carlo-based methods, molecular dynamics methods, image analysis methods, and so on. Students will learn how to work with numerical libraries and how to compile and execute scientific code written in Fortran-90 and C++. Students will be required to work on a course project in which aspects from at least two course modules must be integrated.
Prerequisites: 21-120 and 21-122 and (15-110 or 15-112 or 15-122) and 21-260 and 21-259

27-421 Processing Design

Fall: 6 units
In this course, the concepts of materials and process design are developed, integrating the relevant fundamental phenomena in a case study of a process design. The course includes basic science and engineering as well as economic and environmental considerations. The case study is on environmentally acceptable sustainable steelmaking. Other case studies in materials processing could be used.

27-432 Electronic and Thermal Properties of Metals, Semiconductors and Related Devices

Intermittent: 9 units
Fall odd years: This is Part I of a two-part course (Part II is 27-433) sequence concerned with the electrical, dielectric, magnetic and superconducting properties of materials. Students taking Part I will develop an in-depth understanding, based on the modern theories of solids, of the electrical, electronic and thermal properties of metals and semiconductors and the principles of operation of selected products and devices made from these materials. Overarching and interrelated topics will include elementary quantum and statistical mechanics, relationships between chemical bonds and energy bands in metals and semiconductors, the roles of phonons and electrons in the thermal conductivity of solids, diffusion and drift of electrons and holes, the important role of junctions in the establishment and control of electronic properties of selected metal- and semiconductor-based devices. Examples of commercial products will be introduced to demonstrate the application of the information presented in the text and reference books and class presentations. Additional topics will include microelectro-mechanical systems and nanoelectronics.

27-433 Dielectric, Magnetic, Superconducting Properties of Materials & Related Devices

Intermittent: 9 units
Fall even years: 9 units This is Part II of a two-part course sequence (Part I is 27-432) concerned with the electrical, dielectric, magnetic and superconducting properties of materials. Students taking Part II will develop an in-depth understanding, based on the modern theories of solids, of the dielectric, magnetic and superconducting properties of materials and the principles of operation of selected products and devices made from these materials. Topics will include relationships between chemical bonds and energy bands in dielectric and magnetic materials; polarization mechanisms in materials and their relationship to capacitance, piezoelectricity, ferroelectricity, and pyroelectricity; magnetization and its classification among materials; magnetic domains; soft and hard magnets; and the origin, theory and application of superconductivity. Examples of commercial products will be introduced to demonstrate the application of the information presented in the text and reference books and class presentations.

27-445 Structure, Properties and Performance Relationships in Magnetic Materials

Spring: 9 units
This course introduces the student to intrinsic properties of magnetic materials including magnetic dipole moments, magnetization, exchange coupling, magnetic anisotropy and magnetostriction. This is followed by discussion of extrinsic properties including magnetic hysteresis, frequency dependent magnetic response and magnetic losses. This will serve as the basis for discussing phase relations and structure/properties relationships in various transition metal magnetic materials classes including iron, cobalt and nickel elemental magnets, iron-silicon, iron-nickel, iron-cobalt and iron platinum. This will be followed by a discussion of rare earth permanent magnets, magnetic oxides, amorphous and nanocomposite magnets. Polymers used in Electromagnetic Interference (EMI) Absorbers applications will also be covered.

27-454 Supervised Reading

Spring
This course provides the opportunity for a detailed study of the literature on some subject under the guidance of a faculty member, usually but not necessarily in preparation for the Capstone Course, 27-401/402.

27-477 Introduction to Polymer Science and Engineering

Spring: 9 units
This survey-level course introduces the fundamental properties of polymer materials and the principles underlying the synthesis, engineering, manufacturing, and design with polymer materials. Fundamental concepts of molecular interactions and structure formation in molecular materials will be introduced and the effect of chemical composition on physical properties of polymers will be discussed. The basic principles of polymer chemistry will be introduced and discussed in the context of step- and chain-growth reactions. This is followed by an introduction to technologically relevant engineering properties of polymer materials with focus on mechanical properties, concepts of viscoelasticity and their application to polymer product engineering, a survey of relevant forming technologies as well as the effect of processing on material performance. Case studies will introduce students to the various stages of technical product development, i.e. problem analysis, material selection and processing plan. A final section will discuss polymer recycling and sustainable polymer technologies for a circular economy.
Prerequisite: 27-215

27-503 Additive Manufacturing and Materials

All Semesters: 9 units
This course will develop the understanding required for materials science and engineering for additive manufacturing. The emphasis will be on powder bed machines for printing metal parts, reflecting the research emphasis at CMU. The full scope of methods in use, however, will also be covered. The topics are intended to enable students to understand which materials are feasible for 3D printing. Accordingly, high power density welding methods such as electron beam and laser welding will be discussed, along with the characteristic defects. Since metal powders are a key input, powder-making methods will be discussed. Components once printed must satisfy various property requirements hence microstructure-property relationships will be discussed because the microstructures that emerge from the inherently high cooling rates differ strongly from conventional materials. Defect structures are important to performance and therefore inspection. Porosity is a particularly important feature of 3D printed metals and its occurrence depends strongly on the input materials and on the processing conditions. The impact of data science on this area offers many possibilities such as the automatic recognition of materials origin and history. Finally the context for the course will be discussed, i.e. the rapidly growing penetration of the technology and its anticipated impact on manufacturing.

27-505 Exploration of Everyday Materials

Spring: 9 units
This course is developed for upper level undergraduate and master level students outside of the College of Engineering that wish to learn about materials by experientially exploring a material and or an application of a material. Each year the course will select a material that through its' application, presents and opportunity or a concern in service. It will engage the students with studio-based exploration of the material and application, the selection criteria applicable, and engineering principles that influence the performance. It will explore a wide range of influential topics constraining material selection including societal concerns about materials and global sustainability.

27-508 Special Topics: Principles of Digital Twins in Material Science and Advanced Man

Intermittent: 9 units
This course introduces students to the concept of Digital Twins and provides a thorough introduction to digital twin modeling. An emphasis is placed on improving student literacy across digital twin capabilities and requirements so that students can navigate and understand the scope and applicability of the AI-predictive analytics lifecycle interdependencies supporting digital twins. Students learn not only how to generate and use digital twin models but also how to appropriately select digital environments given specific project requirements.

27-514 Bio-nanotechnology: Principles and Applications

Spring: 9 units
"Have you ever wondered what is nanoscience and nanotechnology and their impact on our lives? In this class we will go through the key concepts related to synthesis (including growth methodologies and characterizations techniques) and chemical/physical properties of nanomaterials from zero-dimensional (0D) materials such as nanoparticles or quantum dots (QDs), one-dimensional materials such as nanowires and nanotubes to two-dimensional materials such as graphene. The students will then survey a range of biological applications of nanomaterials through problem-oriented discussions, with the goal of developing design strategies based on basic understanding of nanoscience. Examples include, but are not limited to, biomedical applications such as nanosensors for DNA and protein detection, nanodevices for bioelectrical interfaces, nanomaterials as building blocks in tissue engineering and drug delivery, and nanomaterials in cancer therapy."

27-515 Introduction to Computational Materials Science

Fall: 9 units
This course introduces students to the theory and practice of computational materials science from the electronic to the microstructural scale. Both the underlying physical models and their implementation as computational algorithms will be discussed. Topics will include: Density functional theory Molecular dynamics Monte Carlo methods Phase field models Cellular automata Data science Coursework will utilize both software packages and purpose-built computer codes. Students should be comfortable writing, compiling, and running simple computer programs in C, C++, Fortran, MatLab, Python, or comparable environment. THIS COURSE IS FOR MSE UNDERGRADUATE STUDENTS ONLY.

27-520 Tissue Engineering

Spring: 12 units
This course will train students in advanced cellular and tissue engineering methods that apply physical, mechanical and chemical manipulation of materials in order to direct cell and tissue function. Students will learn the techniques and equipment of bench research including cell culture, immunofluorescent imaging, soft lithography, variable stiffness substrates, application/measurement of forces and other methods. Students will integrate classroom lectures and lab skills by applying the scientific method to develop a unique project while working in a team environment, keeping a detailed lab notebook and meeting mandated milestones. Emphasis will be placed on developing the written and oral communication skills required of the professional scientist. The class will culminate with a poster presentation session based on class projects. Pre-requisite: Knowledge in cell biology and biomaterials, or permission of instructor

27-533 Principles of Growth and Processing of Semiconductors

Fall: 6 units
Development of a fundamental understanding of material principles governing the growth and processing of semiconductors. Techniques to grow and characterize bulk crystals and epitaxial layers are considered. The processing of semiconductors into devices and the defects introduced thereby are discussed. The roles of growth- and processing-induced defects in determining long term reliability of devices are examined.

27-537 Data Analytics for Materials Science

Spring: 9 units
Materials Science and Engineering has traditionally been taught by emphasizing the development and application of technology. This course will present an alternative approach that combines data analytics and machine learning with material fundamentals (i.e. materials informatics). Prerequisites: 19-250 or 36-220

27-542 Thin Film Technologies

Fall: 9 units
This course will provide you with an understanding of the general science and technology involved in the production of solid thin films, the characteristics of thin film growth processes, methods to characterize important properties of thin films, and some of their current applications, particularly with regard to alternative energy sources, energy-efficient technologies and biosensing technologies. The class will include hands-on experience with thin film production, characterization and device fabrication (and characterization).

27-555 Materials Project I

Fall
This course is designed to give experience in individualized research under the guidance of a faculty member. The topic is selected by mutual agreement, and will give the student a chance to study the literature, design experiments, interpret the results and present the conclusions orally and in writing. Students must have a faculty advisor lined up prior to adding this class.

27-556 Materials Project II

Spring
Second semester of Materials Project. This course is designed to give experience in individualized research under the guidance of a faculty member. The topic is selected by mutual agreement, and will give the student a chance to study the literature, design experiments, interpret the results and present the conclusions orally and in writing.

27-561 Kinetics of Metallurgical Reactions and Processes

Fall: 6 units
This class uses examples from the ironmaking and steelmaking to illustrate different rate-determining reaction steps. Reaction times in ironmaking and steelmaking process vary quite widely; the fundamental origins of the large differences in reaction time are analyzed, after a brief overview of the main reactions and process steps in ironmaking and steelmaking. Particular skills to be practiced and developed include derivation of the mathematical relationships which describe the rates of metallurgical processes which involve heat transfer, and mass transfer for solid-gas, liquid-gas and liquid-liquid reactions; quantifying the expected rates of such reactions; identification of rate-determining steps, based on calculated rates and observed reaction rates; predicting the effects of process parameters such as particle size, stirring, temperature and chemical compositions of phases on the overall rate; and critical evaluation of kinetic data and models in scientific papers on metallurgical reactions.

27-565 Nanostructured Materials

Intermittent: 9 units
This course is an introduction to nanostructured materials or nanomaterials. Nanomaterials are objects with sizes larger than the atomic or molecular length scales but smaller than microstructures with at least one dimension in the range of 1-100 nm. The physical and chemical properties of these materials are often distinctively different from bulk materials. For example, gold nanoparticles with diameters ~15 nm are red and ~40 nm gold nanoparticles are purple whereas bulk gold has a golden color. The course starts with a discussion of top-down and bottom-up fabrication methods for making nanostructures as well as how to image and characterize nanomaterials including scanning probe microscopies. Emerging nanomaterials such as fullerenes, graphene, carbon nanotubes, quantum dots and nanocomposites are also discussed. The course then focuses on applications of nanomaterials to microelectronics, particularly nanoscale devices and the emerging field of molecular-scale electronics. The miniaturization of integrated systems that sense mechanical or chemical changes and produce as electrical signal is presented. The principles and applications of the quantum confinement effects on optical properties are discussed, mainly as sensors. The last part of the course is a discussion of nanoscale mechanisms in biomimetic systems and how these phenomena are applied in new technologies including molecular motors.

27-570 Polymeric Biomaterials

Spring: 12 units
This course will cover aspects of polymeric biomaterials in medicine from molecular principles to device scale design and fabrication. Topics include the chemistry, characterization, and processing of synthetic polymeric materials; cell-biomaterials interactions including interfacial phenomena, tissue responses, and biodegradation mechanisms; aspects of polymeric micro-systems design and fabrication for applications in medical devices. Recent advances in these topics will also be discussed.

27-577 Advanced Polymer Science and Engineering

Fall: 9 units
This advanced-level course introduces the physical concepts necessary to understand the structure-processing-properties relationships of polymers in the solid state. Chain models fundamental to the description of polymers will be introduced. The structure of solid-state polymers will be discussed with focus on the amorphous, crystalline and liquid-crystalline state. The glass transition in amorphous polymers as well as the morphology and kinetics of crystal formation in semi-crystalline polymers will be discussed in detail. Mechanical properties of polymers will be discussed with emphasis of network elasticity and linear viscoelastic behavior. Models to describe nonlinear deformation will be introduced. Simplified and viscoelastic flow models as well as the solidification of polymers will be discussed and their relevance to polymer processing illustrated. Anisotropy development during processing and the application of symmetry concepts to deduce microstructure in processed parts will be discussed. A final section of the class will be dedicated to polymer blends. Basic concepts of lattice models will be introduced and applied to predict the phase behavior of polymer blends. Applications of polymer blends, including thermoplastic elastomers and rubber toughening will be discussed.
Prerequisite: 27-477

27-591 Mechanics of Materials

Fall: 9 units
This course connects the applied loading and displacement on the materials to their internal stress and strains. We will cover failure criteria such as yield criteria and fracture mechanics. The macroscale problem will be connected to microstructure and atomistic scale features when necessary.

27-592 Solidification Processing

Intermittent: 9 units
Spring odd years: The goal of this course is to enable the student to solve practical solidification processing problems through the application of solidification theory. The objectives of this course are to: (1) Develop solidification theory so that the student can understand predict solidification structure; (2) Develop a strong understanding of the role of heat transfer in castings; (3) Develop an appreciation for the strengths and weaknesses of a variety of casting processes. The first half of the course will be theoretical, covering nucleation, growth, instability, solidification microstructure: cells, dendrites, eutectic and peritectic structures, solute redistribution, inclusion formation and separation, defects and heat transfer problems. The second part of the course will be process oriented and will include conventional and near net shape casting, investment casting, rapid solidification and spray casting where the emphasis will be on process design to avoid defects.

27-700 Energy Storage Materials and Systems

Fall and Spring: 12 units
Contemporary energy needs require energy storage and conversion for a range of mobile and stationary applications. This course will examine electrochemically functional materials, devices, and systems that are used to convert, store, and release electrical energy. The principles and mathematical models of electrochemical energy conversion and storage will be examined in depth; students will study thermodynamics and reaction kinetics pertaining to electrochemical reactions, phase transformations, transport, and processing relating to a wide range of related technologies. This course also will also cover the practical aspects associated with the application of batteries, fuel cells, supercapacitor technologies. Students are asked to conduct a class project that involves interacting with outside industry and culminates in a end-of-semester poster session.

27-703 Additive Manufacturing and Materials

All Semesters: 12 units
This course will develop the understanding required for materials science and engineering for additive manufacturing. The emphasis will be on powder bed machines for printing metal parts, reflecting the research emphasis at CMU. The full scope of methods in use, however, will also be covered. The topics are intended to enable students to understand which materials are feasible for 3D printing. Accordingly, high power density welding methods such as electron beam and laser welding will be discussed, along with the characteristic defects. Since metal powders are a key input, powder-making methods will be discussed. Components once printed must satisfy various property requirements hence microstructure-property relationships will be discussed because the microstructures that emerge from the inherently high cooling rates differ strongly from conventional materials. Defect structures are important to performance and therefore inspection. Porosity is a particularly important feature of 3D printed metals and its occurrence depends strongly on the input materials and on the processing conditions. The impact of data science on this area offers many possibilities such as the automatic recognition of materials origin and history. Finally the context for the course will be discussed, i.e. the rapidly growing penetration of the technology and its anticipated impact on manufacturing.

27-704 Principles of Surface Engineering and Industrial Coatings

Fall and Spring: 6 units
Many modern technologies rely on the use of innovative, multi-functional coatings to ensure competitive advantage in the fast-changing global markets. Building such coatings requires advanced planning of the entire coating-substrate system, and of the manufacturing steps. This course will discuss the design principles of multi-functional coatings, present advanced coating architectures and review the relevant manufacturing steps. The course will be illustrated with design principles of functional coatings in three major industries: aerospace, automotive, and machining. We will identify the relevant key challenges, and follow the thinking process of the industry leaders addressing the challenge. Then, we will examine the developed coating solutions: multi-functional tribological coatings on cutting tools; thermal barrier coatings on nickel alloy turbine blades for aircraft and power generation; diamond like coatings and wear protective coatings for automotive diesel engines; and corrosion protection in the aerospace and in the automotive industries. The course will conclude with a discussion of new trends in surface engineering and in the design of multi-functional coatings, including self-healing, self-cleaning, and other smart coatings.

27-706 Hard and Superhard Materials

Fall and Spring: 6 units
This course will focus on the fundamental principles of hard and superhard materials. We will first discuss the origin of hardness across materials, and then describe important examples of materials prized for their intrinsic or extrinsic hardness. We will focus on the preparation, microstructure, and properties of materials such as diamond, cubic boron nitride and compound carbides. Then, we will emphasize the design of novel nano-structured and nano-composite materials and coatings, which are at the frontier of material science. Finally, the course will present examples of the architecture and processing methods used to generate hard materials and coatings in manufacturing automotive and aerospace industries.

27-709 Biomaterials

Fall: 12 units
This course will cover structure-processing-property relationships in biomaterials for use in medicine. This course will focus on a variety of materials including natural biopolymers, synthetic polymers, and soft materials with additional treatment of metals and ceramics. Topics include considerations in molecular design of biomaterials, understanding cellular aspects of tissue-biomaterials interactions, and the application of bulk and surface properties in the design of medical devices. This course will discuss practical applications of these materials in drug delivery, tissue engineering, biosensors, and other biomedical technologies.

27-715 Applied Magnetism and Magnetic Materials

Spring: 12 units
In this course we address the physics of magnetism of solids with emphasis on magnetic material properties and phenomena which are useful in various applications. The content of this course includes the origins of magnetism at the atomic level and the origins of magnetic ordering (ferro-, ferri-, and antiferromagnetism), magnetic anisotropy, magnetic domains, domain wall, spin dynamics, and transport at the crystalline level. The principles of magnetic crystal symmetry are utilized to explore the various domains in ferromagnetic crystals, and tensors are used in the description of such magnetic properties as magnetocrystalline anisotropy, susceptibility and magnetostriction. To a limited extent, the applications of magnetism are discussed in order to motivate the understanding of the physical properties and phenomena.

27-719 Computational Thermodynamics

Spring: 6 units
Computational thermodynamics is a powerful tool of a Materials Engineer. We will examine how thermodynamic simulation software outputs an equilibrium calculation from a list of input conditions. This requires a description of Gibbs energy minimization calculations, Gibbs energy models, and the construction of these models from thermodynamic data. At the end of the class students should be able to use thermodynamic simulation software to solve engineering problems while recognizing its limitations. This class is for graduate students interested in these computational tools.

27-720 Tissue Engineering

Spring: 12 units
This course will train students in advanced cellular and tissue engineering methods that apply physical, mechanical and chemical manipulation of materials in order to direct cell and tissue function. Students will learn the techniques and equipment of bench research including cell culture, immunofluorescent imaging, soft lithography, variable stiffness substrates, application/measurement of forces and other methods. Students will integrate classroom lectures and lab skills by applying the scientific method to develop a unique project while working in a team environment, keeping a detailed lab notebook and meeting mandated milestones. Emphasis will be placed on developing the written and oral communication skills required of the professional scientist. The class will culminate with a poster presentation session based on class projects. Pre-requisite: Knowledge in cell biology and biomaterials, or permission of instructor

27-721 Processing Design

Fall: 6 units
In this course, the concepts of materials and process design are developed, integrating the relevant fundamental phenomena in a case study of a process design. The course includes basic science and engineering as well as economic and environmental considerations. The case study is on environmentally acceptable sustainable steelmaking. Other case studies in materials processing could be used.

27-729 Solid State Devices for Energy Conversion

Intermittent: 6 units
Intensive research efforts have yielded promising new materials approaches to 'alternative' energy conversion technologies, such as solar cells or photovoltaics; thermoelectric materials, which convert waste heat to electricity; metal/semiconductor superlattices for thermionic energy conversion; and fuel cells. At the same time, notable advances have been made in devices that substantially enhance our energy efficiency: e.g., chemical sensors and light-emitting diodes for solid-state lighting. In all of these devices, interfaces between dissimilar materials often govern and/or limit the behavior. In addition to the basic structures and operating principles, this course will cover practical materials interface issues, such as electrical transport, thermal stability, contact resistance, and bandgap engineering, that significantly affect the performance of a variety of energy conversion and energy-saving devices.

27-731 Texture, Microstructure & Anisotropy

Intermittent: 6 units
The purpose of Texture, Microstructure and amp; Anisotropy is to acquaint the student with a selected set of characterization tools relevant to the quantification of microstructure (including crystallographic orientation, i.e. texture) and anisotropic properties. The motivation for the course is problem solving in the areas of property measurement (e.g. grain boundary energy), prediction of microstructural evolution (e.g. in grain growth and recrystallization), and prediction of properties based on measured microstructure (e.g. anisotropy of work hardening and ductility). In this 6 unit mini version of the course, the specific objectives are to develop skills and understanding in the following areas: (1) The mathematical basis for crystallographic orientation distributions (aka ODFs), with explanations of the many representations of rotations/orientations; (2) Crystallographic preferred orientation (texture) and its representation by pole figures, inverse pole figures and orientation distributions, with a particular emphasis on the effects of symmetry in representations; (3) Methods of measuring texture such as X-ray (diffraction) Pole Figures and Electron Back Scatter Diffraction (EBSD) with reference to orientation mapping; (4) The effect of texture on elastic and plastic anisotropy in polycrystals; the uniform stress model (Sachs), the Taylor-Bishop and amp; Hill model, the Eshelby analysis; Emphasis is placed on the use and understanding of quantitative tools for texture data acquisition and amp; analysis (e.g. orientation distribution determination from pole figure data, and automated electron back-scatter diffraction/EBSD/OIM), the effect of crystal and sample symmetry on distributions and their representation, and the prediction of anisotropy (e.g. calculation of yield surfaces for plastic deformation). Since the datasets are often large, such as from EBSD scans, computer programs are essential.

27-734 Methods of Computational Materials Science

Fall: 12 units
This course introduces students to the theory and practice of computational materials science from the electronic to the microstructural scale. Both the underlying physical models and their implementation as computational algorithms will be discussed. Topics will include: Density functional theory Molecular dynamics Monte Carlo methods Phase field models Cellular automata Data science Examples and homework problems will be taken from all areas of materials science. Coursework will utilize both software packages and purpose-built computer codes. Students should be comfortable writing, compiling, and running simple computer programs in MatLab, Python, or comparable environment.

27-737 Data Analytics and Machine Learning for Materials Science

Intermittent: 12 units
Materials Science and Engineering has traditionally been taught by emphasizing the development and application of technology. This course will present an alternative approach that combines data analytics and machine learning with material fundamentals (i.e. materials informatics).

27-741 Practical Methods in Transmission Electron Microscopy

Fall and Spring: 12 units
This course is designed to provide instrument training on transmission electron microscopes in the Materials Characterization Facility (MCF). Emphasis will be placed on acquiring the basic skills needed to successfully operate this type of microscope; this will be achieved by a combination of lectures and hands-on lab sessions. Lectures will provide the necessary background to understand electron scattering techniques, including electron diffraction, bright field and dark field imaging, phase contrast microscopy, and energy dispersive x-ray spectroscopy. Lab sessions will inform the student on standard operating procedures for the techniques discussed in the lecture portion of the course. At the end of the course, the student is expected to demonstrate the ability to independently use the transmission electron microscope for basic operations; successful demonstration of such skills will lead to certification for day-use of transmission electron microscopes in the MCF.

27-752 Fundamentals of Semiconductors and Nanostructures

Spring: 12 units
This course is designed to provide students with a foundation of the physics required to understand nanometer-scale structures and to expose them to different aspects of on-going research in nanoscience and nanotechnology. Illustrative examples will be drawn from the area of semiconductor nanostructures, including their applications in novel and next-generation electronic, photonic, and sensing devices. The course begins with a review of basic concepts in quantum physics (wave-particle duality, Schr and #246;dinger's equation, particle-in-a-box, approximation methods in quantum mechanics, etc.) and then continues with a discussion of bulk three-dimensional solids (band structure, density of states, the single-electron effective-mass approximation). Size effects due to nanometer-scale spatial localization are then discussed within a quantum-confinement model in one-, two-, and three- dimensions for electrons. An analogous discussion for photons is also presented. The basic electronic, optical, and mechanical properties of the low-dimensional nanostructures are then discussed. A select number of applications in electronics, photonics, biology, chemistry, and bio-engineering will be discussed to illustrate the range of utility of nanostructures. Upon completion of the course, students will have an appreciation and an understanding of some of the fundamental concepts in nanoscience and nanotechnology. The course is suitable for first-year graduate students in engineering and science (but advanced undergraduates with appropriate backgrounds may also take it with permission from the instructor). Pre-requisites include 09-511, 09-701, 09-702, 18-311, 27-770, 33-225, 33-234 or familiarity with the material or basic concepts covered in these courses.

27-754 Mechanical Behavior of Engineering Materials

Intermittent: 12 units
Engineers employ all classes of materials (metals, polymers, ceramics and hybrids) in load-bearing applications. To reduce material cost, save energy and maximize performance, engineering materials are frequently designed to be used near their load-bearing limits. An understanding of underlying deformation mechanisms complements a design rule approach in that unexpected failures can be far better anticipated and hence minimized. This course will survey the major deformation mechanisms in the main materials classes. Topics will include structure, elasticity, continuum failure models, fracture mechanics, and plastic deformation mechanisms of polymers, fiber-reinforced, composites, ceramics and metals. Proper design practice and real-life failures will be discussed.

27-761 Kinetics of Metallurgical Reactions and Processes

Fall: 6 units
This class uses examples from the ironmaking and steelmaking to illustrate different rate-determining reaction steps. Reaction times in ironmaking and steelmaking process vary quite widely; the fundamental origins of the large differences in reaction time are analyzed, after a brief overview of the main reactions and process steps in ironmaking and steelmaking. Particular skills to be practiced and developed include derivation of the mathematical relationships which describe the rates of metallurgical processes which involve heat transfer, and mass transfer for solid-gas, liquid-gas and liquid-liquid reactions; quantifying the expected rates of such reactions; identification of rate-determining steps, based on calculated rates and observed reaction rates; predicting the effects of process parameters such as particle size, stirring, temperature and chemical compositions of phases on the overall rate; and critical evaluation of kinetic data and models in scientific papers on metallurgical reactions.

27-766 Defects and Diffusion in Materials

Fall: 12 units
Defects in materials, and the transport of matter through these defects by diffusion, strongly influence a material's physical properties and microstructural evolution. For example, the strength of materials, the electrical and optical properties of materials, and the rates at which microstructures coarsen, recrystallize, and oxidize all depend on the population of intrinsic and extrinsic defects and the transport of matter through these defects. The objective of this course is to define methods of quantifying the population and properties of defects in materials and the transport of matter through these defects. The course addresses both crystalline, semicrystalline, and amorphous materials and begins with the fundamentals of diffusion in amorphous materials. After describing point defect formation and equilibrium defect populations in elements and compounds, diffusion through these defects will be described. Point defect diffusion will be illustrated using examples such as the Kirkendall effect and diffusive creep. The properties and characteristics of dislocations, their motion, and the role of dislocations in deformation will also be discussed. Short circuit diffusion and the role of diffusion in dislocation creep will be described as examples of transport involving dislocations. Finally, the energetics of planar defects, grain boundaries, and interfaces will be discussed. Diffusive transport along interfaces will be described, using examples including transport in two phase systems, sintering, and coarsening.

27-791 Mechanical Behavior of Materials

Spring: 12 units
This course connects the applied loading and displacement on the materials to their internal stress and strains. We will cover failure criteria such as yield criteria and fracture mechanics. The macroscale problem will be connected to microstructure and atomistic scale features when necessary.

27-792 Solidification Processing

Spring: 12 units
The goal of this course is to enable the student to solve practical solidification processing problems through the application of solidification theory. The objectives of this course are to: (1) Develop solidification theory so that the student can understand predict solidification structure; (2) Develop a strong understanding of the role of heat transfer in castings; (3) Develop an appreciation for the strengths and weaknesses of a variety of casting processes. The first half of the course will be theoretical, covering nucleation, growth, instability, solidification microstructure: cells, dendrites, eutectic and peritectic structures, solute redistribution, inclusion formation and separation, defects and heat transfer problems. The second part of the course will be process oriented and will include conventional and near net shape casting, investment casting, rapid solidification and spray casting where the emphasis will be on process design to avoid defects.

27-796 Structure and Characterization of Materials

Fall: 12 units
The objective of this course is for the student to be able to understand important crystal structures of both inorganic and organic materials in terms of their building blocks (atom positions, Bravais lattices, structural units, symmetry groups, stacking and packing configurations) and also to understand how modern experimental materials characterization techniques (including x-ray, electron, and neutron diffraction and spectroscopic techniques) are used to obtain structural and chemical information.

27-798 Thermodynamics of Materials

Fall: 12 units
This course offers a practical introduction to the principles of statistical thermodynamics that links the microscopic atomic details of materials to their macroscopic behavior, and applies these principles to multicomponent material equilibria. The laws and concepts of classical thermodynamics and probability are briefly reviewed, and then applied to introduce the atomic statistical definitions for temperature, entropy, and thermodynamic equilibrium. Statistical methods for enumerating the microscopic configurations of fluids, magnets, solid crystals, and polymers will be covered and applied to evaluate thermodynamic free energies subject to varying macroscopic constraints. These will be used to relate equilibrium properties and phase behavior to the engineerable molecular details of materials. Applications will include equilibrium phase diagrams (binary and ternary), predominance diagrams, chemical reactions, thermodynamics of surfaces, and electrochemistry.

27-990 SPECIAL TOPICS: Teaching Materials Science & Engineering

Spring: 3 units
This course is designed to prepare graduate students for their future role as educators in Materials Science and amp; Engineering. Teaching is a critical facet of higher education whether as a course assistant, instructor, or student mentor. Although excellent teaching can have a significant positive impact on students at all levels, formal training at the University level is relatively uncommon. Contrary to popular belief, teaching is not simply a skill you are born with, but rather one that requires significant practice and continuous refinement. The primary goal of this course is to provide pedagogical strategies necessary to be an effective teacher with a focus on fundamental topics in materials science and amp; engineering.

Department of Mechanical Engineering

Jonathan Cagan,
Department Head and George Tallman and Florence Barrett Ladd Professor in Engineering

Location: Scaife Hall 336
www.cmu.edu/me (http://www.cmu.edu/me/)

General Overview

Mechanical engineers use their knowledge of mechanical systems to describe phenomena, propose solutions to problems, and build those solutions. Concerned with the principles of force, energy and motion, they use their knowledge of physical systems, design, manufacture, and operational processes to advance the world around us. Mechanical engineers work in a variety of sectors: small start-up companies, multi-national corporations, government agencies, national laboratories, consulting firms, and universities.

The Carnegie Mellon Mechanical Engineering curriculum emphasizes engineering theory, hands-on experience, and technical skills. Our students learn how to solve practical problems and analyze situations by converting ideas into reliable and cost-effective devices and processes.

A strong foundation in mechanical engineering fundamentals culminates in a design capstone class where student teams develop prototypes for new products. These projects expose students to the design process, from concept to product, and emphasize effective communication and presentations skills.

Our curriculum is intended to allow ample opportunity for students to pursue areas of personal interest. A student may choose to pursue a minor offered by departments in other colleges, or one of the designated minor programs offered in the College of Engineering, or to pursue an additional major. Students are encouraged to participate in research with department faculty members, explore their chosen field through internships, and take advantage of opportunities to study abroad and be exposed to other cultures. Students may also choose to pursue the Integrated Master’s/Bachelor’s Program (IMB) which allows students to earn both a bachelor’s and a master’s degree with an additional semester or year of study.

Mechanical Engineering students access TechSpark (https://engineering.cmu.edu/techspark/) for hands-on projects in multiple core courses and technical electives. TechSpark (https://engineering.cmu.edu/techspark/) is the cornerstone of the College of Engineering's maker ecosystem, where students are advised by faculty and staff to create, develop, and test new ideas for technology innovation. The space houses a computer simulation cluster, 3D printers, laser machines, electronics stations, manual lathes & CNC mills, metal welding, wood working & CNC Router, polymer composite fabrication, paint booth, and more. This integrated set of resources allows students, faculty, and staff to design and prototype in a multi-disciplinary environment.

Accreditation

The Mechanical Engineering program is accredited by the Engineering Accreditation Commission of ABET, https://www.abet.org, under the General Criteria and the Program Criteria for Mechanical and Similarly Named Engineering Programs.

Program Educational Objectives

According to ABET (http://www.abet.org/), which evaluates applied science, computing, engineering and technology programs for accreditation, “program educational objectives are broad statements that describe what graduates are expected to attain within a few years of graduation.”

The core objective of our undergraduate program is to provide our students an education that enables them to be productive, impactful, and fulfilled professionals throughout their careers. In light of this vision, the program educational objectives of the Bachelor of Science in Mechanical Engineering at Carnegie Mellon are to produce graduates who:

- Distinguish themselves as effective problem solvers by applying fundamentals of mechanical engineering alongside modern experimental and computational methods
- Are innovative and resourceful in their professional activities.
- Excel in team settings, incorporating diverse viewpoints and ideas and implementing strategies for equitable participation
- Become effective communicators who are prepared to take on leadership roles in their organizations, their profession, and in society
- Conduct themselves in a professional and ethical manner in the workplace.
- Excel in diverse career paths within and beyond engineering profession, including in industry and academia.

student Outcomes

The undergraduate curriculum in the Department of Mechanical Engineering offers students significant opportunities to pursue directions of personal interest, including minors, double majors, participation in research projects, and study abroad. Design and teamwork experiences occur at regular intervals in the curriculum, and graduates have significant hands-on experience through laboratories and projects.

Carnegie Mellon's Mechanical Engineering faculty members are in support of the following set of skills and outcomes put forth by ABET:

- an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
- an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
- an ability to communicate effectively with a range of audiences
- an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
- an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
- an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
- an ability to acquire and apply new knowledge as needed, using appropriate learning strategies

Curriculum

Minimum units required for B.S. in Mechanical Engineering: 382

The following template outlines the four-year B.S. program through the standard and recommended course sequence. To ensure that prerequisites are completed and to prevent scheduling conflicts, students should discuss any changes to this sequence with their department academic advisor. Students need a minimum of 382 units to complete the B.S. degree. Since there are variable units for some core requirements, additional units can be made up with free electives.

First Year

Fall		Units
21-120	Differential and Integral Calculus	10
24-101	Fundamentals of Mechanical Engineering	12
33-141	Physics I for Engineering Students	12
99-101	Core@CMU	3
76-101	Interpretation and Argument	9
		46

Spring		Units
21-122	Integration and Approximation	10
xx-xxx	Second Introductory Engineering Course	12
xx-xxx	Physics II/Computer Science/Chemistry*	10-12
xx-xxx	General Education Course	9
		41-43

First Year Curriculum Notes:

1. During the first year, students complete 24-101 Fundamentals of Mechanical Engineering and one other introductory engineering

course. 24-101 Fundamentals of Mechanical Engineering is a prerequisite for sophomore courses 24-261 Mechanics I: 2D Design and 24-251 Electronics for Sensing and Actuation, as well as junior course 24-351 Dynamics. Students who are not able to take 24-101 in their first year will push the 24-261 Mechanics I and 24-262 Mechanics II sequence into their junior year. If 24-101 is taken in fall of sophomore year, students can take 24-251 Electronics for Sensing and Actuation and 24-351 Dynamics in sophomore spring to continue progress towards the Mechanical Engineering degree.

2. All Mathematics courses (21-xxx) required for the engineering degree must have a minimum grade of C in order to fulfill the graduation requirement for the BS engineering degree and to count as a prerequisite for engineering core classes.
3. Students must pass the following three courses before they begin the core Mechanical Engineering courses in the fall of their sophomore year:
    21-120 Differential and Integral Calculus
    21-122 Integration and Approximation

    33-141 Physics I for Engineering Students

Sophomore Year

Fall		Units
24-221	Thermodynamics	10
24-261	Mechanics I: 2D Design	10
21-254	Linear Algebra and Vector Calculus for Engineers	11
xx-xxx	Physics II/Computer Science/Chemistry*	10-12
24-xxx	24-200 Machine Shop OR 24-251 Electronics for Sensing and Actuation ** and ***	1-3
xx-xxx	General Education Course	9
39-210	Experiential Learning I	0
		51-55

Spring		Units
24-231	Fluid Mechanics	10
24-262	Mechanics II: 3D Design	10
21-260	Differential Equations	9
xx-xxx	Physics II/Computer Science/Chemistry*	10-12
24-xxx	24-200 Machine Shop OR 24-251 Electronics for Sensing and Actuation **and***	1-3
xx-xxx	Lab requirement ****	
xx-xxx	General Education Course	9
39-220	Experiential Learning II	0
		49-53

* **Physics II/Chemistry/Computer Science:**
First year students are encouraged to prioritize completing Physics II and Programming requirement over Chemistry in the first year.

- The recommended Physics sequence is 33-141 (http://coursecatalog.web.cmu.edu/search/?P=33-141) / 33-142 (http://coursecatalog.web.cmu.edu/search/?P=33-142) for engineering students, however, 33-151 (http://coursecatalog.web.cmu.edu/search/?P=33-151) / 33-152 (http://coursecatalog.web.cmu.edu/search/?P=33-152) will also meet the CIT Physics requirement.
- The programming requirement can be filled with 15-110 Principles of Computing or 15-112 Fundamentals of Programming and Computer Science.
- The Chemistry requirement can be filled with 09-105 Introduction to Modern Chemistry I or 09-111 Nanolegos: Chemical Building Blocks.

** **24-200 or 24-203 and 24-251 Completed Sophomore Year:**
Machine shop 24-200 Maker Series: Intro to Manual Machining **or** 24-203 Special Topics: TechSpark: Manual Machining **and** 24-251 Electronics for Sensing and Actuation should be completed in sophomore year. Both are required courses.

*** **Waiving Electronics for Sensing and Actuation:**
Mechanical Engineering (MechE) students who took the 18-100 Introduction to Electrical and Computer Engineering in their first year, have the option of waiving 24-251 Electronics for Sensing and Actuation. These units must be replaced with 3 units of graded Mechanical Engineering credit which could be done by taking a 12 unit MechE Technical Elective instead of a 9 unit course. Eligible students will be invited to complete a form to confirm their intention to waive 24-251.

**** **Lab Requirement:**
Mechanical engineering undergraduates must satisfy one science laboratory requirement to graduate. The lab requirement may be fulfilled with one of the following courses in any semester:

03-124	Modern Biology Laboratory	9
09-101	Introduction to Experimental Chemistry	3
33-100	Basic Experimental Physics	6
33-104	Experimental Physics	9
42-203	Biomedical Engineering Laboratory	9

Junior Year

Fall		Units
24-302	Professional Development for Mechanical Engineers Taken either Fall or Spring.	2
24-322	Heat Transfer	10
24-351	Dynamics (Offered Fall and Spring)	10
24-370	Mechanical Design: Methods and Applications	12
36-220	Engineering Statistics and Quality Control	9
xx-xxx	General Education Course	9
39-310	Experiential Learning III	0
		52

Spring		Units
24-302	Professional Development for Mechanical Engineers Taken either Fall or Spring.	2
24-311	Numerical Methods	10
24-321	Thermal-Fluids Experimentation	12
24-352	Dynamic Systems and Controls (Offered Fall and Spring)	12
xx-xxx	General Education Course	9
		45

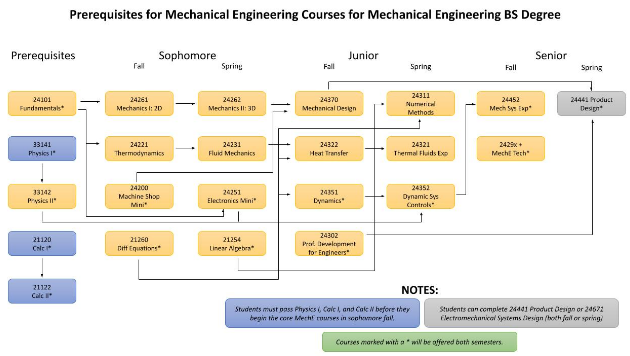
Senior Year

Fall		Units
24-441	Engineering Design II: Conceptualization and Realization ****	12
or 24-671	Electromechanical Systems Design	
24-452	Mechanical Systems Experimentation (Offered Fall and Spring)	9
xx-xxx	Elective	9
xx-xxx	Elective	9
xx-xxx	General Education Course	9
		48

Spring		Units
24-441	Engineering Design II: Conceptualization and Realization ****	12
or 24-671	Electromechanical Systems Design	
24-xxx	Mechanical Engineering Technical Elective	9-12
xx-xxx	General Education Course	9
xx-xxx	Elective	9
xx-xxx	Elective	9
		48-51

**** **Capstone Courses:**

- Mechanical Engineering students complete **one** capstone class either fall or spring of senior year. This course is the culmination of the knowledge gained over the previous years in mechanical engineering core classes. To fulfill the capstone course requirement, students can complete one of the following 24-441 Engineering Design II: Conceptualization and Realization (FALL OR SPRING), 24-671 Electromechanical Systems Design (FALL OR SPRING).
- Capstone course can be taken either Fall or Spring of senior year.
- Biomedical Engineering Double Majors **may** use the capstone for their double major **instead of** the above listed MechE capstone classes.



Mechanical Engineering Technical Electives

Students must take at least one approved non-core Mechanical Engineering course labeled as "Mechanical Engineering Technical Elective" in the example course sequence. The course must be an approved 24-xxx course (9-unit minimum) at the 300 level or above to fulfill the technical elective requirement. 24-292 Renewable Energy Engineering is the only 200 level courses that may be used as a Mechanical Engineering Technical Elective.

Students can also take mechanical engineering graduate courses to fulfill the technical elective requirement. However, students must have the appropriate prerequisites and the instructor must approve taking the course. Undergraduates do not have priority for graduate level courses. Students can find a list of graduate courses we offer on the Carnegie Mellon Schedule of Classes (https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/).

Course offerings are variable, please check the Schedule of Classes (https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/) to see the most current list of classes.

Students cannot use research or project courses to fulfill the technical elective requirement. However, these courses, with limitations, will count as free elective units. Up to 27 units of project/research may be counted in the free electives. Project/research courses that do not fulfill the technical elective requirements are:

- 24-391 / 24-392 Mechanical Engineering Project
- 24-491 / 24-492 Department Research Honors
- 39-xxx CIT series courses

Free Electives

A Free Elective is defined as any graded course offered by any academic unit of the university. Free electives offer students the opportunity to add additional majors and minors, pursue additional interests or deepen their experience in Mechanical Engineering. Typically, once the core requirements are completed, there remain about 45 units of free electives to reach the minimum of 382 to complete the degree.

Up to 9 units of Student Taught Courses (StuCO) and Physical Education courses, or other courses taken as Pass/Fail, may also be used toward Free Electives.

Guidance on Engineering Electives

The Mechanical Engineering department offers several elective courses for undergraduates seeking further knowledge and experience in specialty areas of mechanical engineering. These courses (with approval) can fulfill for your Mechanical Engineering Technical Elective, Free Electives, and/or additional major or minor requirements.

Robotics and Automation

Fundamental Courses		
24-451	Feedback Control Systems	12
24-677	Modern Control Theory	12
24-760	Robot Dynamics and Analysis	12
24-773	Multivariable Linear Control	12
24-776	Non Linear Control	12
Application Courses		
24-614	Microelectromechanical Systems	12
24-671	Electromechanical Systems Design	12
24-673	Soft Robots: Mechanics, Design and Modeling	12
24-753	Special Topics: Robotic Materials: Designs, Principles & Mechanics	12
24-774	Advanced Control Systems Integration	12
24-775	Robot Design and Experimentation	12
24-778	Mechatronic Design	12

Energy, Environment, and Thermal Fluid Systems

Fundamental Courses		
24-711	Fluid Dynamics	12
24-718	Computational Fluid Dynamics	12
24-721	Advanced Thermodynamics	12
24-722	Energy System Modeling	12
24-730	Advanced Heat Transfer	12
Application Courses		
24-292	Renewable Energy Engineering	9
24-381	Environmental Systems on a Changing Planet	12
24-421	Internal Combustion Engines	12
24-425	Combustion and Air Pollution Control	9
24-428	Computational Analysis of Transport Phenomena	9
24-623	Molecular Simulation of Materials	12
24-626	Air Quality Engineering	12
24-628	Energy Transport and Conversion at the Nanoscale	12
24-629	Direct Solar and Thermal Energy Conversion	12
24-631	Thermal Design	12
24-643	Energy Storage Materials and Systems	12

Product Design and Development

Fundamental Courses		
24-651	Material Selection for Mechanical Engineers	12
24-681	Computer-Aided Design	12
24-683	Design for Manufacture and the Environment	12
24-688	Introduction to CAD and CAE Tools	12
Application Courses		
24-632	Special Topics: Additive Manufacturing Processing and Product Development	12
24-633	Additive Manufacturing Laboratory	12
24-672	Special Topics in DIY Design and Fabrication	12
24-680	Quantitative Entrepreneurship: Analysis for New Technology Commercialization	12
24-691	Mechanical Engineering Project Management	12
24-692	Special Topics: Engineering a Startup: How to Start and Grow a Hardware Company	12

Autonomous Systems and Machine Learning

Fundamental Courses		
24-451	Feedback Control Systems	12
24-480	Special Topics: Artificial Intelligence and Machine Learning for Engineering	9
24-677	Modern Control Theory	12
24-704	Probability and Estimation Methods for Engineering Systems	12
24-789	Special Topics: Deep Learning for Engineers	12
Application Courses		
24-774	Advanced Control Systems Integration	12
24-775	Special Topics: Robot Design and Experimentation	12
24-784	Special Topics: Trustworthy AI	12

Computational Engineering

Fundamental Courses		
24-703	Numerical Methods in Engineering	12
24-780	Engineering Computation	12
24-783	Advanced Engineering Computation	12
24-785	Engineering Optimization	12
Application Courses		
24-658	Image-Based Computational Modeling and Analysis	12
24-681	Computer-Aided Design	12

24-718	Computational Fluid Dynamics	12
24-755	Finite Elements in Mechanics I	12
24-781	Engineering Computation Project	12

Engineering Mechanisms and Materials

Fundamental Courses		
24-634	Structural Design	12
24-635	Structural Analysis	9
24-652	Mechanical Behavior of Engineering Materials	12
24-653	Special Topics: Materials and Their Processing for Mechanical Engineers	12
24-751	Solid Mechanics and Elasticity	12
Application Courses		
24-643	Energy Storage Materials and Systems	12
24-650	Applied Finite Element Analysis	12
24-684	Special Topics: Nanoscale Manufacturing Using Structural DNA Nanotechnology	12
24-755	Finite Elements in Mechanics I	12
24-753	Special Topics: Robotic Materials: Designs, Principles & Mechanics	12

Quality Point Average Requirements

To be eligible to graduate, undergraduate students must complete all course requirements for their program with a cumulative Quality Point Average of at least 2.00 for all courses taken. For undergraduate students who enrolled at Carnegie Mellon as freshmen and whose freshman grades cause the cumulative QPA to fall below 2.0, this requirement is modified to be a cumulative QPA of at least 2.0 for all courses taken after the freshman year. Note, however, the cumulative QPA that appears on the student's final transcript will be calculated based on all grades in all courses taken, including freshman year. The Mechanical Engineering Department requires that students attain a quality point average of 2.00 or higher for all required Mechanical Engineering core courses.

Pursuant to university rules, students can repeat a course in which a grade below C was attained in order to achieve the QPA requirement. When a course is repeated, all grades will be recorded on the official academic transcript and will be calculated in the student's QPA. For all required Mechanical Engineering core courses, the highest grade obtained between the original and the repeated class will be used to calculate the Mechanical Engineering QPA.

Credit Overload Policy

Mechanical Engineering students can register for a maximum of 54 units per semester. A student can request additional units from the Undergraduate Education Committee based on their QPA. The policy is outlined in the Mechanical Engineering Undergraduate Handbook (https://www.meche.engineering.cmu.edu/education/undergraduate-education/undergraduate-handbooks.html).

Additional Majors and Minors

Mechanical Engineering students may pursue additional majors and minors in a variety of subjects, taking advantage of the free elective courses to satisfy the requirements for the major or minor. The College of Engineering has added designated minors to promote flexibility and diversity among engineering students. Common double majors for Mechanical Engineering students include Engineering and Public Policy, Biomedical Engineering, Engineering Design, and Innovation & Entrepreneurship and Robotics.

A complete description of majors and minors in engineering can be found on the College of Engineering website (https://engineering.cmu.edu/education/undergraduate-studies/curriculum/).

Internships and Co-operative Education Program

The Mechanical Engineering Department considers experiential learning opportunities important educational options for its undergraduate students. Students in Mechanical Engineering are encouraged to undertake professional internships during summer breaks.

Another option is cooperative education, which provides a student with an extended period of exposure with a company. All co-ops must be at least 6 consecutive months in length, and must be a full-time, paid position with a single company.

Study Abroad

In today’s global society, a study abroad experience can be an integral part of an undergraduate engineering education. An academic experience abroad is encouraged and assistance is provided for course choices and curriculum sequencing. The Mechanical Engineering department offers scholarships for international experiences to support and encourage students to take advantage of study and work abroad experiences.

Integrated Master's/Bachelor's Program (IMB)

Interested undergraduates may plan a course of study that leads to both the Bachelor's and Master's in Mechanical Engineering. Beyond eight semesters, at least one semester of full-time graduate student status is required. Please refer to the Integrated Master’s/Bachelor’s Degree Program section in the most recent Master of Science in Mechanical Engineering Handbook (https://www.meche.engineering.cmu.edu/education/graduate-programs/handbooks.html) for additional information.

Full-Time Faculty

BURAK AKSAK, Teaching Professor – P.h.D, University of Illinois Urbana-Champaign; Carnegie Mellon, 2025–

AMIR BARATI FARIMANI, Assistant Professor of Mechanical Engineering – Ph.D., University of Illinois at Urbana-Champaign; Carnegie Mellon, 2018–

MARK BEDILLION, Teaching Professor of Mechanical Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2016–

SARAH BERGBREITER, Professor of Mechanical Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 2018–

JACK LEE BEUTH, Professor of Mechanical Engineering – Ph.D., Harvard University; Carnegie Mellon, 1992–

OPHELIA BOLMIN, Assistant Professor – P.h.D., University of Illinois Urbana-Champaign; Carnegie Mellon, 2024–

JONATHAN CAGAN, Department Head and George Tallman and Florence Barrett Ladd Professor of Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 1990–

MAARTEN P. DE BOER, Professor of Mechanical Engineering – Ph.D., University of Minnesota; Carnegie Mellon, 2007–

NESTOR GOMEZ, Assistant Teaching Professor – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2018–

NOELIA GRANDE GUTIERREZ, Assistant Professor of Mechanical Engineering – Ph.D., Stanford University; Carnegie Mellon, 2021–

DIANA HAIDAR, Assistant Teaching Professor of Mechanical Engineering – Ph.D., University of Delaware; Carnegie Mellon, 2017–

ENI HALILAJ, Assistant Professor of Mechanical Engineering – Ph.D., Brown University; Carnegie Mellon, 2018–

B. REEJA JAYAN, Associate Professor of Mechanical Engineering – Ph.D., University of Texas at Austin; Carnegie Mellon, 2015–

AARON M. JOHNSON, Assistant Professor of Mechanical Engineering – Ph.D., University of Pennsylvania; Carnegie Mellon, 2016–

TREVOR J JONES, Assistant Professor – Ph.D., Princeton University; Carnegie Mellon, 2023–

INSEUNG KANG, Assistant Professor – P.h.D., Georgia Tech; Carnegie Mellon, 2024–

LEVENT BURAK KARA, Professor of Mechanical Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2007–

PHILIP R. LEDUC, William J. Brown Professor of Mechanical Engineering – Ph.D., The Johns Hopkins University; Carnegie Mellon, 2002–

SHAWN LITSTER, Professor of Mechanical Engineering – Ph.D., Stanford University; Carnegie Mellon, 2008–

CARMEL MAJIDI, Clarence H. Adamson Professor of Mechanical Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 2011–

JONATHAN A. MALEN, Professor of Mechanical Engineering – Ph.D., University of California at Berkeley; Carnegie Mellon, 2009–

CHRISTOPHER MCCOMB, Associate Professor of Mechanical Engineering – Ph.D. , Carnegie Mellon University; Carnegie Mellon, 2021–

ALAN J.H. MCGAUGHEY, Trustee Professor of Mechanical Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2005–

JEREMY J. MICHALEK, Professor of Mechanical Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2005–

O. BURAK OZDOGANLAR, Ver Planck Professor of Mechanical Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2004–

RAHUL PANAT, Russell V. Trader Career Development Associate Professor of Mechanical Engineering – Ph.D., University of Illinois at Urbana-Champaign; Carnegie Mellon, 2017–

SNEHA PRABHA NARRA, Assistant Professor of Mechanical Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2021–

ALBERT PRESTO, Research Professor of Mechanical Engineering – Ph.D., Carnegie Mellon University; Carnegie Mellon, 2012-–

YOED RABIN, Professor of Mechanical Engineering – D.Sc., Technion-Israel Institute of Technology; Carnegie Mellon, 2000–

SHENG SHEN, Professor of Mechanical Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 2011–

KENJI SHIMADA, Theodore Ahrens Professor of Engineering – Ph.D., Massachusetts Institute of Technology; Carnegie Mellon, 1996–

SATBIR SINGH, Teaching Professor of Mechanical Engineering – Ph.D., University of Wisconsin at Madison; Carnegie Mellon, 2012–

RYAN SULLIVAN, Professor of Mechanical Engineering – Ph.D., University of California at San Diego; Carnegie Mellon, 2012–

REBECCA TAYLOR, Associate Professor of Mechanical Engineering – Ph.D., Stanford University; Carnegie Mellon, 2016–

CONRAD TUCKER, Arthur Hamerschlag Career Development Professor of Mechanical Engineering – Ph.D., University of Illinois at Urbana-Champaign; Carnegie Mellon, 2019–

LIWEI WANG, Assistant Professor – P.h.D, Shanghai Jiao Tong University; Carnegie Mellon, 2024–

DOUGLAS WEBER, Akhtar and Bhutta Professor of Mechanical Engineering – Ph.D., Arizona State University; Carnegie Mellon, 2020–

VICTORIA WEBSTER-WOOD, Assistant Professor of Mechanical Engineering – Ph.D., Case Western Reserve University; Carnegie Mellon, 2018–

KATE S. WHITEFOOT, Associate Professor of Mechanical Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2016–

JESSICA ZHANG, George Tallman Ladd and Florence Barrett Ladd Professor of Mechanical Engineering – Ph.D., University of Texas at Austin; Carnegie Mellon, 2007–

DING ZHAO, Assistant Professor of Mechanical Engineering – Ph.D., University of Michigan; Carnegie Mellon, 2018–

Emeriti

ADNAN AKAY, Lord Emeritus Professor of Mechanical Engineering – Ph.D., North Carolina State University; Carnegie Mellon, 1992–

JERRY HOWARD GRIFFIN, William J. Brown Emeritus Professor of Mechanical Engineering – Ph.D., California Institute of Technology; Carnegie Mellon, 1981–

EDWARD STEPHAN RUBIN, Emeritus Professor of EPP, Mechanical Engineering, and Environmental Engineering and Science – Ph.D., Stanford University; Carnegie Mellon, 1969–

PAUL STEIF, Professor Emeritus – P.h.D., Harvard University; Carnegie Mellon, 1983–

SHI-CHUNE YAO, Emeritus Professor of Mechanical Engineering – Ph.D., University of California, Berkeley; Carnegie Mellon, 1977–

Department of Mechanical Engineering Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

24-050 Study Abroad

Fall
Mechanical Engineering students studying abroad through other institutions are registered for this zero-unit place holder "course." Prior to being enrolled for study abroad, the student must have completed an Office of International Education "Study Abroad Transfer Credit (SATC) Form," which must be signed by their academic advisor in Mechanical Engineering.

24-101 Fundamentals of Mechanical Engineering

Fall and Spring: 12 units
The purpose of this course is to introduce the student to the field of mechanical engineering through an exposition of its disciplines, including structural analysis, mechanism design, fluid flows, and thermal systems. By using principles and methods of analysis developed in lectures, students will complete two major projects. These projects will begin with conceptualization, proceed with the analysis of candidate designs, and culminate in the construction and testing of a prototype. The creative process will be encouraged throughout. The course is intended primarily for CIT first year students.

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-104 TechSpark: Modern Making

Fall and Spring: 3 units
This course teaches the fundamental skills needed to plan, develop, and prototype a functional device. A significant portion of the course will cover introductory-level use of 3D CAD software, 3D printers, and Arduino. Homework assignments are important for reinforcement of skills learned, and the utilization of these skills will be applied to a self-directed project. 3-unit mini (7-weeks)

Course Website: http://www.cmu.edu/me (http://www.cmu.edu/me/)

24-105 Special Topics: Maker Series: Intro to Laser Cutting & Engraving

Fall and Spring: 1 unit
This course teaches the safe operation of the laser cutter-engraver machine through structured hands-on activities. A significant portion of this course is dedicated to learning joinery, color mapping, and material selection for prototyping. Homework assignments are important for reinforcement of skills learned, and are flexible for students to complete guided or self-directed projects. 1-unit micro (2-weeks)

24-200 Maker Series: Intro to Manual Machining

Fall and Spring: 1 unit
This course teaches safe operation of manual machining equipment through structured hands-on activities. A significant portion of the course is dedicated to learning subtractive manufacturing, the industrial standard for the mass manufacture of products around the world. The skills learned in this course can be applied to fabricate durable components for design projects, research equipment, and extracurricular activities. 1-unit mini (7-weeks)

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-201 Special Topics: TechSpark: Project Fabrication and Assembly

Fall: 1 unit
This course teaches the fundamental skills of fabrication and assembly by progressing through a hands-on building project. A significant portion of the course is dedicated to safely operating hand and power tools, using common components as parts for assemblies, and incorporating moving mechanisms within housings. This class provides a foundational experience that can be built upon in future project classes. 1-unit mini (7-weeks)

24-202 Introduction to Computer Aided Design

Fall and Spring: 1 unit
Introduction to computer aided mechanical design using SolidWorks 3D CAD software. Includes the creation and analysis of components and assemblies, generation of drawings, and exporting for manufacture. Two hours of guided computer lab work each week. Prerequisite: Undergraduate Mechanical Engineering standing
Prerequisites: 24-104 or 24-101

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-203 Special Topics: TechSpark: Manual Machining

Fall and Spring: 3 units
This course teaches the safe operation of manual machining equipment, including knee mill and lathe through structured hands-on activities. A significant portion of this course is dedicated to reading technical drawings, and then fabricating those components using equipment. Homework assignments are important for reinforcement of skills learned, and a self-directed project will utilize known techniques in new applications. This course is required to use the student machine shop at TechSpark. 3-unit mini (7-weeks)

24-204 TechSpark: Metal Jewelry

Fall and Spring: 3 units
This course teaches introductory-level metal jewelry fabrication through structured hands-on activities. Students will learn to safely use various tools and metal working techniques including cold forging, investment casting, bezel settings, soldering, and patinas. Homework assignments are important for reinforcement of skills learned, which will include creating personal jewelry items such as earrings, pendants, and rings. This course is required to use the hot metals room at TechSpark. 3-unit mini (7-weeks)

24-205 TechSpark: Welding

Fall and Spring: 2 units
This course teaches the safe operation of welding equipment through structured hands-on activities. A significant portion of the course is dedicated to learning workpiece setup, material selection, and weldability assessment for introductory-level projects. Homework assignments are important for reinforcement of skills learned, and the utilization of these skills will be applied to a self-directed project. This course is required to use the welding equipment at TechSpark. 3-unit mini (7-weeks)

24-206 TechSpark: Wood Working I

Fall and Spring: 3 units
This course teaches the safe operation of wood working equipment, including table saw, panel saw, and miter saw through structured hands-on activities. A significant portion of the course is dedicated to learning optimal workflow, tool selection, and equipment selection for introductory-level projects. Homework assignments are important for reinforcement of skills learned. This course is required to use the student wood shop at TechSpark. 3-unit mini (7-weeks)

24-207 TechSpark: Wood Working II

Fall and Spring: 1 unit
This course builds upon previous skills taught in 24-206 TechSpark: Wood Working I. A significant portion of the course is dedicated to learning wood material properties, joinery methods, and CNC router machine for mid-level projects. Homework assignments are important for reinforcement of skills learned. This course is required to use the CNC wood router in the student wood shop at TechSpark. 3-unit mini (7-weeks)
Prerequisite: 24-206

24-210 Special Topics: Maker Series: Inventive Projects

Fall and Spring
This course supports students in pursuing a self-defined project. Students will apply their preexisting access to equipment towards prototyping an inventive project, either as an individual or a group member. Students will receive weekly one-on-one consultations with the instructor to conduct project planning, design for fabrication, prototype testing, and more. This course is useful for students interested in initiating, progressing, and/or completing a prototyping project for research, student orgs, entrepreneurship, hobbies, or other interests.
Prerequisites: 24-206 or 24-205 or 24-204 or 24-200 or 24-101 or 24-105 or 24-104

24-212 Special Topics: Maker Series: Make It Move

Fall and Spring: 9 units
This course explores many types of mechanisms for movement and their optimal applications. A significant portion of class will be dedicated to hands-on labs, during which objects are dissected to reveal their methods of movement. Springs, gears, motors, pneumatics, levers, wheels, bearings, and other components will be analyzed for their roles in energy storage, power delivery, and motion. These lessons will culminate in a complete design project, for which students will use rapid fabrication equipment to make a prototype that moves.
Prerequisites: 24-101 or 24-104

Course Website: https://www.meche.engineering.cmu.edu/

24-213 Special Topics: Citizen Science: Sensors, Makers and the Environment

Spring: 9 units
This course will introduce students to technical aspects of citizen science, using air pollution as a case study. Students will learn about important air pollutants and the environmental regulations that govern these pollutants in the U.S. Students will be introduced to data quality requirements for applications ranging from regulatory pollutant monitoring to education/outreach. Students will also learn about operating principles for both laboratory- and consumer-grade pollutant monitoring equipment. The class will culminate in a project where student teams will design, construct, and test a low-cost air pollutant monitoring system. The groups will then deploy these sensor packages to collect and present their data. The project will use the TechSpark maker space. It is primarily aimed at non-engineering majors.

24-214 IDeATe Special Topics: Mazes

Fall: 9 units
Labyrinths have been a part of our culture for millennia, from Greek myths to Renaissance palaces, to childrens pastime. The mental challenge of traversing a maze combines both the intuitive and the systematic processes that delight our human experience. As our society becomes more sedentary, the rebirth of the physical maze can serve as a bridge from the pure mental exercise to increased mobility, especially if they are modernized to become more dynamic, more adaptable, more portable, more modern. This course will allow students to study the history of labyrinths and to discover how to design and build fun, challenging, technically-enhanced, and community-engaging mazes.

24-215 IDeATe Special Topics: Smart Furniture

All Semesters: 9 units
As we integrate personal technology into our daily lives, the spaces we inhabit evolve from purely functional, comfortable, and efficient locations for work, play, and relaxation to statements on our lifestyle, tastes, and self-image. Of the attributes in our spaces we can control, furniture has the greatest effect on how our living spaces reflect our personalities. This course will thus focus on the design and physical prototyping of smart, multi-use, transforming furniture that can elevate our modern living spaces to unique showcases of our individuality.

24-221 Thermodynamics

Fall: 10 units
Temperature and thermometry; equations of state for fluids and solids; work, heat, and the first law; internal energy, enthalpy, and specific heats; energy equations for flow; change of phase; the second law, reversibility, absolute temperature, and entropy; combined first and second laws; availability; power and refrigeration cycles. Applications to a wide range of processes and devices. 3 hrs. lec., 1 hour recitation
Prerequisites: (33-121 or 33-106 or 33-141 or 33-151) and 21-122 Min. grade C and 24-101

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-231 Fluid Mechanics

Spring: 10 units
Hydrostatics. Control volume concepts of mass, momentum, and energy conservation. Euler's and Bernoulli's equations. Viscous flow equations. Head loss in ducts and piping systems. Dimensional analysis and similitude as an engineering tool. Measurement techniques. 3 hrs. lec., 1 hr. rec.
Prerequisites: (33-151 or 33-141 or 33-106) and 21-122 Min. grade C

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-251 Electronics for Sensing and Actuation

Fall and Spring: 3 units
Mechanical engineers design, build, and troubleshoot basic circuits that perform signal conditioning on sensor measurements and provide power amplification for actuation. This course covers the basics of passive circuit design, applications of operational amplifiers, and the use of transistors to amplify low power signals coming from microcontrollers. Lecture materials are coupled with hands-on in-class exercises and homework assignments using the Arduino to interface with sensors and actuators.
Prerequisite: 24-101

24-261 Mechanics I: 2D Design

Fall: 10 units
This is the first course in a three-semester sequence that integrates the principles of mechanics with hands-on projects that have students apply those principles in a design context. In the first semester, students review and extend methods of 2D statics to study single and multiple bodies, such as structures and machines. Internal loads in 2D are defined and quantified, followed by a study of stresses and strains under axial loading, bending and shear. Students will also learn engineering design process methods and skills, including concept design, detailed design, analysis, fabrication, and testing. As topics are introduced and applied by students in hands-on assignments, they will compare theoretical computations and experimental testing of their design ideas, so as to reinforce fundamentals and practice the engineering design process.
Prerequisites: 21-122 Min. grade C and (33-106 or 33-141 or 33-121 or 33-151) and 24-101

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-262 Mechanics II: 3D Design

Spring: 10 units
This is the second course in a three-semester sequence that integrates the principles of mechanics with hands-on projects that have students apply those principles in a design context. In the second semester, students extend their foundation in 2D statics to the analysis of 3D engineering systems, including determination of reactions at connections and internal loads. Friction, shear stress, and shear strain are introduced, followed by a study of stresses and deformation in torsion. Multiaxial stresses, such as those occurring in combinations of torsion and bending or in pressure vessels, are studied. Stress transformations are introduced, as well as the formulation of simple failure criteria. Students will expand their engineering design skills through team-based hands-on and computational projects that utilize stress and failure analysis of 3D engineered systems. In addition, students will learn elementary aspects of machine design and catalog selection to support projects. Altogether, students will learn to express ideas in sketches, interpret and create engineering drawings, model detailed shapes with CAD tools, analyze product performance with CAE tools, choose materials and manufacturing schemes, and create and test prototypes.
Prerequisites: (33-141 or 33-106 or 33-151) and 24-261

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-280 Special Topics: C++ Programming for Engineers

Fall and Spring: 9 units
Using the C++ programming language as a platform, this course serves as an intermediate-level programming course with a strong emphasis on software requirements for engineering applications. Students will refine and enhance their coding skills while applying their mathematical, analytical and design backgrounds. Topics covered include data structures, algorithm design, numerical computation, modular programming, data modeling, interactive graphics, object-orientation, and user interfaces, all in an engineering-specific domain.
Prerequisites: 15-110 or 15-112

Course Website: http://www.cmu.edu/me (http://www.cmu.edu/me/)

24-281 Introduction to Scientific Computing

Fall and Spring: 2 units
This course provides an introduction to scientific computing with Matlab for engineers. The course introduces the basics of Matlab syntax and programming, data analysis, visualization, curve fitting and interpolation, symbolic computation, differential equations, and debugging. The use of Matlab in solving mechanical engineering applications will be demonstrated.

Course Website: https://www.meche.engineering.cmu.edu/

24-291 Environmental Systems on a Changing Planet

Fall: 9 units
This course introduces the interconnected environmental systems that regulate our climate and ecosystems, providing the resources required to sustain all life, including human societies. These systems are the fascinating connections between the oceans, atmosphere, continents, ecosystems, and people that provide our planet with resources that all life depends on. Human activities disrupt these natural systems, posing critical threats to the sustainable functioning of environmental systems. We will explore how solar and biochemical energy moves through the Earths interconnected systems, recycling nutrients; how complex environmental systems function to produce critical resources such as food and water; and how human activities interfere with these systems. Earth science concepts will be used to explain the relationship between climate zones and biomes, the stability of the Earth's climate in the Holocene, and the instability in the current Anthropocene. Case studies include the interplay between climate change feedbacks, wildfires, ecosystems, and agricultural systems; the hazards that everyday chemical toxins pose to ecosystems and human health and reproduction; and growing threats to ecosystem health and biodiversity. We will also develop the relevant science and information literacy required to understand current issues that are frequently debated in the public sphere, and connect these to environmental justice.

24-292 Renewable Energy Engineering

Intermittent: 9 units
Introduction to engineering principles of various renewable energy systems, including the following topics: background on climate change and carbon sequestration, engineering analysis of renewable energy systems such as solar photovoltaic, (solar thermal), wind power, hydropower, wave energy, bio mass energy, geothermal energy, and hydrogen based fuel cells. In addition, transitional energy systems such as nuclear power and advanced combined cycles will be introduced. Both engineering performance and present state of development will be discussed. Students will review and present their progress on various subjects, which will be selected based on personal interest.
Prerequisites: 33-141 or 33-106

Course Website: http://www.andrew.cmu.edu/user/satbirs/24292/

24-300 TechSpark: CNC Machining

Fall and Spring: 2 units
This course builds upon previous skills taught in TechSpark's Manual Machining class. A significant portion of the course is dedicated to learning 2.5D Computer Aided Manufacturing (CAM) software, equipment setup, and machine operation. Homework assignments are important for reinforcement of skills learned, and the utilization of these skills will be applied to a self-directed project. This course is required to use the CNC milling machines in the student machine shop at TechSpark. 2-unit mini (7-weeks)
Prerequisite: 24-200

24-302 Professional Development for Mechanical Engineers

Fall and Spring: 2 units
This course prepares students to communicate verbally as an engineer. Students will practice and receive feedback on their oral communication in a range of contexts, including formal presentations, elevator pitches, job interview questions, and communicating technical concepts to non-engineers. In addition, students will be introduced to a range of professional topics, including ethical decision-making, communicating in global contexts, negotiation strategies, and strategies for overcoming implicit bias.
Student grades will be based upon weekly homework assignments, formal presentations, and class participation.

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-311 Numerical Methods

Spring: 10 units
Use of numerical methods for solving engineering problems with the aid of a digital computer. The course will contain numerical methods such as roots of equations, linear algebraic equations, optimization, curve fitting, integration, and differential equation solving. MATLAB will be used as the programming language. Programming cluster laboratory times will be available twice a week. Problems will be drawn from all fields of interest to mechanical engineers. 3 hrs. lecture plus lab
Prerequisites: 21-254 and 21-260

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-321 Thermal-Fluids Experimentation

Spring: 12 units
Thermal-Fluids Experimentation Spring: 12 units This is a capstone course for the thermal-fluids core-course sequence. This course covers techniques of measurement, uncertainty analysis, and realization of systems, which demonstrate fundamental principles in thermodynamics, fluid mechanics, and heat transfer. The principles of designing thermal experiments are also integrated into this course.
Prerequisites: 24-221 and 24-322 and 24-231

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-322 Heat Transfer

Fall: 10 units
Introduction to basic concepts of engineering heat transfer. Steady and transient heat conduction in solids, including the effect of heat generation. Finned surfaces. Correlation formulas for forced and free convection, condensation, and boiling. Design and analysis of heat exchangers. Radiation heat transfer. Problems in combined convection and radiation. Measurement techniques. 3 hrs. lec., 1 hr. recitation.
Prerequisites: 24-221 and 21-260 Min. grade C and 24-231

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-334 Introduction to Biomechanics

Fall: 9 units
This course covers the application of solid and fluid mechanics to living tissues. This includes the mechanical properties and behavior of individual cells, the heart, blood vessels, the lungs, bone, muscle and connective tissues as well as methods for the analysis of human motion.
Prerequisite: 24-231

Course Website: http://www.cmu.edu/me/

24-341 Manufacturing Sciences

Spring: 9 units
This course has two broad concerns: an introductory review of manufacturing systems organization and a review of common manufacturing processes from the point of view of design for manufacturability. The features of mass and batch production are quantitatively considered. The basic principles of group technology and production planning are outlined. The use of computers in manufacturing is described, together with a review of the current capabilities of industrial robots. Students will be involved in weekly seminars, which will describe the basic features of common manufacturing processes, including metal machining, metal forming, polymer processing, casting techniques, joining techniques, ceramic processing, and powder processing. Case studies from industry and films may be used. 3 hrs. rec.
Prerequisite: 24-262

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-351 Dynamics

Fall: 10 units
This first course on the modeling and analysis of dynamic systems concentrates on the motion of particles, systems of particles, and rigid bodies under the action of forces and moments. Topics include the kinematics of motion in rectangular, polar, and intrinsic coordinates; relative motion analysis with multiple reference frames; and planar kinetics through the second law, work-energy method, and impulse-momentum method. Time and frequency domain solutions to first and second order equations of motion are discussed. 3 hrs. lec. 1 hr rec.
Prerequisites: 24-101 and 21-260 Min. grade C

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-352 Dynamic Systems and Controls

Fall and Spring: 12 units
This second course on the modeling and analysis of dynamic systems emphasizes the common features, which are exhibited by physical systems that include mechanical, hydraulic, pneumatic, thermal, electrical, and electromechanical elements. State equations and the concepts of equilibrium, linearization, and stability are discussed. Time and frequency domain solutions are developed. 4 hr. lec.
Prerequisites: (33-107 and 21-260 Min. grade C and 24-251 and 24-351) or (24-351 and 33-142 and 24-251 and 21-260 Min. grade C) or (21-260 Min. grade C and 24-251 and 33-152) or (24-351 and 33-132 and 21-260 Min. grade C and 24-251)

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-354 Mechatronics Applications in Mechanical Engineering

Fall: 9 units
Most modern products contain elements of sensing, actuation, and control. This course builds on concepts from Dynamic Systems and Control to design simple mechatronic systems. Topics include modeling and selection of sensors and actuators, measurement systems, digital signal processing, microcontroller architectures, and the basics of state space control methods; these topics are taught in the context of integration with mechanical systems. This course includes a substantial project component in which students design, build, and test a mechatronic system through a series of subsystem prototypes and systems integration.
Prerequisite: 24-352

Course Website: http://www.cmu.edu/me/

24-358 Culinary Mechanics

Intermittent: 9 units
This course discusses how mechanical quantities and processes such as force, motion, and deformation influence food and the culinary arts. The aim of the course is to apply important aspects of mechanics to ideas in cooking. Specific topics include: (1) how do stress and strain affect food and its perceived taste; (2) what is the role of cell mechanics in the resulting micro structure of both consumed plant and animal tissues; (3) how can mechanics be used to alter nutrition; (4) what are the roles of common and uncommon mechanical tools such as a knife or mortar and pestle in food preparation. Emphasis will be placed on the biomechanics of edible matter across multiple length scales, including at the tissue, cellular, and molecular levels; additionally, impact on global health and engineering implications will be elucidated. During this course, we will introduce you to these concepts,train you to use them in real world applications, and allow you to pursue a creative group-defined project, which will be shared in both written and oral formats. We will integrate a hands-on kitchen experience in at least 3 specific laboratory classes so that students will get a true feel and understanding for culinary mechanics. We also will be visiting the restaurant of at least one first-rate Pittsburgh chef to gain real world insight into mechanics and cooking.

Course Website: http://www.cmu.edu/me/

24-370 Mechanical Design: Methods and Applications

Fall: 12 units
This is the third course in a three-semester sequence that integrates the principles of mechanics with hands-on projects that have students apply those principles in a design context. Building on the principles and design methodology introduced in the first two courses, this course consists of a detailed study of typical loading conditions and resulting stresses and deflections in commonly used machine elements, such as shafts, gears, power screws, fasteners, brakes/couplings, flywheels, and bearings, and best practices in their design and application. Machine design against static and dynamic failure will be considered with focus on the effect of material properties, manufacturability, and cost considerations. Students will also learn the connections between theory and analytical methods, available computational tools, and field design. Learning objectives will be assessed through homework, class exams, and the conduct of the group projects.
Prerequisites: 24-262 and 24-200

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-371 Special Topics: Design of Machine Elements

Spring: 9 units
In this class, the students will gain an understanding of the best practices in the design of machine elements such as shafts, gears, power screws, fasteners, brakes/couplings, flywheels, bearings, etc. The course material consists of the study of stress and deflection under common loading conditions, effect of material properties, static and fatigue failure models, cost considerations, and manufacturability in the context of the machine components. Student learning will be achieved through interactive lectures on underlying technical approaches in conjunction with a group project where students will be required to design and fabricate an ensemble of machine elements. Students will also learn about the strong connections between theory, analytical methods, available computational tools, and field design. Assessment of the learning objectives will happen via homework, class exams, and demonstration of the group project. This course builds upon the skills and methods taught in Design-I (24-370) and will help students prepare to enter the modern workplace where mechanical design takes place.
Prerequisite: 24-370

24-381 Environmental Systems on a Changing Planet

Fall: 12 units
This course introduces the interconnected environmental systems that regulate our climate and ecosystems, providing the resources required to sustain all life, including human societies. We will explore how solar and biochemical energy moves through the Earths interconnected systems, recycling nutrients; how complex environmental systems function to produce critical resources such as food and water; and how human activities interfere with these systems. Earth science concepts will be used to explain the relationship between climate zones and biomes, the stability of the Earth's climate in the Holocene, and the instability in the current Anthropocene. Case studies include the interplay between climate change feedbacks, wildfires, ecosystems, and agricultural systems; the hazards that everyday chemical toxins pose to ecosystems and human health and reproduction; and growing threats to ecosystem health and biodiversity. We will also develop the relevant science and information literacy required to understand current issues that are frequently debated in the public sphere, and connect these to environmental justice. This course draws on principles learned in high school science and serves as the foundational Earth and amp; Environmental Science requirement for both the Minor and Additional Major in Environmental and Sustainability Studies.

24-390 Mechanical Engineering Co-op

Fall and Spring
The Department of Mechanical Engineering at Carnegie Mellon considers practical learning opportunities important educational options for its undergraduate students. One such option is cooperative education, which provides a student with an extended work experience with a company or government institution. To participate, students must possess at least junior status and have an overall grade point average of 3.0 or above. Students must complete a Co-Op Approval Form and submit it for approval. If the application is approved, the course will be added to the student's schedule and the student will be assessed tuition for 0 units for each semester that the student participates. All co-ops must be approximately 5-8 months in uninterrupted length. Upon completion of the co-op experience, students must submit a 1-2 page report of their work experience, and a 1-2 page evaluation from the company supervisor to the ME Undergraduate Education Committee. If the reports are approved, a "P" grade will be assigned. International students should contact their academic advisor for additional information. Prerequisite: Special permission required

Course Website: https://www.meche.engineering.cmu.edu/education/undergraduate-education/index.html (https://www.meche.engineering.cmu.edu/education/undergraduate-education/)

24-391 Mechanical Engineering Project

Fall and Spring
Practice in the organization, planning, and execution of appropriate engineering projects. These investigations may be assigned on an individual or a team basis and in most cases will involve experimental work.

Course Website: https://www.meche.engineering.cmu.edu/education/undergraduate-education/index.html (https://www.meche.engineering.cmu.edu/education/undergraduate-education/)

24-392 Mechancial Engineering Project

All Semesters
Practice in the organization, planning, and execution of appropriate engineering projects. These investigations may be assigned on an individual or a team basis and in most cases will involve experimental work.

Course Website: https://www.meche.engineering.cmu.edu/education/undergraduate-education/index.html (https://www.meche.engineering.cmu.edu/education/undergraduate-education/)

24-421 Internal Combustion Engines

Fall: 12 units
This course discusses working principles of internal combustion engines found in many practical applications. Focus is given to understanding the design of air handing system, in-cylinder fuel/air mixing, geometric design of the combustion chamber, engine performance and calibration, and mechanism of pollutant formation and reduction. Introductory discussion of advanced automotive engine concepts, alternative fuels, gas turbine engines, rocket engines, and hybrid electric vehicles is also provided. The course relies on a number of lab experiments, analysis of actual experimental data, and a combination of analytical and numerical homework assignments. 3 hrs. lecture 2 hrs. lab
Prerequisites: 24-221 and 24-231

Course Website: http://www.andrew.cmu.edu/user/satbirs/24421/

24-424 Energy and the Environment

Fall: 9 units
Fuel cycles for conventional and non-conventional energy resources; relationships between environmental impacts and the conversion or utilization of energy; measures of system and process efficiency; detailed study and analysis of coal-based energy systems including conventional and advanced power generation, synthetic fuels production, and industrial processes; technological options for multi-media (air, water, land) pollution control; mathematical modeling of energy-environmental interactions and tradeoffs and their dependency on technical and policy parameters; methodologies for energy and environmental forecasting; applications to issues of current interest. Junior or Senior standing in CIT or permission of instructor. 3 hrs lecture

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-425 Combustion and Air Pollution Control

Intermittent: 9 units
Formation and control of gaseous and particulate air pollutants in combustion systems. Basic principles of combustion, including thermochemical equilibrium, flame temperature, chemical kinetics, hydrocarbon chemistry, and flame structure. Formation of gaseous and particulate pollutants in combustion systems. Combustion modifications and post-combustion technologies for pollutant control. Relationship between technology and regional, national, and global air pollution control strategies. The internal combustion engine and coal-fired utility boiler are used as examples. 3 hours lecture Cross listed as 24-740 and 19440/19-740

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-428 Computational Analysis of Transport Phenomena

Spring: 9 units
In this course, students will develop basic understanding and skill sets to perform simulations of transport phenomena (mass, momentum, and energy transport) for engineering applications using a CAE tool, learn to analyze and compare simulation results with theory or available data, and develop ability to relate numerical predictions to behavior of governing equations and the underlying physical system. First 8 weeks of the course will include lectures and simulation-based homework assignments. During last 7 weeks, teams of students will work on self-proposed projects related to computational analysis of transport phenomena. In the project, students will learn to approach loosely defined problems through design of adequate computational mesh, choice of appropriate numerical scheme and boundary conditions, selection of suitable physical models, efficient utilization of available computational resources etc. Each team will communicate results of their project through multiple oral presentations and a final written report. Detailed syllabus of the course is provided on the URL given below.
Prerequisites: 24-231 and 24-322 and 24-221

Course Website: http://www.andrew.cmu.edu/user/satbirs/24618/

24-441 Engineering Design II: Conceptualization and Realization

Fall and Spring: 12 units
This course guides students through the design process in the applied design of a practical mechanical system. Lectures describe the typical design process and its associated activities, emphasizing methods for innovation and tools for design analysis. Professional and ethical responsibilities of designers, interactions with clients and other professionals, regulatory aspects, and public responsibility are discussed. The design project is typically completed in teams and is based on a level of engineering knowledge expected of seniors. Proof of practicality is required in the form of descriptive documentation. Frequently, a working model will also be required. Oral progress reports and a final written and oral report are required. 3 hrs. rec., 3 hrs lab Senior standing and Machine Shop Practice 24-200 required.
Prerequisites: 24-370 and 24-302

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-451 Feedback Control Systems

Fall: 12 units
Fundamentals of feedback control with emphasis on classical techniques and an introduction to discrete-time (computer controlled) systems. Topics include the following: frequency domain modeling and state space modeling of dynamical systems; feedback control system concepts and components; control system performance specifications such as stability, transient response, and steady state error; analytical and graphical methods for analysis and design - root locus, Bode plot, Nyquist criterion; design and implementation of proportional, proportional-derivative, proportional-integral-derivative, lead, lag, and lead-lag controllers. Extensive use of computer aided analysis and design software. 4 hrs lec.
Prerequisites: (15-112 or 15-110) and 24-352

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-452 Mechanical Systems Experimentation

Fall and Spring: 9 units
Experimentation in dynamic systems and controls. The course will cover translational and rotational systems. Topics will include mechanical elements, natural frequencies, mode shapes, free and forced response, frequency response and Bode plots, time constants, transient response specifications, feedback controls such as PID control, and stability for single-degree-of-freedom and multi-degree-freedom systems. The course will introduce and use state-of-the-art experimentation hardware and software.
Prerequisite: 24-352

Course Website: http://www.cmu.edu/me/undergraduate/index.html (http://www.cmu.edu/me/undergraduate/)

24-453 Special Topics: Introduction to Programmable Logic Controllers

Fall and Spring: 3 units
Programmable Logic Controllers (PLCs) are prevalent in many industrial process control and manufacturing applications. Knowledge of and experience with PLCs is a marketable skill, opening up many career opportunities in a wide range of industries. This course provides an introduction to the applications of PLCs and techniques used for their programming and implementation. The course will be primarily lab-based, aimed at introducing the capabilities, limitations, and applications of PLCs through hands-on experience. Topics include ladder logic, PLC programming, PLC memory structures, program execution, troubleshooting methods, and typical industrial practices.
Prerequisite: 24-352

24-480 Special Topics: Artificial Intelligence and Machine Learning for Engineering

Spring: 9 units
This course introduces algorithms that are at the center of modern day artificial intelligence (AI) and machine learning (ML) techniques. The course takes an engineering-focused approach to AIML by investigating the wide array of sources of data available in the world, how these sources generate data, and algorithms and methods that are used to transform this data into knowledge/insights.
Prerequisites: (15-112 or 15-110) and (36-220 or 19-250 or 36-225 or 36-217)

24-491 Department Research Honors

Fall and Spring
This course is designed to give students increased exposure to "open-ended" problems and research type projects. It involves doing a project on a research or design topic and writing a thesis describing that project. The project would be conducted under the supervision of a mechanical engineering faculty member (the advisor), and must be approved by the advisor before inception. This course can be taken at any time after the Junior year and before graduation which includes the summer after the Junior year. Completion of 18 units of this course with a grade of B or better is a partial fulfillment of the requirements for Departmental Research Honors.

Course Website: https://www.meche.engineering.cmu.edu/education/undergraduate-education/index.html (https://www.meche.engineering.cmu.edu/education/undergraduate-education/)

24-492 Department Research Honors

Fall and Spring
This course is designed to give students increased exposure to "open-ended" problems and research type projects. It involves doing a project on a research or design topic and writing a thesis describing that project. The project would be conducted under the supervision of a mechanical engineering faculty member (the advisor), and must be approved by the advisor before inception. This course can be taken at any time after the Junior year and before graduation which includes the summer after the Junior year. Completion of 18 units of this course with a grade of B or better is a partial fulfillment of the requirements for Departmental Research Honors.

Course Website: https://www.meche.engineering.cmu.edu/education/undergraduate-education/index.html (https://www.meche.engineering.cmu.edu/education/undergraduate-education/)

24-602 Maker Series: Prototyping for Equity

Spring
This course applies prototyping techniques to develop products for underserved populations of people. In order to fabricate components for prototypes, this course teaches the safe operation of fabrication tools, including 3D printer, laser cutter-engraver machine, and power tools. A significant portion of the course is dedicated to applying the engineering design cycle to meet the unique needs/wants of a specific user population. This hands-on course culminates in building a prototype that can be tested to validate its performance as the physical solution to a real-world problem. 5-6-unit mini (7-weeks)

24-614 Microelectromechanical Systems

Intermittent: 12 units
This course introduces fabrication and design fundamentals for Microelectromechanical Systems (MEMS): on-chip sensor and actuator systems having micron-scale dimensions. Basic principles covered include microstructure fabrication, mechanics of silicon and thin-film materials, electrostatic force, capacitive motion detection, fluidic damping, piezoelectricity, piezoresistivity, and thermal micromechanics. Applications covered include pressure sensors, micromirror displays, accelerometers, and gas microsensors. Grades are based on exams and homework assignments.
Prerequisites: 24-351 or 18-321

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-623 Molecular Simulation of Materials

Spring: 12 units
The purpose of this course is to expose engineering students to the theory and implementation of numerical techniques for modeling atomic-level behavior. The main focus is on molecular dynamics and Monte Carlo simulations. Students will write their own simulation computer codes, and learn how to perform calculations in different thermodynamic ensembles. Consideration will be given to heat transfer, mass transfer, fluid mechanics, mechanics, and materials science applications. The course assumes some knowledge of thermodynamics and computer programming. 4 hrs lec.
Prerequisites: 24-221 and 24-311

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-626 Air Quality Engineering

Fall: 12 units
The course provides a quantitative introduction to the processes that control atmospheric pollutants and the use of mass balance models to predict pollutant concentrations. We survey major processes including emission rates, atmospheric dispersion, chemistry, and deposition. The course includes discussion of basic atmospheric science and meteorology to support understanding air pollution behavior. Concepts in this area include vertical structure of the atmosphere, atmospheric general circulation, atmospheric stability, and boundary layer turbulence. The course also discusses briefly the negative impacts of air pollution on society and the regulatory framework for controlling pollution in the United States. The principles taught are applicable to a wide variety of air pollutants but special focus is given to tropospheric ozone and particulate matter. The course is intended for graduate students as well as advanced undergraduates. It assumes a knowledge of mass balances, fluid mechanics, chemistry, and statistics typical of an undergraduate engineer but is open to students from other scientific disciplines.
Prerequisites: 09-105 and 36-220 and 24-231

Course Website: http://www.cmu.edu/me/

24-628 Energy Transport and Conversion at the Nanoscale

Spring: 12 units
Energy transport and conversion processes occur at the nanoscale due to interactions between molecules, electrons, phonons, and photons. Understanding these processes is critical to the design of heat transfer equipment, thermoelectric materials, electronics, light emitting diodes, and photovoltaics. The objective of this course is to describe the science that underlies these processes and to introduce the contemporary experimental and theoretical tools used to understand them. The course includes a laboratory that gives the students experience with modern transport measurement instrumentation and data analysis. Integrated literature reviews and a final project require students to apply learned fundamentals to understand state-of-the-art research and technology. 4 hrs. lecture
Prerequisites- 24-322 and amp; 24-221 or equivalents
Prerequisites: 24-221 and 24-322

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-629 Direct Solar and Thermal Energy Conversion

Intermittent: 12 units
This course introduces graduates and senior undergraduates the principles and technologies for directly converting heat and solar light into electricity using solid-state devices. The first part of the course reviews the fundamentals of quantum mechanics, solid state physics and semiconductor device physics for understanding solid-state energy conversion. The second part discusses the underlying principles of thermoelectric energy conversion, thermionic energy conversion, and photovoltaics. Various solar thermal technologies will be reviewed, followed by an introduction to the principles of solar thermophotovoltaics and solar thermoelectrics. Spectral control techniques which are critical for solar thermal systems will also be discussed. By applying the basic energy conversion theory and principles covered in lectures, students will finish a set of 4 homework assignments. This course also requires one project in which students will work individually to review one present solar or thermal energy conversion technology 12 units

Course Website: http://www.cmu.edu/me/

24-631 Thermal Design

Spring: 12 units
This course guides students through the design process of a practical thermal system. The course plan assumes a mastery of the fundamentals of thermodynamics, fluid mechanics and heat transfer at the undergraduate level. Lectures aim at design aspects and analysis techniques commonly used in the development of thermal systems. Lecture topics include heat sinks, heat pipes, compact heat exchangers, sensors and instrumentation, thermoelectric devices, and special topics closely related to the theme of the design activity for the semester. Design activity is conducted in teams and includes several cycles of oral presentations, class discussions, and a final written report. System design and analysis of performance are heavily based on computer-added design tools and simulation means. Student performance in this course is evaluated based on individual homework assignments on the various topics presented in class and on a team design project.
Prerequisites: 24-370 and 24-302 and 24-322

24-632 Special Topics: Additive Manufacturing Processing and Product Development

Fall: 12 units
Introduction to additive manufacturing (AM) processing fundamentals and applications using Solidworks 3-D CAD software and a variety of polymer and metal AM machines. Includes a brief history of AM processing, a review of and technical fundamentals of current AM processes, a study of the current AM market, and future directions of the technology. Lab Sessions will support an open-ended product development project. Lectures on metals AM will address current research impacting industry. Students will also perform a literature review of papers on the state of the art. Basic Solidworks knowledge required.

Course Website: http://www.cmu.edu/me/

24-633 Additive Manufacturing Laboratory

Spring: 12 units
Hands-on laboratory projects will teach students about all aspects of metals additive manufacturing (AM). Students will learn how to use SOLIDWORKS for part design, create and transfer design files to the AM machines, run the machines to build parts, perform post-processing operations, and characterize AM parts. Students will work in teams and complete three separate lab projects, each utilizing a different material system, part design, AM process/machine, post-processing steps and characterization methods. A major lab report and presentation will be required for each of the three lab projects. The course includes weekly lectures to complement the laboratory component. Priority for enrollment will be given to students who have declared the Additive Manufacturing Minor.
Prerequisites: 24-632 or 39-602 or 27-503 or 27-765 or 39-601

24-634 Structural Design

Spring: 12 units
Design of structural members for bending moment, shear force, axial force, and combined axial force and bending. Reinforced concrete, structural steel, and composite beam construction are considered. Buckling effects in columns, beams and local plate segments are treated. Serviceability limits such as deflection and cracking are addressed. Design projects include the determination of loads and the selection of system geometry.
Prerequisite: 24-262

24-635 Structural Analysis

Fall: 12 units
Classical and matrix-based methods of structural analysis; energy principles in structural mechanics. Basic concepts of force and displacement methods for analyzing redundant structural systems. Matrix methods utilizing the flexibility (force) and stiffness (displacement) concepts.
Prerequisite: 24-262

24-636 Energy Applications in Biology and Medicine

Spring: 12 units
This course covers a wide range of energy-based applications in biology and medicine, such as cancer treatments by cryosurgery (freezing), thermal ablation (heating), photodynamic therapy (light-activated drugs), and irreversible electroporation (a non-thermal electrical application). This course also covers thermal regulation in humans and other mammals, as well as cryopreservation (low-temperature preservation) of tissues and organs for the benefit of organ banking and transplant medicine. The course combines lectures and individual assignments relating to the underlying principles of engineering, with teamwork on open-ended projects relating to concurrent challenges at the convergence of engineering and medical sciences. The course plan assumes a mastery of the fundamentals of heat transfer at the undergraduate level
Prerequisite: 24-322

24-637 Manufacturing Futures

Spring: 12 units
The course will introduce an array of technologies that will contribute to the future of making things and will be organized into 4 logical modules that will culminate in a team-based design project. Module 1 (Manufacturing Visions and Design Methodolgy): David Bourne. Module 2 (Manufacturing Processes and Process Tradeoffs): Brandon Bodily. Module 3 (Electronic Manufacturing): Rahul Panat. Module 4 (Workforce Development) : David Bourne.

24-640 Climate Change Mitigation

Intermittent: 12 units
Have you ever thought about how we could address the climate change problem? In this course we will study the technological and policy options for responding to the threat of climate change. We will review climate-change science, understand the current systems for energy supply and use, and have a deep dive onto technological solution for low-carbon energy supply and use, as well as the policy frameworks that can help us reduce greenhouse gas emissions. 2hrs 40min of lectures per week.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-643 Energy Storage Materials and Systems

Intermittent: 12 units
Contemporary energy needs require large scale electrochemical energy conversion and storage systems. Batteries are playing a prominent role in portable electronics and electric vehicles. This course introduces principles and mathematical models of electrochemical energy conversion and storage. Students will study thermodynamics, reaction kinetics pertaining to electrochemical reactions, phase transformations relating to batteries. This course includes applications to batteries, fuel cells, supercapacitors

Course Website: http://www.andrew.cmu.edu/user/venkatv/24643/

24-650 Applied Finite Element Analysis

Intermittent: 12 units
This is an introductory course on the finite element method with emphasis on application of the method to a wide variety of problems. The theory of finite element analysis is presented and students learn various applications of the method through assignments utilizing standard finite element software packages commonly used in industry. Various types of analyses are considered, which may include, for example, static, pseudo-static, dynamic, modal, buckling, contact, heat transfer, thermal stress and thermal shock. Students also learn to use a variety of element types in the models created, such as truss, beam, spring, solid, plate, and shell elements.
Prerequisites: 24-322 and 24-262

Course Website: https://www.meche.engineering.cmu.edu/education/graduate-programs/index.html (https://www.meche.engineering.cmu.edu/education/graduate-programs/)

24-651 Material Selection for Mechanical Engineers

Spring: 12 units
This course provides a methodology for selecting materials for a given application. It aims to provide an overview of the different classes of materials (metal, ceramic, glass, polymer, elastomer or hybrid) and their properties including modulus, strength, ductility, toughness, thermal conductivity, and resistance to corrosion in various environments. Students will also learn how materials are processed and shaped (e.g., injection molding, casting, forging, extrusion, etc.), and will explore the origins of the properties, which vary by orders of magnitude. Topics include: Materials selection by stiffness, strength, fracture toughness and fatigue. Shape factors and materials processing. Binary phase and time temperature transformation diagrams, microstructure. Polymer types and structures. Alloying and strengthening of metals, types of steels. Corrosion, oxidation, tribology and thermal properties.
Prerequisites: 09-105 and 24-262

Course Website: http://www.cmu.edu/me/

24-652 Mechanical Behavior of Engineering Materials

Intermittent: 12 units
Mechanical engineers employ all classes of materials (metals, polymers, ceramics and hybrids) in load-bearing applications. To reduce material cost, save energy and maximize performance, engineering materials are frequently designed to be used near their load-bearing limits. An understanding of underlying deformation mechanisms complements a design rule approach in that "unexpected" failures can be far better anticipated and hence minimized. This course will survey the major deformation mechanisms in the main materials classes. Topics will include structure, elasticity, continuum failure models, fracture mechanics, and plastic deformation mechanisms of polymers, fiber-reinforced, composites, ceramics and metals. Proper design practice and real-life failures will be discussed.
Prerequisite: 24-262

Course Website: http://www.cmu.edu/me/

24-653 Special Topics: Materials and Their Processing for Mechanical Engineers

Spring: 12 units
The study of the major classes of materials (e.g., metals, alloys, ceramics, polymers, composites) and their structure-processing-property relationships is integral to many engineering disciplines. This course will introduce the fundamental concepts behind how the processing of materials influences their atomic/molecular structures and resulting properties. The course will adopt a game-based learning approach in which students will utilize the virtual Minecraft environment to study crystal structures, imperfections (defects), diffusion, and phase equilibria. These concepts are then applied to characterize and interpret the (mechanical, electrical, magnetic, and optical) properties of various material systems as part of a final collaborative group project.

24-654 Special Topics: Welding Engineering

Spring: 12 units
This course introduces the Welding Engineering field by teaching its fundamental aspects (e.g. metallurgy, solidification, heat transfer, arc physics, etc.) as applied to welding common ferrous and non ferrous materials with representative fusion (e.g. GMAW, LBW) and solid-state (e.g. FSW, FW) based processes and aspects of their use in production (i.e. variables to control, specific techniques and methodologies, standards/specifications, inspection and amp; testing of welds to ensure their quality). This will provide students with the knowledge to start to become more conversant in this discipline and to those that elect to further delve and specialize in specific areas of joining and amp; assembly, the preparation/step-stone to start to do so in their careers in industry or academia.

24-655 Cellular Biomechanics

Intermittent: 9 units
This course discusses how mechanical quantities and processes such as force, motion, and deformation influence cell behavior and function, with a focus on the connection between mechanics and biochemistry. Specific topics include: (1) the role of stresses in the cytoskeleton dynamics as related to cell growth, spreading, motility, and adhesion; (2) the generation of force and motion by moot molecules; (3) stretch-activated ion channels; (4) protein and DNA deformation; (5) mechanochemical coupling in signal transduction. If time permits, we will also cover protein trafficking and secretion and the effects of mechanical forces on gene expression. Emphasis is placed on the biomechanics issues at the cellular and molecular levels; their clinical and engineering implications are elucidated. 3 hrs. lec.
Prerequisite: Instructor permission.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-656 Introduction to Vibrations with Applications

Spring: 12 units
This is an introductory course in vibrations and structural dynamics. Vibrations are frequently observed in mechanical (e.g., automobiles, robots), aerospace (e.g., airplanes, satellites), civil (e.g., buildings, bridges), and biological (e.g., eardrum, myocardial cells) systems. As such, modeling, analysis, experimentation, and control of vibrations are critical for many systems. This course covers fundamental concepts on vibrations of simplified (single- and multi-degree-of-freedom lumped-parameter models) and distributed-parameter systems (strings, beams in bending and torsion). Various applications of vibrations are analyzed. An overview of vibration testing and experimental modal analysis is also provided. The topics include free and forced response of single- and multi-degree of freedom structures; harmonic response analysis; vibration suppression; Lagrange's equations to derive the equations of motion; vibrations of strings and beams; and numerical methods to determine natural frequencies and mode shapes.
Prerequisites: 24-352 and 24-351

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-658 Image-Based Computational Modeling and Analysis

Spring: 12 units
Image-based computational modeling and analysis play an important role in mathematical modeling and computer simulation of many physical and biological phenomena. This course integrates mechanical engineering, biomedical engineering, material sciences, computer science, and mathematics together. Topics to be studied include scanning techniques, image processing, geometric modeling, mesh generation, computational mechanics, as well as broad applications in biomedicine, material sciences and engineering. The techniques introduced are applied to examples of multi-scale modeling and simulations in various research fields.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-663 Special Topics: Biomechanics of Human Movement

Spring: 12 units
This course provides an overview of the mechanical principles underlying human movement biomechanics and the experimental and modeling techniques used to study it. Specific topics will include locomotion, motion capture systems, force plates, muscle mechanics, musculoskeletal modeling, three dimensional kinematics, inverse dynamics, forward dynamic simulations, and imaging-based biomechanics. Homework and final class projects will emphasize applications of movement biomechanics in orthopedics, rehabilitation, and sports. ***Students are expected to have knowledge of ordinary differential equations and rigid body dynamics at the level of 24-351.***

24-664 Introduction to Biomechanics

Fall: 12 units
The purpose of this course is to achieve a broad overview of the application of mechanics to the human body. This includes solid, fluid, and viscoelastic mechanics applied to single cells, the cardiovascular system, lungs, muscles, bones, and human movement. The physiology of each system will be reviewed as background prior to discussing mechanics applications within that system. There are no firm prerequisites, but statics, fluid mechanics, and biology are helpful.

Course Website: http://www.cmu.edu/me/

24-665 Special Topics: Wearable Health Technologies

Spring: 12 units
This project-based course will provide an overview of emerging wearable health technologies and give students hands-on experience in solving ongoing technical challenges. The wearable sensing field is experiencing explosive growth, with exciting applications in medicine. New lightweight devices will make it easier to monitor health conditions in real time, automatically import data into health informatics systems, and provide haptic feedback with humans in the loop. We will review several aspects of these technologies, including hardware, software and big data analytics, user experience, and applications. Students will be working collaboratively in a semester-long project that tackles timely experimental and computational challenges. Programing experience, in any language, is a pre-requisite.

Course Website: https://www.meche.engineering.cmu.edu/education/courses/24-665.html

24-666 Special Topics: Introduction to Geometric Dimensioning and Tolerancing

Spring: 3 units
Geometric Dimensioning and Tolerancing (GD and amp;T) encompasses a language and system of rules used to precisely and unambiguously communicate the intended geometry and allowable variation of manufactured objects. This tolerance informs the design, process selection, tooling, and inspection of a part. This course will introduce students to this system of communication and its applications. Topics will include interpreting GD and amp;T on engineering drawings, implementing it in Solidworks, and performing tolerance analyses.
Prerequisite: 24-370

24-667 Special Topics: Introduction to Geometric Dimensioning and Tolerancing

Spring: 6 units
Geometric Dimensioning and Tolerancing (GD and amp;T) encompasses a language and system of rules used to precisely and unambiguously communicate the intended geometry and allowable variation of manufactured objects. This tolerance informs the design, process selection, tooling, and inspection of a part. This course will introduce students to this system of communication and its applications. Topics will include interpreting GD and amp;T on engineering drawings, implementing it in Solidworks, and performing tolerance analyses.

24-668 Mechatronics Applications in Mechanical Engineering

Fall: 12 units
Most modern products contain elements of sensing, actuation, and control. This course builds on concepts from Dynamic Systems and Control to design simple mechatronic systems. Topics include modeling and selection of sensors and actuators, measurement systems, digital signal processing, microcontroller architectures, and the basics of state space control methods; these topics are taught in the context of integration with mechanical systems. This course includes a substantial project component in which students design, build, and test a mechatronic system through a series of subsystem prototypes and systems integration.

24-671 Electromechanical Systems Design

Fall: 12 units
This course guides students through the design process as applied to mechatronic systems, which feature electrical, mechanical, and computational components. Lectures describe the typical design process and its associated activities, emphasizing methods for analyzing and prototyping mechatronic systems. Professional and ethical responsibilities of designers, interactions with clients and other professionals, regulatory aspects, and public responsibility are discussed. The design project is team-based and is based on a level of engineering knowledge expected of seniors. Proof of practicality is required in the form of descriptive documentation and a working prototype system at the end of the course. Oral progress reports and a final written and oral report are required.
Prerequisites: 24-370 and 24-302 and 24-352

Course Website: http://www.cmu.edu/me/

24-672 Special Topics in DIY Design and Fabrication

Fall: 12 units
The traditional principles of mass production are being challenged by concepts of highly customized and personalized goods. A growing number of do-it-yourself (DIY) inventors, designers, makers, and entrepreneurs is accelerating this trend. This class offers students hands-on experience in DIY product design and fabrication processes. Over the course of the semester, students work individually or in small groups to design customized and personalized products of their own and build them using various DIY fabrication methods, including 3D laser scanning, 3D printing, laser cutting, molding, vacuum forming, etc. In addition to design and fabrication skills, the course teaches students skills for communicating their ideas effectively through industrial design sketches and presenting their products with aesthetically refined graphics.

Course Website: https://www.andrew.cmu.edu/course/24-672/

24-673 Soft Robots: Mechanics, Design and Modeling

Spring: 12 units
Soft, elastically-deformable machines and electronics will dramatically improve the functionality, versatility, and biological compatibility of future robotic systems. In contrast to conventional robots and machines, these ? soft robots? will be composed of elastomers, gels, fluids, gas, and other non-rigid matter. We will explore emerging paradigms in soft robotics and study their design principles using classical theories in solid mechanics, thermodynamics, and electrostatics. Specific topics include artificial muscles, peristaltic robotics, soft pneumatic robotics, fluid-embedded elastomers, and particle jamming. This course will include a final project in which students may work individually or as a team. For the project, students are expected to design and simulate and/or build all or part (eg. sensors, actuators, grippers, etc.) of a soft robot. Prerequisites: Statics and Stress Analysis or equivalents.
Prerequisite: 24-262

Course Website: http://www.cmu.edu/me/

24-677 Modern Control Theory

Fall: 12 units
This course offers a practical introduction to the analysis and design of model-based control for linear systems. Topics include modeling and linearization of multi-input multi-output dynamic systems using the state-variable description, fundamentals of linear algebra (linear space, linear transformation, linear dynamics), analytical and numerical solutions of systems of linear time-invariant differential and difference equations, structural properties of linear dynamic physical systems (controllability, observability and stability), canonical realizations, and design of state feedforward/feedback, optimal, and stochastic controllers and observers (pole placement, LQR, MPC, Kalman filter approaches). Students will learn how to design linear controllers and implement them to solve real-world problems in control and robotics.

Course Website: https://www.meche.engineering.cmu.edu/education/graduate-programs/index.html (https://www.meche.engineering.cmu.edu/education/graduate-programs/)

24-680 Quantitative Entrepreneurship: Analysis for New Technology Commercialization

Intermittent: 12 units
This course provides engineers with a multidisciplinary mathematical foundation for integrated modeling of engineering design and enterprise planning decisions in an uncertain, competitive market. Topics include economics in product design, manufacturing and operations modeling and accounting, consumer choice modeling, survey design, conjoint analysis, decision-tree analysis, optimization, model integration and interpretation, and professional communication skills. Students will apply theory and methods to a team project for a new product or emerging technology, developing a business plan to defend technical and economic competitiveness. This course assumes fluency with basic calculus, linear algebra, and probability theory.

24-681 Computer-Aided Design

Intermittent: 12 units
his course is the first section of the two-semester sequence on computational engineering. Students will learn how computation and information technologies are rapidly changing the way engineering design is practiced in industry. The course covers the theories and applications of the measurement, representation, modeling, and simulation of three-dimensional geometric data used in the engineering designed process. Students taking this course are assumed to have knowledge of the first course in computer programming. 4 hrs lecture, 2 hrs computer cluster

Course Website: http://www.andrew.cmu.edu/course/24-681/

24-683 Design for Manufacture and the Environment

Fall: 12 units
Design for Manufacturing and the Environment examines influences of manufacturing and other traditionally downstream issues on the overall design process. Manufacturing is one facet that will be examined. Other downstream influences that will be studied include: assembly, robustness and quality, platform design, maintenance and safety, economics and costing, lean manufacturing and globalization. In addition, a core part of the course will focus on environment-based design issues. The class will study basic fundamentals in each of these areas and how they affect design decisions. Prerequisites: Senior standing in mechanical engineering, or permission of instructor

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-684 Special Topics: Nanoscale Manufacturing Using Structural DNA Nanotechnology

Fall: 12 units
This course provides an introduction to modern nanoscale manufacturing using structural DNAnanotechnology. This DNA-based approach to manufacturing has much in common with other fabrication methods in micro- and nano-engineering: computer aided design tools are necessary for device design and resulting structures can only be seen using advanced microscopy. However, instead of machining larger materials down to micro- and nanostructures, DNA origami is fabricated using a "bottom up" approach for self-assembling individual oligonucleotides into 2D and 3D nanostructures. Resulting structures can be designed to have novel mechanical and electrical properties and have applications as broad-ranging as medicine, biological computing, and energy systems. The course will include lectures, hands-on physical modeling, homework problems, 3D modeling of DNA origami using caDNAno and CANDO software, and student team projects and presentations.

Course Website: https://www.meche.engineering.cmu.edu/

24-685 Engineering Optimization without Project

Fall: 9 units
This course introduces students to 1) the process of formally representing an engineering design or decision-making problem as a mathematical problem and 2) the theory and numerical methods needed to understand and solve the mathematical problem. Theoretical topics focus on constrained nonlinear programming, including necessary and sufficient conditions for local and global optimality and numerical methods for solving nonlinear optimization problems. Additional topics such as linear programming, mixed integer programming, global optimization, and stochastic methods are briefly introduced. Model construction and interpretation are explored with metamodeling and model reformulation techniques, study of model boundedness, constraint activity, and sensitivity analysis. Matlab is used in homework assignments for visualization and algorithm development, and students apply theory and methods to a topic of interest in a course project. Fluency with multivariable calculus, linear algebra, and computer programming is expected. Students who are unfamiliar with Matlab are expected to learn independently using available tutorials and examples provided. This course is identical to 24-785 Engineering Optimization, except students in 24-685 will not complete the project, but will be responsible for any homework assignments and exams. 19785 and 24785: 12-units including the team-based engineering optimization project 19685 and 24685: 9-units excluding the project
Prerequisites: 21-341 and 21-259

Course Website: http://www.cmu.edu/me/

24-686 Advanced Mechanical Design

Intermittent: 12 units
This course will build expert foundational knowledge in mechanical design. Students will perform a series of multi-week modules in which they design, fabricate, and test high-performance mechanical components or assemblies individually or in small teams. Interactive lectures and topic readings on underlying technical approaches will occur simultaneously, thereby drawing a strong connection between theory, analytical methods, computational tools, and experience-based intuition. Modules will address optimal structures for tensile, bending, buckling, and torsion conditions, fatigue life, mechanism design, fluid power system design, and optimization of dynamical system properties. This course builds on the skills and methods taught in 24-370, Engineering Design I, and students are recommended to first take 24-370 and its prerequisites or similar courses at their undergraduate institution. Priority will be given to students who have already passed 24-200 Machine Shop Practice.
Prerequisite: 24-370

Course Website: http://www.cmu.edu/me (http://www.cmu.edu/me/)

24-687 Special Topics: New Technology Development and Roadmapping

Fall: 12 units
This course teaches a set of quantitative analysis methods fundamental to technology development and assessing the potential of emerging technologies. Students apply the analysis methods to a particular technology of their choosing in a project. The analysis tools learned in the course allow students to identify critical factors for advancing emerging technologies, strategizing R and amp;D to meet technical and market adoption targets, and predicting future technology performance. Topics include production models, adoption S-curves, dynamic consumer preferences, materials selection, and valuation of technological breakthroughs. Assignments include a series of presentations and written reports. The course assumes familiarity with college-level introductory probability and statistics.

Course Website: http://www.cmu.edu/me/

24-688 Introduction to CAD and CAE Tools

Fall: 12 units
This course offers the hands-on training on how to apply modern CAD and CAE software tools to engineering design, analysis and manufacturing. In the first section, students will learn through 7 hands-on projects how to model complex free-form 3D objects using commercial CAD tools. In the second section, students will learn through 7 hands-on projects how to simulate complex multi-physics phenomena using commercial CAE tools. Units: 12 Format: 2 hrs. Lec., 2 hrs. computer lab
Prerequisites: 24-262 and 24-231

Course Website: http://www.cmu.edu/me/

24-691 Mechanical Engineering Project Management

Fall and Spring: 12 units
Organizations are increasingly adopting formal project management techniques to successfully initiate, plan, execute, monitor, control, and close out projects. In this course, students will learn project management tools which are commonly applied in industry. Working in teams, students will incorporate these tools into a documented plan for a project on which they are currently working or have previously completed. The project plan will address the ten knowledge areas of project management, including the management of project integration, scope, schedule, cost, quality, resources, communications, risk, procurement, and stakeholders. Students will also work in teams to plan and manage simulated projects. Real world constraints, challenges, and incentives will be applied. Additional special topics in project management will be discussed based on student interest, which may include lean, iterative, incremental, and industry-specific approaches, as well as productivity and human relations principles, and project management professional certification.

Course Website: http://www.cmu.edu/me/

24-692 Special Topics: Engineering a Startup: How to Start and Grow a Hardware Company

Fall: 12 units
Many modern devices are created by entrepreneurs starting their own enterprises. This course will provide a practical foundation for creating a new technology company. Specifically, it focuses on the unique challenges with creating, funding, and scaling a hardware-centric startup, with a heavy focus on examining real world examples of engineered product companies. Topics will include: issues with product development processes in a startup setting, identifying key market differentiators, launching a product to market, fund raising strategies, establishing and scaling manufacturing, and creating and understanding financial statements. This class is geared towards students with no business experience. The class will feature guest speakers with entrepreneurial experience developing and launching high tech products. The class will culminate with student teams creating and presenting an original pitch deck to a review board of entrepreneurs and investors.

Course Website: http://www.cmu.edu/me/

24-693 Special Topics: Leadership and Communication

Fall and Spring: 12 units
The objective of this course is to prepare students to be better leaders and communicators in their future careers, in industry, academia, and elsewhere. Topics include: psychological analysis of leaders and followers, negotiation and conflict resolution, interviewing, organizational decision making, and harnessing and deploying skills in challenging situations. To address these topics, the course employs new teaching techniques involving hands on activities, for example mock interviews and role playing around challenging situations. Learning outcomes include: improved ability to adapt, communicate, and lead in difficult situations in real time, understand team interactions and group dynamics to become a successful leader and follower, best practices in negotiating and resolving conflict in team situations and business interactions, and understand fundamentals of the interview process to achieve best outcomes.

24-695 Academic and Professional Development for Mechanical Engineering Masters Student

Fall: 1 unit
This course, required for all first-year masters students in the Department of Mechanical Engineering, will cover fundamental and practical topics for their academic and professional development. The course offers ten one-hour workshop sessions throughout the fall semester. A short assignment will be given after each session. The sessions will cover three categories of topics: (1) career planning, (2) graduate study, and (3) social issues. The first category covers alumni panels, Ph.D. panels, and employer information. The second category covers time management and group dynamics. The third category covers diversity, equity and inclusion, ethics, and academic integrity. Assessment Structure: Attendance and assignments

24-696 Professional Communication in Engineering

Fall and Spring: 5 units
This course, required for all masters students in the Department of Mechanical Engineering, will help students hone their written and oral communication skills for the workplace. Students will meet weekly throughout a semester to learn communication strategies, practice those strategies in formal and informal contexts, and give and receive peer feedback. There will be weekly deliverables (both written and oral) that will receive formal feedback from communication TAs. To maximize learning benefits, students will have the option to revise assignments in order to improve their skills. Topics covered include: preparing brief (30-60 second) pitches, responding to job interview questions, writing challenging emails, writing progress reports, writing executive summaries, presenting technical work to non-experts, writing project descriptions for non-experts, creating a web portfolio.

24-697 Research Communication in Mechanical Engineering

Spring: 4 units
This course, required for all MSME-R students, will support students in effectively writing and presenting their final research projects. Students will meet bi-weekly throughout a semester to learn communication strategies and give and receive peer feedback. There will be weekly deliverables (both written and oral) that will receive formal feedback from communication TAs. Topics covered include: writing a proposal, describing your project for different audiences, data visualization, designing a research poster, orally presenting your project in different venues, responding to questions about your project.

24-703 Numerical Methods in Engineering

Fall: 12 units
This course covers numerical methods for solving a range of mathematical problems that are encountered in the analysis of engineering applications. Procedures will be presented for solving problems related to systems of equations, regression, optimization, integration, eigenvalues, ordinary differential equations, and partial differential equations. Students will be required to develop and implement computer algorithms and then apply them to engineering systems. Some programming experience is required.

Course Website: http://www.cmu.edu/me/graduate/courses.html

24-704 Probability and Estimation Methods for Engineering Systems

Fall: 12 units
Overview of rules of probability, random variables, probability distribution functions, and random processes. Techniques for estimating the parameters of probability models and related statistical inference. Application to the analysis and design of engineered systems under conditions of variability and uncertainty. 12 units Prerequisites(s) 26-211, or 36-220 or equivalent. Cross listed CEE 12-704
Prerequisite: 36-220

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-711 Fluid Dynamics

Fall: 12 units
This course focuses on development and application of control volume forms of mass, momentum and energy conservation laws, differential forms of these laws in Eulerian and Lagrangian coordinates, and Navier-Stokes equations. Students also explore applications to problems in incompressible and compressible laminar flows, boundary layers, hydrodynamic lubrication, transient and periodic flows, thermal boundary layers, convective heat transfer, and aerodynamic heating. 4 hrs. lec. Prerequisites: 24-701 or permission of the instructor.
Prerequisite: 24-701

Course Website: https://www.meche.engineering.cmu.edu/

24-718 Computational Fluid Dynamics

Fall: 12 units
This course focuses on numerical techniques for solving partial differential equations including the full incompressible Navier-Stokes equations. Several spatial-temporal discretization methods will be taught, namely the finite difference method, finite volume method and briefly, the finite element method. Explicit and implicit approaches, in addition to methods to solve linear equations are employed to study fluid flows. A review of various finite difference methods which will be used to analyze elliptic, hyperbolic, and parabolic partial differential equations and the concepts of stability, consistency and convergence are presented at the beginning of the course to familiarize the students with general numerical methods. Detailed syllabus of the course is provided on the URL given below. 4 hr. lec
Prerequisites: 24-311 and 24-231

Course Website: http://www.andrew.cmu.edu/user/satbirs/24718/

24-721 Advanced Thermodynamics

Intermittent: 12 units
The course covers advanced macroscopic thermodynamics and introduces statistical thermodynamics. Review of first and second laws. Axiomatic formulation of macroscopic equilibrium thermodynamics and property relationships. Criteria for thermodynamic equilibrium with application to multiphase and multi-component systems. Thermodynamic stability of multiphase systems. Elementary kinetic theory of gases and evaluation of transport properties. Statistical-mechanical evaluation of thermodynamic properties of gases, liquids, and solids. Students are expected to have an undergraduate level of understanding of Thermodynamics (comparable to 24-221). 4 hrs. lec.
Prerequisite: 24-221

Course Website: http://www.andrew.cmu.edu/user/venkatv/24721/

24-722 Energy System Modeling

Fall: 12 units
This course focuses on the thermodynamic modeling of energy systems with emphasis on energy/availability analysis techniques. These techniques are developed and applied to both established and emerging energy technologies, such as internal combustion engines, gas- and coal-fired power plants, solar and wind energy systems, thermochemical hydrogen production cycles, and fuel cells. The course will also consider the integration of components such as reformers and electrolyzers. Modern computational tools are used throughout the course. The course culminates with a group project that requires developing sophisticated, quantitative models of an integrated energy system. Students are expected to have completed an undergraduate course in thermodynamics comparable to 24-221.
Prerequisites: 24-221 or 27-215 or 06-221

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-727 Special Topics: Aerosol Measurement Technology

Intermittent: 12 units
This course explores modern methods and instrumentation used to characterize key physical and chemical properties of aerosol particles, and the fundamental principles underlying the technology. Topics include particle sampling and collection (aerosol inlets, impactors, cyclones, virtual impactors, collection on substrates, electrostatic precipitation), aerosol charging and neutralization, particle size measurements (electrical mobility, optically, and aerodynamically based), particle detection (optical and electrical), aerosol optical properties, and the characterization of particle chemical composition (online mass spectrometry, in particular). Methods for analyzing both individual and ensembles of aerosol particles are discussed and compared. Recent advances reported in the literature are explored through student-led presentations. Students write a term paper describing and justifying their choice of techniques to solve a realistic aerosol measurement need. While the focus is on atmospheric aerosol particles, industrial applications such as particle synthesis and characterization are also discussed.

Course Website: http://www.cmu.edu/me/

24-730 Advanced Heat Transfer

Spring: 12 units
This course is open to students from all areas of engineering, although an undergraduate background in heat transfer is assumed. This class is an appropriate preparation for the doctoral qualifying exam.Topics to be covered include: mathematical formulation of heat transfer problems, heat conduction, thermal radiation, hydraulic boundary layers, and laminar and turbulent convection. Problems and examples will include theory and applications drawn from a spectrum of engineering design problems. Prerequisite: Undergraduate Heat Transfer 24-322 or equivalent.
Prerequisite: 24-322

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-740 Combustion and Air Pollution Control

Intermittent: 12 units
24-740 Combustion and Air Pollution Control This course examines the generation and control of air pollution from combustion systems. The course's first part provides a brief treatment of combustion fundamentals, including thermochemical equilibrium, flame temperature, chemical kinetics, hydrocarbon chemistry, mass transfer, and flame structure. This foundation forms the basis for exploring the formation of gaseous (oxides of nitrogen, carbon monoxide, hydrocarbons, and sulfur dioxide) and particulate pollutants in combustion systems. The course then describes combustion modifications for pollutant control and theories for pollutant removal from effluent streams. The internal combustion engine and utility boilers serve as prototypical combustion systems for discussion. The course also addresses the relationship between technology and the formulation of rational regional, national, and global air pollution control strategies. Cross listed 19-740, 19-440, 24-425

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-751 Solid Mechanics and Elasticity

Fall: 12 units
This introductory course develops the fundamental concepts of continuum mechanics for solids in a manner useful for applications in engineering. Physical understanding of elasticity theory is introduced from first principles in kinematics, stress, and material constitutive laws with a focus on understanding and solving important problems in solids. Topics covered include linear elastic bodies; slender structures of rods and plates; finite deformation of rubbery materials; fracture and adhesion; contact mechanics; and dynamics. Emphasis is placed on using elasticity theory to not only solve classical problems but to also construct and understand experimental results and finite element method simulations in applied engineering applications and fundamental scientific research.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-753 Special Topics: Robotic Materials: Designs, Principles & Mechanics

Fall and Spring: 12 units
This is an interdisciplinary course focused on principles, theoretical models, and material architectures relevant to applications of condensed soft matter to problems in engineering. Special attention will be given to the design of soft, elastically-deformable machines and electronics that are primarily composed of elastomers, gels, fluids, gas, and other non-rigid matter. Specific topics will include the mechanics of hyperelastic solids, statistical mechanics of polymers and polymer composites, energy-based modeling techniques derived from the Laws of Thermodynamics, and their applications in modeling soft multifunctional material systems. Additionally, we will explore emerging paradigms in soft robotics, wearable computing, and human machine interaction, including material architectures for artificial muscles, stretchable electronics, and sensorized robotic skin. This course will include extensive reading with problem set assignments, a take-home exam, and final report. Students need familiarity with undergraduate-level solid mechanics, vector mechanics, thermodynamics, and ODEs
Prerequisite: 24-751

24-755 Finite Elements in Mechanics I

Fall: 12 units
The basic theory and applications of the finite element method in mechanics are presented. Development of the FEM as a Galerkin method for numerical solution of boundary value problems. Applications to second-order steady problems, including heat conduction, elasticity, convective transport, viscous flow and others. Introduction to advanced topics, including fourth-order equations, time dependence and nonlinear problems. 12 Units Prerequisite(s): Graduate standing or consent of instructor

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-760 Robot Dynamics and Analysis

Fall: 12 units
This course covers the dynamics of robotic systems with a focus on the mathematical structure of the dynamics and numerical analysis. Topics will start by reintroducing basic kinematics and dynamics in a more formal mathematical framework before moving on to contact conditions, friction, hybrid dynamical systems, simulation, and trajectory optimization. After the course students will be able to write simulation and optimization methods for analyzing robotic systems. Students should have taken a prior course in dynamics, and be comfortable with linear algebra, multivariable calculus, and programming in Matlab.
Prerequisites: 16-711 or 24-351

Course Website: http://www.andrew.cmu.edu/user/amj1/classes/robotdynamics.html

24-771 Linear Systems

Fall: 12 units
Topics include review of classical feedback control; solution of differential and difference equations; Laplace and Z-transforms, matrix algebra, and convolution; state variable modeling of dynamic continuous and discrete processes; linearization of nonlinear processes; state variable differential and difference equations; computer-aided analysis techniques for control system design; state variable control principles of controllability, observability, stability, and performance specifications; trade-offs between state variable and transfer function control engineering design techniques; and design problems chosen from chemical, electrical, and mechanical processes. 4 hrs. lec. Prerequisite: An undergraduate course in classical control engineering or consent of the instructor.
Prerequisite: 24-451

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-773 Multivariable Linear Control

Spring: 12 units
Robust control techniques are used in various industries, from hard disk drives to robotics, to rigorously account for model uncertainty and manufacturing variations. This course will introduce robust control of multi-input, multi-output linear systems, providing a synthesis of frequency-domain concepts from classical control with state space analysis from linear systems. Topics include performance limitations in control systems, uncertainty models, generalized plants, robust stability and performance measures, controller synthesis, and model order reduction. The course will mix theoretical developments with practical design examples drawn from industry (robotics, data storage, aerospace, etc.). This is intended to be the 2nd in a three course sequence designed to prepare students for an industrial career in control systems engineering.
Prerequisites: 24-771 Min. grade C or 24-677 Min. grade C

Course Website: http://www.cmu.edu/me/

24-774 Advanced Control Systems Integration

Fall: 12 units
This course focuses on the practical implementation of feedback / feedforward controllers. The entire controller design process is presented, including system modeling and identification, compensator design, simulation, and hardware prototyping. This is a project-based course in which students complete the controller design process on a nonlinear, MIMO hardware system. The goal is train students on the system integration skills necessary for success in industry or experimental laboratory work.
Prerequisites: 24-677 Min. grade C or 24-771 Min. grade C

Course Website: http://www.cmu.edu/me/

24-775 Bioinspired Robot Design and Experimentation

Spring: 12 units
This course will give students hands on experience designing, building, and analyzing robotic systems. Through a semester-long project, students will need to propose and test a research hypothesis with an experimental robotic system. Projects will focus on topics in bioinspired robotics and the robot must either test a biological hypothesis using a robot or test a hypothesis about the robot that is based on bioinspired robotic principles. In addition to the project, lectures and homework will cover topics in bioinspired robotics, robotic component design, systems integration, experimental instrumentation, biohybrid robotics, and biomimetic modeling. This class provides the opportunity for students to apply techniques in design, control, and analysis that students have acquired during their graduate studies. Students are expected to be comfortable programming in Matlab and have some prior graduate-level experience in mechanical design, controls, optimization, or robotics.

Course Website: https://www.andrew.cmu.edu/course/24-775/

24-776 Non Linear Control

Intermittent: 12 units
Nonlinear Control (12 Units) This course provides an introduction to the analysis and design of nonlinear systems and nonlinear control systems; stability analysis using Lyapunov, input-output and asymptotic methods; and design of stabilizing controllers using a variety of methods selected from linearization, vibrational control, sliding modes, feedback linearization and geometric control. 4 hrs. lec.
Prerequisite: 24-771

24-778 Mechatronic Design

Spring: 12 units
Mechatronics is the synergistic integration of mechanical mechanisms, electronics, and computer control to achieve a functional system. Because of the emphasis upon integration, this course will center around laboratory projects in which small teams of students will configure, design, and implement mechatronic systems. Lectures will complement the laboratory experience with operational principles and system design issues associated with the spectrum of mechanical, electrical, and microcontroller components. Class lectures will cover selected topics including mechatronic design methodologies, system modeling, mechanical components, sensor and I/O interfacing, motor control, and microcontroller basics.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-780 Engineering Computation

Fall: 12 units
This course covers the practical programming and computational skills necessary for engineers. These include: (1) programming in C++, (2) visualization using OpenGL, (3) basic data structures, and (4) basic algorithms. The course covers computational techniques required for solving common engineering problems and background algorithms and data structures used in modern Computer-Aided Design, Computer-Aided Manufacturing, and Computer-Aided Engineering tools. The course also offers intensive hands-on computational assignments for practice of common applications.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-781 Engineering Computation Project

Fall
24-781 This project course is the first section of the two-semester sequence of Computational Engineering Projects. The course provides the students with hands-on problem-solving experience by using commercial computational tools and/or developing their own custom software. Each student, individually or along with other students, will work on a project under the guidance of Carnegie Mellon faculty members and/or senior engineers from industry. Students may select a project topic from those presented by advising faculty members and/or industry engineers. Alternatively, a student may propose and work on his/her own project topic if he/she can identify a sponsoring faculty member or industry engineer.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-782 Machine Learning and Artificial Intelligence for Engineers - Project

Spring: 12 units
This course provides an open-ended computational project experience in artificial intelligence and machine learning. This course will enable student teams to design, develop and test data-driven computational algorithms. Course objectives are: - Gain experience in data sciences and data-driven methods for engineering. - Learn advanced programming and computational system design. - Learn project planning and management, project evaluation, teamwork, technical communication. The projects will target problems involving experimental, simulated or crowd-sourced data. Each project will aim to build an artificial intelligence or machine learning system that accomplishes one or more of the following: Identify patterns in data, establish a mathematical model for the input/output relationships, classify data into distinct categories, use existing data to synthesize new solutions to a synthesis problem. Team activities include three presentations, two written reports, a final technology demo, and one final report in the form of an archival publication.
Prerequisites: 10-701 Min. grade C or 15-781 Min. grade C or 10-601 Min. grade C or 24-787 Min. grade C

Course Website: http://www.cmu.edu/me/

24-783 Advanced Engineering Computation

Spring: 12 units
This course covers the advanced programming and computational skills necessary for solving engineering problems. These include (1) efficient data structures and algorithms for modeling and processing real-world data sets such as trees, hash tables, searching, priority queues, etc. (2) techniques for simulation and visualization such as numerically solving ODEs and PDEs, viewing control, programmable shader, etc., (4) tools for version controlling, scripting, and code building including sub-version, git, and cmake. Students will experience practical training in the above knowledge and programming skills through bi-weekly assignments and a final team project. Prerequisites- 24-780 Engineering Computation or equivalent C++ and OpenGL programming experience
Prerequisite: 24-780

Course Website: http://www.cmu.edu/me/

24-784 Special Topics: Trustworthy AI

Intermittent: 12 units
Innovations driven by recent progress in artificial intelligence such as deep learning and reinforcement learning, have shown human-competitive performance. However, as research expands to real-world cyber-physical autonomy, the question of safety is becoming a crux for the transition from theories to practice. This course will first review fundamental knowledge for trustworthy AI autonomy, including adversarial attack/defend, generative models, hierarchical Bayesian models, safe reinforcement learning, rare-event/few-shot learning, and robust evaluation. Then from the research perspective, students will explore the novelty and potential extension of various state-of-the-art trustworthy AI research and their implementation through a series of readings. Students will develop the ability to conduct research in teams. Knowledge and research skills learned in this course can be applied to self-driving, healthcare devices, assistant robots, and intelligent manufacturing. This course is devised for research-focused students who have backgrounds and interests in statistical machine learning, robotics and control, and human-machine interaction. Other interested students should contact the instructor to determine if it is a good fit for them.

24-785 Engineering Optimization

Intermittent: 12 units
Engineering Optimization Intermittent: 12 units This course introduces students to 1) the process of formally representing an engineering design or decision-making problem as a mathematical problem and 2) the theory and numerical methods needed to understand and solve the mathematical problem. Theoretical topics focus on constrained nonlinear programming, including necessary and sufficient conditions for local and global optimality and numerical methods for solving nonlinear optimization problems. Additional topics such as linear programming, mixed integer programming, global optimization, and stochastic methods are briefly introduced. Model construction and interpretation are explored with metamodeling and model reformulation techniques, study of model boundedness, constraint activity, and sensitivity analysis. Matlab is used in homework assignments for visualization and algorithm development, and students apply theory and methods to a topic of interest in a course project. Fluency with multivariable calculus, linear algebra, and computer programming is expected. Students who are unfamiliar with Matlab are expected to learn independently using available tutorials and examples provided. 4 hrs.lecture Prerequisites: None 19785 and 24785: 12-units including the team-based engineering optimization project 19685 and 24685: 9-units excluding the project
Prerequisites: 21-341 and 21-259

24-787 Machine Learning and Artificial Intelligence for Engineers

Fall: 12 units
This course introduces fundamental machine learning and artificial intelligence techniques useful for engineers working on data-intensive problems. Topics include: Probability and Bayesian learning, generative and discriminative classification methods, supervised and unsupervised learning, neural networks, support vector machines, clustering, dimensionality reduction, regression, optimization, evolutionary computation, and search. The lectures emphasize the theoretical foundations and the mathematical modeling of the introduced techniques, while bi-weekly homework assignments focus on the implementation and testing of the learned techniques in software. The assignments require knowledge of Python including text and image input/output, vector and matrix operations, simple loops, and data visualization. Students must have undergraduate level experience with linear algebra and vector calculus.
Prerequisites: (21-341 and 15-112) or (15-112 and 21-254)

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-788 Introduction to Deep Learning

Spring: 6 units
This course introduces the deep learning methodology. Students will learn about the basics of deep neural networks, and their applications to different tasks in engineering. Students will be able to apply Deep Learning to a variety of artificial intelligence tasks pertinent to different engineering problems. Neural Networks and Convolutional Neural Networks (CNN) and different variations of it will be taught. The fundamental knowledge and mathematics behind backpropagation and automatic differentiation will be discussed. Deep learning libraries such as Pytorch will be taught, and students will learn to use these libraries for developing deep learning models.
Prerequisites: 10-601 or 24-787 or 10-715 or 18-611 or 10-701

Course Website: http://www.cmu.edu/me/

24-789 Intermediate Deep Learning for Engineers

Spring: 6 units
This course will introduce some of the advances in deep learning technology such as sequential learning using Recurrent Neural Networks, Generative Adversarial Networks, Attention models and Transformers, and Diffusion models. Students will learn how to implement these models using deep learning libraries (Pytorch). Introduction to deep learning is the prerequisite.
Prerequisites: (24-787 or 10-601 or 11-785 or 10-715) and (24-788 or 11-785)

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-790 Thesis Research

Intermittent
This course is designed to give students enrolled in the Ph.D. program an opportunity to conduct extensive research over the course of their studies. Variable hrs.

24-791 Graduate Seminar

All Semesters
Graduate seminar speakers include faculty, students, and invited guests from industry and academia. Through seminars, students widen their perspectives and become more aware of other topics in mechanical engineering

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-793 Supervised Reading

Fall and Spring
This independent study is designed to give students an opportunity to explore pertinent subjects through faculty directed reading. Variable hrs. Prerequisite: Completion of "Supervised Reading" form acquired by your graduate MechE advisor; which includes permission of the instructor.

Course Website: https://www.meche.engineering.cmu.edu/education/graduate-programs/index.html (https://www.meche.engineering.cmu.edu/education/graduate-programs/)

24-794 Master of Science Research

Fall and Spring
This course is designed to be a training opportunity in engineering research and associated professional activity. Content includes a series of investigations under the student's initiative culminating in comprehensive reports, with special emphasis on orderly presentation and effective English composition for Master of Science candidates. Variable hrs. Prerequisite: permission of the instructor.

Course Website: https://www.meche.engineering.cmu.edu/education/graduate-programs/index.html (https://www.meche.engineering.cmu.edu/education/graduate-programs/)

24-795 PhD Internship in Teaching Counterpoint

Fall and Spring
A teaching assignment under the guidance of a faculty member for intermediate or terminal-level doctoral candidates. Typical activities include preparing and teaching recitations, preparing and teaching laboratory sessions, holding office hours, grading and preparation of quizzes, problem sets and other assignments, and assisting instructor with other activities associated with teaching a course. 24-795 is 12 units and offered in Fall and Spring (P/F). All non-native English speakers must conform to the university regulation on the TA language requirements.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-797 Thesis Research

Fall and Spring
This course is designed to give students enrolled in the Ph.D. program an opportunity to conduct extensive research over the course of their studies. Variable hrs.

Course Website: http://www.cmu.edu/me/graduate/index.html (http://www.cmu.edu/me/graduate/)

24-799 Practicum in Mechanical Engineering

All Semesters
The Department of Mechanical Engineering at Carnegie Mellon considers experiential learning opportunities important educational options for its graduate students. One such option is an internship, normally completed during the summer. If a student receives an internship, the Mechanical Engineering Department will add the internship course to the student's schedule, and the student will be assessed tuition for 3 units. Upon completion of the internship, students must submit a 2-3 page report with supervisor signature detailing the work experience and including how the internship was related to Mechanical Engineering. After the report has been reviewed and approved, a letter grade will be assigned and these 3 units will count towards degree requirements. International students interested in registering for the practicum must also be authorized for Curricular Practical Training (CPT). Further information is available on the Office of International Education?s website: www.cmu.edu/oie.

Course Website: https://www.meche.engineering.cmu.edu/education/graduate-programs/index.html (https://www.meche.engineering.cmu.edu/education/graduate-programs/)

24-850 Implantable Cell-Based Medical Devices

Fall: 12 units
This advanced seminar course explores the emerging field of implantable medical devices that utilize living cells to deliver therapeutics and/or continuously monitor patient's health through key biomarkers. After discussing requirements for such devices, the course will examine the literature on various aspects, including design principles, material requirements, cell engineering and selection, cell encapsulation and protection, supporting long-term cell viability and functionality in vivo. We will then discuss various current and emerging applications of those devices from targeted drug delivery for various diseases to continuous biomarker monitoring enabling personalized treatment strategies. We will conclude by examining the regulatory pathways and clinical trials necessary to bring these groundbreaking devices to patients.

24-892 Locomotion Seminar

Intermittent
The CMU Bipedal Locomotion Seminar is a weekly meeting amongst students and professors who study bipedal locomotion using a variety of approaches. Each week, one graduate student participant gives a presentation on a topic of their choosing related to their research. We encourage discussion and interaction, especially from fellow students. Each meeting is intended to work like a small, informal conference discussion or workshop, providing students with new perspectives on their projects, practice presenting and answering questions, and a forum for meeting colleagues. We encourage participation from all interested students and faculty, including members of Carnegie Mellon, The University of Pittsburgh, and Disney Research Pittsburgh. Please join the waitlist and contact one of the instructors for admission.

Course Website: http://www.andrew.cmu.edu/user/amj1/locomotion_seminar.html

24-991 Professional Development for PhD students

Fall: 2 units
This course is the first in a sequence of two required courses where incoming PhD students learn research and professional communication skills that will benefit them throughout the PhD and in their careers. Topics covered include DEI and cross-cultural communication, reading and understanding technical publications, building the student/advisor relationship, working in teams, communicating by email, presenting for success, receiving and addressing critical feedback, and performing a literature review. The class intends to strengthen the PhD cohort and activities will often require group work and evaluation.

24-992 Professional Development for PhD students II

Spring: 2 units
This is one of two required courses (the other being 24-991) where incoming PhD students learn research and professional skills that will benefit them throughout the PhD and in their careers. Topics covered include leadership and equity in teamwork, equity in evaluation, ethics in research, presenting your work to different audiences, responding to questions in an oral presentation, responding to peer review, and writing an effective abstract. The class intends to strengthen the PhD cohort and activities will often require group work and evaluation. Students entering in the Spring should take 24-992 before 24-991

Engineering Minors for Non-Engineering Students

Biomedical Engineering Minor

Kristin Kropf, *Undergraduate Program and Alumni Relations Coordinator, Biomedical Engineering*
kgaluska@andrew.cmu.edu
www.cmu.edu/bme/Academics/undergraduate-programs/minor.html (https://www.cmu.edu/bme/Academics/undergraduate-programs/minor.html)

The minor program is designed for students who desire exposure to biomedical engineering but may not have the time to pursue the Biomedical Engineering additional major. The program is open to students of **all** colleges and is popular among both engineering and science majors. In conjunction with other relevant courses, the program may provide a sufficient background for jobs or graduate studies in biomedical engineering. Students interested in a medical career may also find this program helpful.

The Biomedical Engineering minor curriculum is comprised of three core courses and three electives. The Quality Point Average (QPA) for courses that count toward the minor must be 2.00 or better. No course taken on a pass/fail or audit basis may be counted towards the minor.

Students who have questions or are interested in declaring Biomedical Engineering minor should contact Kristin Kropf (kgaluska@andrew.cmu.edu).

Requirements

Minimum units required for minor:		57
03-121	Modern Biology	9
or 03-151	Honors Modern Biology	
42-101	Introduction to Biomedical Engineering	12
42-202	Physiology	9
42-xxx	BME Elective I	9-12
42-xxx	BME Elective II	9-12
42-xxx	BME Elective III	9-12

A BME Elective is defined as one of the following:

1. One semester of 42-200 Sophomore BME Research Project, 42-300 Junior BME Research Project, 42-400 Senior BME Research Project or 39-500 Honors Research Project. The project must be supervised by a core or courtesy Biomedical Engineering faculty member and for 9 or more units. Research projects supervised by a courtesy Biomedical Engineering faculty member must have significant biomedical engineering relevance. Note that BME Research Project can only be count as one BME elective.

2. 42-203 BME Laboratory (or the cross-listed version 03-206 for students in the Health Professions Program). Please note that priority for enrollment in 42-203 or 03-206 will be given to students who have declared the Additional Major in Biomedical Engineering. If sufficient room in the course remains after all majors have been accommodated in a given semester, students who have declared the Biomedical Engineering Designated Minor will be given the next priority for enrollment. If space still allows, other students will be enrolled.

3. Any 42-xxx course with a course number greater than 42-300 and worth at least 9 units (excluding 42-300 and 42-400- see previous comment regarding BME Research Project).

Students can petition the Biomedical Engineering Undergraduate Affairs Committee to count non-BME classes that have significant biological or medical content towards the minor requirements.

Engineering Studies Minor

(for non-engineering students)

Kurt Larsen, *Director*
Location: Scaife Hall 426

Carnegie Mellon undergraduate students enrolled in colleges other than engineering can complete a Minor in Engineering Studies in addition to their regular majors. Students pursuing this minor are required to complete courses from at least two different engineering departments in order to assure some breadth of exposure to engineering. In addition, the minor provides students the opportunity to pursue an in-depth concentration in a particular field of engineering.

For the Minor in Engineering Studies, students must complete five engineering courses as follows and must earn a cumulative QPA of 2.00 in these five courses. Students may declare the minor by contacting the director after they have successfully completed one introductory engineering courses (from list #1 below).

Requirements

1. At least one and up to three of the following:

12-100	Exploring CEE: Infrastructure and Environment in a Changing World	12
18-100	Introduction to Electrical and Computer Engineering	12
19-101	Introduction to Engineering and Public Policy	12
24-101	Fundamentals of Mechanical Engineering	12
27-100	Engineering the Materials of the Future	12
42-101	Introduction to Biomedical Engineering	12

2. Four engineering-centric courses of at least nine units each. Students must demonstrate both breadth and depth by taking courses from at least two of the below departments; and at least two courses from the same department.

- Biomedical Engineering
- Chemical Engineering
- Civil and Environmental Engineering
- Electrical and Computer Engineering
- Engineering Design, Innovation, and Entrepreneurship
- Engineering and Public Policy*
- Materials Science and Engineering
- Mechanical Engineering

Up to one of the following Robotics courses can count toward the ES minor. But it cannot be double-counted with the Robotics minor or double major.

1.

16-311	Introduction to Robotics	12
16-362	Mobile Robot Algorithms Laboratory	12
16-384	Robot Kinematics and Dynamics	12
16-385	Computer Vision	12
16-421	Vision Sensors	12
16-474	Robotics Capstone	12
16-350	Planning Techniques for Robotics	12

NOTE: The following courses may NOT be included as part of the minor in Engineering Studies.

06-262	Mathematical Methods of Chemical Engineering	12
12-201	Geology	9
15-213	Introduction to Computer Systems	12
18-090	Twisted Signals: Multimedia Processing for the Arts	10
18-200	ECE Sophomore Seminar	1
18-202	Mathematical Foundations of Electrical Engineering	12

18-213	Introduction to Computer Systems for a core major requirement (e.g. CS minor)	12
24-280	Special Topics: C++ Programming for Engineers	9
24-291	Environmental Systems on a Changing Planet	9
24-311	Numerical Methods	10
42-202	Physiology	9

Double counting of core courses in student's primary major is not permitted.

*Because of the nature of the courses offered by Engineering and Public Policy, only two EPP courses (including 19-101) can be used toward the minor requirements. Most EPP courses (19-xxx) are not permissible for the minor; students need special permission to use 19-xxx toward this minor and should contact the director for prior approval. Students interested in EPP coursework should consider the Technology and Policy minor instead.

Technology and Policy Minor

Deanna H. Matthews, *Associate Department Head for Undergraduate Affairs, Engineering and Public Policy*
Location: Wean Hall 4101

The Technology and Policy Minor is administered by the Department of Engineering and Public Policy (EPP). The Technology and Policy Minor is designed to give students a basic understanding of the interactions between technology, society and policy and some project experience in problems involving technology and policy.

Pre-requisites

Students should have prerequisite knowledge in economics (73-102 Principles of Microeconomics or similar level economics course) and statistics (36-202 Methods for Statistics & Data Science or similar level statistics course) in order to pursue the Technology and Policy Minor.

Course Requirements

19-101	Introduction to Engineering and Public Policy	12
19-301	Decision Making Methods for Engineers and Scientists or other approved Decision Science course	9
or 19-351	Applied Methods for Technology-Policy Analysis	
19-451	EPP Projects I	12
xx-xxx	Two EPP Technology-Policy Electives	18

EPP Technical Electives include courses that address problems at the society-technology interface and the means of analyzing these issues. A list of qualifying Technology-Policy electives is assembled each semester and is available from the EPP Department. Example Technology-Policy electives include:

19-211	Ethics and Policy Issues in Computing	9
19-303	Cryptocurrencies, Blockchains and Applications	Var.
19-403	Policies of Wireless Systems	12
19-411	Science and Innovation Leadership for the 21st Century: Firms, Nations, and Tech	9
19-425	Sustainable Energy for the Developing World	9
19-429	Climate Change Science and Solutions	9
19-433	Data Science for Technology, Innovation and Policy	9
19-469	Behavior, Decision and Policy	9
19-639	Policies of the Internet	12
19-668	Electric Vehicles: Technology, Economics, Environment and Policy	12

Students must earn a cumulative QPA of 2.0 in all courses taken for the minor. Required courses taken for a student’s primary major may not be counted toward the Technology and Policy Minor. Elective courses for a student’s primary major or courses fulfilling general education requirements may be counted, however.

Information Security, Privacy and Policy Minor

Lujo Bauer, *Professor, Electrical and Computer Engineering and Software and Societal Systems Department (SCS)*

Deanna H. Matthews, *Associate Department Head for Undergraduate Affairs, Engineering and Public Policy*

Interdisciplinary minor offered by both CIT and SCS

There is a growing demand for security and privacy experts, and increasing interest among CMU undergraduates in taking security and privacy courses. Security and privacy expertise is an asset in a variety of careers outside, not just in computer science, but also in areas that include business, management, and law. In addition, the policy side of security and privacy is becoming increasingly important and employers are interested in hiring people with an understanding of relevant policy issues, especially in the privacy and security area.

This minor is for undergraduate students across the university who are interested in policy issues related to security and privacy, including those who are planning careers in security/privacy as well as those who plan to focus their careers in other areas. The curriculum has been designed to accommodate students from any major as long as they have taken at least one introductory-level college programming course (such as 15-110 or 15-112).

After completing this minor, students will have a good understanding of how to identify potential security and privacy risks and relevant legal and policy issues; a working understanding of security topics such as cryptography, authentication, and Internet security protocols; as well as broad knowledge of several security- and privacy-related areas as they pertain to the design, development, deployment and management of technologies in a variety of practical contexts (e.g., Web, mobile, Internet of Things, social media, crypto currencies).

Admission

Students are not required to apply to enroll in this minor to start the required courses. However, they are encouraged to consult with the minor director on their elective course selection. In addition, students doing the independent study option must get approval from the minor director prior to enrolling in their independent study course. Finally, students must contact the minor director to certify their completion of the minor.

Curriculum

Students are required to take five courses to complete this minor with a minimum of 48 units.

INTRODUCTORY SECURITY COURSE

17-331	Information Security, Privacy, and Policy	12

Students who have taken 15-213 Introduction to Computer Systems may substitute 15-330 Introduction to Computer Security/18-330 Introduction to Computer Security

PRIVACY AND POLICY COURSE

17-333	Privacy Policy, Law, and Technology	9

Students may substitute a 12-unit version of this course: 19-608, 17-333, or 95-818.

PRIVACY ELECTIVES

Complete a minimum of 9 units:		
19-534/17-334	Usable Privacy and Security	9
19-602/17-702	Current Topics In Privacy Seminar	3
17-731	Foundations of Privacy	12

TECHNOLOGY AND POLICY ELECTIVES

Complete a minimum of 9 units:		Units
19-211	Ethics and Policy Issues in Computing	9
17-562	Law of Computer Technology	9
19-101	Introduction to Engineering and Public Policy	12
19-402	Telecommunications Technology and Policy for the Internet Age	12
19-403	Policies of Wireless Systems	12
19-639	Policies of the Internet	12
84-387	Remote Systems and the Cyber Domain in Conflict	9

Crosslisted courses are also allowed.

ADDITIONAL APPROVED ELECTIVE

Students must complete an additional elective of 9 units or more. Students may choose an additional privacy elective or technology policy elective from the list above, or the one of the following security electives:

15-316	Software Foundations of Security and Privacy	9
15-356	Introduction to Cryptography	12
19/17-303	Cryptocurrencies, Blockchains and Applications	Var.
19-534/17-334	Usable Privacy and Security	9
18-334	Network Security	12
18-335	Secure Software Systems	12
18-435	Foundations of Blockchains	12

Students who have the necessary prerequisites may choose any approved elective from the SCS or ECE security and privacy undergraduate concentration. Check with the minor program director to determine which category of elective each course will fulfill.

Students should be careful to choose electives for which they have appropriate prerequisites. New elective options are expected as more courses are offered. Students may petition to count a course not on this list as an elective. Students should request permission *before* taking a course that is not on this list. Students may not count multiple electives that overlap substantially.

Optional Project: Subject to approval by the minor director, students may optionally count towards one of the elective requirements 9 units of an independent study or research project course in the security or privacy area, under the supervision of a faculty member in any department. In order to receive credit towards the minor, students must submit a brief project proposal to their project advisor and to the minor director and have it approved prior to conducting the project. Depending on the topic of the project, the minor director may approve credits counting towards privacy electives, technology policy electives, security electives, or some combination of these. Students may work individually, with other undergraduates, or as part of project teams with graduate students or research staff. Students involved in a group project must identify specific project components for which they are responsible. In addition, they must submit a final project report to their project advisor and the minor director that includes a literature review and describes the work they completed. Students working on a group project must each submit their own final report, which should also situate their contribution in the context of the larger project. Note, students are expected to work approximately 1 hour per week for each unit of project in which they are enrolled (e.g. 9 units = 9 hours/week of project work).

Double Counting: At most 2 of the courses used to fulfill the minor requirements may be counted towards any other undergraduate major or minor program. This rule does not apply to courses counted for general education requirements.

Undergraduate Designated Minors in the College of Engineering

Overview

Undergraduate students in the Carnegie Institute of Technology can elect to complete an interdisciplinary Designated Minor in addition to their regular majors for B.S. degrees. Designated minors have been added to the curriculum of the Carnegie Institute of Technology to promote flexibility and diversity among the college's engineering students. Independent of a student's major, he or she is able to pursue a selected designated minor from the following list:

- Additive Manufacturing
- Audio Engineering
- Biomedical Engineering
- Colloids, Polymers and Surfaces
- Electronic Materials
- Global Engineering
- Materials Science and Engineering
- Mechanical Behavior of Materials

An engineering student may elect to complete a CIT designated minor. Generally, the student takes all the required courses in an engineering major but uses electives to take courses needed to fulfill the requirements of the designated minor. Upon completion of the requirements of a CIT designated minor and the engineering degree, the minor is a formally recognized on the student's transcript.

Each of the CIT designated minors is administered by a Program Committee consisting of faculty from all major engineering departments who serve as faculty advisors. Each Program Committee certifies the completion of requirements of the designated minor. But the student's major department is responsible for approving the degree with a designated minor after reviewing a student's entire academic record. Any substitution or departure from the published curriculum should be avoided. For example, non-technical courses may not be substituted for required technical courses or electives. Equivalent technical electives offered by a designated minor as substitutions for required courses in a major must be approved by the Head of the student's major department.

Although a student generally can complete a designated minor without increasing the number of required units for graduation, early planning in electing a designated minor is important. A student also may find that some minors are more compatible than others with his/her major because of different relations between various major and minor requirements. The requirements for these CIT designated minors are listed below.

Additive Manufacturing Minor

The objective of the Minor in Additive Manufacturing is to provide the student with a background in the engineering science that applies to additive manufacturing (also known as 3D printing), from part design through additive processes, to properties and component performance. Particular emphasis is given to metals additive manufacturing, due to its rapidly growing impact on manufacturing across multiple industries, and the need for talent in this area. The minor is open to students in all engineering majors.

Students may not use any given course to satisfy simultaneously requirements in both their enrolled major and in this minor. Graduate courses counted towards this minor may not be (double) counted for a graduate degree.

Minor Coordinators

Paige Houser, Academic Advisor

Departmental Contacts

Biomedical Engineering	**Robert Tilton**
Chemical Engineering	**Robert Tilton**
Electrical and Computer Engineering	**Maysam Chamanzar**
Engineering and Public Policy	**Deanna Hart Matthews**
Materials Science and Engineering	**Anthony Rollett**
Mechanical Engineering	**Jack Beuth**

Course Requirements

This minor requires a total of five (5) courses comprising of three core courses and two technical electives.

Three Core Courses 36 units

		Units
39-601	Special Topics: Additive Manufacturing Processing and Product Development	12
39-602	Additive Manufacturing and Materials	12
39-603	Additive Manufacturing Laboratory	12

Two Technical Electives

To select acceptable technical elective course options, please speak with your departmental contact, or see https://engineering.cmu.edu/education/undergraduate-programs/curriculum/additive-manufacturing-minor.html.

Audio Engineering Minor

Tom Sullivan, *Director and Faculty Advisor*

This sequence is for candidates who are engineering majors with interest in and/or have background in music, recording, sound-editing and/or other music technology areas; or majors from any discipline in the university who have the above interests and who can meet the prerequisite requirements for the engineering courses in the minor.

Note: Students who do not have the requisite engineering/science/math background should investigate the Minor in Music Technology offered by the School of Music.

Course Requirements

Minimum units required for minor: 73-79

The student must have taken the appropriate prerequisite courses for the listed courses.

Prerequisite Courses, 0-3 units

Beginning Piano is required of students who do not pass a piano proficiency test.

		Units
57-103	Elective Studio (Beginning Piano Class)	3

Music Courses, 43-49 units

Basic Harmony I is required of students who do not qualify for entrance into Harmony I, based on their scores on the theory placement test.

		Units
57-101	Introduction to Music Technology	6
or 57-171	Introduction to Music Technology (self-paced)	
57-149	Basic Harmony I	9
or 57-152	Harmony I	
57-173	Survey of Western Music History *	9
57-188	Repertoire and Listening for Musicians	1
57-337	Sound Recording	6

* co-requisite 57-188.

(choose two of the courses below)		Units
15-322	Introduction to Computer Music	9
57-338	Sound Editing and Mastering	6
57-347	Electronic and Computer Music	6
57-438	Multitrack Recording	9

Technical Courses, 33 units

Other courses may be taken with the approval of the Audio Engineering Minor Advisor.

		Units
33-114	Physics of Musical Sound	9
18-490	Electroacoustics **	12

** prerequisites 18-220 and 18-290.

(choose one of the courses below)		Units
18-300	Fundamentals of Electromagnetics	12
18-341	Logic Design and Verification	12
18-370	Fundamentals of Control	12
18-491	Digital Signal Processing	12
15-210	Parallel and Sequential Data Structures and Algorithms	12
15-214	Principles of Software Construction: Objects, Design, and Concurrency	12
18-320	Microelectronic Circuits +	12
18-349	Introduction to Embedded Systems ***	12

+ prerequisite 18-220.

*** prerequisites 18-240 and 18-213.

Biomedical Engineering Minor

Kristin Kropf, *Undergraduate Program and Alumni Relations Coordinator, Biomedical Engineering*
kgaluska@andrew.cmu.edu
www.cmu.edu/bme/Academics/undergraduate-programs/minor.html (https://www.cmu.edu/bme/Academics/undergraduate-programs/minor.html)

The minor program is designed for students who desire exposure to biomedical engineering but may not have the time to pursue the Biomedical Engineering additional major. The program is open to students of **all** colleges and is popular among both engineering and science majors. In conjunction with other relevant courses, the program may provide a sufficient background for jobs or graduate studies in biomedical engineering. Students interested in a medical career may also find this program helpful.

The Biomedical Engineering minor curriculum is comprised of three core courses and three electives. The Quality Point Average (QPA) for courses that count toward the minor must be 2.00 or better. No course taken on a pass/fail or audit basis may be counted towards the minor.

Students who have questions or are interested in declaring Biomedical Engineering minor should contact Kristin Kropf (kgaluska@andrew.cmu.edu).

Requirements

Minimum units required for minor: 57

03-121	Modern Biology	9
or 03-151	Honors Modern Biology	
42-101	Introduction to Biomedical Engineering	12
42-202	Physiology	9
42-xxx	BME Elective I	9-12
42-xxx	BME Elective II	9-12
42-xxx	BME Elective III	9-12

A BME Elective is defined as one of the following:

1. One semester of 42-200 Sophomore BME Research Project, 42-300 Junior BME Research Project, 42-400 Senior BME Research Project or 39-500 Honors Research Project. The project must be supervised by a core or courtesy Biomedical Engineering faculty member and for 9 or more units. Research projects supervised by a courtesy Biomedical Engineering faculty member must have significant biomedical engineering relevance. Note that BME Research Project can only be count as one BME elective.

2. 42-203 BME Laboratory (or the cross-listed version 03-206 for students in the Health Professions Program). Please note that priority for enrollment in 42-203 or 03-206 will be given to students who have declared the Additional Major in Biomedical Engineering. If sufficient room in the course remains after all majors have been accommodated in a given semester, students who have declared the Biomedical Engineering Designated Minor will be given the next priority for enrollment. If space still allows, other students will be enrolled.

3. Any 42-xxx course with a course number greater than 42-300 and worth at least 9 units (excluding 42-300 and 42-400- see previous comment regarding BME Research Project).

Students can petition the Biomedical Engineering Undergraduate Affairs Committee to count non-BME classes that have significant biological or medical content towards the minor requirements.

Colloids, Polymers and Surfaces Minor

Professor Robert Tilton, *Director of CPS Minor*
Location: Doherty Hall A207C

The sequence of courses in the Colloids, Polymers and Surfaces (CPS) designated minor provides an opportunity to explore the science and engineering of fine particles and macromolecules as they relate to complex fluids and interfacially engineered materials. These topics are very relevant to technology and product development in industries that manufacture pharmaceuticals, coatings and paints, pulp and paper, biomaterials, surfactants and cleaning products, cosmetics and personal care products, food, textiles and fibers, nanoparticles, polymer/plastics, composite materials.

Course Requirements

Minimum units required for minor: 45

This minor requires a total of five classes with a minimum of 45 units. The following four courses are mandatory:

06-609/09-509	Physical Chemistry of Macromolecules	9
06-607	Physical Chemistry of Colloids and Surfaces	9
06-426	Experimental Colloid Surface Science	9
06-466	Experimental Polymer Science	9

In addition, the student must take one CPS related elective course from the following list:

06-612	Formulation Engineering	12
06-610	Rheology and Structure of Complex Fluids	9
09-502	Organic Chemistry of Polymers	9
27-565	Nanostructured Materials	9
27-477	Introduction to Polymer Science and Engineering	9

Other CPS electives are possible but must be approved by the Director of the CPS minor, Professor Tilton

Electronic Materials Minor

Jim Bain, *Co-Director*
Marek Skowronski, *Co-Director*
Paige Houser, *Academic Advisor*

Electronic materials are ubiquitous and essential in 21st century society. They underpin technologies that we rely on everyday – everything from communication, transportation, and lighting to commerce and entertainment. Advances in the synthesis, processing, and design of electronic materials are continuing to push boundaries towards more energy-efficient technologies, such as neuromorphic and quantum computing, long-range electric vehicles, AI, renewable energy sources, and other yet-to-be-discovered applications.

The Electronic Materials (EM) Minor is designed for students who have a keen interest in electronic materials, such as semiconductors, dielectrics and magnetics, and who are considering graduate school studies or careers pertaining to electronic materials industries. Students in the EM Minor will choose from a list of course electives from which they will learn about the physics, chemistry, synthesis, processing, design, characterization, and applications of a wide variety of electronic materials and devices.

Course Requirements

Minimum units for minor 54

54 Units From the Following Electives * :

27-100	Engineering the Materials of the Future ECE students only)	12
or 27-201	Structure of Materials	
or 27-211	Structure of Materials (Minor Option)	
18-100	Introduction to Electrical and Computer Engineering (MSE students only)	12
27-202	Defects in Materials (ECE students only)	9
or 27-212	Defects in Materials (Minor Option)	
27-432	Electronic and Thermal Properties of Metals, Semiconductors and Related Devices	9
27-433	Dielectric, Magnetic, Superconducting Properties of Materials & Related Devices	9
27-445	Structure, Properties and Performance Relationships in Magnetic Materials	9
27-533	Principles of Growth and Processing of Semiconductors	6
27-542	Thin Film Technologies	9
18-220	Electronic Devices and Analog Circuits	12
18-300	Fundamentals of Electromagnetics	12
18-310	Fundamentals of Semiconductor Devices	12
33-225	Quantum Physics and Structure of Matter	9
xx-xxx	An approved special topics or graduate level class pertaining to electronic materials	6-12

xx-xxx	An approved research project on electronic materials	6-12

*Students in ECE must take a minimum of 9 units in MSE, students in MSE must take a minimum of 9 units in ECE.

Global Engineering Minor

Treci Bonime, Director
Office: Scaife Hall 424

Many engineers work on international projects or for multinational companies. Carnegie Mellon is an international community, with a significant fraction of international students and many events featuring foreign speakers and cultural experiences. This minor is intended for engineering students interested in broadening their background in international experiences and global awareness and engagement.

Course Requirements

International Management (1 course)

Complete one course in international management or business such as:

70-342	Managing Across Cultures	9
70-365	International Trade and International Law	9
70-381	Marketing I	9
70-430	International Management	9
Or approved equivalent		

Regional Specialization (1 course)

Complete one course in non-US History, international politics, or literature in a single region of the world. See the list at https://engineering.cmu.edu/education/undergraduate-programs/curriculum/global-courses-minors.htmll (http://www.cit.cmu.edu/global/courses_degrees.html) below for examples (Note: Please consult with the Global Engineering director before planning your course schedule, as some course information may have changed).

Ethics (1 course)

Any ethics course that provides some exposure to international ethics issues such as:

70-332	Business, Society and Ethics	9
80-136	Social Structure, Public Policy & Ethics	9
80-244	Environmental Ethics	9
Or approved equivalent		

Languages, Cultures, and Applied Linguistics

Demonstration of basic competency in a foreign language via one of the three options listed below:

- Complete one (1) Languages, Cultures, and Applied Linguistics course at the 200 level, with a minimum grade of C, or
- Achieve a score of 4 or higher in one foreign language Advanced Placement examination, or
- Demonstrate equivalent proficiency to the satisfaction of the Department of Languages, Cultures, and Applied Linguistics

Study/Work Abroad

Study or engineering internship work abroad for a semester or a summer. The region visited should be consistent with the language and regional culture/history studied.

Information Security, Privacy and Policy Minor

Lujo Bauer, *Professor, Electrical and Computer Engineering and Software and Societal Systems Department (SCS)*

Deanna H. Matthews, *Associate Department Head for Undergraduate Affairs, Engineering and Public Policy (CIT)*

Interdisciplinary minor offered by both CIT and SCS

There is a growing demand for security and privacy experts, and increasing interest among CMU undergraduates in taking security and privacy courses. Security and privacy expertise is an asset in a variety of careers outside, not just in computer science, but also in areas that include business, management, and law. In addition, the policy side of security and privacy is becoming increasingly important and employers are interested in hiring people with an understanding of relevant policy issues, especially in the privacy and security area.

This minor is for undergraduate students across the university who are interested in policy issues related to security and privacy, including those who are planning careers in security/privacy as well as those who plan to focus their careers in other areas. The curriculum has been designed to accommodate students from any major as long as they have taken at least one introductory-level college programming course (such as 15-110 or 15-112).

After completing this minor, students will have a good understanding of how to identify potential security and privacy risks and relevant legal and policy issues; a working understanding of security topics such as cryptography, authentication, and Internet security protocols; as well as broad knowledge of several security- and privacy-related areas as they pertain to the design, development, deployment and management of technologies in a variety of practical contexts (e.g., Web, mobile, Internet of Things, social media, crypto currencies).

Admission

Students are not required to apply to enroll in this minor to start the required courses. However, they are encouraged to consult with the minor director on their elective course selection. In addition, students doing the independent study option must get approval from the minor director prior to enrolling in their independent study course. Finally, students must contact the minor director to certify their completion of the minor.

Curriculum

Students are required to take five courses to complete this minor with a minimum of 48 units.

INTRODUCTORY SECURITY COURSE

17-331	Information Security, Privacy, and Policy	12

Students who have taken 15-213 Introduction to Computer Systems may substitute 15-330 Introduction to Computer Security/18-330 Introduction to Computer Security

PRIVACY AND POLICY COURSE

17-333	Privacy Policy, Law, and Technology	9

Students may substitute a 12-unit version of this course: 19-608, 17-333, or 95-818.

PRIVACY ELECTIVES

Complete a minimum of 9 units:		Units
19-534	Usable Privacy and Security	9
19-602	Current Topics In Privacy Seminar	3
17-731	Foundations of Privacy	12

TECHNOLOGY AND POLICY ELECTIVES

Complete a minimum of 9 units:		Units
19-211	Ethics and Policy Issues in Computing	9
19-101	Introduction to Engineering and Public Policy	12
19-402	Telecommunications Technology and Policy for the Internet Age	12
17-562	Law of Computer Technology	9
19-403	Policies of Wireless Systems	12
19-639	Policies of the Internet	12
84-387	Remote Systems and the Cyber Domain in Conflict	9

Crosslisted courses are also allowed.

ADDITIONAL APPROVED ELECTIVE

Students must complete an additional elective of 9 units or more. Students may choose an additional privacy elective or technology policy elective from the list above, or the one of the following security electives:

15-316	Software Foundations of Security and Privacy	9
15-356	Introduction to Cryptography	12
19-303	Cryptocurrencies, Blockchains and Applications	9
19-534	Usable Privacy and Security	9
18-334	Network Security	12
18-335	Secure Software Systems	12
18-435	Foundations of Blockchains	12

Students who have the necessary prerequisites may choose any approved elective from the SCS or ECE security and privacy undergraduate concentration. Check with the minor program director to determine which category of elective each course will fulfill.

Students should be careful to choose electives for which they have appropriate prerequisites. New elective options are expected as more courses are offered. Students may petition to count a course not on this list as an elective. Students should request permission *before* taking a course that is not on this list. Students may not count multiple electives that overlap substantially.

Optional Project: Subject to approval by the minor director, students may optionally count towards one of the elective requirements 9 units of an independent study or research project course in the security or privacy area, under the supervision of a faculty member in any department. In order to receive credit towards the minor, students must submit a brief project proposal to their project advisor and to the minor director and have it approved prior to conducting the project. Depending on the topic of the project, the minor director may approve credits counting towards privacy electives, technology policy electives, security electives, or some combination of these. Students may work individually, with other undergraduates, or as part of project teams with graduate students or research staff. Students involved in a group project must identify specific project components for which they are responsible. In addition, they must submit a final project report to their project advisor and the minor director that includes a literature review and describes the work they completed. Students working on a group project must each submit their own final report, which should also situate their contribution in the context of the larger project. Note, students are expected to work approximately 1 hour per week for each unit of project in which they are enrolled (e.g. 9 units = 9 hours/week of project work).

Double Counting: At most 2 of the courses used to fulfill the minor requirements may be counted towards any other undergraduate major or minor program. This rule does not apply to courses counted for general education requirements.

Materials Science and Engineering Minor

Paige Houser, *Academic Advisor*
Location: Wean Hall 3317

The Designated Minor in Materials Science and Engineering provides the CIT student with a background in the field of Materials Science and Engineering. This minor is open to all CIT students, with the exception of MSE majors. All required and elective courses are taught within the MSE Department.

Course Requirements

Minimum units required for minor 45

The minor requires a minimum of 45 units.

Prerequisites

Students wishing to take the MSE minor must have prerequisite thermodynamics and transport courses. The prerequisite MSE courses may be substituted for by a thermodynamics and transport course in another engineering discipline.

Core Courses (21 units)

27-211	Structure of Materials (Minor Option)	6
27-212	Defects in Materials (Minor Option)	6
27-227	Phase Relations and Diagrams (Minor Option)	9

The laboratories with these courses are not required as core but will be counted as elective units if desired.

Elective Courses (24 units minimum)

The student must select a minimum of 24 units from the following list:

27-100	Engineering the Materials of the Future	12
27-301	Microstructure and Properties I	9
27-570	Polymeric Biomaterials	12
27-477	Introduction to Polymer Science and Engineering	9
27-357	Introduction to Materials Selection	6
27-367	Selection and Performance of Materials	6
27-433	Dielectric, Magnetic, Superconducting Properties of Materials & Related Devices	9
27-432	Electronic and Thermal Properties of Metals, Semiconductors and Related Devices	9
27-421	Processing Design	6
27-445	Structure, Properties and Performance Relationships in Magnetic Materials	9
27-591	Mechanics of Materials	9
27-454	Supervised Reading	Var.
27-533	Principles of Growth and Processing of Semiconductors	6
27-555	Materials Project I	Var.
27-565	Nanostructured Materials	9
27-542	Thin Film Technologies	9
27-592	Solidification Processing	9
42-444	Medical Devices	9

Mechanical Behavior of Materials Minor

Program Contacts

Paige Houser, *Academic Advisor*

Paul S. Steif, *Mechanical Engineering*

An understanding of mechanical behavior is important to both the development of new materials and the selection of appropriate materials for many applications. The mechanical behavior of materials is best investigated and understood by integrating solid mechanics with the microstructural basis of flow and fracture. The purpose of this minor is to allow a formal basis for students to pursue an integrated approach to the mechanical behavior of materials.

Although this minor is open to all CIT students, only students in the departments of Civil Engineering, Materials Science and Engineering, and Mechanical Engineering can take advantage of the double counting permitted for some courses in their department majors. Students in other departments may have difficulty in fulfilling the requirements in four years.

Course Requirements

Minimum units required for minor 51-54

The minor requires six courses: three core courses, two solid mechanics courses, and one materials science course. In satisfying these course requirements, each student must take three out-of-department courses. Each student is required to complete three core courses:

Core Courses:

27-201	Structure of Materials	9
27-591	Mechanics of Materials	9-12
or 27-791	Mechanical Behavior of Materials	
12-212	Statics	9
or 24-261	Mechanics I: 2D Design	

Group A: Materials Science Courses

Each student must take one course from this list of Materials Science courses:

27-202	Defects in Materials [1]	9
27-357	Introduction to Materials Selection [2]	6
27-709	Biomaterials	12

[1] 27-202 cannot be used by MSE students to satisfy the requirements of the minor.

[2] 27-357 cannot be used by MSE students to satisfy the requirements of the minor.

Group B: Solid Mechanics Courses

Each student must take two of the following Solid Mechanics courses:

12-231	Solid Mechanics	9
or 24-262	Mechanics II: 3D Design	
12-635	Structural Analysis	12
or 24-351	Dynamics	

Students should check with the director of the program or their faculty advisor for an up-to-date list of relevant courses that will count towards this minor. For more information, please consult the Undergraduate Course Catalog and the current Schedule of Classes.

College of Fine Arts

Mary Ellen Poole, Dean (CFA 100)

Kristen Kovak, Senior Associate Dean for Academics (CFA 100)
www.cfa.cmu.edu (http://www.cfa.cmu.edu)

Overview

The College of Fine Arts at Carnegie Mellon University was founded in 1905 as the first comprehensive arts learning institution in the United States. For 110 years it has educated outstanding artists, architects, designers, theater artists and musicians who have made important contributions to culture in the United States and the world. The alumni of the College of Fine Arts have shaped the worlds of television, stage, film, and electronic media; are collected in numerous international museums; have composed for and are performing in and conducting major symphony orchestras, choruses and opera companies throughout the world; have built notable buildings, pioneered innovative sustainable design strategies and created interactive software systems; created significant innovations in graphic and industrial design; and are professors and deans in major arts institutions.

The College of Fine Arts concentrates on the education of professionals in the arts in the broader context of Carnegie Mellon University. Beyond their education in their chosen field, through required and elective course work, students are involved with other disciplines within the College of Fine Arts and within the other colleges of Carnegie Mellon University. Further, the College's location in the Oakland District of Pittsburgh with its broad cultural resources (The Carnegie Museum of Art, the Carnegie Museum of Natural History, The Carnegie Library, the University of Pittsburgh, The Hillman Library, the Frick Fine Arts Building, and Phipps Conservatory and Botanical Gardens) places the College of Fine Arts at the center of a premier cultural environment.

The College of Fine Arts has a 9:1 student faculty ratio which provides a rigorous learning environment. It is a highly spirited federation of schools (Architecture, Art, Design, Drama and Music) made up of students and faculty who have an intense need to create and excel. Interacting among the schools, the University and the wider community are research centers such as the Frank-Ratchye Studio for Creative Inquiry, the Center for Building Performance and Diagnostics, Remaking Cities Institute, Center for Iranian Music, and the Center for Arts in Society. The intellectual and artistic life of the College is interwoven with a dense calendar of theater performances, concerts, exhibitions, film and media presentations and lectures by visiting artists, practitioners and scholars.

The College of Fine Arts offers a wide range of professionally oriented majors and minors in each of its schools. In addition, the College offers the Bachelor of Computer Science and Arts (BCSA), jointly with the School of Computer Science, the Bachelor of Humanities and Arts (BHA), jointly with the Dietrich College of Humanities and Social Sciences, the Bachelor of Science and Arts (BSA), jointly with the Mellon College of Science, the Engineering and Arts (EA) additional major, jointly with the College of Engineering, and the Master of Arts Management (MAM) and Master of Entertainment Industry Management (MEIM), jointly with the Heinz College of Public Policy and Management. These are presented only briefly below, but a complete listing of the graduation requirements for these programs may be found in the school descriptions later in this section and elsewhere in this volume.

Schools

School of Architecture

Office: CFA 201

The School of Architecture provides deep immersion in the discipline of architecture, intensified by the broader Carnegie Mellon culture of interdisciplinary innovation and creative inquiry. We define the discipline of architecture as the integrated pursuit of design creativity, historical perspective, social responsibility, technical expertise, and global environmental leadership. Though every School of Architecture student graduates with intensive architecture knowledge, no two graduates leave with the same education. In the twenty-first century, few architecture problems are straightforward. Our graduates excel in the roles architects have performed for centuries—and in new roles catalyzed by the depth and breadth of their education—to create and execute innovative solutions to a huge range of emerging global challenges. The school offers the following degree programs: Bachelor of Architecture (B.Arch), Bachelor of Arts in Architecture, Master of Advanced Architectural Design (MAAD), Master of Architecture (M.Arch), Master of Science and Ph.D. in Architecture–Engineering–Construction Management (MSAECM/PhD-AECM), Master of Science and Ph.D. in Building Performance and Diagnostics (MSBPD/PhD-BPD), Master of Science and Ph.D. in Computational Design (MSCD/PhD-CD), Master of Science in Sustainable Design (MSSD), and Master of Urban Design (MUD).

School of Art

Office: CFA 300

The primary mission of the School of Art is to develop in the individual student the skills, knowledge, and commitment required to work as an artist in society. The four-year undergraduate program leads to a Bachelor of Fine Arts degree in Art. Concentrations within the art major are offered in four areas: 1) Painting, Drawing, Print Media and Photography; 2) Electronic and Time-Based Work; 3) Sculpture, Installation, and Site Work; and 4) Contextual Practice. A Master of Fine Arts degree in Art is also offered.

School of Design

Office: MM 110

The School of Design combines its professional program with a sound education in the liberal arts, leading to careers in many fields of design. It offers the following degrees: Bachelor of Design with concentrations in Communications, Products, and Environments; M. Design in Design for Interactions; M.P.S. in Design for Interactions; M.A. in Design; Ph.D. in Transition Design.

School of Drama

Office: PCA 220

The School of Drama offers a highly focused, world-class theatre education with thorough preparation for sustained careers and innovation in today's widely-varied entertainment industries. The undergraduate programs lead to BFA degrees in Drama, with focuses in Acting, Music Theatre, Directing, Dramaturgy, Design, Production Technology and Management; MFA programs are offered in Scene, Costume, Sound, and Lighting Design; Directing; Dramatic Writing; and Production Technology and Management.

School of Music

Office: HOA 102

The School of Music has as its goal the preparation of musicians for careers in performance, composition, conducting, music education and music technology. The programs provide the opportunity to study with world-class artists utilizing the best aspects of conservatory training in the context of a major research university, combining the educational with the intensely professional. The Bachelor of Fine Arts is offered in Music Composition, Music Performance, and Music and Technology (a joint degree with the School of Computer Science and the Electrical and Computer Engineering Department) with minors in Collaborative Piano, Conducting, Music Education, Music Performance, and Music Technology available. The Master of Music is offered in Composition, Conducting, Performance, Music Education, and Music and Technology (a joint degree with Computer Science and the Electrical and Computer Engineering Department).

Academic Standards

Grading Practices

Grades given to record academic performance in the College of Fine Arts are detailed in the catalog section entitled "Undergraduate Academic Regulations." All courses taught by the schools in the College of Fine Arts follow the standard letter grade system of the university. Responsibility for the grade given to the student rests entirely with the instructor and the school concerned. A permanent grade may not be raised by taking a second examination or evaluation. Students who wish to repeat a course already passed must obtain approval from the Dean of the College. At the time of approval, the Dean will decide in the light of circumstances whether the new grade or the old grade will be the official grade used as the computing factor for honors. Both grades, however, will appear on the official transcript.

Grade Appeals

In the event a student believes an assigned grade is incorrect or not appropriate, the student may follow the university processes outlined in the Word to seek prompt and equitable resolution of the matter. All appeals are initially addressed to the instructor of record. If unresolved, the appeal can be forwarded to the Head of School (or department head if outside of CFA). https://www.cmu.edu/student-affairs/theword/academic/appeal-of-grades-and-academic-actions.html

Monitoring Degree Progress

The College of Fine Arts seeks to support each of our students on their pathway towards graduation. Thus, we review each student's academic performance and progress towards degree at the close of each semester. Academic actions are designed to notify a student of specific academic and graduation requirements, outline goals for completion, and identify avenues of support. Academic actions are opportunities for students to reflect, grow, and get connected with appropriate campus resources to help them succeed.

To stay on track for graduation, each student is expected to complete a minimum of 36* units each semester, have both a semester and cumulative QPA of at least 2.0, and make adequate progress towards their declared degree. *Adequate progress requires that at least 80% of their semester units are passed, that a student registers for their program's expected coursework, and that they have met the minimum grades required to progress in sequential coursework.*

If a student's academic record falls below these standards, they receive an academic action. These actions are assigned based on the most recent semester under review as well as a cumulative review of a student's performance to date. Each program will recommend students for notification and the CFA Academic Advisory Committee will finalize these decisions. The CFA Dean's office will then disseminate the academic action letters directly to the students and their advisors via their CMU email. To best support academic success, a student placed on an academic action is not permitted to overload, undertake independent studies, or study abroad until they return to good standing. (See school/program handbook for additional restrictions and specifications.)

Incomplete grades will be conditionally actioned by the default grades until the student completes the missing coursework. If the student does not complete their missing coursework by the faculty deadline agreed upon, their default grade and action will become permanent.

**Students approved for Part Time Status through the Office of Disability Resources will work with their Program's administration to determine the minimum number of units needed to remain in Good Standing.*

Academic Notifications

A preliminary email from an academic advisor may alert a student of an issue that will impede their degree progress if left unresolved (aka re-taking a general education requirement or falling behind on registering for required courses etc.) If the student meets new actionable criteria in the following semesters, they may be assigned an academic action.

The College of Fine Arts administers academic action letters to help all students stay abreast of their progress towards degree and to ultimately support their path to graduation. If a student falls below the outlined academic standards listed above (earn a minimum 2.0 semester and cumulative QPA and make adequate degree progress), they will receive an academic action letter at the close of that semester. If problems persist, they will receive escalating actions as listed below. <u>However, once a student resumes adequate degree progress and earns a semester and cumulative QPA of at least 2.0, they are returned to Good Academic Standing and will remain in good standing so long as the academic standards are still being met.</u>

Academic Concern

Academic Concern letters notify the student of a concerning academic performance issue(s) and suggests that the student take immediate steps to correct the cause of the difficulty. It is the first academic action administered to students who fall behind one or more of the degree standards. A student will remain on Academic Concern for the length of the next semester (Fall or Spring). Note that Academic Concern is an internal notification and will not appear on a student's academic transcript. If the student does not meet these standards in future semesters, they may be assigned a successive academic action.

Academic Warning

A student will be placed on Academic Warning for <u>continued</u> poor performance, or for <u>continued</u> failure to meet the requirements of their declared degree path. Academic Warning is the second level academic action administered to students who fall behind at least one of the degree standards for two or more semesters. A student will remain on this action for the length of the next semester (Fall or Spring). Again, Academic Warning is an internal notification and will not appear on a student's academic transcript. One or more previous actions are needed to qualify. If the student does not meet these standards in future semesters, they may be assigned a successive academic action.

Academic Suspension

Academic Suspension is a required, temporary leave from the university. It is administered to students who fall behind at least one of the degree standards for three or more semesters. (Two or more academic actions must proceed a suspension). An Academic Suspension is intended to allow the student time to address any issues impeding or affecting their performance in order to progress towards meeting the academic standards of their declared degree path. The student is required to temporarily withdraw from the university for a specific period as defined in their suspension letter.

The College of Fine Arts remains committed to students during these periods of temporary leave and continues to connect them to College and University level supports while they are away. Return from suspension is subject to the conditions specified in the suspension letter and approval of the CFA Dean's office. Details concerning associated restrictions can be found at: *https://www.cmu.edu/policies/student-and-student-life/suspension-required-withdrawal-policy.html*).

Final Academic Warning

Following a Suspension, students will be placed on Final Academic Warning during their initial semester of return.

Academic Drop

An Academic Drop is the final academic notification and is only administered after a substantial pattern of academic difficulty. Four or more semesters below standards, including a Suspension, are needed prior to an Academic Drop.

This action terminates the student's enrollment in their current School/Program but is not intended to prejudice admission to another academic program within Carnegie Mellon University, or to another institution. If a student has earned a cumulative grade point average of at least a 2.0, they may still apply for internal transfer within CMU– noting that the student must successfully transfer prior to resuming study at Carnegie Mellon.

Appeal of Academic Actions

Students have the right to appeal Academic Action decisions to the CFA Dean. All appeals must be received in writing by the deadline printed in the academic standing notification (within 10 days of the dated letter). If a student's initial appeal is denied they may choose to further their appeal to the Provost's Office in writing by the deadline printed in the appeal response (within 5 days of the dated letter). Additional information about appealing an academic action decision is found in The Word: Student Handbook (https://www.cmu.edu/student-affairs/theword/academic/appeal-of-grades-and-academic-actions.html).

Dean's Honor List

Each semester the College of Fine Arts recognizes those students who have attained outstanding semester quality point averages by naming them to the Dean's List. To be eligible, students must complete at least 36 factorable units and have no conditional, missing or failing grades in core classes at the time when final semester grades are recorded. The top 35% of eligible students in each of the College of Fine Arts schools are named to the Dean's List.

Graduation Requirements

Because of the special nature of work in the College of Fine Arts, the first year in all schools should be considered probationary, a period in which a student and faculty can evaluate professional promise in terms of the college's standards. Graduation from the College of Fine Arts follows the general university guidelines. As part of a student's qualification for an undergraduate degree, the equivalent of two terms of full-time work must be pursued under the direction of faculty members in the college during the period immediately prior to the degree award. Courses completed at other institutions will not be acceptable as terminal credit for a degree. Exceptions to this stipulation can be recommended by a school faculty in unusual cases, but the concurrence of the College Council is necessary before final approval of an exception can be given.

To be eligible to graduate, undergraduate students must complete all course requirements for their program with a cumulative Quality Point Average of at least 2.0 for all courses taken. For undergraduate students who enrolled at Carnegie Mellon as freshmen and whose freshman grades cause the cumulative QPA to fall below 2.0, this requirement is modified to be a cumulative QPA of at least 2.0 for all courses taken after the freshman year. Note, however, the cumulative QPA that appears on the student's final transcript will be calculated based on all grades in all courses taken, including freshman year. Some programs may have additional QPA requirements in order to graduate.

Other graduation requirements in the College of Fine Arts are described in the curriculum of each school. Further questions about specific course requirements and the total number of units required should be directed to the respective school advisors.

Other Regulations Affecting Student Status

Schedule Changes

Courses may be added or dropped within the times stated in the college calendar. No courses may be added or dropped after the stated deadline dates except with the approval of the student's School Head and the Dean of the College. (See Undergraduate Academic Regulations (p. 25) for Add/Drop procedures.)

Withdrawal/Leave of Absence

Please refer to the Student Leave Policy.

Transfer Students

Undergraduate students seeking transfer within or to any school of the College of Fine Arts must file an application with the School and proceed with the established transfer application procedure, audition, portfolio review or ASAT requirements. Admission may dictate freshman status regardless of the student's prior college experience.

Materials

The college does not furnish students with any drawing materials, make-up materials, textbooks, or other expendable equipment except those in courses in which materials fees are charged to cover specific costs.

Retention of Students' Work

The college reserves the right to retain indefinite documentation of any student work the faculty may select. All work not retained by the faculty must be claimed at the time specified by the schools concerned. The college assumes no liability for student materials in its custody.

Student Defined Majors

The Student Defined Major program in the College of Fine Arts is designed for the exceptional student, whose area of artistic interest lies outside of any pre-existing program at the University. Student Defined Majors are expected to propose a comprehensive plan of study that combines all of their coursework into a singular focus for their research and artistic practice. To create a successful proposal, the student must engage in additional career and preparatory research outside of their normal coursework. Designing the independent degree program typically takes six months to one year to complete.

Students interested in pursuing this unique degree path should meet with their academic advisors to discuss feasibility. They will then work with the CFA Senior Associate Dean of Interdisciplinary Initiatives to ensure that their proposed coursework meets the rigorous requirements of a Carnegie Mellon degree. They will need approval from their academic advisor, faculty mentor(s), relevant Head(s) of School, (Senior) Associate Dean(s), and the Vice Provost for Education. If the proposal is approved and the student has successfully met the requirements of the new major, the degree conferred at graduation will be a *Bachelor of Arts* with a *Student Defined Major: *approved title**. The CFA Office of the Dean, in consultation with the academic advisor, will determine final certification of the degree. Note that all academic actions and CFA policies still apply to Student Defined Majors.

To apply for a Student Defined Major in the College of Fine Arts, one:

1. Must be a student in good standing at the University.
2. Must have successfully completed at least one semester of study and have at least two semesters left prior to their intended date of graduation.
3. Must have a cumulative QPA of 2.75 or better. (A student whose QPA is under 2.75 may still submit a proposal, but is strongly advised against it. If the proposal is accepted by the CFA Senior Associate Dean of Interdisciplinary Initiatives, the student must apply for transitional status for the following semester and will have only one semester to improve his or her QPA to the 2.75 minimum. If the student is not successful in raising the QPA to the 2.75 minimum they will not be permitted to continue with the Student Defined Major. They must either be re-admitted back into their old program or seek admittance into another department or college.)
4. Must have a faculty mentor in the College of Fine Arts who has agreed to mentor the student through the completion of the degree. This mentor should be from the school where the student is taking the majority of their courses, and be approved by the CFA Senior Associate Dean of Interdisciplinary Initiatives. If a student wishes to work extensively across colleges, they will need a faculty advisor(s) from their additional area(s) of concentration as well as approval from an Associate Dean of each college involved.
5. Must successfully complete the proposal process and submit all approved documentation with necessary signatures to the CFA Office of the Dean, CFA 100, by May 1 to be effective in the fall semester, and by October 1 to be effective in the spring semester. (Proposals that come in after these dates will be considered, but may not be able to be processed until the following semester.)

Student Organizations

Professional and honorary societies for students in the College of Fine Arts are the American Institute of Architects, Architecture Peer Mentors, Architecture Student Advisory Council, National Organization of Minority Architecture Students, Freedom by Design, Alpha Rho Chi Medal, AIA Medal of Excellence, the Design League, American Institute of Graphic Arts (AIGA), Industrial Designers Society of America (IDSA), United States Institute for Theatre Technology (USITT), Phi Mu Alpha Sinfonia (music fraternity for men), Sigma Alpha Iota (music sorority for women), Pi Kappa Lambda (honorary for students in music) and the Music Educators' National Conference.

BXA Intercollege Degree Programs

BACHELOR OF COMPUTER SCIENCE AND ARTS (BCSA), BACHELOR OF HUMANITIES AND ARTS (BHA), BACHELOR OF SCIENCE AND ARTS (BSA), ENGINEERING AND ARTS (EA) ADDITIONAL MAJOR

M. Stephanie Murray, *Director & Academic Advisor*
Location: HOA 211

www.cmu.edu/interdisciplinary (http://www.cmu.edu/interdisciplinary/)

The **Bachelor of Computer Science and Arts** (BCSA) is a four-year intercollege degree-granting program designed for students interested in pursuing fields that comprehensively meld technology and the arts through courses offered in the College of Fine Arts and the School of Computer Science. It combines general education requirements, a concentration of courses in the College of Fine Arts, a concentration of courses in the School of Computer Science, and free electives.

The **Bachelor of Humanities and Arts** (BHA) is a four-year intercollege degree-granting program designed for students interested in blending studies in the College of Fine Arts and the Dietrich College of Humanities and Social Sciences. The BHA degree combines a general education requirement, a concentration of courses in the College of Fine Arts, a concentration of courses in the Dietrich College of Humanities and Social Sciences, and free electives.

The **Bachelor of Science and Arts** (BSA) is a four-year intercollege degree-granting program designed for students interested in combining studies in the College of Fine Arts and the Mellon College of Science. It combines general education requirements, a concentration of courses in the College of Fine Arts, a concentration of courses in the Mellon College of Science, and free electives.

The **Engineering and Arts** (EA) additional major is an interdisciplinary program designed for College of Engineering students interested in developing their skills and interests in an area of the College of Fine Arts while retaining their full engineering curriculum and licensure. It combines a BXA course requirement and a concentration of courses in the College of Fine Arts with a students primary engineering major.

Please refer to Interdisciplinary Programs (p. 894) in this catalog for details.

The Master of Arts Management Program

Location: 1115 Hamburg Hall

The search for both increased support and larger audiences has intensified over the last decade and now, more than ever, arts organizations seek skilled managers. To meet this need, the College of Fine Arts and the Heinz College's School of Public Policy and Management jointly developed the Master of Arts Management (MAM) Program to provide strong leadership in theater companies, dance companies, orchestras, opera companies, museums, galleries and arts policy organizations. In addition to the traditional two-year graduate degree structure, the Master of Arts Management Program provides undergraduate students the opportunity to complete the Bachelor of Fine Arts and Master of Arts Management degrees within a period of five years through the Heinz College's Accelerated Masters Program (AMP). MAM Program alumni can be found managing music and arts service organizations; marketing orchestras, theaters and dance companies; fund-raising for museums, opera companies, ballet companies and public television stations; and managing the finances of university arts departments and private businesses working in the arts and entertainment industry.

College of Fine Arts Interdisciplinary Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

62-002 CFA Elective

Intermittent: 9 units
TBA

62-104 Design Ethics & Social Justice in Architecture

Fall and Spring: 3 units
This course is aimed at first year architecture students as an introduction to social justice and design ethics. The course will explore how architecture relates to the human experience, human labor, and human rights; how the economic, political, and cultural contexts in which architects work contribute to issues of inequity; and what responsibilities architects and designers have to assure a greater sense of social justice for all. We will start by examining the traditional norms for the "standard" human body in design. Then will explore the meaning of identity (including race, class, gender, ethnicity), economic class and privilege. We will continue by exploring social justice, activism, climate change, colonialism and historically racist urban practices. Throughout the course, we will discuss how architecture is embedded in these issues and how architects might address these issues in current and future practice, both as citizens and as designers. This course includes lectures, weekly reading responses, and small group discussions. Class attendance and participation is required.

62-106 Architecture and the Arts

Fall: 9 units
This interdisciplinary course explores the entangled relationship between architecture and the arts, and their struggle between autonomy and engagement. It will be structured around a series of themes, drawings, and writings that reveal architecture's constantly changing involvement with art, culture, society, and related disciplines The course functions both an introduction to Architecture as Art for a general audience, as well as a critical introduction to architectural thinking and theory for architecture majors. The course will include slide lectures, readings, reading reports, discussions, and a series of research exercises to engage architecture and art more critically, and an exam. We'll examine the common roots, disparate characters, and inter-twined histories of architecture and the arts. We'll investigate not just buildings and art works, but ideas, drawings, images and other representations involved in the construction and reception of architecture that often relate closely to the arts. We'll look at shared terms like composition, rhythm, studio, and form. We'll define architecture in relation to categories such as fine and applied arts, high and low arts, visual and performing arts, and relate these to broad categories such as design, visual culture, and the liberal arts. We'll ask "why" we make architecture and art, rather than "how," and discuss how the human need for expression and meaning can augment the technical and constructed value of mere making or building. We'll debate how the discipline of architecture has been, and can continue to be framed as a fine art, but also act as a service profession, a political tool, a technical expertise, a research endeavor, or as a mode of cultural discourse.

62-122 Digital Media I

Fall: 6 units
This course will engage in an overview of foundational workflows in digital media regarding two-dimensional representation techniques for spatial design processes. The course is divided into two topics with one assignment each: Technical Drawing and 2D Graphics. Students are required to submit work at the end of each class, in addition to self-guided work outside of class times: satisfactory completions of the two assignments, specific Lynda tutorials, final project, and final portfolio are required for the successful completion of the course. Through these deliverables, the course will inquire issues of 2D representation as it pertains to the effective communication of technical and conceptual information in spatial design processes. With digital media, designers now have an arsenal of tools that can subvert and augment traditional means of representation with exponentially greater fidelity and efficiency. Students will have an opportunity to practice these values and favor hybrid approaches that strive to blur the boundaries of analog and digital media, so as to learn how to be versatile in leveraging all forms of media for the design task at hand. Students are required to bring their own laptop computers with AutoCAD, Photoshop, Illustrator, and InDesign installed.

62-123 Digital Media II

Spring: 6 units
This is the second course in a two-course sequence that introduces students to a broad range of architectural drawing techniques and practices that document, communicate, and generate design possibilities. The course situates modes of representation within a rich disciplinary tradition, as well as within adjacent fields of discourse on visual culture and epistemology. This second instantiation expands the foundational skills established in 62-122 by surveying select, contemporary modes of digital production and communication especially as situated between design disciplines and adjacent practices in the sciences, the animation and gaming industries, digital forensics and archaeology, artificial intelligence and other modes of cultural production. The course also challenges students to establish a visual agenda of their by referencing and critiquing chosen practices and styles within contemporary architectural media.
Prerequisite: 62-122

62-125 Drawing I

Fall: 6 units
62-125 is an introductory course in free-hand architectural drawing. Its central learning objective is building a capacity for visualizing three-dimensional space through freehand drawing. A parallel objective is fostering visual literacy: the ability to use line and tonal values to represent architectural space. Topics covered are contour drawing, freehand perspective, axonometric projection, and tonal drawing in charcoal. The course concludes with a final project conducted jointly with 48-100, first-year architectural design.

62-126 Drawing II

Spring: 6 units
The central learning objective of Drawing II is building a capacity for visualizing three-dimensional space through freehand drawing. It has two secondary objectives: using line, tone and color to represent architectural space and architectural proposals. The course has four parts 1) free-hand and constructed perspective, 2) shade and shadow and chiaroscuro drawing in charcoal and colored pencil, 3) color drawing in pastel. 4) a final project combining freehand drawing, color work in Photoshop and a 3D digital model. Prerequisite: 62-125 or permission of the instructor.
Prerequisite: 62-125

62-141 Black and White Photography I

Fall and Spring: 10 units
This course will teach you the basic craft of photography from exposure of the negative through darkroom developing and printing to print finishing and presentation. Content includes student presentations, class discussions, shooting assignments, darkroom sessions and class critiques. We will concentrate not only on the technical aspects of photography, but also the aesthetics of seeing with a camera. The course concentrates on photography as a fine art and #8212; what is unique to it and the concerns that are shared with other visual arts, such as composition, tonal values, etc. and aims to equip students with an understanding of the formal issues and the expressive potentials of the medium. Use your own 35 mm camera, or borrow one from us for the semester. Students are responsible for the cost of photo paper and film, and a lab fee is charged for the course.

62-142 Digital Photography I

Fall and Spring: 10 units
This course explores digital photography and digital printing methods. By semester's end students will have knowledge of contemporary trends in photography, construction (and deconstruction) of photographic meaning, aesthetic choices, and the use of color. Students will learn how digital cameras work, proper digital workflow, RAW file handling, color management and Adobe Photoshop. Through the combination of the practical and theoretical, students will better define their individual voices as photographers. No prerequisites.

62-150 IDeATe Portal: Introduction to Media Synthesis and Analysis

Fall: 10 units
Technologists, artists, and designers are engaging in new, interdisciplinary modes to consume, create, and reuse media. To do this, they thoughtfully collaborate and critically reflect on media creation, distribution, participation, interaction, and how media affects the audience. In this course, students will challenge themselves to work in these new modal contexts by thinking critically in a genre of exploration. They will formulate the intent of their creative work, articulate relationships to art/design practice and theory, and respond insightfully to creative, media-rich outcomes. The class will introduce core concepts through foundational texts, in-class exercises, collaborative projects, and group critique. Through hands-on media exploration, students will ground concepts such as embodiment, emergence, composition, participatory interfaces, and mediated experiences. Section A will be an Introduction to Textile Media. Section B will be an Introduction to Mediascapes: 2D to 3D Spatial Environments. Section C will be Life in the Digital Factory: Spatial Storytelling about Computational Landscapes.

Course Website: https://ideate.cmu.edu/courses/portal-and-section-details.html

62-207 IDeATe: Variational Geometry I

Fall: 6 units
This course will introduce concepts and strategies for the modeling and development of complex computational geometry for 3D printing purposes and introduce algorithmic thinking using the Rhinoceros McNeel platform and Grasshopper plugin. This course is intended for students with no or little 3-D modeling skills to advance their abilities in modeling, digital prototyping and visual communication.

Course Website: http://ideate.cmu.edu/about-ideate/departments/college-fine-arts/ideate-variational-geometry-i/

62-225 Generative Modeling

Fall and Spring: 9 units
This course introduces students to the fundamentals of generative modeling using computer aided design as practiced in the field of architecture. Core competencies will be developed through modeling projects and software intensive labs, while a broader critical framework for conceiving of contemporary and historical parametric practices will be encouraged through periodic lectures. Emphasis will be placed on careful consideration of digital mediums and developing a sense of craft related to digital modeling in the hope that students will become conscientious makers and consumers of digital content. Students will be encourage to understand and apply algorithmic problem solving to the many design constraints encountered in architecture. The course will explore the relationship of parametric workflows to design thinking and will situate contemporary trends in a broader framework of computational design. The course will also forefront complex form-making as a response to bio-mimicry, systems thinking, and mass-customization. Rather than positioning parametric modeling as a disruption of historical architectural design process, the course will encourage students to consider how new tools might augment the discipline's historical commitments to orthographic projection, perspectival drawing, and physical modeling.

62-239 Reading Pictures, Writing Photography

Intermittent: 9 units
Through photography's history, writers have sought to identify what is special about photography, the medium's essential characteristics, and what happens when photographs make something visible. In this course students will engage critically with photographs and photography through classic and contemporary texts on photography, and by producing their own writing. Students will become familiar with significant photographers and key issues raised around photography and develop their own critical and authorial voices. Readings include pieces by Roland Barthes, Walter Benjamin, Susan Sontag, Hito Steyerl, Rebecca Solnit, Teju Cole, and many others.

Course Website: http://cfaphoto.cfa.cmu.edu/classesf17.html

62-241 Black and White Photography II

Fall and Spring: 10 units
Black and White Photography II continues developing your technical skills in analog photography by introducing medium and large format cameras and prints. Large format view cameras remain the state of the art in control and quality in both film and digital photography. These cameras as well as unusual panoramic and pinhole cameras will be supplied. This course emphasizes aesthetic development and personal artistic growth through individual tutorials and group critiques, and will help to build professional level photography skills. Additional topics include digital printing and negative scanning, advanced monotone printing methods, and a focus on exhibition and folio presentation. Students are responsible for the cost of photo paper and film, and a lab fee is charged for the course.
Prerequisites: 62-141 or 60-141

62-245 Portrait Photography

Intermittent: 10 units
Portraiture maintains a unique standing in photography for its direct and collaborative relationship between an individual and a photographer. This course will examine this relationship and the larger contexts which provide the conceptual framework for deriving meaning and understanding from an image of another person. We will study the theoretical and practical aspects of portrait photography in both studio and environmental settings, providing students with an understanding of the genre by developing both technical and conceptual skill sets. Students will utilize analog and digital equipment, learn studio lighting techniques, develop approaches to working with natural light, and explore methods of printing and presentation. Students will gain knowledge in the development of portraiture through the work of notable figures in the medium's history and contemporary field, including August Sander, Dorothea Lange, Walker Evans, Dawoud Bey, Milton Rogovin, Rineke Dijkstra, Zoe Strauss, Susan Lipper, Justine Kurland, Stefan Ruiz, Larry Sultan, Carrie Mae Weems, Roy DeCarava and Alec Soth. Class discussions, readings and critiques will provide an outline for completing both single and serial image assignments.

62-247 Introduction to Hot Glass I

Fall and Spring: 3 units
In this introductory class, learn to gather clear molten glass from the furnace and then shape it into various forms, from paperweights to simple blown shapes, such as cups and bowls. Instruction focuses on a team approach to glassblowing, with an emphasis on safety, proper tool use, basic techniques, and materials. You'll never drink from a glass again without appreciating the energy and detail that went into making it! Little to no hot shop experience is required. You may also wish to take this class a second time in order to continue to develop and refine basic skills before moving on to Hot Glass 2. Each time you take it, your skill level, confidence, and passion for glass will grow. Class tuition includes 2 hours of open-studio time to be used during the 8-week course period. This will help you become familiar with the studio itself and learn the process of studio rental beyond class hours. Registration for Pittsburgh Glass Center classes can only be done on or after your scheduled registration day. Spaces are limited. Registration is done on a first come, first served basis. Please email Stefanie McGowan (stefanim@andrew.cmu.edu) for more information and to register. Course fee is $325. Not eligible for PCHE Cross Registration. Course taught at the Pittsburgh Glass Center. Courses at the Pittsburgh Glass Center will run from September 24, 2024 to November 24, 2024.

Course Website: https://www.pittsburghglasscenter.org/

62-275 Fundamentals of Computational Design

Fall and Spring: 9 units
As analog mechanisms; as metaphors; as bodily extensions or prosthetics; as material systems; as building envelopes; as partners or slaves? of humans. This course takes computers outside the box and outs a journey of discovery revealing computation as the connective tissue encompassing multiple facets of architectural practice and experience. Addressing conceptual and practical aspects of the relationship between computation and design, the course explores the fundamentals of generative and rule-based systems for designing and making, simulation, and responsiveness, along with basic approaches to creative data processing, representation, and realization. The course offers a holistic view of computation, exploring the different roles computing plays in the design of our built environment. Organized in two-week modules, the course explores six themes, each combining historical insight, architectural examples, and hands-on design exploration.
Prerequisite: 48-100

62-279 Photography and the Ineffable

Fall and Spring: 10 units
This course explores the relationship between photography and the indescribable, intangible, and hard-to-see. From the spiritual, to the sublime, to the abstract; we will review different frameworks for thinking about the ineffable and how it relates to photographic work. Students will explore these themes through weekly presentations, discussions, assignments, writing workshops, and critiques. We'll look at artists who think critically about photographic representation and investigate a heightened sensorial interpretation of the world. This class will encourage experimental methods and approaches to photography.

62-314 The Art of Personal Finance

Fall and Spring: 6 units
Money is an inevitable part of our everyday lives. Managing the money we earn and living within our means is essential to ensure that we have the freedom to do what we want to do with our lives. However, even if we successfully eliminate debt and save for the future, true financial freedom will not exist unless we have a plan to guide us on our way. In this course, students will create a simple one-page financial plan that they can use to guide them through their next several years as they cultivate the skills that will ensure their artistic success. Additionally, they will develop the tools needed to support the execution of the plan and create a sourcebook of information they can refer to in the future as their lives (and their financial plans) change.

62-315 Shaping Environments: Experiments in Geometry and (Waste)Matter

Fall
Shaping Environments is a design-research seminar that explores alternative material formations beyond our current petrochemical reality. Using digital environments and computational tools, such as photogrammetry, depth-map texture modeling, AI workflows, and 3D printing, we will experiment with shaping new hybrid material systems. Using resources, such as food and/or construction waste, our goal is to propose new material paradigms that embrace ecological thinking and environmental stewardship through physical prototyping.

62-343 Professional Practices in Photography

Fall and Spring: 10 units
This studio course will introduce students to the working methods of professional photographers and artists. For the first half of the course, students will develop a substantial body of visual work. They will then use that work in the second half of the semester to produce portfolios across a variety of media (digital, print, web, exhibition, etc.). Throughout the process they will develop skills in constructing and completing projects, cultivate their personal vision and aesthetic tastes, explore methods of disseminating their work to larger audiences, establish time management and planning around long form projects, and acquire an understanding of the marketing, outreach and community building necessary for working artists to build and sustain a career.
Prerequisites: 60-142 or 62-142 or 62-141 or 60-141

62-347 Hot Glass II

Fall and Spring: 3 units
Enroll in Hot II and build on your existing skill set and expand your creative potential. Refine and diverge from the standard cup and bowl shape in the first few weeks before moving on to more complex forms. Explore basic color application methods and learn how to troubleshoot common problems. It is recommended that all students take this class a second time in order to continue to develop and refine basic skills before moving on to Advanced Hot Glass. Hot I, 24 hours of hot shop experience, or instructor permission is required. Registration for Pittsburgh Glass Center classes can only be done on or after your scheduled registration day. Spaces are limited. Registration is done on a first come, first served basis. Please email Stefanie McGowan (stefanim@andrew.cmu.edu) for more information and to register. Course fee is $325. Not eligible for PCHE Cross Registration. Course taught at the Pittsburgh Glass Center. Courses at the Pittsburgh Glass Center will run from September 24, 2024 to November 24, 2024.
Prerequisite: 62-247

Course Website: https://www.pittsburghglasscenter.org

62-360 Photographers and Photography Since World War II

Spring: 9 units
Invented in 1839, photography was a form of visual expression that immediately attracted a large public following. Starting around 1900, photography was practiced with two dominant strands. One of these firmly believed in the power of photographs to provide a window on the world, and was led by Lewis Hine, whose documentary photographs for the National Child Labor Committee helped to ameliorate living and working conditions for thousands of immigrant children. The other strand adhered to the philosophy of Alfred Stieglitz who adamantly affirmed that photographs were first and foremost reflections of the soul and were art objects, equal to painting, drawing and sculpture. These two schools of thought guided photographers throughout the twentieth century. This course explores in depth the tremendous range of photographic expression since World War II and examines in particular the contributions of significant image-makers such as Helen Levitt, W. Eugene Smith, Robert Frank, Diane Arbus, Garry Winogrand, Charles "Teenie" Harris, Cindy Sherman, Carrie Mae Weems, Nan Goldin, James Nachtwey, and many others. Classes include a slide lecture, student presentation, and video segments that introduce a focused selection of images by major photographers in an attempt to understand their intentions, styles, and influences.

62-362 IDeATe: Electronic Logics && Creative Practice

Intermittent: 12 units
Electronic Logics and amp; and amp; Creative Practice investigates the fundamentals of electronic computation as metaphors for art and interaction. Students explore technology through a creative lens, as conceptual and physical material to be manipulated and synthesized, by examining the basis of digital computation alongside contemporary and new media art practices. There are three main units: Gates (the logical building blocks of computers), Flow (ways in which signals "flow" through physical and electronic systems), and Arrows (the stacked layers of indirection used in modern computer systems). These major themes are addressed through lecture, readings, and the creation of individual and collaborative works. Throughout the semester students complete a series of quick thematic exercises and three larger-scale projects; these works are reviewed through meetings, group critique, and documentation. Our toolbox includes 7400-series logic chips, the Arduino electronics platform, software, wood, laser cut acrylic, found objects, props, projections, and glue. We address technical engineering subjects (e.g. Karnaugh maps) alongside art and performance theory. Students deepen conceptual skills while increasing the scale and ambition of creative output. The course culminates in an end-of-semester showcase where students publicly exhibit their work.

62-371 Photography, The First 100 Years, 1839-1939

Fall: 9 units
Photography was announced to the world almost simultaneously in 1839, first in France and then a few months later in England. Accurate "likenesses" of people were available to the masses, and soon reproducible images of faraway places were intriguing to all. This course will explore the earliest image-makers Daguerre and Fox Talbot, the Civil War photographs organized by Mathew Brady, the introduction in 1888 of the Kodak by George Eastman, the critically important social documentary photography of Jacob Riis and his successor, Lewis Hine, the Photo-Secession of Alfred Stieglitz, the Harlem Renaissance of James VanDerZee, the precisionist f64 photographers Ansel Adams, Imogen Cunningham, and Edward Weston, and other important photographers who came before World War II. The class will be introduced to 19th century processes, such as the daguerreotype, tintype, and ambrotype, as well as albumen prints, cyanotypes, and more.

62-450 Introduction to Flameworking

Fall and Spring: 3 units
Learn flame shop essentials and a variety of creative techniques while working with a solid rod of glass. Using a propane/oxygen torch, students will learn to melt and manipulate glass into little treasures, such as beads, pendants, marbles, chains, and sculptures. Over the course of 8 weeks, learn color application, hand control, and annealing. The instructor will also provide one-on-one troubleshooting. Class tuition includes 2 hours of open-studio time to be used during the 8-week course period. This will help you become familiar with the studio itself and learn the process of studio rental beyond class hours. Registration for Pittsburgh Glass Center classes can only be done on or after your scheduled registration day. Spaces are limited. Registration is done on a first come, first served basis. Please email Stefanie McGowan (stefanim@andrew.cmu.edu) for more information and to register. Course fee is $200. Not eligible for PCHE Cross Registration. Course taught at the Pittsburgh Glass Center. Courses at the Pittsburgh Glass Center will run from September 24, 2024 to November 24, 2024.

Course Website: https://www.pittsburghglasscenter.org

62-459 Intro to Stained Glass

Fall and Spring: 3 units
Explore the possibilities of colorful stained glass. In this introductory course, you will learn the basics for working with flat glass; cutting, grinding, foiling, and soldering. You will explore the famous Tiffany Method of construction and work with provided patterns to create a beautiful stained-glass pane ready for display! This class is designed for beginners and is a pre-requisite for Intermediate and Advanced Stained Glass. Registration for Pittsburgh Glass Center classes can only be done on or after your scheduled registration day. Spaces are limited. Registration is done on a first come, first served basis. Please email Stefanie McGowan (stefanim@andrew.cmu.edu) for more information and to register. Course fee is $250. Not eligible for PCHE Cross Registration. Course taught at the Pittsburgh Glass Center. Courses at the Pittsburgh Glass Center will run from September 24, 2024 to November 24, 2024.

Course Website: https://www.pittsburghglasscenter.org

62-478 IDeATe: digiTOOL

Fall and Spring: 9 units
This course serves as an introduction to the fundamental concepts, processes, and procedures to utilize digital and traditional equipment within the IDeATe facilities in Hunt Library. After completion, participating students should leave with a thorough understanding of 3D modeling, 3D printing, laser cutting, engraving, and basic finishing techniques. Students will learn how to operate in a safe, responsible, and efficient manner. This comprehension and experience proves useful for all creative disciplines, and participants are certified for future fabrication equipment access.

Minors Offered by the College of Fine Arts

The College of Fine Arts offers minors in Architecture, Art, Design, Drama, and Music to students from other colleges at Carnegie Mellon University. These minors allow students at Carnegie Mellon to take courses and develop a direction for electives in any of the five schools in CFA. Students in the College of Fine Arts may also earn minors outside of their major within other schools in the College. They may also study any of the minors offered by the other colleges to the University at large, thus taking advantage of the broad educational opportunities available at Carnegie Mellon University.

Minors Offered by the College of Fine Arts:

- Architectural Design Fabrication (available only to B. Arch candidates)
- Architectural Representation and Visualization (available also to B. Arch candidates)
- Architectural Technology
- Architecture
- Architecture History (available also to B. Arch candidates)
- Art
- Building Science (available only to B. Arch candidates)
- Collaborative Piano (available only to Piano majors in the School of Music)
- Conducting (available only to students in the School of Music)
- Design
- Drama
- History of the Arts
- Media Design (IDeATe)
- Music
- Music Education (available only to students in the School of Music)
- Music Technology
- Music Theory
- Musicology
- Photography
- Sonic Arts (IDeATe)

Guidelines for students are: 1) except where so designated, CFA students are not eligible to earn a minor in their own school; students from outside CFA may earn a minor in any school in CFA; 2) faculty advisors in the student's home school (in consultation with the academic officer of the other unit involved) will advise students as to the structuring of the courses in each minor; 3) a minor is not to be considered an overload; rather, through the assistance of faculty advisors it should be integrated into a student's overall units required for graduation; 4) the advisors will also monitor the student's development in these minors and keep records in their files which indicate the fulfillment of the course requirements in the minors, as well as in the majors in the student's own school. Courses listed as possible for the minors may be available, but not all courses are offered every semester. Students should consult with their advisors.

Students interested in earning a minor in any of the CFA schools should contact: Architecture: Heather Workinger; Art: Keni Jefferson; Design: Jamie Kosnosky; Drama: Valeria McCrary; Music: Sharon Johnston; IDeATe: Kelly Delaney.

Architecture Minors

For the most up-to-date list of architecture-related minors, see: https://soa.cmu.edu/minors (https://soa.cmu.edu/minors/).

Minor in Architecture

Available to non-architecture majors only (minimum 54 units total)

This sequence is for candidates who intend to develop intellectual links to the architectural profession. The scope of courses offered includes a full spectrum of professional issues in architecture.

Prerequisite Courses — 9 units

79-104	Global Histories or course 62-110 or 62-106	9

Required Courses — 19-24 units

48-100	Architecture Design Studio: POIESIS STUDIO 1	12
or 48-095	Spatial Concepts for Non-Architecture Majors	
48-240	History of World Architecture, I	9

Elective Courses* — 26-31 units

62-125	Drawing I	6
62-126	Drawing II	6
62-122	Digital Media I	6
62-123	Digital Media II	6
48-215	Materials & Assembly	9
48-324	Structural Design 1: Form and Forces	3
48-380	Constructing Value(s): Economies of Design	6
48-381	Issues of Practice	6
48-383	Ethics and Decision Making in Architecture	6
48-xxx	Architecture History (Pre-Approval of coursework required)	9
48-xxx	Architecture Elective (Pre-Approval of coursework required)	9

Minimum Units: 54

*Students should consult the Architecture advisor regarding elective choices.

Minor in Architecture History

Available to both architecture majors (63 total units total) and non-architecture majors (54 total units total)

This sequence is intended for candidates interested in the history of architecture in its many manifestations, including high style and vernacular buildings, western and non-western traditions, built and theoretical works, and rural to urban contexts. Non-architecture majors are required to take 54 units of architectural history. Architecture majors wishing to minor in Architectural History must fulfill the three core required courses in architectural history, plus four additional architectural history electives, for a total of 63 units. Students wishing to pursue the minor should meet with the Architecture advisor to determine if a course is eligible.

Required Courses — 18 units

48-240	History of World Architecture, I	9
48-241	History of Modern Architecture	9

Selective Courses — 36 units/45 units

Students should consult the Architecture advisor regarding elective choices.

Minimum Units: 54 (non-architecture majors)
Minimum Units: 63 (architecture majors)

Minor in Architectural Representation and Visualization

Available to both architecture majors (63 total units total) and non-architecture majors (54 total units total)

The Minor in Architectural Representation and Media is intended for those students that want to deepen their knowledge in architectural representation and media and for those who are interested in gaining advanced placement (AMP) in the M.S. programs offered by the School in the areas of Computational Design (MSCD). It is earned by completing the four required media courses and then an additional three elective courses in these areas. Architecture majors wishing to pursue a Minor in Architectural Representation and Visualization must complete the required 33 units and at least an additional 30 units to fulfill the minor for a total of 63 units.

Required Courses 24 units

62-122	Digital Media I	6
62-123	Digital Media II	6
62-125	Drawing I	6
62-126	Drawing II	6

Selective Courses 30-39 units

48-568	Advanced CAD, BIM, and 3D Visualization	9
48-724	Scripting and Parametric Design	10
48-3xx	Architectural Drawing Elective (Pre-Approval of coursework required)	9
48-xxx	Architectural Representation/Visualization Elective: (Pre-Approval of coursework required)	9
48-xxx	Architectural Representation/Visualization Elective: (Pre-Approval of coursework required)	9

Minimum Units: 54 (non-architecture majors)

Minimum Units: 63 (architecture majors)

Minor in Architectural Technology

Available to non-architecture majors only (minimum 54 units total)

This sequence is for candidates who intend to develop intellectual links to the technical aspects of the profession.

Prerequisite Courses 22 units

33-141	Physics I for Engineering Students	12
21-120	Differential and Integral Calculus	10

Selective Courses 32 units

48-116	Introduction to Building Performance	3
48-215	Materials & Assembly	9
48-324	Structural Design 1: Form and Forces	3
48-315	Environmental Systems: Climate & Energy in Buildings	9
48-432	Environment II: Design Integration of Active Building Systems	9
48-752	Zero Energy Housing	9
48-xxx	Architectural Technology Elective (pre-approval required)	

Minimum Units: 54

Minor in Building Science

Available to architecture majors only (minimum 54 units total)

The Minor in Building Science is intended for those students that want to deepen their knowledge in the building sciences and for those who are interested in gaining advanced placement (AMP) in the M.S. programs offered by the School in the areas of Building Performance & Diagnostics (MSBPD) and Sustainable Design (MSSD). It is earned by completing the two required building technology and three environmental science courses and then an additional three elective courses in the building sciences.

Required Course 12 units

48-722	Building Performance Modeling	12

Selective Courses 45 units

48-795	LEED	6
48-721	Building Controls and Diagnostics	12
48-723	Performance of Advanced Building Systems	Var.
48-729	Sustainability, Health and Productivity to Accelerate a Quality Built Environmen	9-12
48-749	Special Topics in Computational Design	6
48-752	Zero Energy Housing	9

Minimum Units: 54.

Minor in Architectural Design Fabrication

Available to architecture majors only (minimum 63 units total)

The Minor in Architectural Design Fabrication is intended for those who wish to develop focused, disciplinary expertise in both analog and digital material methods for shaping the built environment and become involved in a community of practice dedicated to a rigorous pursuit of *making* as a mode of architectural research and cultural expression. It is also for students interested in gaining advanced placement in the SoA's Master of Advanced Architectural Design (MAAD) program.

Required Courses 30 units

48-531	Fabricating Customization: Prototype	9
48-545	Design Fabrication	9
48-555	Introduction to Architectural Robotics	9
48-xxx	ASO Studio with digital fabrication focus	18

Selective Courses 30 units

48-470	The Depth of Surface	9
48-473	Hand and Machine Joinery, New Directions	9
48-xxx	Design Fabrication Independent Study	3-9
xx-xxx	Pre-approved design fabrication course	

Minimum Units: 63.

Minor in Computational Design

Available to both architecture majors and non-architecture majors (minimum 54 units total)

The minor in Computational Design is intended for students who wish to engage with computation as a vehicle of generative, material, and spatial design exploration. It brings together courses from the School of Architecture and the College of Fine Arts to offer students hands-on experience, and a deep understanding, of computation as a resource in creative design practices. Students minoring in computational design will be eligible for advanced standing in the School of Architecture’s Master of Science in Computational Design (MSCD) program. The minor offers students the possibility of exploring three areas of computational design: designing, making, and theory. Please refer to this document (https://static1.squarespace.com/static/54c2a5c7e4b043776a0b0036/t/5f4eb94ce17d4e73ccbbd371/1598994764926/cd_minor_20200829.pdf) for the latest information.

Required Courses 30 units

62-122	Digital Media I	6
62-123	Digital Media II	6
62-225	Generative Modeling	9
62-275	Fundamentals of Computational Design	9

Selective Courses 24 units

Designing		
48-568	Advanced CAD, BIM, and 3D Visualization	9
51-367	Design Center: Computational Design Thinking	9
Making		
48-530	Human-Machine Virtuosity	12
48-545	Design Fabrication	9
48-555	Introduction to Architectural Robotics	9
54-399	Decoding Media	9
54-405	Digital Narratives	5
Theory		

48-727	Inquiry into Computational Design	
48-749	Special Topics in Computational Design	6

Minimum Units: 54.

Art Minor

The Art minor allows undergraduate students outside of the School of Art to pursue a largely studio-based minor in addition to their primary degree. Students can narrowly focus their interest or explore a number of mediums.

To declare an Art minor, students should contact Keni Jefferson (kjefferson@cmu.edu), in the College of Fine Arts, room 300. A portfolio is not required.

Five studio-based courses are required, with a minimum of three studios being Intermediate and/or Advanced. A critical studies course exploring art history and theory is also required.

ART STUDIO COURSES (CHOOSE FIVE) 50 UNITS

		50 units
60-136	Ceramics for Non-Majors	10
60-137	Physical Computing for Non-Majors	10
60-157	Drawing for Non-Majors	10
60-2xx	Intermediate Studio Electives	
60-4xx	Advanced ETB: Electives	
60-4xx	Advanced SIS: Electives	
60-4xx	Advanced DP3: Electives	
60-4xx	Advanced CP: Electives	

Critical Studies (choose one) 9 units

60-105	Cultural History of the Visual Arts	9
60-106	Cultural History of the Visual Arts - the Modern Period	9
60-3xx	Critical Theory Elective	9

Minimum units: 59

Media Design Minor – IDeATe

The minor in *Media Design* is offered by the School of Art as part of the Integrative Design, Arts and Technology (https://ideate.cmu.edu/) (IDeATe) network. IDeATe offers students the opportunity to become immersed in a collaborative community of faculty and peers who share expertise, experience, and passions at the intersection of arts and technology. Students will engage in active "learning by doing" in shared labs and maker spaces. The program addresses current and emerging real-world challenges that require disciplinary expertise coupled with multidisciplinary perspectives and collaborative integrative approaches.

The IDeATe undergraduate curriculum consists of ten areas, all of which can also be taken as minors. The themes of these areas integrate knowledge in technology and arts: Game Design, Animation & Special Effects, Media Design, Design for Learning, Sonic Arts, Innovation and Entrepreneurship, Intelligent Environments, Physical Computing, Soft Technologies, and Immersive Technologies in Arts & Culture. For more information about the IDeATe network, please see Undergraduate Options (p.).

The IDeATe *Media Design* minor invites students on a wide-ranging exploration of the digital media landscape. This multifaceted program encourages a holistic engagement with media technologies and practices, offering an opportunity to embrace the full breadth of media arts disciplines within the IDeATe network. Students gain the skills to design experiences across various platforms, from mobile devices to performances and large-scale installations, while gaining an understanding of how technology and content relate in new media systems, and how meanings are made in these evolving forms.

The flexibility inherent in the *Media Design* minor allows students to create a learning pathway that mirrors their unique interests, integrating elements from the other IDeATe minors. This approach makes it an ideal option for students who wish to experience the broad tapestry of digital media arts or those yet to pinpoint their exact focus within this dynamic field. The *Media Design* minor therefore cultivates versatile media practitioners, ready to innovate within the diverse and rapidly evolving digital media arena.

Curriculum

One Computing Course - Minimum of 9 Units

		Units
15-104	Introduction to Computing for Creative Practice	10
15-110	Principles of Computing	10
15-112	Fundamentals of Programming and Computer Science	12
60-212	Intermediate Studio: Creative Coding	12

One IDeATe Portal Course - Minimum of 9 Units

		Units
62-150	IDeATe Portal: Introduction to Media Synthesis and Analysis Recommended Portal Course for this area	10
16-223	IDeATe Portal: Creative Kinetic Systems	10
18-090	Twisted Signals: Multimedia Processing for the Arts	10
53-322	IDeATe: Little Games/Big Stories: Indie Roleplaying Game Studio	9
60-125	IDeATe: Introduction to 3D Animation Pipeline	12
60-223	IDeATe Portal: Introduction to Physical Computing	10
82-250	Digital Realities: Introducing Immersive Technologies for Arts and Culture	9
99-361	IDeATe Portal Sec A: Learning about Learning; Sec B: Intelligent Environments	9

IDeATe Media Design Courses - Minimum of 27 Units

		Units
05/18-540	Rapid Prototyping of Computer Systems	12
15-294	Special Topic: Rapid Prototyping Technologies	5
15-394	Intermediate Rapid Prototyping	5
16/54-375	IDeATe: Robotics for Creative Practice	10
24-672	Special Topics in DIY Design and Fabrication	12
51-236	Information Design	9
51-400	Transition Design	9
53-250	Immersive Experience Pre-production Process	9
53-312	Guest Experience in Theme Park Design	9
53-376	360 Story and Sound	12
53-558	Reality Computing Studio	12
54-399	Decoding Media	9
60-110	Foundations: Time-Based Media	10
60-428	Advanced ETB: Drawing with Machines	12
60-461	Advanced ETB: Experimental Capture	12
62-362	IDeATe: Electronic Logics && Creative Practice	12
62-478	IDeATe: digiTOOL	9
67-240	Mobile Web Design & Development	9
67-265	Design Fundamentals: Shaping Interactions and Experiences	9
67-338	Information & Grid Design	9
76-374	Mediated Narrative	9
82-285	Podcasting: Language and Culture Through Storytelling	9

Additional course options as available. Please refer to the IDeATe website for courses for the current and upcoming semester.

Double-Counting

Students may double-count up to two of their *Media Design* minor courses toward requirements for other majors or minors.

Design Minor

Minoring in Design is a great way for students to diversify their studies and incorporate design skills and thinking into their overall academic experiences. Students who are already School of Design majors are not eligible to earn a Design minor. The 54 required units must be unique to the Design minor. No courses may be double counted.

Requirements and Electives

For a design minor, students must complete 54 units: 27 units of required courses, plus 27 units of design electives.

Required Design Courses

Three required courses:

51-262	Design Center: Communication and Digital Design Fundamentals (formerly CDF)	9
or 51-261	Communication & Digital Design Fundamentals	
51-264	Product Design Fundamentals: Design for Interactions for Products (formerly IDF)	9
51-173	Human Experience in Design	9

Three Design Electives:

51-xxx	Design Elective	9
51-xxx	Design Elective	9
51-xxx	Design Elective	9

Applications

Students must submit transcripts, personal statements, and completed applications by the beginning of February, and submit portfolios or design projects by the beginning of March. They must also obtain permission to complete minors from their major advisors. The minor application form includes detailed requirements.

Admission depends mainly on a student's demonstration of design skills and aptitude. Students are notified of acceptance by the end of March.

If you are interested in applying for the Minor in Design, please contact Design Advisor, Melissa Cicozi (cicozi@cmu.edu). You can download the Design Project and Application at www.design.cmu.edu (http://www.design.cmu.edu), or paper applications are available at the School of Design office, MMCH 110.

Drama Minor

The Drama minor provides students with a well-rounded opportunity to obtain preliminary professional exposure to the theatre arts. Courses may involve acting, directing, playwriting, design, production technology and management, and dramatic literature courses. Students also become involved with Drama productions by signing up for Production for Non-Majors, which involves evening crew work on various Drama productions.

Admission Requirements

1. Students must apply to enter the program in the office of the Drama Academic Advisor.
2. The student must successfully pass one Drama course prior to being considered for minor status.

Required Courses 25 units

54-163	Production for Non Majors (needs to be taken twice for a total of 12 units)	6
54-175	Conservatory Hour	1
54-177	Foundations of Drama I	6
54-281	Foundations of Drama II	6

Students must meet with the School of Drama Production Manager (PCA 224) for assignments related to Production for Non-Majors.

Elective Courses 30 units

The remainder of the minor is fulfilled with Drama courses of the student's choosing, with approval from the Drama Academic Advisor. For certain courses, students may need instructor permission to register.

SAMPLE: Selected Elective Courses not requiring instructor permission:

54-187	Writing for an Inspired Life	9
54-190	Intro to Writing the Television Pilot	9
54-191	Acting for Non-Majors	9
54-193	Acting for Non-Majors: Improv	9
54-196	Introduction to 10-Minute Plays	9

SAMPLE: Selected Elective Courses requiring instructor permission:

54-109	Dramaturgy 1: Approaches to Text	9
54-121	Directing I: A Director's Mindset	9
54-157	Production Science	6
54-169	Studiocraft 1	13
54-171	Basic Design 1	6

Additional Drama Courses are available by instructor agreement and may require an audition, interview, or portfolio review. Students should contact the Drama Academic Advisor, to inquire about permission for specific courses in which they are interested.

Minimum units required: 55

Music Minors

Minor in Music

This sequence is for candidates who are majors from any discipline in the university other than music who have some background in music and would like to know more about music.

Admission Requirements:

1. The student must apply online to enter the program by submitting the minor application that is available here (https://www.cmu.edu/cfa/music/current-students/guidelines-forms/music-minor.html) on the Current Students website.

Prerequisite Course 0–3 units

Beginning Piano for Minors is required of students who do not pass a beginning piano proficiency test.

57-329	Beginning Piano for Minors	3

Required Music Courses 25 units

Basic Harmony I and/or Basic Solfege I are required of students who do not qualify for entrance into Harmony I and/or Solfege I, based on their scores on the theory and solfege placement tests. These classes fulfill the harmony and solfege requirements.

57-152	Harmony I	9
57-161	Eurhythmics I	3
57-181	Solfege I	3
57-173	Survey of Western Music History	9
57-188	Repertoire and Listening for Musicians	1

Required Studio Courses (studio fee is charged) 24 units

57-1xx	Elective Studio	6
57-1xx	Elective Studio	6
57-1xx	Elective Studio	6
57-1xx	Elective Studio	6

Elective Courses 18 units

Elective courses are to be chosen from those courses listed for the School of Music in the current course catalog. Performance electives are encouraged. (An audition is required for all School of Music performance ensembles.)

Minimum units required: 67

Minor in Music Technology

This sequence is for candidates who are majors from any discipline in the university who have some background in music and would like to know more about music technology.

Note: Students in the School of Music have slightly different requirements for the Minor in Music Technology. See School of Music (p.).

Admission Requirements

1. The student must apply online to enter the program by submitting the minor application that is available here (https://www.cmu.edu/cfa/music/current-students/guidelines-forms/music-minor.html) on the Current Students website.

Prerequisite Course 0–3 units

Beginning Piano for Minors is required of students who do not pass a beginning piano proficiency test.

57-329	Beginning Piano for Minors	3

Required Music Courses 25 units

Basic Harmony I and/or Basic Solfege I are required of students who do not qualify for entrance into Harmony I and/or Solfege I, based on their scores on the theory and solfege placement tests. These classes fulfill the harmony and solfege requirements.

57-152	Harmony I	9
57-161	Eurhythmics I	3
57-173	Survey of Western Music History	9
57-181	Solfege I	3
57-188	Repertoire and Listening for Musicians	1

Sound Recording Courses 21 units

57-337	Sound Recording	6
57-338	Sound Editing and Mastering	6
57-438	Multitrack Recording	9

Music Technology/Sound Courses (choose at least three) 21 units

Choose at least three courses. One of the three courses must be either Introduction to Computer Music or Electronic and Computer Music. (Note that 15-112 is a prerequisite for 15-322; 57-101 or 57-171 is a prerequisite for 57-347.) Other courses may be taken with the permission of the music technology minor advisor.

15-104	Introduction to Computing for Creative Practice	10
15-322	Introduction to Computer Music	9
18-090	Twisted Signals: Multimedia Processing for the Arts	10
33-114	Physics of Musical Sound	9
54-166	Introduction to Sound Design for Theatre	6
57-344	Experimental Sound Synthesis	9
57-347	Electronic and Computer Music	6
57-478	Survey of Historical Recording	6
57-421	Exploded Ensemble	6

Minimum units required: 67

Minor in Music Theory

This sequence is for candidates who are majors from any discipline in the university who have some background in music and would like to know more about music theory.

Note: Students in the School of Music have slightly different requirements for the Minor in Music Theory. See School of Music (p.).

Admission Requirements

1. The student must apply online to enter the program by submitting the minor application that is available here (https://www.cmu.edu/cfa/music/current-students/guidelines-forms/music-minor.html) on the Current Students website.

Prerequisite Course 0–3 units

Beginning Piano for Minors is required of students who do not pass a beginning piano proficiency test.

57-329	Beginning Piano for Minors	3

Required Music Courses 25 units

Basic Harmony I and/or Basic Solfege I are required of students who do not qualify for entrance into Harmony I and/or Solfege I, based on their scores on the theory and solfege placement tests. These classes fulfill the harmony and solfege requirements.

57-152	Harmony I	9
57-161	Eurhythmics I	3
57-173	Survey of Western Music History	9
57-181	Solfege I	3
57-188	Repertoire and Listening for Musicians	1

Required Theory Courses 21 units

57-151	Counterpoint in Theory and Application	6
57-153	Harmony II	9
57-408	Form and Analysis	6

Upper Level Theory Course (choose one) 6 units

See theory courses on the Music Support Courses Two-Year Rotation list. It is available here (https://www.cmu.edu/cfa/music/current-students/music-support-courses-f231.pdf) on the Current Student website. A graduate course may be taken with the permission of the instructor.

Elective Courses 18 units

Elective courses are to be chosen from those courses listed for the School of Music in the current course catalog.

Minimum units required: 70

Sonic Arts Minor – IDeATe

Sonic Art is a creative expression that uses sound as its primary medium. Just as visual artists create landscapes, portraits, and narratives through light, color, and form, sonic artists craft transformative experiences through sound, noise, and music.

Students in the *Sonic Arts* minor explore the processes and products of digital sound design and music production. They receive basic training in key component areas: principles of computer music, sound synthesis, spatialization, and core practices in sound design. Combining this training with courses that bring together experts from many disciplines, they create experimental music and explore emerging applications and markets for sound design, music creation, and performance.

Curriculum

One Computing Course - Minimum of 9 Units

		Units
15-104	Introduction to Computing for Creative Practice	10
15-110	Principles of Computing	10
15-112	Fundamentals of Programming and Computer Science	12
60-212	Intermediate Studio: Creative Coding	12

One IDeATe Portal Course - Minimum of 9 Units

		Units
18-090	Twisted Signals: Multimedia Processing for the Arts Other IDeATe Portal Course by permission only. Consult the IDeATe advisor.	10

IDeATe Sonic Arts Courses - Minimum of 27 Units

		Units
15-322	Introduction to Computer Music	9
33-114	Physics of Musical Sound	9
54-166	Introduction to Sound Design for Theatre	6
54-267	Conceptual Sound Design	9
54-509	Theatrical Sound System Design 2	9
57-337	Sound Recording	6
57-344/60-407	Experimental Sound Synthesis	9
57-347	Electronic and Computer Music	6
57-358	Introduction to Electronic Music portfolio required for registration	9
57-359	Audiovisual Composition	9
57-421	Exploded Ensemble	6
57-458	Business of Music	6
Additional course options as available. Please refer to the IDeATe website for courses for the current and upcoming semester.		

Double-Counting

Students may double-count up to two of their *Sonic Arts* minor courses for other requirements.

CFA Dean's Office Minors

Minor in the History of Arts

This minor of six or more courses as designated below, offers students flexibility to engage in a broad survey in the arts or can be tailored to reflect a more specific area of interest. For College of Fine Arts students, all courses meeting the requirements of the Minor in the History of the Arts must be taken outside of their major School, with the exception of the School of Architecture. Interested students should contact Stefanie McGowan (stefanim@andrew.cmu.edu) in the College of Fine Arts, Room 100.

Introductory Level Courses 27 units

(choose at least three, CFA students pick 3 outside of major)

48-240	History of World Architecture, I	9
48-241	History of Modern Architecture	9
54-239	History of Architecture and Decor 1: Ancients to Gothic	Var.
54-240	History of Architecture and Decor 2: Renaissance to the 21st Century	Var.
54-245	Who Wore What: When, Where, and Why (instructor permission only)	Var.
54-246	Who Wore What: When, Where, Why II (instructor permission only)	Var.
57-173	Survey of Western Music History (coreq: 57-188)	9
57-188	Repertoire and Listening for Musicians (coreq of 57-173)	1
60-105	Cultural History of the Visual Arts (instructor permission only)	9
60-106	Critical Theory in Art II	9

Intermediate/Advanced Level Courses 27 units

(choose at least three, CFA students pick 3 outside of major)*

48-348	Architectural History of Mexico & Guatemala	9
48-374	History of Architecture in the Islamic World- A Primer (prereq: 48-240)	9
51-376	Semantics & Aesthetics	4.5
57-209	The Beatles	9
57-476	How Music Works: An Affective History	6
57-477	Music of the Spirit	6
57-478	Survey of Historical Recording	6
57-480	History of Black American Music	6
57-485	History of the Symphony	9
Art Critical Studies Electives: 60-352 to 60-398 (instructor permission only)		9
62-360/79-328	Photographers and Photography Since World War II	9
62-371/79-316	Photography, The First 100 Years, 1839-1939	9
79-395	The Arts in Pittsburgh	9

Minimum units required for minor: 54

*Other courses not on this list may qualify as approved by CFA Dean's Office (College of Fine Arts, Room 100).

Minor in Photography

The Photography Minor exposes students to the breadth of offerings from traditional photography (i.e. film exposure and silver printing) to digital shooting and output. The student will become familiar with photography's craft, its history and significant practitioners, and develop their own distinct engagement with the medium.

Students may apply for the Photography Minor after they have taken a beginning photography course. Students will be admitted to the minor based on their aptitude, appropriate level of photography skills, and space availability within the program. Once admitted, students will be assigned a faculty advisor who will help them determine a sequence of courses that best fits their needs and interests.

Application Requirements

The application process for the Photography Minor requires submission of: a completed application form signed by the home department advisor, a personal statement, and a portfolio of photographs. Contact the CFA Photography Administrator, Jamie Gruzska (gruzska@andrew.cmu.edu), MM B18, for further information. Applications are processed every semester.

Photography Required Courses (3) minimum 30 units

62/60-141	Black and White Photography I *	10
62/60-142	Digital Photography I	10
62/60-241	Black and White Photography II	10

Photography Elective (1) minimum 10 units

Choose one (1) or more additional photography course. Recent offerings are listed below, some are offered intermittently; consult Jamie Gruzska for current offerings.

62-245	Portrait Photography	10
62-375	Large Format Photography: The Antiquarian Avant-Garde	10
62-343	Professional Practices in Photography	10
62-279	Photography and the Ineffable	10

Photo History Required Course (1) minimum 9 units

62-371	Photography, The First 100 Years, 1839-1939 *	9
or 62-360	Photographers and Photography Since World War II	

History, Theory, or Criticism of the Visual Arts Elective (1) minimum 9 units

Choose one (1) additional History, Theory or Criticism of the Arts course in consultation with the photo advisor. A second Photo History course (62-360 or 62-371) can be used for this requirement.

*or course approved by the photography advisor

Minimum units required for minor: 58

School of Architecture

Omar Khan
Location: CFA 201
www.soa.cmu.edu (http://www.soa.cmu.edu)

The SoA educates students in the discipline of architecture emphasizing the role of creativity in architectural design; understanding its historical, social and environmental context; critically engaging technology in its innovation; and ethically working for social progress and justice in the built environment. Our undergraduate and graduate degree programs prepare students for the challenges facing architecture and urbanism in the twenty-first century, namely global warming, artificial intelligence and social justice. We aim to produce discipline-defining designers and thinkers in diverse global contexts.

This world-class architecture education is enhanced by our position within one of the world's leading research and entrepreneurship institutions, and by the fundamental premise that architectural excellence demands both rigorous training in fundamentals and the development of unique specializations. Students may extend their core knowledge either through concentration in architecture subdisciplines like urban design, sustainable design or computational design, or through interdisciplinary interaction with CMU's other renowned programs in the sciences, humanities, business and engineering. Though every SoA student graduates with intensive architecture knowledge, no two graduates leave with the same education.

In the twenty-first century, few architecture problems are straightforward. Graduates of SoA excel in the roles architects have performed for centuries - and in new roles catalyzed by the depth and breadth of their education - to create and execute innovative solutions to a huge range of emerging global challenges.

Undergraduate Degree Programs

The SoA offers two baccalaureate degree programs: the 5-year, professional Bachelor of Architecture (B.Arch), and the 4-year Bachelor of Arts in Architecture (B.A.). Both programs begin with the same studio-based curriculum in the first year, but then begin to diverge in terms of opportunities and outcomes. The B.Arch requires 10 studios and an extensive set of required professional courses, while the B.A. requires a minimum of 4 studios and fewer technical courses, all of which can be spread out over the four years of the program, and thus allow students to explore different opportunities in their studies.

Undergraduate students are admitted to the SoA without a declared degree program. By the end of the second year, students must select either the B.A. or the B.Arch degree program. The student's academic advisors, faculty, and Head provide mentoring and information to guide the student in selecting their degree option.

Bachelor of Architecture Program (B.Arch)

The Bachelor of Architecture (B.Arch) is a 5-year, first professional degree program accredited by the National Architectural Accrediting Board (NAAB, https://www.naab.org/) with a carefully defined set of "Program Criteria" (PC) and "Student Performance Criteria" (SPC). The B.Arch is for students proposing to pursue a career as a licensed architect or related profession, and centers around a carefully structured set of professional and technical courses about building design and construction, alongside the social, cultural and professional contexts in which architects operate. Our students graduate with a professional degree that prepares them to excel in practice—but that also launches them into key specialties within and around the profession.

Due to the technical nature of the B.Arch program at CMU, it is STEM-eligible, meaning that in addition to one year of Optional Practical Training (OPT), an international student on an F-1 visa may apply for a 24-month STEM OPT extension following graduation.

Statement on NAAB-Accredited Degrees

In the United States, most registration boards require a degree from an accredited professional degree program as a prerequisite for licensure. The National Architectural Accrediting Board (NAAB), which is the sole agency authorized to accredit professional degree programs in architecture offered by institutions with U.S. regional accreditation, recognizes three types of degrees: the Bachelor of Architecture, the Master of Architecture, and the Doctor of Architecture. A program may be granted an eight-year term, an eight-year term with conditions, or a two-year term of continuing accreditation, or a three-year term of initial accreditation, depending on the extent of its conformance with established education standards.

Doctor of Architecture and Master of Architecture degree programs may require a non-accredited undergraduate degree in architecture for admission. However, the non-accredited degree is not, by itself, recognized as an accredited degree.

The Carnegie Mellon University School of Architecture offers the following NAAB-accredited programs:
-- Bachelor of Architecture (450 units)
-- Master of Architecture (Pre-professional degree or equivalent + 180 units)

The next NAAB accreditation visit for the Bachelor of Architecture is scheduled for 2026.
The next NAAB accreditation visit for the Master of Architecture is scheduled for 2030.

The full 2020 NAAB Conditions for Accreditation can also be found on NAAB's website at: https://www.naab.org/accreditation/about-accreditation (https://www.naab.org/accreditation/about-accreditation/).

Bachelor of Arts in Architecture Program (B.A.)

The Bachelor of Arts in Architecture (B.A.) is a 4-year liberal studies degree program that allows and encourages interdisciplinary exploration. The program is built around a core foundation of architectural studios and technical coursework, but more than half of the units required for graduation are general studies courses and flexible electives. B.A. students have the opportunity to double major, test the boundaries of the discipline, and explore a variety of interests. If you are a student that embraces creativity, is curious about the world around you, and enjoys engaging both the left and right sides of your brain, the B.A. program could be a perfect fit for you.

As a 4-year, pre-professional architecture program, the B.A. allows those who are interested to continue in architecture with a 2-year professional M.Arch degree program (often called a 4+2 degree), or to go on to specialize in other fields in graduate school, including urban design, landscape architecture or other fields related to design, the built environment, virtual worlds, community engagement, sustainability, and more. The B.A. also makes it possible for students to transfer into architecture from other studies.

In the first year, the B.A. program begins with the same studio-based curriculum as the B.Arch program, but then begins to diverge in terms of opportunities and outcomes. The B.A. requires only the first four studios and the core courses from the first two years of the B.Arch sequence, and these can be spread out over the four years of the program. Students may take more studios, specialize in particular aspects of architecture, or explore broadly.

For students seeking to integrate architecture with another field of study, CMU also offers the BXA Intercollege Degree Programs. BXA students graduate with a Bachelor of Humanities and Arts, a Bachelor of Science and Arts, or a Bachelor of Computer Science and Arts degree.

B.Arch Curriculum

Minimum units required for Bachelor of Architecture 450

First Year: Poeisis

48-100	Architecture Design Studio: POIESIS STUDIO 1	15
48-104	Shop Skills	3
62-122	Digital Media I	6
62-104	Design Ethics & Social Justice in Architecture	3
62-125	Drawing I	6
76-101	Interpretation and Argument	9
99-101	Core@CMU	3

48-105	Architecture Design Studio: Poiesis Studio 2	15
48-112	Digital Fabrication Skills	2
62-123	Digital Media II	6
62-126	Drawing II	6
48-240	History of World Architecture, I	9
xx-xxx	Elective	6

Second Year: Poeisis

48-200	Poiesis Studio 3: Architecture Biome and Climate	18
48-215	Materials & Assembly	9
48-116	Introduction to Building Performance	3
62-225	Generative Modeling	9
48-111	Exploring Pittsburgh	3
xx-xxx	Elective	6

48-205	Architecture Options Studios	18
48-241	History of Modern Architecture	9
48-234	Introduction to Structures	6
62-275	Fundamentals of Computational Design	9
48-xxx	Seminar II	3
xx-xxx	Elective	3

Third Year: Praxis

48-300	Architecture Design Studio: Praxis Studio 1	18
48-315	Environmental Systems: Climate & Energy in Buildings	9
48-250	Urbanism and the Social Production of Space	6
48-xxx	Structures 2	9
xx-xxx	Elective	6

48-305	Architecture Design Studio: Praxis Studio 2	18
48-380	Constructing Value(s): Economies of Design	6
48-xxx	Architectural History3 (Selective)	9
xx-xxx	Elective	3

Fourth Year

48-400	Architecture Design Studio: Praxis Studio 3	18
48-432	Environment II: Design Integration of Active Building Systems	9
48-xxx	Professional Development	3
xx-xxx	Elective	9
xx-xxx	Elective	4

48-405	Advanced Synthesis Options Studio II	18
48-381	Issues of Practice	6
48-383	Ethics and Decision Making in Architecture	6
xx-xxx	Elective	9
xx-xxx	Elective	4

Fifth Year

48-500	Advanced Synthesis Options Studio	18
xx-xxx	Elective	9
xx-xxx	Elective	9
xx-xxx	Elective	6

48-510	Advanced Synthesis Options Studio IV	18
or 48-519	Architecture Design Studio: Thesis II/ Independent Project	
xx-xxx	Elective	9
xx-xxx	Elective	9
xx-xxx	Elective	6

B.A. Curriculum

Minimum units required for Bachelor of Arts in Architecture	360

Design Studios

48-100	Architecture Design Studio: POIESIS STUDIO 1	15
48-105	Architecture Design Studio: Poiesis Studio 2	15
48-200	Poiesis Studio 3: Architecture Biome and Climate	18
48-205	Architecture Options Studios	18

Architecture Coursework

48-104	Shop Skills	3
48-116	Introduction to Building Performance	3
48-112	Digital Fabrication Skills	2
48-111	Exploring Pittsburgh	3
48-240	History of World Architecture, I	9
48-241	History of Modern Architecture	9
48-250	Urbanism and the Social Production of Space	6
48-215	Materials & Assembly	9

General Studies

99-101	Core@CMU	3
48-025	First Year Seminar: Architecture Edition I	3
76-101	Interpretation and Argument	9
62-104	Design Ethics & Social Justice in Architecture	3
62-122	Digital Media I	6
62-123	Digital Media II	6
62-125	Drawing I	6
62-126	Drawing II	6
62-225	Generative Modeling	9
48-234	Introduction to Structures	6
62-275	Fundamentals of Computational Design	9
48-xxx	Seminar II	3

Electives

48-xxx	Architecture Electives	45
xx-xxx	University Electives (Outside SoA)	45
xx-xxx	Flex Electives (In or out of SoA)	92

Minors in Architecture

The SoA offers several minors in various specialty subjects related to architecture, some are only available to non-architecture students, others are only available to architecture majors, and still others can be taken by all CMU students. For the most up-to-date list of minors, see: https://www.architecture.cmu.edu/minors (https://www.architecture.cmu.edu/minors/).

Non-architecture students may minor in: Architecture, Architectural History, Architectural Representation & Visualization, Architectural Technology, and Computational Design.

Architecture majors may minor in: Architectural Design Fabrication, Architectural History, Architectural Representation & Visualization, Building Science, and Computational Design.

The **Minor in Architecture** sequence is for students who intend to develop intellectual links to the architectural profession. The scope of courses offered includes a full spectrum of professional issues in architecture. (*Available to non-architecture majors only.)*

The **Minor in Architectural Design Fabrication** is intended for students who wish to develop focused, disciplinary expertise in both analog and digital material methods for shaping the built environment and become involved in a community of practice dedicated to a rigorous pursuit of *making* as a mode of architectural research and cultural expression. It is also for students interested in gaining advanced placement in the SoA's Master of Advanced Architectural Design (MAAD) (https://soa.cmu.edu/maad/) program. *(Available to architecture majors only.)*

The **Minor in Architectural History** is intended for candidates interested in the history of architecture in its many manifestations, including high style and vernacular buildings, western and non-western traditions, built and theoretical works, and rural to urban contexts. Students wishing to pursue the minor should meet with the Architecture advisor to determine if a course is eligible. *(Available to both architecture majors and non-architecture majors.)*

The **Minor in Architectural Representation and Visualization** is intended for students who wish to develop particular skills in architectural representation, and for those who are interested in gaining advanced placement in the SoA's Master degree program in Computational Design (MSCD) (https://www.architecture.cmu.edu/computational-design/). *(Available to both architecture majors and non-architecture majors.)*

The **Minor in Architectural Technology** is intended for students who seek to develop intellectual links to the technical aspects of the profession. (*Available to non-architecture majors only.)*

The **Minor in Building Science** is intended for students that want to deepen their knowledge in the building sciences, and for those who are interested in gaining advanced placement in the SoA's Master degree programs in Building Performance & Diagnostics (MSBPD) (https://soa.cmu.edu/bpd/) or Sustainable Design (MSSD) (https://soa.cmu.edu/mssd/). *(Available to architecture majors only.)*

The **Minor in Computational Design** is intended for students who wish to engage with computation as a vehicle of generative, material, and spatial design exploration, and for those who are interested in gaining advanced placement in the SoA's Master of Science in Computational Design (MSCD) (https://soa.cmu.edu/mscd/). *(Available to both architecture majors and non-architecture majors.)*

Advanced Standing in Master Degree Programs

The SoA offers a unique opportunity to undergraduate students who wish to pursue a post-professional Master's degree in an architecture-related field. The Accelerated Master's Program (AMP) (https://soa.cmu.edu/accelerated/) offers baccalaureate students the opportunity to expedite their completion of a Master's degree, saving both time and money—and allowing them to hit the job market with specialized knowledge and two CMU degrees. Baccalaureate students can pursue a graduate degree in the following subjects: Master of Architecture (M.Arch) (B.A. students only), Advanced Architectural Design, Architecture–Engineering–Construction Management, Building Performance and Diagnostics, Computational Design, Sustainable Design, and Urban Design. An AMP student must complete all of the units required by BOTH programs, less a maximum of 48 units that can be double-counted. For instance, B.Arch + MSSD-Applied would be 450 units + 135 units less 48 double-counted units, or 537 total units total for two degrees. B.Arch students may begin pursuit of a post-professional Master's degree through AMP as early as their third year.

Graduate Degree Programs

Carnegie Mellon University is recognized for outstanding contributions to science, technology, management, policy, and the fine arts. The School of Architecture builds on a tradition of interdisciplinary study. **The School of Architecture offers seven (7) Master's degrees, and three (3) Doctoral degrees in the following areas of study:**

Master of Advanced Architectural Design

The Master of Advanced Architectural Design (MAAD) (https://www.architecture.cmu.edu/maad/) is a post-graduate, studio-based program that engages emerging methods of design and fabrication through architectural design to speculate upon future modes of architectural practice, enhanced construction methods, and material culture within the built environment.

Master of Architecture

The Master of Architecture (M. Arch) (https://www.architecture.cmu.edu/march/) is two-year, studio-based, NAAB-accredited (https://www.architecture.cmu.edu/accreditation/), first professional degree program to educate tomorrow's leaders in architecture-related careers. It requires a 4-year, pre-professional architecture program such as the B.A. or its equivalent to enroll, and is thus often called a 4+2 degree. The M.Arch program provides both the broad, comprehensive training in fundamentals required for U.S. professional registration and licensure, and the opportunity to focus on, speculate in, and obtain dual degrees with other research-based master's programs in the SoA. Our M.Arch program's strategically small size allows our self-motivated students to shape their individual educational agendas and career paths as they interact directly with a broad array of vertically integrated studios and advanced research projects in the school, the university, the local community, and around the world.

Master of Science/Doctor of Philosophy in Architecture–Engineering–Construction Management

A joint effort between the School of Architecture and the Department of Civil & Environmental Engineering, the Architecture–Engineering–Construction Management (AECM) (https://www.architecture.cmu.edu/aecm/) programs prepare building delivery professionals for careers in capital project delivery dealing with the entire life-cycle of capital projects, from pre-design to design, construction, commissioning, operation, and maintenance stages. Graduates are educated to become effective decision makers who can positively impact economic, environmental, and ethical aspects of the built environment through professional management strategies. Our graduates have successful careers in government, industry, business, and NGO (non-governmental organization) sectors, prospering in positions where design professionals continuously make large-scale capital project design, construction, and maintenance decisions.

Master of Science/Doctor of Philosophy in Building Performance and Diagnostics

Our graduate programs in Building Performance & Diagnostics (BPD) (https://www.architecture.cmu.edu/bpd/) have long led the world in advanced building technologies that sustainably reshape the built environment. BPD deals with the comprehensive integration of *building design* and *advanced technology*, as a means of producing high performance architecture. Led by the Center for Building Performance & Diagnostics (CBPD) (https://soa.cmu.edu/cbpd/) and housed within the Robert L. Preger Intelligent Workplace, students have the opportunity to gain both diversity and depth of knowledge from world-renowned and experienced faculty.

Master of Science/Doctor of Philosophy in Computational Design

Our graduate programs in Computational Design (https://www.architecture.cmu.edu/computational-design/) (CD) are among the first and best known in the country, and our legacy continues today. The Computational Design program takes a computer science view of design, applying both the science and art of computing to design problems, in relation to creation, presentation, analysis, evaluation, interaction or aesthetic expression; in real and imagined applications, both perceived and conceived. From the beginning, the program has benefitted from close cooperation with other units of the university, particularly the School of Computer Science and the Department of Civil & Environmental Engineering. Our research-based degree programs are intended for practitioners, educators and researchers in architecture, computer science, engineering and those interested in design. Our graduates go on to successful careers in government, industry, academia, and software development.

Master of Urban Design

The Master of Urban Design (MUD) (https://www.architecture.cmu.edu/mud/) is a studio-based program distinguished by its emphasis on integrating socially engaged practice with new tools and techniques for representing, understanding, and designing cities; by the opportunity to work in trans-disciplinary teams at the intersection of the arts, humanities and technology across Carnegie Mellon's departments and colleges; and by its location in Pittsburgh—a thriving post-industrial laboratory.

MASTER OF SCIENCE IN SUSTAINABLE DESIGN

The Master of Science in Sustainable Design (MSSD) (https://www.architecture.cmu.edu/mssd/) is a post-professional research-based graduate program focused on enabling deep expertise, critical thinking, and investigation of innovative sustainable strategies for the design of the built environment. The MSSD program explores technical and multicultural aspects of ecological thinking, while enabling actionable expertise in sustainable design methodologies. Based in the legacy of sustainability teaching at Carnegie Mellon University, the MSSD program prepares students to excel in research methods, and to become experts in integrative design thinking for the future of the built environment.

Student Advising

Architecture students can receive advice from many sources, including the faculty, staff, and administration of the School. All SoA undergraduates are urged to meet with the Senior Academic Advisor to review their academic progress and plans before each semester. Such meetings are important to take full advantage of elective possibilities within the curriculum, general progress toward graduation, and professional goal-setting. Students may also check their progress using the online academic audit in the Student Information Online (SIO) and should review the audit results with the senior academic advisor. The Academic Advisor will assist students with registration, academic audits, transfer credits, study abroad, SoA minors, finals grades and academic actions, as well as SoA and university policies and resources.

In addition, we encourage all of our students to become involved with student organizations such as AIAS or NOMAS, as well as committees such as the Student Advisory Council (SAC) in order to learn from peers. Students should seek advice about the Architectural Experience Program (AXP) and architectural licensing through the Architect Licensing Advisor

Study Abroad

The SoA strongly encourages students to study abroad. The perspective gained through immersion in another culture and language is invaluable. A student is exposed to architectural subjects not readily available at CMU and will study architecture directly in a foreign context. The Office of International Education (OIE) is an excellent resource for getting started for study abroad planning.

Study abroad can fall into four categories: University Direct Exchanges, University Sponsored Programs, External Programs, and Departmental Summer Programs.

Students are allowed one semester abroad for which they receive studio credit except for those students at approved direct, year-long exchange programs. Students may study abroad in the Fall, Spring, or Summer semesters. Careful planning and scheduling of your courses are necessary when incorporating a study away experience into your curriculum. Students should investigate and start making decisions to study abroad by the fall of their second year, so they can plan their courses accordingly. Please see the academic advisor prior to making any decisions on what term to schedule your study away experience.

To qualify for a study abroad program other than the departmental summer programs, a student must have completed their third year of the program, have a minimum overall QPA of 3.00, and be in good academic standing (no current academic actions).

Students in SoA departmental summer programs must have completed their first year, and must be free of any academic actions for the semester prior to studying away, or permission may be denied. Students can petition the UPEC for exceptions.

Students who participate in a study abroad program for one semester will transfer non-studio course credit by submitting course descriptions of each course taken as well as an official transcript from the host Institution. Official translated transcripts must be submitted to the academic advisor before the beginning of the academic year to receive transfer credit. Grades are not transferred, only credits. Transfer credit is awarded upon receipt of an official translated transcript and only for courses with the grade of a C or better (not C-). When students return from study abroad, they must pin up original work during the study away exhibit, which will be subject to review by the UPEC or designated faculty.

Faculty

JARED ABRAHAM, Associate Studio Professor

VICKY ACHNANI, Associate Studio Professor

NILOUFAR ALENJERY, Special Faculty

SAROSH ANKLESARIA, Assistant Teaching Professor

MARY-LOU ARSCOTT, Studio Professor & Associate Head

NINA BARBUTO, Adjunct Faculty

JOSHUA BARD, Associate Professor & Associate Head

WILLIAM BATES, Adjunct Faculty

HEATHER BIZON, Special Faculty

DARAGH BYRNE, Associate Teaching Track

DANIEL CARDOSO LLACH, Associate Professor

GLORIA CHANG, Special Faculty

XIN CHEN, Adjunct Instructor

JIMMI WEI-CHUN CHENG, Special Faculty

LORI CLAUS, Special Faculty

ERICA COCHRAN HAMEEN, Associate Professor & Director of DEI

DOUG COOPER, Andrew Mellon Professor

DANA CUPKOVA, Professor

GERARD DAMIANI, Associate Professor

STEFANI DANES, Adjunct Faculty

ASLI DARGA,, Adjunct Faculty

JEFFREY DAVIS, Adjunct Faculty

JEREMY FICCA, Associate Professor, Director dFAB

STEVEN SONTAG, Assistant Shop Director

BEA SPOLIDORO, Adjunct Faculty

ANDREW STONE, Thomas Visiting Professor

LOUIS SUAREZ, Adjunct Faculty

NAZIA TARRANUM, Adjunct Faculty

FRANCESCA TORELLO, Special Faculty

ALICIA VOLCY, Adjunct Faculty

GARRET WOOD-STERNBURGH, Adjunct Instructor

HEATHER WORKINGER MIDGLEY, Adjunct Faculty

TOMMY CHEEMOU YANG, Associate Studio Professor

School of Architecture Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

48-025 First Year Seminar: Architecture Edition I

Fall: 3 units
The main objective of this first-year seminar course is on how students learn, develop, and make decisions as they transition into architecture education. The goal of this course is to promote academic success and encourage connections within the SoA and the University at large. Teaching and learning strategies will be introduced to help support the transition into architecture and the development of independent critical thinkers. Students will be introduced to campus resources that support their academic/social/personal integration into the campus community. Topical areas to be covered in the seminar will include academic success strategies in architecture education, academic development, career planning, mentorship, academic and personal support services, and the aspects of professional practice in architecture.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-095 Spatial Concepts for Non-Architecture Majors

Fall and Spring: 10 units
This course serves as an introduction to the spatial concepts of architecture for students from other disciplines. The course is focused entirely on project design work (this is not an historical survey, technical or lecture course). This course is very hands-on Projects will explore the design and experience of spatial environments through a series of creative investigations. The semester will be broken in to 3 parts:Intro/Exploration and a long term project. In Intro/Exploration, students will have many hands on opportunities to start to build a common language to describe spacial investigations as well as creating them. This will consist of short projects, with each design investigation progressively building upon the previous exploration; these early projects will consist of both individual and group work. They will focus on Making. The second half of the semester will consist of one long term project to be created individually, incorporating students? personal theories of architecture based on an overarching question. Studio work will be supported by group discussion based upon critical review of student work, readings, slide presentations, videos and films. There will also be a few field trips. Students are encouraged to explore their own areas of interest with respect to their work in class. Self-motivation, class attendance and an open mind is mandatory, however, no prior architectural, engineering or artistic experience is required. Students are expected to perform work both inside and outside of class. Students should be prepared to purchase various supplies throughout the course. This course is in partial fulfillment of requirements for an Architecture Minor.

48-100 Architecture Design Studio: POIESIS STUDIO 1

Fall: 15 units
This studio will investigate the role and process of architectural design as different forms of practice. The studio will practice drawing, making, and building architectural narratives in iterations at various scales of time and space, to establish productive habits and develop essential techniques and skills in architectural design. In learning how architects see in both visible and invisible terms, the studio will analyze design precedents and problems that generate ideas about architectural material, form, and systems. In understanding how architects empathize with whom or what they serve, the studio will rigorously investigate methods of abstraction and critical dimensions relative to human form and experience. In practicing how architects deliver in the professional context, the studio will develop mastery of spatial composition, representation, and narrative as means for an architect to iteratively test, experiment with, and communicate spatial ideas.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-104 Shop Skills

Fall
This course will introduce basic material assembly methods, and the use of shop machinery, hand and power tools. It prepares students to participate in a wide range of subsequent building and fabrication projects. We will aim to build confidence and safe work habits while demystifying the interactions between tools and physical materials.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-105 Architecture Design Studio: Poiesis Studio 2

Spring: 15 units
As the second studio within the Poiesis Sequence, this studio will nurture a way of making and thinking in design that aims to cultivate the practice of architecture as an act of creative citizenship. By building an affinity for an approach linking the cross-cultural study of how people perceive and manipulate their environments can push a multimodal understanding of architecture and urban design. We will use a multi-disciplinary approach to become detectives interrogating the contemporary and historical tissue of Pittsburgh through the occupations and working lives, therefore elevating ordinary folks and trades that had and continues to foster the fabric of the city. Grasping the multi-faceted changing environment, this studio will use architectural tools as a base of inquiry to speculate and allow us to transform the way we view our world through multiscale multisystemic perspectives. The structure of the studio will follow one cohesive research driven design project that will explore narrative modalities, by using critical cartography, archival research, storytelling, programming adjacencies and tectonic exploration as a method to produce a hybrid shop-house focused on the historical trades of Pittsburgh. Students in the sequence will be introduced to critical proficiencies, learn new techniques of representation, adapt rigorous illustration and animation tools in the production of a dwelling project that is rooted in its urban fabric.
Prerequisite: 48-100 Min. grade C

48-111 Exploring Pittsburgh

Spring: 3 units
The city of Pittsburgh is at once your (permanent or temporary) home and the site of many of your studio projects. In this class you will start exploring Pittsburgh - as built environment in which your work might be situated, as cultural context you need to interpret, and as creative material for your own work. You will learn some of Pittsburgh's urban history, looking at phases of physical growth and dramatic change over time. You will take walks, do site visits and sharpen your observation skills. You will critically engage with some of the evidence. You will start to read cities as complex and layered, shaped by invisible forces as much as by visible ones.

48-112 Digital Fabrication Skills

Spring: 2 units
"The formal qualities explored by designers today necessitates the use of sophisticated tools with a combination of flexibility and precision. This course serves as an introduction to the type of equipment and methodologies utilized in architectural fabrication. Students will develop a basic understanding of the field to leverage these processes to explore and represent the complex nature of their designs. Through lectures and lab sessions, students will learn the affordances of the machines available in the DFAB Lab (Digital Fabrication Lab), how to prepare 3D CAD models in Rhino 3D for digital fabrication, and basic CAM (Computer Aided Manufacturing) programming. A series of projects, each highlighting an individual machine, will reinforce this technical knowledge while requiring students to rationalize their designs so their physical manifestations are informed by the techniques introduced."

48-116 Introduction to Building Performance

All Semesters: 3 units
This course will introduce fundamental concepts of building physics. The knowledge and skills obtained from this course can be applied to studio projects and beyond, improving building design and performance through standard methods of evaluation and simulation tools. Couse curriculum running concurrent with studio projects will aid students in further developing and guiding design decisions to incorporate fundamental concepts related to climate, energy, light, relationship to site, and occupant visual and thermal comfort. Students will develop a general understanding of, site analysis, building placement and amp; form as it relates to building performance, photometric principles to evaluate lighting conditions, thermodynamic principles, and heat transfer, building energy, renewable and embodied energy. Skills, tools, and knowledge base learned in this course with enable designers and architects to employ sustainable practices at all phases of design, leading to better performing buildings.
Prerequisites: 62-125 and 62-122 and 62-123 and 62-126

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-120 Digital Media I

Fall: 6 units
IDM is a required course for all first year architecture students. The course introduces students to a wide range of digital methods and concepts available to architects for design, representation, and documentation. The coursework is directly coordinated with Studio assignments providing the students with the opportunity to master their digital skills in a meaningful manner. Due to the amount of content covered there is no single text for this course, but the course is supported by materials created by the instructor. IDM addresses topics such as digital image editing, vector illustration, HTML coding, and 3D modeling.

48-121 Drawing I

Fall: 6 units
Architects draw and build models for a variety of reasons: to record and reference; to analyze and reveal order, intent, and relationships; to speculate; and to visualize new propositions. The study of architecture requires the connection between the mind, the eye and the hand, so that the nature of ideas and their relationship to physical form can be investigated. The connection of the mind, hand and drawing skills requires considerable time and effort. This course introduces why architects use these forms of representation. Students are introduced to how to do basic academic research as well direct assignments that apply the fundamentals of freehand drawings and drafting techniques as it pertains to plans, sections, elevations and paraline drawing, analytical diagraming and model making.

48-125 Digital Media II

Spring: 6 units
IDM2 is a required course for all first year architecture students. This course is the continuation of IDM. IDM2 introduces students to measured drafting and the process of creating a construction drawing set. The coursework is directly coordinated with Studio assignments providing the students with the opportunity to master their digital skills in a meaningful manner. Due to the amount of content covered there is no single text for this course, but the course is supported by materials created by the instructor. IDM2 addresses topics such as digital drafting, construction drawings, advanced 3D modeling and HTML programming.
Prerequisite: 48-120

48-126 Drawing II

Spring: 6 units
Drawing and Appearance? is a traditional course in free-hand architectural drawing. Its central learning objective is building a capacity for visualizing three-dimensional space through the making of hand-made drawings. Two secondary objectives foster visual literacy: the ability to use line, tonal values and color to represent architectural space and the ability to use drawing to represent architectural proposals at various levels of abstraction Coursework includes free-hand and constructed perspective, shade and shadow projection, chiarroscurro drawing in colored pencil and color drawing in pastel. Work is submitted in three portfolio submissions of two weeks duration each. Coursework is built around exercises in the required course text: Drawing and Perceiving, John Wiley and Sons.

48-175 Descriptive Geometry

Spring: 9 units
Descriptive geometry deals with solving problems in three-dimensional geometry through working with two-dimensional planes using basic mechanical tools. Descriptive geometry deals with physical space, the kind that one is used to since birth. Things one can see around us have geometry and even things that one cannot see, also have geometry. All these things concern geometric objects almost always in relationshipsthat is, next to, above, below, intersecting with, occluding, hidden by and so onto one another that sometimes requires us to make sense of it allin other words, when we try to solve geometric problems albeit in architecture, engineering, or the sciences. In fact, descriptive geometry has proved itself to be practically useful; it has been one of the more important factors in the design of scientific apparatus, engineering systems and architectural structuresit is the basis of modern geometrical computing. Descriptive geometry is constructivemeaning, one uses conventional mechanical drawing tools: namely, compass, ruler, protractor, divider, triangles, etc., to construct solutions to geometric problems. This course specifically revolves around the historical techniques for manually solving three-dimensional geometry problems.

Course Website: http://soa.cmu.edu

48-200 Poiesis Studio 3: Architecture Biome and Climate

Fall: 18 units
By conceptually recognizing the built/natural environment as a complex web of interacting parts constantly exchanging energy and resources, we may learn to develop architecture that enriches the context from which it arises. In response, the Poiesis Studio 3 explores how architectural and landscape design can respond to a local biome and climate through passive design strategies. We highlight the use of precedent and the relevance of our changing climatic context in how architecture takes shape - how it develops its morphology. Through an iterative process students develop formal and programmatic organizations as field conditions, or aggregations that highlight the localized interconnectivity of buildings, bodies, and environment. These building and landscape morphologies redefine boundary conditions to promote a connection to the local biome. Their envelopes become mediators between interior and exterior, public and private, the social and the ecological. Working from the scale of the territory to that of the building enclosure our goal is to arrive at a sensorially rich, environmentally responsive, and resilient architecture.
Prerequisites: 48-105 Min. grade C and 48-100 and 62-122 and 62-125 and 62-104 and 48-025 and 62-123 and 62-126

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-205 Architecture Options Studios

Spring: 18 units
The second year option studios offer varied design strategies through material, computational, chronopolitical, cultural and ecological lenses.
Prerequisite: 48-200

Course Website: http://soa.cmu.edu

48-215 Materials & Assembly

Spring: 9 units
This course introduces and examines the fundamentals between design intent and construction materials, and the science of materials (performance) and their assemblies. Learning how materials and techniques inform spatial and form making decisions will be a central theme for the semester. Lectures and discussions will focus on the meaning, aesthetics and techniques related to the use of materials and the process of construction. A basic understanding of essential, well-known systems of building construction will be our base line. Discussions and case studies of contemporary systems that extend, experiment with and question these known systems will introduce you to the great depth to which this basic knowledge can lead you. Joint assignments with the design studio will provide you with an opportunity for an in-depth exploration of these fundamentals of construction through a direct application and synthesis of this new knowledge to your studio project.
Prerequisite: 48-100

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-217 Structures

Spring: 9 units
Structures is a required course taught in the second year. It is a successor course to Statics, complementing that previous course by emphasizing structural member design in wood, steel, and reinforced concrete; spatial synthesis of hierarchical one-way systems for gravity load; structural types for lateral load including braced frames, shear walls, and rigid frames; introduction to geometric structures such as cable nets, domes, shells, and air-supported structures.

48-222 Explorations in Craft: Soft Forms, Stable Structures

Fall and Spring: 9 units
Softness is an evocative quality in architecture, but how do we "find" and then fabricate those elusive forms? How do we manipulate materials with control when the forms we seek, or their own structural makeup may lack it? When do we follow the material and when do we control it? This course is focused on physical model making of soft forms. It offers a series of encounters with material specificity, including textile, metal, and plastic materials, and the techniques used in transforming 2D patterns to 3D forms. Demonstrations, and workshops will inform material qualities, their formal affordances, and structural stability. Design and application of cutting and sewing patterns, bending jigs and casting molds will introduce the planning required to facilitate thoughtful crafting. The methods we work with are intended to open possibilities and refine skills for future making, ranging from quick form finding strategies to techniques for execution with precision. Note: A materials fee will cover workshop costs.

48-234 Introduction to Structures

All Semesters: 3 units
This course introduces structural systems and the materials and elements that make up those systems. Students will study historical and contemporary examples of bridges, long-span roofs, and tall buildings from technical, social, and symbolic perspectives. Through these built works, students will become familiar with structural engineering terminology and the behavior of different structural systems. They will also learn how materials, construction, and non-technical factors influence structural form. Additionally, students will evaluate the aesthetics of large-scale structures and discuss the relationship between engineers and architects. As they learn about structures, students will develop their problem solving skills and ability to communicate ideas by practicing using equations, drawing, and writing.
Prerequisite: 48-105

48-240 History of World Architecture, I

Spring: 9 units
This survey cuts a broad swath through time, geography and cultures, surveying critical episodes in the built environment of Europe, the Middle East, Asia, Africa, and the Americas from ancient times through the nineteenth century. Reflecting the inseparable relation between building and human needs, this course is not only a history of architecture, but also a history through architecture. Over the semester, we will examine architecture as a form of cultural expression unique to its time and place. Through readings and lectures, we will study the ways that the design, use, meaning, and legacy of a building and its site was conditioned not only by the architect's will or the patron's desire, but also by a web of technological, religious, social, cultural, economic, and political factors of the time. There will be several exams over the course of the semester including during finals week.

Course Website: http://soa.cmu.edu

48-241 History of Modern Architecture

Fall: 9 units
This course investigates the global history of modern architecture and theory across the 20th century. We ask critical questions about the canon, the changing nature of history and theory, the biases embedded in terms like "modernism," "progress," and "Non-Western," and the deep legacies of colonialism, globalization, extractivism, and capitalism in which modern architecture so actively participated. The course loosely works backward in time to explore major movements and monuments of the Euro-American avant-garde and so-called "heroes" of modernism, but also diverse responses to modernity, including popular, tropical, vernacular, indigenous, and even anti-architecture around the world, including increasingly the Global South. The course content changes slightly every year to acknowledge the evolving understanding of the subject, but also to keep up with changes in architectural education, the discipline of architectural history, and professional practice, as well as changes in global culture, social context, and our student aspirations.

Course Website: http://soa.cmu.edu

48-250 Urbanism and the Social Production of Space

Fall: 9 units
The course introduces contemporary urbanism, offering a comprehensive exploration of how cities and urban systems are made, remade, and even unmade. It approaches contemporary urbanism through urban theory, research, and practice to investigate the relationship between a set of intentions and consequences. It reflects the multidimensional nature of the externalities that determine the complex processes of urbanization and draws discussions on the fields of architecture, planning, landscape architecture, and social science. With a focus on physical, social, environmental, technological, political, and economic forces that influence city-making and urban life, this course analyzes various types of urban issues and phenomena, exploring through the questions of aesthetics, power, equity, and sustainability measures. In doing so, the course offers an understanding of the challenges of the 21st century, spanning from architecture to the city to planetary, and equips students with both conceptual and practical frameworks to observe, document, and analyze diverse urban milieus.

48-300 Architecture Design Studio: Praxis Studio 1

Fall: 18 units
Typically, we do site research and then design something for that site. However, this is a studio where the design research part of the semester will become the project itself. We're going to do site research and correlate it with the information we can find. We're going to make unconventional models and experiment with how we construct a network of sites through sets of relationships, linguistic, computational, and visual descriptions. In principle, we're going to think critically about how we construct the identity of a place through its cultural, social, and ecological systems, and develop procedures for doing so. We will investigate Pittsburgh as a collective site. Over the course of the semester, we will develop a "necklace" or circuit of sites that addressing Event, Housing and Infrastructure. The Steel Necklace will be a composite of these three different architectural/urban interventions to address the cultural, social and ecological issues of Pittsburgh. As the urban condition is a network of shared expressions, lived experiences and relationships, our studio will be a collaborative studio exchanging and intermixing projects. Students will detail into the collective network developing in high resolution a housing component relative to infrastructure and event spatial interventions.
Prerequisites: 48-215 and 48-200 Min. grade C and 48-205 Min. grade C and 48-116 and 62-275 and 62-225

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-305 Architecture Design Studio: Praxis Studio 2

Spring: 18 units
This studio introduces integrated architectural design as the synthesis of disparate elements, demands, and desires. It situates architecture as a technological, cultural, and environmental process that is inherently contingent and entangled, yet tethered to a historical project of autonomy. It is within the contested space between these two notions of architecture that the studio operates. The studio sets out alternatives to extractive practices and introduces students to bio-based material practices and computationally facilitated methods of manufacturing and construction. While the studio directs attention to concerns of building, such as context, building systems, program, and regulatory constraints, it challenges students to situate design as a Project that engages contemporary discourse and ecological imperatives to explore emerging aesthetics, spatial organizations, and materializations. Our discussions and your work this semester will be guided by the following overarching questions: What is architecture's capacity to facilitate civic exchange/life in America today? How might we understand public space today? What are the public spaces, rooms, and interiors of the city in an era of increasing virtuality and privatization of public space? How do building typologies evolve and transform in response to technological and cultural shifts? How can architecture support and reveal the fluid and diverse needs of a community? How might a material-first, carbon-aware approach infuse the design process with greater material specificity and productive constraints?
Prerequisite: 48-300

Course Website: http://soa.cmu.edu

48-308 Reading and Writing Architecture

All Semesters: 9 units
As readers and learners, we consume lots of writing about architecture: articles appear in magazines, convincing and polished, finished products for which we struggle to imagine the process. We seldom pause to reflect on how that writing is produced, much less on how we could make writing a tool that works for us. In this collaborative, hands-on class we will work to demystify the process of writing in all its messiness and to highlight its iterative nature. We will explore how various genres of writing work and how architects can use them effectively, not only to communicate with audiences of all kinds but also to explore their own creative ideas. We will read writing about architecture by a number of different voices - architects, critics, historians, journalists, and activists. We will discover from their own approaches to writing what might work for us. We will experiment with writing and editing and explore how text, images and layout may come together to create a cohesive communication strategy. We will focus on becoming sophisticated as consumers and producers of written communication as we are for visual media.

48-310 Bizarre Details: stories of the ordinary, the uncanny, and the archit

Fall and Spring: 9 units
This design research course explores the current developments in hybrid, multi-platform design and communication mediums to prototype new ways of creative storytelling in architecture, visual development, and concept design. Research methods around oral storytelling, ethno-ecology, radical mapping, and the children's book can allow for the exploration of subjects in ways not available to typical architectural and urban research conventions. Throughout the Fall '23 Term designers will be tasked to use Pittsburgh, PA as a laboratory to develop a research project, from initial concept to an extensive script, including design elements, character development, as well as an urban critique of the city. Frameworks around composition, color, mapping, modeling, the parallel projection, and techniques in painting that are used in architecture, visual development, and concept design will ask how storylines translate and transform in the creation of a comprehensive project using industry techniques. To curate the explorations, we will explore innovative ideas in visual storytelling using techniques of interactivity in children's book design, experimenting with new forms of narrative strategies. The experimentations will result in a final exhibition at the end of Fall 2023.

48-313 New Pedogogies

Spring: 9 units
No course description provided.

48-314 New Pedagogies

Fall and Spring: 9 units
New Pedagogies are courses offered by new and visiting faculty (sections A-D). Please visit https://soa.cmu.edu/courses for complete course descriptions.

48-315 Environmental Systems: Climate & Energy in Buildings

Fall: 9 units
Our commitment to designing net zero energy and indeed carbon positive buildings and communities is critical to environment equity and the UN Sustainable Development Goals. This course introduces architectural design responses for energy conservation and natural conditioning, human comfort, and the site-specific dynamics of climate. The state of the art in building energy conservation and passive heating and cooling technologies will be presented in lectures and supported by readings and assignments. An overview of energy flows in buildings and energy design standards is illustrated by lectures on building energy conservation successes, and emerging demands for a broader definition of sustainability. To understand the significance of architectural design decision-making on energy consumption and comfort, students will compile a professional energy consultant's report for a residential-scale building, designing the most viable energy conservation retrofit measures for their client from siting, massing, organization, enclosure detailing, opening control, to passive system integration and management.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-317 The Chair

All Semesters: 9 units
Making entitles to an intimate connection with the site, native atmosphere, building components, and their assemblies, where a designer/maker can operate at local - regional and global levels comprising all the building systems. This sedulous process takes very closer to the materials where a designer/ maker can gather insights into material behavior (both mechanical and visual) and is better placed to alter the effects of architecture through its materials and generating processes. The same can be applied to chair making. The chair no longer remains a chair, as the making process makes it a ground of experimentation and learning to shape the material into the desired object. The reaction with the matter is no more inert, as it tends to provide feedback to the maker while shaping it. This immersive process of learning by doing in entirety, aids students, in improvising their thought process, the judgment of material behavior, use of the right tool to save material, and developing novel ideas for production and assembly. Prototyping and making largely help develop the understanding concept of joinery/material behavior, and properties in relation to form. The exercise allows understanding chair as a piece of furniture, the manner of making that gives qualities to an abstract design or idea, the know-how of handling material, emergence of tacit knowledge in the maker, and tolerance and feedback from the material.

48-318 Discourse and Praxis in the Climate Emergency

Spring
This course engages with emergent modes of architectural thinking and praxis in the climate emergency. If buildings consume vast resources and are embedded in extractive systems of material and labor, how can discourse be deployed to consider other forms of praxis?

48-324 Structural Design 1: Form and Forces

Fall and Spring: 6 units
This course introduces fundamental concepts of static equilibrium and stability of structures. In contrast to conventional methods of learning structures that are based on numerical calculation and analysis of stresses in materials, this course explores a new geometric approach to understanding the relationship between form and forces of structures through graphic statics, a graphical method of visualizing, designing and analyzing equilibrium. By using geometry as the common language between architecture and structure, the students will explore new ways of shaping structural form by drawing and manipulating the geometry of forces. Through a series of lab exercises, the students will learn how to construct form and force diagrams used in graphic statics, and learn how the behavior of basic structural systems can be understood through such representations. The lab exercises are complemented by group design projects, where the students have the opportunity to apply the concepts and principles learned in the lab to design and build physical structural models that will be loaded to failure. No prior knowledge is required for this course. Structural Design 1 is the first of three courses of the Structural Design curriculum offered at Carnegie Mellon Architecture.
Prerequisite: 48-205

Course Website: http://soa.cmu.edu

48-328 Detailing Architecture

Spring: 9 units
"This course examines the role of the architectural detail in the formation/ thematic development of a work of architecture and how the detail reinforces the theoretical position of the architect.
Prerequisite: 48-205

Course Website: http://soa.cmu.edu

48-332 Teaching and Learning

Intermittent: 6 units
In this course, students will learn about effective strategies for teaching architecture and the built environment. Topics include the cognitive differences between novices and experts, instructional techniques, and goal alignment. As part of the coursework, each student will implement these teaching strategies to design and teach a lesson. Elements of developmental psychology, learning theories, and classroom practices will inform the architectural education lesson. Teaching and learning techniques can be generalized for communication with clients, practice, and the community.

48-336 Architecture and Agency

All Semesters: 9 units
If buildings consume vast resources and are often embedded in extractive systems of material and labor, how can the agency of architecture be deployed to consider other forms of thinking and praxis? What tactics, strategies, manifestos, and actions can architects deploy to resist, upend, destabilize or reinvent normative mechanisms of architectural production? How do such practices seek new modes of conceiving the architectural project and its concomitant processes; radically reinvent the brief, site, program, material or tectonic capabilities? This course will consider agency simultaneously through historical and contemporary forms of praxis as well as theories that inform them.

Course Website: http://soa.cmu.edu

48-338 European Cities in the XIX Century: Planning, Architecture, Preservation

All Semesters: 9 units
The history of the main cities of Europe during the XIX century is a history of change and transformation. The physical environment and the political, financial and administrative structures adapt to the needs of new masses of population and to the challenges of metropolitan life. In some cases, cities even acquire new representative functions, as they become a national capital. This course traditionally offers an overview of the urban culture of XIX century Europe, reconstructing aspects of the broader historical context and then focusing on reading the effects of the XIX century transformations on the physical appearance, structures and image of present-day European cities, such as Paris, London, Berlin, Barcelona, Vienna and Rome. This semester we will add to this analysis, acquired by learning and applying a set of essential questions about XIX century urban transformations, a second look at the image of the city - the issue of how the city is represented and described in the various moments of its Nineteenth century transformation (from historical maps, to paintings, from postcards to literary descriptions). We will try to consider its changing visual representation and the different perception of its character and peculiarities over time, finally discussing how the Nineteenth century image of each city still affects how it is viewed today. We will rely, along with the usual reading materials (articles, book excerpts) also on visual documentation, such as photography and film. The course is based on lectures and discussions and requires personal elaboration, as well as a fair amount of reading and writing.
Prerequisite: 48-240

48-339 IDeATe: Making Things Interactive

Spring: 12 units
In this hands-on design-build class you will learn the skills to embed sensors and actuators (light, sound, touch, motion, etc.) into everyday things (and places etc.) and to program their interactive behavior using a microcontroller. You'll also dive into the fields of VR/AR/MR and experiment with combining these disciplines with physical computing. Through weekly exercises and a term project the class will introduce basic analog electronics, microcontroller programming, projection mapping and virtual reality; as well as exploration into using kinetics and materials to make the things you design perform. Emphasis will be on creating innovative experiences. The graduate edition of this course will require additional work including a paper that can be submitted to a peer-reviewed interaction design conference such as CHI, UIST, or TEI. Students from all disciplines are welcome: but please note that the class demands that you master technical material. Experience in at least one of: programming, electronics, or physical fabrication is strongly recommended.(Participants will provide their own supplies and materials.)
Prerequisites: 60-223 or 16-223

Course Website: http://soa.cmu.edu

48-340 Modern Architecture and Theory 1900-1945

Intermittent: 9 units
This architectural history lecture course surveys the modern buildings and literature of the first half of the twentieth century, focusing primarily on Europe but extending also to non-western countries. We begin with a look at the "crisis of modernity" that plagued most of western civilization in the late 19th-century, and then focus on the major movements of both the avant-garde and other responses to modernity from 1900-1945. The course includes lectures, readings, and discussions about a broad range of issues, including 1) Formal tendencies; 2) Theoretical issues; 3) National traditions; 4) Biographical sketches; 5) Significant technologies and materials; 6) Political motivations; 7) Social and amp; cultural influences. Emphasis will be placed on the relationship of buildings to the more general cultural, intellectual, and historical circumstances in which they were created, especially the important manifestoes, theoretical and critical writings that so determined the project of modern architecture. Work for the course involves extensive reading and a major research paper.
Prerequisite: 48-240

48-341 Expression in Architecture

Intermittent: 9 units
This architectural history seminar will explore expression in architecture in its many forms, particularly in written works of architectural theory through the ages. We start with the premise that architecture is not merely pragmatic, technical, or functional: it can express or communicate like a language, it can represent and inspire like many of the arts, it can shape behavior and emote, it can trigger memories, emotions, or meanings. As Isozaki put it: ?Architecture is a machine for the production of meaning.? We?ll investigate many ways that architects have theorized the design process, as well as the forms, materials, and contexts of architecture, to express a myriad of ideas and sensibilities. We?ll also look at the ways that buildings can communicate and have meaning, often beyond the intent of the architect, and usually changing over time. Some of the topics to be explored include the classical orders, gothic geometry and mystical light, the theatrical space of the Baroque, architecture parlante, character, and style in the Enlightenment, tectonics as structural expression, political architecture and morality, the aesthetics of functionalism, Expressionism, key terms such as ornament, representation, linguistics, and semiotics, as well as more recent theoretical constructs such as embodiment, materiality, atmosphere, and affect. The work of the seminar will include intensive weekly readings, especially of primary sources by the architects seeking to express ideas, weekly presentations and discussions about the sources, and a term paper on an important theory of expression in architecture of your choice.
Prerequisite: 48-240

48-348 Architectural History of Mexico & Guatemala

Intermittent: 9 units
Despite the leveling forces of mass culture and globalization, the geographic and social diversity of the U.S. has created distinctive regional mosaics of landscape and architecture. Say New England and images of English Pilgrims, town greens with white framed churches, and industrial mill villages may come to mind. The Southwest conjures different images, perhaps of adobe pueblos, Spanish friars, arid ranches, and the color turquoise. The built environment of the Midwest, the California coast, the Mississippi Delta, and many places in between reflect particular regional identities that have been both unconsciously and consciously created over time. This course examines the historical development of regional patterns in the American built environment. It investigates how and why a regions architectural identity evolved in the ways that it did. To what degree is place something to respond to, to interact with, and to what degree is place something that is created? Our focus will be primarily pre-20th century when the forces of vernacular traditions were stronger, we will also examine more recent trends of regionalism as an aesthetic choice and a theoretical stance.
Prerequisite: 48-240

48-350 Postwar Modern Architecture and Theory

Intermittent: 9 units
This architectural history lecture course surveys the modern buildings and architectural theory of the post-World War II period. It begins with the cataclysm of WWII and the fundamental shifts it caused on the conception of modernism, technology, cities, and geo-politics. It proceeds to investigate themes such as rebuilding and reconstruction, grand modern masters such as Mies, Kahn, and Le Corbusier, the fascination with technology, megastructures and utopian thought, the need for monumentality, meaning, and regional identity, and the dissemination of modernism from corporate America to the third world. It ends with the rupture in modernism associated with the social revolutions and the rise of a post-modern architecture in the late 1960s and early 1970s. The course includes lectures, readings, and discussions to define the unique character of the postwar period, as modernism both reigned supreme, and began to be questioned. Emphasis will be placed on the relationship of buildings to the more general cultural, intellectual, and historical circumstances in which they were created. Special attention will be devoted throughout the course to the important manifestoes, theoretical and critical writings that so determined the project of modern architecture. Work for the course involves extensive reading, preparing for class discussions, and a major research paper.
Prerequisites: 48-240 or 48-241

48-355 Perspective

Intermittent: 9 units
This freehand drawing course considers perspective from three understandings of perceptual psychology. Part 1, built on the pedagogy of Kimon Nicolaides, aligns with the Transactionalist understanding of perception. It considers perspective as discovered truth. Part 2 builds on the early work of perceptual psychologist, J.J. Gibson, and aligns with the Ecological position of Gibson and his followers. It considers perspective as an absolute truth of the visual field. Part 3, aligning implicitly with Gestalt psychology, treats perspective as an imposed schema. The course concludes with a final project built around the student's interest.
Prerequisite: 62-126

48-356 Color Drawing

Intermittent: 9 units
48-356 Color Drawing provides practice in the use of color to depict architectural surroundings. Following preliminary exercises using pastels, watercolor is used for most of the course. A central objective is that by the end of the course, students will have good judgement in evaluating color hue, value, and temperature and gained confidence in use of watercolor. Coursework assumes some knowledge of linear perspective. Work consists of in-class exercises and weekend assignments built on these. Students can expect to spend up to 6 hours of work per weekend.
Prerequisites: (48-121 and 48-126) or (48-130 and 48-135) or (62-126 and 62-125) or (48-120 and 48-125)

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-359 Special Topics: Design Build / Building Systems

All Semesters: 9 units
In this studio we will consider Thoreau's essayso much of it about his own design/build experiencein today's context. Collectively, we will design a cabin to meet the high standards of sustainability set by Eden Hall. After a round of prototyping, testing, and design development, the studio will create a set of construction documents and shop drawings. Covid and funding allowing, we will begin building the cabin at mid-term, with construction continuing into the summer or fall as required. This studio has a nine credit co-requisite, 48-358 Cabin Building Systems, which is also open to CEE students. Its focus will be on the building systems for the cabin that is being developed in the parallel studio. Topics include energy performance (e.g. production, renewable energy systems, passive and active ways to achieve efficiency, and modeling); integrated structural and engineering systems (e.g. building envelope, water treatment and management, heating and cooling systems, and electrical and lighting systems; and sensing for monitoring and control. The class will have a team-based format that is hands-on and lab-oriented rather than a seminar structure, and it will contribute directly to the build part of the studio.

48-367 Material Histories

All Semesters: 9 units
Materials affect the way we engage with a building and carry cultural meanings connected with complex histories, deeply and at times messily intertwined with the social, political and ecological context. In this seminar we will look at the history of the architecture of the last two centuries by following the thread of the history of materials. We will discuss the ways in which buildings of the past and the practice of architecture were affected by which materials were available, how they were produced, and the craft required to work them. We will reflect on how architects interpreted, manipulated, or added to those meanings through their own work. Materials' lifecycles and the networks of extraction, production, transportation, and reuse had an impact on the built environment in the past, just as they do today. We will learn from historical examples to assess the consequences of the choices we make as designers. Finally, we will critically engage with the presence of history as a layer of complexity embedded in the material itself - an effect that is compounded in the practice of reuse of materials with patina, marked from their past use.

48-368 Rediscovering Antiquity: Archaeology for Architects

Spring: 9 units
The course follows the intertwined histories of architecture and archaeology from the mid-eighteenth to the early twentieth century, critically engaging with the outsized influence of classical antiquity on architectural theory and practice and its role of authority and model in the Western artistic and cultural debate. The traces of classical antiquity, buried in the Mediterranean and Middle Eastern landscape, retained part of their cultural significance over the centuries and became the object of a "rediscovery", almost a cultural obsession. Artists, travelers and architects filtered and re-interpreted the reality of ancient objects and places, conjuring up their own vision of the past and nourishing their own creative pursuits from a continuous dialogue with history. At the same time, new political agendas, new biases and new goals were associated with antiquity, influencing the way the past of the region was explored, how the finds were studied and exhibited in residences and Museums, and ultimately creating a stern competition to appropriate this legacy, with deep links to colonialism and imperialism. The ripple effects are still being felt today, for example in the discussion about the repatriation of cultural heritage. We will study the history of this moment to better understand the cultural vantage point that often influenced the fabric of our cities, presided over the creation of many of our cultural institutions and the buildings that represent them, and had a deep and lasting impact on the ideas about architecture and its relationship with history. This will help us grasp more clearly the impact of the "passage to the Modern" and some of the complex and still open issues it brought about.
Prerequisite: 48-205

48-369 Sustainable Architecture and Urbanism for the Gulf Region

Intermittent: 3 units
Ensuring a sustainable built environment in Qatar is critical to sustainable Gulf Region and indeed a sustainable world. The quality of our architecture and urban design can significantly address the challenges of heat, water, energy, mobility, material resources, waste, and health. This course is intended for non-architects to explore the potential of sustainable design for desert climates. Six weeks of explorations and presentations will introduce each student to: Climate analysis for Gulf Region countries and their 'twins' around the world; Green standards for desert climates with their embedded metrics (eg UNSDG, LEED, GreenStar, WELL); and Precedent as a precursor to innovation - a search for great sustainable examples across building types and land use. In-class and homework assignments will create a series of collaborative student slide shows each week. As possible, invited speakers and site visits will be pursued. The final week will be dedicated to a class perspective on the importance of the built environment for carbon and climate change, and student recommendations for building and infrastructure goals for a more sustainable Gulf region. CMU-Q graduates should be dedicated to a more sustainable built environment and understand the design changes needed for sustainability, the benefits to quality of life and to ecological sustainability. Every discipline is a catalyst and a stakeholder in our future - as client, as design/engineer, as consumer, as financier, as scientist.

48-371 City & Suburb: Housing in America after 1850

Fall and Spring: 9 units
This architectural history course examines the development of American house and housing choices during the period 1850-1975. A recurring picture of the "American Dream" has typically included the image of a single-family, detached dwelling set within its own green yard in the suburbs. However powerful and durable that image is, the history of house and home in America is actually a far more complex story with many different twists and turns. In the course we will look at both urban and suburban housing choices and cultures, ranging from single family detached dwellings to multi-unit housing, and across a social spectrum income, class, race, and gender. Through the use of occasional field trips, we will use Pittsburgh as a touchstone for understanding broader national trends in the history of American urban and suburban housing. The course is organized as a lecture course supplemented with field trips and discussions based on field trips and primary source readings. The additional time slot on Thursday afternoons will be used only when field trips are scheduled. Student work will include a research paper and several shorter written assignments throughout the semester.
Prerequisite: 48-240

48-373 Istanbul Constantinople. An Urban History

Fall and Spring: 9 units
A dynamic metropolitan area, with a burgeoning population and rapid urbanization, Istanbul is at the same time a finely woven tangle of historical layers. In this class we will introduce urban history and its methods as we focus on key moments of Istanbul's history. We will delve deeply into the city's powerful and at times competing historical narratives. We will trace the growth and transformation of the urban fabric, discussing Istanbul's role as imperial capital of the Romans, the Byzantines, the Ottomans, its changing fortunes in the twentieth century and the historical roots of the present-day world city. We will discuss cultural specificity and reactions to international models, the challenges of preservation and transformation of the urban fabric and the political making and re-making of its cultural identity. We will also take into account the power of this city to fascinate and inspire through the centuries - the imagined city as a layer of the physical one.
Prerequisite: 48-240

48-374 History of Architecture in the Islamic World- A Primer

Fall: 9 units
An introduction to the architecture of the lands where Islam spread over the centuries, this course aims to provide a basic understanding of major epochs and regional variations. We will learn the function and meaning of the most important building types, examine how these types changed over time to adapt to the needs of changing societies and consider influences and exchanges with other traditions. We will examine the historical context within which art and architecture developed and explore critically the lingering signs of those traditions in contemporary society.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-380 Constructing Value(s): Economies of Design

Spring: 6 units
This course explores the systems of economic, political, social, and regulatory forces driving the production of contemporary architectural projects. It critiques these systems, examines alternatives, and tests interventions in pursuit of value propositions outside of the bottom-line driven norms of late capitalism. What do design economies driven by equity, circularity, ecology, pluriversality look like? Through lecture and discussion, real world case studies in both for-profit and non-profit sectors, both locally and internationally, students explore the process of project development from multiple perspectives and gain insight into dynamics that determine if, how, and when projects are realized as well as relationships among various stakeholders, including architects, developers, and communities.

Course Website: http://soa.cmu.edu

48-381 Issues of Practice

Spring: 6 units
"This course explores the interdependence of contracts, drawings, specifications, and correspondence and introduces the concept of the Standard of Care. It addresses business development, staff training, and time management and introduces the economic, cultural, and political contexts in which architecture is created. To reflect the pedagogical priorities of the school, social justice related issues related to architecture will be examined. Students will engage with practitioners, consultants, constructors, and others who together form the design and construction team to learn the specific knowledge and skills the team members bring and to understand the importance of collaboration. They will study the effects of owner expectations and field conditions. Students will learn the value of, and path to, licensure, exploring NCARB's licensure path and Architectural Experience Program (AXP). The course describes alternative career paths that would allow students to use knowledge and creative skills gained in their time in the School of Architecture. The class will align with related courses to provide a comprehensive exploration into the broad profession of architecture and be taught in coordination with the students' concurrent architecture studios so that the students can consider their studio projects from a practitioner's business perspective."

Course Website: http://soa.cmu.edu

48-383 Ethics and Decision Making in Architecture

Intermittent: 6 units
This course investigates ethics for architecture and the built environment. Students will learn about ethics as a discipline, how to identify an ethical issue, and how one might work through an ethical problem. Frameworks will be presented with case studies for practice and discussion. On a macro scale, we will consider the entanglement of architecture with capital as well as sustainability and climate change. We will also touch upon day-to-day concerns regarding safety, zoning, contracts, material selection, internet of things and workplace discrimination. Reading responses and class discussions are the primary format for learning. Each student will also conduct an ethical assessment of one of their studio projects. Non-architects are welcome.

Course Website: http://soa.cmu.edu

48-386 Portfolio & Resume Preparation (UG)

All Semesters: 3 units
No course description provided.

48-390 Physical Computing Studio

Spring: 10 units
This collaborative studio course will allow interdisciplinary teams to develop wearables with a focus on assistive technology. The ubiquitous nature of mobile devices coupled with low-cost and easily integrated sensors and actuators make this a good time to approach real problems for a range of users from the physically disabled to athletes. Teams will learn skills in hardware, software, fabrication, and design communication in order to effectively develop and share their ideas.
Prerequisites: 60-223 Min. grade C or 16-223 Min. grade C

Course Website: http://ideate.cmu.edu/

48-400 Architecture Design Studio: Praxis Studio 3

Fall: 18 units
This studio is the capstone of your undergraduate education and is an opportunity for you to integrate the various technical aspects of your professional degree to date. Each student will have the opportunity to select from one of three proposed building typologies and project scales. As a requirement of this studio, students will participate in student teams developing each project to a high level of technical development. The objective of this studio is to go beyond the typical studio project and to demonstrate the necessary integration within the structural system, building envelope, environmental control systems and life safety system while providing the measurable outcomes of building performance as part of the design process (NAAB student criteria 6). Consultant engineers play an active role in the studio process providing expertise and discussions resembling professional practice. This semester the three studio instructors will be Professors Gerard Damiani, Erica Cochran Hameen and Stephen Lee.
Prerequisite: 48-305 Min. grade C

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-405 Advanced Synthesis Options Studio II

Spring: 18 units
Having proven competency in the spectrum of skills determined necessary for tomorrow's architect during the first three years of the program, students in their fourth and fifth year are permitted to select from a variety of studio options, each providing the opportunity to build upon or augment some of those skills with new or more nuanced perspectives. All advanced synthesis studios are open to both years, the vertical integration offering enhanced learning opportunities.The content and focus of each studio is governed by faculty interests, which run the spectrum of architectural pursuits, ranging in scale from the design of a piece of furniture to a city and in approach from a comprehensive and complex building program to a critically-driven speculation. They may also be interdisciplinary in nature, taking advantage of the unique juxtapositions made possible at Carnegie Mellon.
Prerequisites: 48-412 and 48-400

48-408 Co-designing an Indigenous Biodiversity Knowledge Learning Space for the Vertica

Spring: 12 units
This is an advanced comprehensive Critical Practice track studio, with one large, complex, semester-long building design project. The studio pedagogy is based on the parallel development of a real project currently being planned, a new performance space for the San Francisco Symphony; it is on the same site and with the same goals and constraints as the actual project. The participation of clients, the professional design team working on these projects, and users is incorporated in the studio? exploration and design process, culminating in review presentations to the client and project team and publication of the body of work. This studio is also a key component of Carnegie Mellon University?s Theater Architecture Program, and is offered annually to fourth- and fifth-year students in the Bachelor of Architecture program. The co-Requisite, Theater Architecture Seminar (48:408), provides in-depth research in the typology, analysis of precedents, and the programming and planning of the studio project.

48-409 History and Future of Interaction Design

All Semesters: 9 units
The history of Interaction Design (IxD) is far richer than what is visible from today's tech. Many great ideas have been mangled and even lost. By making prototypes inspired by this history, we reach new insights and illuminate a future of promises and perils. In this course you begin by mining historical IxD innovations by building prototypes in a modern vernacular that forefront lost contributions. In 3 sprints you render a powerful but lost essence in the form of a concept storyboard, video, or clickable prototype. Thus you explore the History of IxD. To explore the Future of IxD, you are invited to invent itby developing your own vision in the design of a final project prototype with the focus and scope that you control. Coursework is partly historical review and largely designing and producing prototypes in a studio setting, especially suited for backgrounds in interaction design, computational design, responsive architecture, media, or coding.

48-410 Advanced Synthesis Options Studio II

Spring: 18 units
The vertically-integrated advanced studios encourage interdisciplinary collaboration from arts, technology, research and design. They range from large scale urban and ecological projects, to detailed investigations of materials, and fabrication strategies.
Prerequisite: 48-305 Min. grade C

48-425 EX-CHANGE: Exhibition & Publication in Practice

Spring: 3 units
Are you interested in exploring exhibition design, curating, or publishing as part of your practice? This course will give you hands-on experience, inviting you into the process of planning, designing, and curating the 2023 EX-CHANGE, an exhibition and publication that will be launched at the School of Architecture in fall 2023. EX-CHANGE is the School of Architecture's annual exhibition and publication celebrating student work from first year to PhD. Inaugurated in 2017, EX-CHANGE represents an ongoing opportunity to shine new light on the SoA's programs and to position the work within larger questions of research and practice. Students will work alongside EX-CHANGE director Sarah Rafson and the professional design team who have been selected for the 2023 EX-CHANGE to get a glimpse into editorial and curatorial practice. This is an opportunity to play a role in shaping an exciting school-wide event.

48-432 Environment II: Design Integration of Active Building Systems

Fall: 9 units
If there is a benefit to recent global and national upheavals, it may be that we are even more keenly aware of the importance of equity, of social justice, and a more sustainable future. That sustainability must cover the full range of the UN Sustainable Development Goals and your understanding of how you can contribute to a better future through design in the built environment is a primary goal of this course. High performance buildings are achieved with designs that effectively integrate passive and active systems. This course focuses on active systems in commercial buildings and their integration with passive design elements you've studied previously: envelope, ventilation and lighting. We also consider building codes that address outside air requirements for ventilation, and for energy and water efficiency, and discuss where related US building codes lead or lag in promoting exceptional building performance. Environmental sustainability and buildings within the United States receive the greatest emphasis in our work, but we also consider how performance definitions may change where resources like energy or water are limited or unavailable. The active systems covered include lighting, ventilation, heating/cooling, water distribution and water heating, and renewable energy production and amp; storage.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-435 Modern Mexico & Guatemala: 19th-21st Century Architecture

Fall and Spring: 9 units
This course focuses on the 20th-century architectural and urban history of Mexico City. We will study both the high-style design vanguards and the vernacular built environment. Topics include the 19th-century ruralscapes and cityscapes that sprouted the seeds of the 1910 Mexican Revolution, the role of arts and architecture in a post-revolutionary world, changing ideas about art and architecture within a globalizing world of international influences, projects oriented toward the elites including upper-class suburbs by prominent architects, projects directed towards the working classes including informal settlements by unnamed "squatters", and the cascading environmental challenges that have pushed to the forefront of the 21st century. A recurring theme of the course will be the various and competing architectural expressions of Mexican identity and #8212; Mexicanidad. Non-majors are welcome.

Course Website: http://soa.cmu.edu

48-438 Modern Mexico & Guatemala: 19th-21st Century Architecture

All Semesters: 9 units
This course examines the architectural history of modern Mexico and Guatemala, with an emphasis on the 20th century, but drawing on the 19th and 21st centuries as well. We will use architecture as a lens through which we study how both the high-style design vanguards and the vernacular built environment were responses to forces such as industrial modernization, urban growth, economic fluctuation, international relationships, political and social revolution, indigenous discrimination, genocide, and cultural regeneration. Throughout the course we will look at the countries' urban and rural architectural evolution as explicit and implicit expressions of identity (Mexicanidad or Guatemalidad).

48-442 History of Asian Architecture

Intermittent: 9 units
This course is intended to serve as an introduction to the evolution of urban spaces and the function of the architecture in South Asia, China, Korea and Japan. It is organized chronologically and will examine the impact of indigenous philosophical principles on the organization of villages, capital cities, and religious centers. The course will begin in the Indus Valley where complex urban planning along with public and private architecture flourished from 2600-1900 BCE. We will examine South Asian Hindu and Buddhist cave monasteries as well as freestanding Hindu temples and identify the salient architectural forms that identify each type. We will then move to China where the earliest villages were arranged according to ideas about nature and the organizing system of fengshui. By the earliest Chinese dynastic period, urban planning and building placement were beginning to be codified according to Confucian and Daoist ideals. Later Chinese imperial centers were consciously designed according to Confucian regularity and hierarchy in order to make visual statements about power. We will then move to consider urban organization and Buddhist temples in China, Korea to Japan where South Asian and Eurasian models were adopted and adapted. The examination of the Japanese warrior culture will include castles, new ideas in residential architecture, the Pleasure Quarters, and retirement villas. Contemporary architecture will be addressed through individual and group projects that will investigate specific structures and situate the buildings within the cultural and historic circumstances that led to their creation.
Prerequisite: 48-240

Course Website: http://soa.cmu.edu

48-448 History of Sustainable Architecture

Intermittent: 9 units
The History of Sustainable Architecture investigates themes of nature, ecology, pollution and conservation in the built environment and visual arts. The term ?sustainable architecture? is a comparatively recent one, arising in reaction to the destructive and toxic nature of the industrial era and its strident ambassador, Modern architecture. Yet, an esthetic and philosophical view of harmony with nature accompanies many forms of historical human activity in the built environment. Similarly, issues of waste removal, mechanical systems and natural materials that characterize current concerns have illustrative historical roots in numerous civilizations going back centuries and even millennia in pre-Industrial or non-industrial cultures. This course will engage texts and examples relating not simply architecture, landscape and urban history, but also art, philosophy and popular culture as a means to understand the many precedents for today?s interest in sustainable architecture and planning. The course will examine texts and works by figures including Vitruvius, Pliny, Leon Battista Alberti, Thomas Cole, Frederic Law Olmsted, Buckminster Fuller, Reyner Banham, Ebenezer Howard, Hassan Fathy, Bernard Rudofsky, Norman Foster, Robert Smithson, Andy Goldsworthy and more. Students will be encouraged to apply principles from the class to understanding and execution of work in their own discipline.

48-452 Real Estate Design and Development

Fall: 6 units
This course will introduce the Real Estate development process and explore the interdependence of development drivers and the design process. Classroom learning, exercises and guest-lectures will introduce students to the concepts of market and financial analysis, as well as the basic techniques of budgeting, proforma development, and valuation. Parallel to this investigation, students will evaluate real world developments and interface with the development professionals that executed them to learn how development drivers shaped the development process and decision making. Students will study how market demand, tenant requirements, site constraints, and available capital affect feasibility, and through this the ultimate design solution. The semester's effort culminates in the execution of a mini-development project. Students will work in teams to complete a basic market analysis, program evaluation, schematic design, construction and development cost estimate, proforma analysis, and a determination of financial feasibility. Development practitioners will interface with student teams during this mini-project to offer "real world" guidance on student schematic designs and feasibility analysis.
Prerequisite: 48-305

48-453 Urban Design Methods

Fall: 6 units
This undergraduate lecture course introduces urban design history, theory and methods. It is a required supporting course for the Urban Laboratory design studio, and similarly examines urban design at multiple scales: city form and networks, neighborhoods and block structures, streets, public spaces, and urban building typologies. Key issues introduced include the emergence and evolution of urban design as a discipline, economic, social and political factors affecting the contemporary city, and environmental sustainability at the urban scale. A wide variety of cities, projects, proposals and methodologies are examined. Assignments include readings from seminal texts, quizzes, and a final examination.
Prerequisite: 48-305

48-454 Futures of the City/Cities of the Future

Intermittent: 9 units
If all design can be read as attempts to predict and to shape the future, then no one looks further into the future than the urban designer and the urban planner. The work in which they are involved often does not materialize in their lifetimes; in fact, the duration of the projects are so long twenty, thirty, fifty and hundred year timeframes, it is more than likely that he or she will pass on before the project reaches fruition. The trouble with predicting the future is that it is so uncertain, so undecided, so unknowable. A brief look backwards reveals that we are not the first generation to consider the future. History is replete with predictions, some of which were actualized, the vast majority of which were not. Today's forecasts for tomorrow vary wildly. A handful of optimists view the future through rose colored glasses, whereby humanity is delivered to salvation via technological wonders and the widespread adoption of common social values. A larger group predicts the end of the world as we now know it, but even they cannot agree on the cause of our demise, with those arguing that climate change will kill us clashing with those convinced that we will be destroyed when robots achieve technological singularity. Shy of total extinction, however, any vision of the future requires designers, and will likely occur in urban (or formerly urban) locations. As of this decade, for the first time in history, more than half of the world's population, almost three and a half billion people, live in towns and cities. Estimates suggest that by 2030 this number will swell to almost five billion.
Prerequisite: 48-205

48-459 Material Simulacra

All Semesters: 9 units
This fabrication-based course interprets Jean Baudrillard's ideas of "panic-stricken production of the real and the referential, above and parallel to the panic of material production." Serial mold-generated surface studies activated by material properties, behavior, intuition, and expression ask how our perceptions of the real is mediated by language of the made artifact. Structured as the tripartite investigation: TheoryResearch-Craft, this seminar's pedagogy is centered on the cultural, historical, ethical, aesthetic and tectonic values of architectural materialism to arrive at an awareness of what a material conveys. Analog and digital techniques and simulations engage the technological and intellectual roles of the craftsperson.

Course Website: http://soa.cmu.edu

48-470 The Depth of Surface

Fall: 9 units
Lamination is the process of gluing wood together along the edge or face of a plank. There is unlimited variety in the ways to do this and to generate pattern in the process. This course will prescribe a few basic ways to laminate following standard rules of wood working and then introduce the possibilities of pattern generation. Generally lamination is unidirectional, however, in this class we will introduce ways to achieve cross directional patterning and the use of inlay to elaborate on the idea of patterning. Projects will be visual and sculptural statements. Their function will be limited and will not be furniture. Each exercise will present a series of basic wood working operations, which, when repeated and recombined will become products of compelling visual character. As visual idea statements you will be asked to experiment, invent and explore and take these standard operations in new directions. As visual idea statements the greatest clarity of vision will be achieved through careful construction.

48-473 Hand and Machine Joinery, New Directions

Fall: 9 units
In the Fall 2017 and Spring 2018 there will be some changes to the shop electives offered. First the Spring Furniture Design and Construction course # 48564 will no longer be offered because that content is incorporated within the Furniture Studio in the fall. Next, the two shop mini courses previously offered in the fall will each be expanded to become full electives, one in the fall and one in the spring. The prerequisite for both of these classes is documentable experience with the band saw, table saw (ripping and crosscut), drill press and the belt and disk sander. The Hand and Machine Joinery, New Directions, is scheduled Tuesday and Thursday mornings 10:30 am to 11:50 in the spring 2018, and will be a 9 unit elective running the entire semester. The elective will focus on building a free standing (or hung) cabinet with doors. If enrolled students have taken the Exploring Pattern course in the fall the doors made in that class will be mounted on the cabinet. If students have not taken that course then a pair of simple doors will be made instead. The primary goal of this course will be to learn the steps of making a simple cabinet using hand and machine joinery. Quality of craft will be of great importance. Uniqueness of design will not be emphasized, however individuation of the cabinet will still be possible throughout the construction, starting with choices between a wall mounted or free standing (with legs) cabinet, the selection of hardwoods, the specific size of parts, and the selection of particular detail options. The construction process will be carefully staged with demonstrations continuing throughout the semester. The cabinet will be perpendicular and rectangular. Students will use standard mortise and tenons of various sizes, bridal joints, floating tenons, tongue and groove, spline and dovetail joints.

48-478 Digital Tooling

All Semesters: 6 units
This course serves as an immersive analysis of the available technologies located in the Digital Fabrication Lab at Carnegie Mellon and beyond. Students begin to understand equipment limits/boundaries, purposes and concepts; and the possibilities that arise from thoroughly comprehending how these tools work. During your Digital Experience, students begin to understand more systematically how to use these tools to their advantage. A better understanding of the equipment proves very useful towards a SoArch Student's 3rd, 4th and 5th years at Carnegie Mellon; but more importantly provides a fundamental understanding of a leading edge technology that will certainly prove itself as an integral tool for any Designer throughout their professional career. It is based on the idea that pushing the limits of design fabrication; comes from knowing the limits of your tools. The course operates by discovering tooling extremes; thus indicating limits, and then incorporating these boundaries (and/or breaking them) with Digital Fabrication methods and tooling; ultimately providing a platform in which students begin to understand and incorporate project efficiency. Prerequisites: Imagination, Laser Cutting, Milling and 3D-Modeling Experience required. (Rhinoceros 3D Preferred)
Prerequisite: 48-205

48-482 Advanced Structural Design: Computational Explorations

Fall: 9 units
This course covers advanced topics in computational structural design and analysis. Students will explore various form-finding algorithms and computational design methodologies, learning to use structural geometry as a key design driver for creating efficient and expressive forms. Key topics include: parametric structural modeling; computational structural analysis; structural optimization; and form finding. The course is hands-on and skill-focused, organized around interactive workshops and design projects throughout the semester, each addressing specific computational tools and design objectives. Students are expected to have basic knowledge of statics and structural design and be comfortable using Rhino and Grasshopper.

48-485 Design and Documentation in Revit

Fall and Spring: 3 units
This course will guide you through the process of designing in Revit from the schematic, conceptual design phase, to the construction document phase. The course will start with basic concepts moving on to more advanced topics. Layering information and how much to incorporate into the model, based on stakeholders and end users, will be discussed. Capturing the essential information from the BIM model will be explored to develop presentations, bidding documents, and construction documents to relay relevant information to clients, consultants, and contractors. We will discuss when it is imperative to model in 3D and when to overlay 2D linework detail. Real-time rendering techniques that streamline the design process will be explored using Enscape. The skills learned from this course will help you understand the phases of design and documentation in the Revit environment.

48-486 Systems, Cybernetics, Conversation

All Semesters: 9 units
Across many design disciplinesarchitecture and computational design, media and interaction design, design of services and organizationsmethods for grappling with complex adaptive systems is now table stakes. Furthermore, design today demands profound, authentic attention to equity, human and non-human living systems, climate and environment, sustainability and ethics. Overall, designers must have skills to collaborate in cross-disciplinary teams. An encompassing framework for these disparate disciplines and domains of 21st-century design is the transdisciplinarity (or "antidisciplinarity") of Cybernetics. Cybernetics can be understood as the study of "systems with purpose", whether machines or living things, including their unpredictable interactions. Central to Cybernetics is conversation as a mechanism of design, inclusivity, participation, innovation, and the impetus to action. The course offers systems frameworks and models of conversation that are also relevant to Designing for the Internet of Things (48-675), Inquiry into Computation Design (48-727), and Design Studies: Systems (51-277). Class time balances readings, discussion panels, and guest conversations with executing assignments that involve systems modeling; creating conditions for designing that are participatory and inclusive; and prototyping in a range of media (installations, screen-based interactivity, physical prototypes, workshops, etc.) that offer responses to global wicked challenges.

48-493 Representing Activism

Intermittent: 9 units
Efforts to promote social, political, economic and environmental change range in form from written word to direct action. Sources of injustice that those efforts address are multi-dimensional and complex. Effective forms of activism are fueled by creativity that synthesize and distill complex constellations of information and foster understanding. REPRESENTING ACTIVISM explores the role of multi-media graphic representation as a lens through which change and social justice can be fostered. Exploration of efficacy in application will span four dimensions, 1) Social Media, 2) Film, 3) Poster/Graphic Design, and 4) Publication - all aspiring to achieve the status of art. Art and Activism are predicated on exposing the truth. Art has the unique power to convey messages across linguistic and cultural barriers that often divide. Part of the Activist's challenge is to grip and inspire people to action. With the avalanche of information and media modern society absorbs every day, this is increasingly hard to do. Sometimes it is too much to ask people to stop and think: sometimes it's too much just to ask them to stop. Successful art compels this, penetrating apathy and imploring the viewer to look deeper and explore the narrative that is embedded in what elicited a visceral response. This seminar aspires to compel action in the public interest through artful representation.

48-494 Beyond Patronage

Intermittent: 9 units
TBD

48-497 Pre-Thesis

Spring: 3 units
This 3 unit course is designed for B.Arch and M.Arch students a year before their final Spring semester. The course develops an understanding of research methods, and explores the formation of ideas for architecture thesis projects. Many directions of architectural thinking (spatial, material, ideological and procedural), will be discussed and in framing a theoretical position we will see how an architecture thesis can use a creative process to discover and express findings in relation to large questions and to disciplinary discussions. This is a required course for Fall Thesis Seminar in F23 (9units) and Spring Thesis ASOS S24 (18units).

Course Website: http://soa.cmu.edu

48-500 Advanced Synthesis Options Studio

Fall
Having proven competency in the spectrum of skills determined necessary for tomorrow's architect during the first three years of the program, students in their fourth and fifth year are permitted to select from a variety of studio options, each providing the opportunity to build upon or augment some of those skills with new or more nuanced perspectives. All advanced synthesis studios are open to both years, the vertical integration offering enhanced learning opportunities.The content and focus of each studio is governed by faculty interests, which run the spectrum of architectural pursuits, ranging in scale from the design of a piece of furniture to a city and in approach from a comprehensive and complex building program to a critically-driven speculation. They may also be interdisciplinary in nature, taking advantage of the unique juxtapositions made possible at Carnegie Mellon.
Prerequisite: 48-410

48-505 Advanced Synthesis Options Studio III

Spring: 18 units
Having proven competency in the spectrum of skills determined necessary for tomorrow's architect during the first three years of the program, students in their fourth and fifth year are permitted to select from a variety of studio options, each providing the opportunity to build upon or augment some of those skills with new or more nuanced perspectives. All advanced synthesis studios are open to both years, the vertical integration offering enhanced learning opportunities.The content and focus of each studio is governed by faculty interests, which run the spectrum of architectural pursuits, ranging in scale from the design of a piece of furniture to a city and in approach from a comprehensive and complex building program to a critically-driven speculation. They may also be interdisciplinary in nature, taking advantage of the unique juxtapositions made possible at Carnegie Mellon.
Prerequisite: 48-105

48-510 Advanced Synthesis Options Studio IV

Spring: 18 units
The vertically-integrated advanced studios encourage interdisciplinary collaboration from arts, technology, research and design. They range from large scale urban and ecological projects, to detailed investigations of materials, and fabrication strategies.
Prerequisites: 48-400 Min. grade C or 48-410 Min. grade C

48-516 NOMAS Competition

All Semesters
Coming Soon.

48-517 Carnival Gateway Project Management

Spring
This course is for the team responsible or the design and project management of the Carnival Entryway Pavilion, to be completed for the 2023 CMU Carnival, April 13-15. The course is conducted by NOMAS and advised by Professor Vicky Achnani.

48-519 Architecture Design Studio: Thesis II/ Independent Project

Spring
Thesis is a year-long, independently defined research and design project that takes the place of upper level option studios. Thesis is an opportunity to develop skills, thoughts, and habits essential for future success, including mental discipline; independence of mind and judgment; working with advisors; the capacity to focus and pursue a subject in depth and over an extended time; the ability to design and execute a complex project; the skills of analysis, synthesis, and clear writing; and the self-confidence that grows from mastering a difficult challenge. Thesis topics and research agendas are generated by the student, but must be determined in collaboration with an advising team, and approved by a Thesis Coordinator. The School seeks to encourage an expansive range of rigorous and provocative inquiry as a culminating experience for the B.Arch education, including work that speculates, invents, or improves on existing ideas, practices, or systems through research and design; work that challenges the boundaries of the discipline and the profession, and moves beyond mere practice or solution-based work; worj that engages with open-ended and generalizable ideas, as much as with specific situations; work that projects or imagines a better future and an improved world; work that leads to the new knowledge, ideas, understanding, or paradigms. Acceptance into Thesis is dependent on passing the 48-497 ?Thesis Prep? course or its pre-approved equivalent, and submitting a rigorous thesis proposal to the Thesis Coordinator in late August, before the begin of classes.

Course Website: http://soa.cmu.edu

48-524 Building Performance Modeling

Fall: 9 units
"You can't hammer a nail over the Internet" Matthew B. Crawford, Shop Class as Soulcraft: An Inquiry Into the Value of Work The Design/ Build ASO Studio is part of a year-long, interdisciplinary, design-build project to provide a diverse group of students with the opportunity to work with their eyes, hands, and brains to transform an idea from a virtual world into the physical world. The elective is an opportunity for any student to join the spring "build" activity for 9 units. In this semester, we will again work campus constituents to improve the quality of life on campus through engaging design intervention(s). The project is fully funded, and the expectation is that the project will be turned over to the campus community by the last day of classes in the spring semester. During the fall, the Building Integration Option Studio (BIOS) students envisioned a farmer's market for Hazelwood Green creating design proposals at three scales-XL-M-XS. These design proposals for "XS" components will be a potential launching point for the spring build experience. These designs are just that-launching points-they have not been considered in the context of the Carnegie Mellon campus, so design will be a critical component of the early spring.
Prerequisite: 48-305 Min. grade C

Course Website: https://omerkaraguzelphd.wixsite.com/praxismodeling (https://omerkaraguzelphd.wixsite.com/praxismodeling/)

48-525 Thesis Seminar

All Semesters: 9 units
This seminar prepares undergraduate students planning to work on a thesis project in the following semester. Thesis work requires individual effort to identify a valid area of concern, understand the disciplinary discourse around a chosen topic and its cultural and social context, determine which are the appropriate means and methods to implement the project, and establish the criteria by which to evaluate the work. Students enter this course with an initial thesis statement, a body of background research and a set of questions that can be interrogated by engaging in research and discussion. The seminar help them refine the scope of the thesis argument, define appropriate research methods and sharpen communication about thesis work in all of its phases. In addition, it facilitates group conversation and exchange of ideas, providing dialogue, feedback, and continued motivation.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-527 5th-Year/Senior Seminar

Intermittent: 3 units
Seminar for students graduating from the Bachelor of Architecture and Bachelor of Arts in Architecture programs.

Course Website: http://soa.cmu.edu

48-528 IDeATe: Responsive Mobile Environments

Intermittent: 9 units
As part of this project-based course, we'll get hands-on with emerging technologies, concepts and applications in the Internet of Things through a critical lens. We'll prototype everyday intelligences and design smart and connected devices that examine and speculate on the strange, supernatural, and mystic qualities of the smart home. The first half of the semester will introduce students to building connected devices and intelligent spaces through technical development workshops, readings, applied explorations, and guest lectures. The second half of the semester will be organized as an applied collaborative project.

Course Website: http://daraghbyrne.me/teaching/responsive-mobile-environments/

48-530 Human-Machine Virtuosity

Spring: 12 units
Human dexterous skill embodies a wealth of physical understanding which complements computer-based design and machine fabrication. This project-oriented course explores the duality between hand and machine through the practical development of innovative design and fabrication systems. These systems fluidly combine the expressivity and intuition of physical tools with the scalability and precision of the digital realm. Students will develop novel hybrid design and production workflows combining analog and digital processes to support the design and fabrication of their chosen projects. Specific skills covered include 3D modeling (CAD), 3D scanning, algorithmic geometric modeling, digital and robotic fabrication (additive and subtractive manufacturing), motion capture and computer based sensing, and human-robot interaction design. Areas of interest include architecture, art, and product design.

48-531 Fabricating Customization: Prototype

Intermittent: 9 units
Architects have long flirted with production and manufacturing. This has been pursued to yield greater affordability, customization, and expression, and as of late, more carbon-aware material selection and manufacturing. This course builds upon this rich history and foregrounds architectural component customization to explore prototyping and customization within the context of contemporary practice. It introduces students to a range of prototyping and design for manufacturing frameworks. Through case studies and lectures, the course offers students an overview of existing and emerging modes of collaboration between designer and manufacturer in service to the production of a customized building component. The course places great emphasis upon the reciprocity of design and prototyping, challenging students to leverage physical artifacts as tools for thinking and testing. Throughout the semester, students will utilize additive and subtractive fabrication techniques to iterate the design of architectural components. Through this process, students will build proficiency in prototyping to design, test, and refine components of limited scope and scale.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-541 The Cut, The Beach and Beyond

All Semesters
The Cut, the Beach and amp; Beyond will be a FALL design elective with a SPRING build option studio working with Campus Design and amp; Facility Development, the Department of Civil and Environmental Engineering and campus constituents to improve the quality of life through design intervention(s) on campus.

48-543 Color Constructs

All Semesters: 9 units
In this course you will study and experiment with the relationships and perception of space and form through two- and three-dimensional optical experiments using color. Lectures, discussions, and field trips will delve into color theory particularly focused on the work of artist, designer, and educator Joseph Albers, look at culturally defined use of color, and its experience. In keeping with Albers definition of color theory as a hands-on experiential and experimental process of creating relationships through perception students will work on skills needed to craft compelling images using linear, planar and volumetric assemblies in digital and analog media. Initial weekly exercises will cover principles of color relativity, intensity, temperature, etc., and consider various principles of graphic perception including but not limited to vibrating and vanishing boundaries, figure ground reversals, and the illusion of transparency. Through this process you will gain an understanding of the use of color in the graphic representation of designs, patterns, diagrams and architectural representations that will inform the use of color in transforming the perception of space. The final assignment will be a three-dimensional color structure.

Course Website: http://soa.cmu.edu

48-545 Design Fabrication

Spring: 9 units
Design Fabrication is a project based seminar exploring the application of Computer Aided Manufacturing (CAM) in architecture. The course meets in the School of Architecture's Design Fabrication Lab (dFAB), which serves as a context to better understand the interconnected affordances of building materials, machine processes, and modeling software for design thinking. During the semester students receive hands-on introductions to dFAB equipment, including laser cutting, cnc routing, and 3D printing. Concepts will be explored and tested through iterative making/prototyping. Course Focus The course focuses on Transdimensional Fabrication, a manufacturing framework that forefronts design thinking across space and time. A growing array of approaches in contemporary architecture are motivated by this focus (e.g. flat pack, 4D printing, metamaterials, kinetic architecture, robotic origami, design for disassembly, etc.). We will investigate Transdimensional Fabrication concepts through three that forefront design translations: 2D 3D, Space Time, Assembly Reconfiguration Disassembly

Course Website: http://soa.cmu.edu

48-550 Issues of Practice

Fall: 9 units
Issues of Practice is a required course taught in the fifth year. It consists of three modules: Personal Promotion, Emerging Professional's Companion, and Excursions. The Personal Promotion module provides the students with a framework to create a resume, cover letter, and portfolio. The EPC (Emerging Professional's Companion) provides concentrated study in different aspects of professional practice. The Excursions require students to see how architecture relates to the wider world with architecturally related events that can include volunteer opportunities, lectures, mentorship, or teaching.
Prerequisite: 48-305

48-551 Ethics and Decision Making in Architecture

Spring: 9 units
Ethical Decision Making in Architecture is a required course in the fifth year of the Bachelor of Architecture Degree. It is part of a sequence dealing with professional aspects of the field of architecture, alongside courses like Human Factors, Real Estate Design and Development, and Issues of Practice. It builds on an understanding of the issues of occupancy, economics and practice in design decision making. The course covers basic frameworks of decision making and ethical adjudication through several case studies including Fallingwater, Sydney Opera House, Citicorp Tower, Pruitt-Igoe housing development, Crystal Palace and Kansas City Hyatt. The text for the course is a manuscript by the instructor entitled "Ethical Decision Making in Architecture".
Prerequisite: 48-205

48-554 Entangled: Remaking Nature from the Picturesque to the Hypernatural

All Semesters: 9 units
This seminar questions how we perceive, represent, and reconstruct our world in relation to evolving concepts of "nature" and their manifestation in architecture, art, and landscape. It is focused on the intellectual trajectories that define ecology and environment to arrive at the paradigm shift theoretician Donna Haraway has termed natureculture. We will first familiarize ourselves with historical ways of seeing "nature" and how this has formed the landscapes of the Anthropocene. This will help us put a critical lens on land, environmental and ecological art, ecoventions, architectural living systems, biomimicry, biophilia, and projective ecologies while we consider the influence of gardens, responsive landscapes, hyper-natures, and artificial ecologies in changing the way we design and build. We look for not only relevance but joy and beauty in practices that highlight the relation between desire, responsibility, more-than-human wellbeing, and ecological justice. This may help us build notions of care and stewardship and an understanding traditional and emergent cultural constructs that can define an eco-centric practice which shapes building futures. The course surveys texts from a range of topics including ecological aesthetics, architecture, art, landscape urbanism, and ecologically focused philosophy and theory. It includes weekly readings, discussions, presentations, and visual or written deliverables. Open to graduate and undergraduate students in Architecture and allied fields.

48-555 Introduction to Architectural Robotics

Fall: 9 units
This course provides an introduction to industrial robotics and automated fabrication within the field of Architecture. A series of lectures will cover the basic components, as well as their work flows, needed to design flexible automation - while work sessions will develop skills in hands-on programming, RAPID, work flow simulation, fixtures, and sensors. We will also issue competency-building projects within the lab environment in order to provide students with hands-on experience using the equipment. Upon covering the fundamental software and hardware content, an end-of-semester project will challenge you to apply your newfound knowledge to solve a final prompt. This is a portal course to all sanctioned coursework using the School of Architecture's Robotic Fabrication Lab. Upon successful completion, students will be eligible and prepared to enroll in advanced robotic fabrication courses.

48-557 Formless as an Operation

All Semesters: 9 units
This seminar focuses on the formless as an operation relative to social constructs, parametrics and aesthetics. Geometry is often thought of as a rational or a structure that secures and grounds things, however the structures of the built environment is an unfolding and indeterminate product. Social constructs can be defined as formless or the informe, as coined by George Bataille; an operational existence. In expanding the one's idea of operating, the use of formless allows us to consider the indeterminate. The indeterminate for our purpose in exploring context relative to spatial and cultural traditions. Within social and political space, traditions become spatial operators. How can we spatialize and draw traditions, rituals, and narratives? We will investigate the means and methods of representation relative to the formless and the built environment. Participants in the seminar develop an archive, original visualizations that utilizes multiple mediums and platforms, and culminate in a final project a part of an exhibition.

Course Website: http://soa.cmu.edu

48-558 Reality Computing

Fall: 12 units
Reality computing encompasses a constellation of technologies focused around capturing reality (laser scanning, photogrammetry), working with spatial data (CAD, physical modeling, simulation), and using data to interact with and influence the physical world (augmented reality / virtual reality, 3d printing, robotics). This semester the studio will focus on utilizing these technologies to capture places and objects to digitally recreate them for archives, artifacts, and interactive experiences. We will explore and analyze how to optimize these creations for real-time rendering and analyze how these platforms bridge the divide between "virtual" and "real."

48-560 Design & Redesign of Capital Cities

Fall: 9 units
This architectural and urban design history course examines the cultural histories of the design and redesign of world cities. The scale of urban interventions we will look at varies greatly, from the macro-scale of designing totally new capitals to the micro-scale of altering small nodes within a city. We explore the relationship between form and culture by considering political, social, economic, and aesthetic forces that have shaped the public realm of urban as well as suburban spaces. We focus on recognizing and understanding the rationale behind the design, re-design, and use of culturally important urban spaces during their own time, making periodic forays into the issues that influence those spaces today. Non-majors are welcome.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-564 Furniture Design & Construction

Spring: 9 units
This course is for students who already have a basic knowledge of hand tools and machines, and standard fabrication methods. Wood is the primary material, although other supplemental materials are permitted. One functional project will be built during the semester. Because all the equipment in the shop is traditional analog, the fabrication will remain analog. All operations will be done with hand tools or machines operated and controlled by hand. The emphasis of the design phases will also be non-digital. However recognizing the versatility of CAD, students will be permitted to advance and refine their ideas using their computer. One full scale orthographic drawing by hand will still be required, including plan, elevations, sections, and dimensions on 1/8" ply or mdf.
Prerequisites: 48-105 and (48-470 or 48-473)

48-568 Advanced CAD, BIM, and 3D Visualization

Fall
This course is designed to introduce a student to 3D software tools (3 units each), including Autodesk AutoCAD 3D, Revit Architecture, and/or 3D Studio MAX. Using building information and parametric modeling, materials, lighting, rendering, and animation students will create integrated CAD or BIM projects, 3D video animations, and realistic renderings. Students can choose to learn one, two, or all three applications. Course objectives are to develop an understanding of how to properly set up and manipulate 3D projects integrating software applications, replicating real world projects in leading architectural, lighting, design, construction, and engineering firms; learn how to create detailed 3D CAD models using surfaces and solids; learn about BIM parametric modeling using Revit Architecture; and learn how to apply materials, lighting, and rendering using AutoCAD, Revit, and 3D Studio Max. At the conclusion of this course, students will have 3D projects for one or more applications and animations if using 3DS Max. Students should have some familiarity with basic AutoCAD 2D commands. Those who don't have AutoCAD 2D knowledge can contact the professor to arrange for on-line tutorials that need to be completed before classes begin. The course will be primarily taught asynchronously via video lectures and other materials. Some live remote meetings will be held for topic previews and project reviews. In person and remote office hours will be held weekly.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-569 GIS/CAFM

Spring
A Geographic Information System (GIS) provides storage, retrieval, visualization, and analysis of geographically referenced data. GIS provides analytical tools to investigate spatial relationships, patterns, and processes of location-based data such as cultural, demographic, economic, environmental, health, physical, social, and other phenomena. GIS creates digital twins (virtual representations) of natural and built environments and integrates many types of digital models. GIS topics include geographic concepts (projections and map scales), map design, geodatabases (importing spatial and attribute data, geocodes, table joins, and data aggregation), spatial data processing, digitizing, data mining, multivariate cluster analysis, drive and walk time networking, raster GIS, spatial statistics (proximity and hot spot analysis), animation, and 3D GIS. CAFM (Computer Aided Facility Management) and IWMS (Integrated Work Management Systems) topics include space and asset management, building operations, environmental health and safety, and real property. The course includes in-person and asynchronous video lectures to learn important GIS concepts and a brief introduction to work management systems. Software tutorials cover leading GIS software from Esri Inc. Applications include ArcGIS Pro, ArcGIS Online, ArcGIS Map Viewer, ArcGIS Story Maps, and Dashboards. Subject areas are related to architecture, engineering, construction management, building performance, environmental health, sustainability, public policy, urban design, and planning.
Prerequisite: 48-205

Course Website: http://soa.cmu.edu

48-576 Mapping Urbanism

Intermittent: 9 units
This seminar provides the critical tools necessary to examine the city as both a representation and a reality in flux. Through an interdisciplinary framework, students study urban history, theory, visual thinking and spatial mapping. Contemporary urban issues are introduced through weekly lectures, readings, and class discussions. Parallel to these urban explorations, students learn to employ a diverse set of representational techniques to create inventive mappings. Upper-level (300 and 400 level) undergraduate students and graduate students are encouraged to register.

48-587 Architecture Lighting Design

Intermittent: 9 units
Through hands-on exploration of light students will develop a design process for lighting public spaces. All classes will be held in a fully equipped light lab to give the students full access to experimenting with light in design applications. Understanding how light creates focus and mood will be explored in class lab exercises. Discussion topics will include the role of the architectural lighting designer in the collaboration process, establishing design goals and a lighting point of view, communicating design ideas, analyzing successful lighting design in case studies for interior and exterior applications, and becoming familiar with the technical tools of lighting design. The final design project will include lighting mock-ups of a building site.
Prerequisite: 48-105

Course Website: http://soa.cmu.edu

48-596 LEED Buildings and Green Design

Spring: 6 units
Green building and sustainable design have been rapidly gaining acceptance in all sectors of the building market. Global issues of energy use, emissions, resource depletion, and land use are forcing building professionals to re-evaluate standard design and construction processes, and look to more environmentally friendly practices. The U.S.Green Building Council (USGBC) developed green building rating systems entitled Leadership in Energy and Environmental Design (LEEDTM) in order to define "green building" by establishing a common standard of measurement. LEED considers green building methods and technologies in several categories including site, water, energy, materials, and indoor air quality, and awards points towards an overall green building rating of certified, silver, gold or platinum. Currently, LEED registered projects make up 3% of the current U.S. commercial building market, and Pennsylvania is the third leading state with LEED registered projects. There is now a demand for design professionals with knowledge and experience not only in sustainable design but specifically with the LEED rating system as well. This course will provide students with background knowledge of the USGBC, the LEED system, as well as referenced standards related to specific topics. The course will benefit greatly from the large number of LEED projects in the Pittsburgh region, which will serve as case studies. Upon completion of the course, students will be prepared to take the LEED Professional Accreditation Exam, which is quickly becoming the standard of recognition for green building professionals.
Prerequisite: 48-315

48-607 Architectural Agency: Dig Where You Stand!

All Semesters
The course is organized as a graduate seminar that concludes the cycle of required courses in the history and theory of architecture for the MArch program. By revisiting histories of the twentieth and twenty-first centuries, it treats the profession as an uncertain, contested, and contingent category. It situates histories of architecture across continents in relation to developments, forces and processes including globalization, imperialism, nationalism, climate breakdown, (post)industrialization, as well as decolonization struggles and social, racial and gender movements. Instead of instrumentalizing architecture's history as a repository of formsa series of canonical buildings that each architect should recognize and reverethe course puts emphasis on relational thinking and contextualization. How did architects, buildings, and objects respond to the aforementioned developments and forces? How have architects addressed the ever-expanding crises of human displacement? How does the praxis of architecture contribute to the global environmental degradation? What type of reparative propositions have been put forth for a more equitable coexistence in a warmer, scarcer, and unstable planet? The course will take place in the archives of the Heinz Architectural Center at Carnegie Museum of Art. By digging in and out the Center's collection, the course focuses on specific case studies to bring to the foreground tensions, questions, relations, interdependencies, and alliances.

48-608 Co-designing an Indigenous Biodiversity Knowledge Learning Space for the Vertica

Fall and Spring: 12 units
The seminar emerges from the instructor's work while co-founding the "Vertical University" project in Nepal. As a subversion to the traditional way we understand knowledge, the "Vertical University" builds on the learning potential inherent in the place-based, deep-seated indigenous knowledge of farmers living in biodiversity-rich landscapes. The project spans across a vertical gradient starting at a 67-meter elevation in Koshi Tappu to Mount Kanchenjunga (the third tallest peak in the world) at 8,586 meters. For us, farmers are the professors; the villages are the classrooms, and the 8-000 meter vertical gradient is the "Vertical University." Across this belt, the project is anchored in six regions. However, the seminar will be focused on Kurule-Tenupa, a community where these imaginative ideas and aspirations come to life. A local community-based learning ground on 16 acres of land has been established under the leadership of local indigenous leaders. Through this elective and collectively with the community (online), we'll design this library as a new repository of knowledge that reinforces the local indigenous communities' relationship with their ecology. This production seminar aims to generate a design for the Indigenous Knowledge Library, which will be built in Kurule-Tenupa. If successful, this important typology, we hope, will be replicated in other parts of the project and, hopefully, throughout Nepal.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-610 Bizarre Details: stories of the ordinary, the uncanny, and the architectural com

Fall and Spring: 9 units
This design research course explores the current developments in hybrid, multi-platform design and communication mediums to prototype new ways of creative storytelling in architecture, visual development, and concept design. Research methods around oral storytelling, ethno-ecology, radical mapping, and the children's book can allow for the exploration of subjects in ways not available to typical architectural and urban research conventions. Throughout the Fall '23 Term designers will be tasked to use Pittsburgh, PA as a laboratory to develop a research project, from initial concept to an extensive script, including design elements, character development, as well as an urban critique of the city. Frameworks around composition, color, mapping, modeling, the parallel projection, and techniques in painting that are used in architecture, visual development, and concept design will ask how storylines translate and transform in the creation of a comprehensive project using industry techniques. To curate the explorations, we will explore innovative ideas in visual storytelling using techniques of interactivity in children's book design, experimenting with new forms of narrative strategies. The experimentations will result in a final exhibition at the end of Fall 2023.

48-611 On Speed / Space, Time & Information

All Semesters: 9 units
This seminar focuses on relations between architecture, information and computing technologies, and society as they are conditioned by speed: rates of transfer, response, exchange, movement, cognition, and more. Development in the last century has been marked nearly always by new velocities, at times testing or altering human tolerances for construction, for perception, for adaptation, for reliance on shelter and on computational systems. These roles of speed reveal ways that architecture and information systems embody shifts in culture, in technology, and in society - but also shifts in less obvious things like the emergence of global finance and geopolitics. Since late Capitalism and the rise of post/industrial economies, these shifts continue as indicators for unprecedented ecological and economic phenomena. Speed, in short, is not neutral or relative but always a function of its circumstance. In readings and class discussions, we will consider roles of speed in things like modular construction and shifts to rapid prototyping and fabrication; in the dissemination of Cybernetic thought; in evolving forms of public space with new telecommunications technologies; and in ecologies of material use. Readings in architecture, in media theory, in philosophy and more will explore ways that time is understood, is constructed in different ways, and to different ends. The seminar culminates with the recent movements toward "accelerationism" - rushing modernism and capitalism to some logical conclusions - and an interest in experiences beyond human perception in slowness.

Course Website: http://soa.cmu.edu

48-613 New Pedagogies

All Semesters: 9 units
Coming Soon.

48-614 New Pedagogies

All Semesters: 9 units
New Pedagogies are courses offered by new and visiting faculty (sections A-D). Please visit https://soa.cmu.edu/courses for complete course descriptions.

48-616 NOMAS Competition

Fall and Spring
Coming Soon.

48-617 Carnival Gateway Project Management

Spring
This course is for the team responsible or the design and project management of the Carnival Entryway Pavilion, to be completed for the 2024 CMU Carnival, April 11-14. The course is conducted by NOMAS and advised by Professor Omar Khan.

48-618 Discourse and Praxis in the Climate Emergency

Spring
This course engages with emergent modes of architectural thinking and praxis in the climate emergency. If buildings consume vast resources and are embedded in extractive systems of material and labor, how can discourse be deployed to consider other forms of praxis?

48-619 Machine Intelligence, Cybernetics and Design

Spring: 9 units
The course brings forward cybernetic epistemology, concepts, and models that bridge machine intelligence and the evolution of 21st-century architectural/design practice. The dominance of artificial intelligence, especially with the substitution of machine learning for the broader meanings of AI and more so for machine intelligence, has created a severely limited view of what computation can afford architecture/design, as well as the rapidly evolving techno-culture, and no less society and culture more broadly.

48-621 Beyond the Buildings Footprint

All Semesters: 9 units
This project-based seminar explores the use of machine learning and other software to create a speculative future for Braddock, Pennsylvania, a town just nine miles outside of Pittsburgh. To be mindful of the areas history and our engagement with it, we will study the work of LaToya Ruby Frazier to understand the social and ecological effects of steel extraction, emission, and construction. Frazier builds a visual archive of the intersection of the steel industry, the environment, and the human body, describing her work as excavations of hidden histories, from the micro to macro level. Students are encouraged to collect data using photography, film, record sounds, 3D scanning, and taking drone footage of the site. The workflow will deploy generative adversarial neural networks, various 3D modeling, and rendering software. Students will produce a short animation for the final deliverable. The seminar welcomes students with little or no experience with computation and those with more experience.

48-622 Explorations in Craft: Soft Forms, Stable Structures

Fall and Spring: 9 units
Softness is an evocative quality in architecture, but how do we "find" and then fabricate those elusive forms? How do we manipulate materials with control when the forms we seek, or their own structural makeup may lack it? When do we follow the material and when do we control it? This course is focused on physical model making of soft forms. It offers a series of encounters with material specificity, including textile, metal, and plastic materials, and the techniques used in transforming 2D patterns to 3D forms. Demonstrations, and workshops will inform material qualities, their formal affordances, and structural stability. Design and application of cutting and sewing patterns, bending jigs and casting molds will introduce the planning required to facilitate thoughtful crafting. The methods we work with are intended to open possibilities and refine skills for future making, ranging from quick form finding strategies to techniques for execution with precision. Note: A materials fee will cover workshop costs.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-623 Pittsburgh through the Archives

Fall: 9 units
This new class is designed for upper level Undergraduates and Master students who would like to delve deeper into the urban history of Pittsburgh and at the same time develop research skills that can be applied to other cities. In this small-group, hands-on elective seminar students engage with primary sources in the local archives, explore the urban environment with step-by-step guidance, gain insight from researchers with different disciplinary viewpoints and finally produce their own individual investigation as part of a collaborative class project.

48-625 Thesis Seminar

Fall
This seminar is designed for students planning to work on a thesis project in the M.Arch program and is intended to prepare students for a semester long, studio-based thesis project in the following Spring. You will enter this course with a written thesis statement, a body of background research related to your topic(s), and an initial set of questions that can be interrogated by engaging in research and discussion. Your continued progress is supported by the collective engagement of the seminar participants and the structure provided by course assignments and deadlines, in addition to individual conversations and targeted feedback from the instructor. The seminar focuses on refining the scope of the thesis argument, defining the methods to make the topic(s) of inquiry actionable through design-based methods, and sharpening the communication about thesis work in all of its phases. Thesis work is highly self-directed and requires a level of metacognitive thinking, which includes identifying a valid area of concern motivating the work, understanding the disciplinary and societal context for the project, identifying the means and methods for acting, and establishing the criteria by which to evaluate the work. The course is structured around the individual effort required to advance these aims. In addition, it facilitates group conversation and the regular exchange of ideas, providing dialogue, feedback, and continued motivation.

48-626 Bending Active System_ Bamboo Research Pavilion Using Robotic Arm and Steam Bend

Fall: 3 units
Bamboo, a material brimming with immense, yet largely unexplored, potential, particularly within the realm of architecture, stands as a testament to natures ingenuity. If we look at the current scenario, this fastest-growing, low-cost, carbon-sequestering natural resource remains an unconventional material, in the practice of Architecture, always given the peripheral roles of scaffoldings and at times more than that. This way the potential of such versatile material remains highly underutilized. Its time to shift our perspective and explore the full potential of this protean material in the 21st century. Grown tremendously in the developing parts of the global south, tooling bamboo has predominately relied on traditional techniques. Bamboo embodies flexibility, stiffness, and efficiency in material distribution, yielding lightweight yet efficient systems. This natures extreme product offers high resistance to tensile stresses, buckling, and bending stresses and its elastic properties are remarkable. The research taps into these properties of bamboo to arrive at a spanning and spatial system that stems from its intrinsic properties. Traditional ways of using bamboo as a whole culm restrict the abilities of spanning, and bending, and make it more vulnerable to splitting. Bending activates the tensile capacity of the bamboo and allows for more efficient material distribution. Combining bamboo and digital fabrication enables radically unique and spatially versatile configurations. Digital fabrication with this irregular material is challenging but immensely rewarding, unlocking new possibilities for shaping this material. CNC routing can offer efficient and precise sectioning of bamboo culm and bending bamboo using robotic arms reduces the burden of custom Jig for each new bend profile.

48-630 M.Arch Studio: Praxis 1

Fall: 18 units
TBA

Course Website: https://soa.cmu.edu/march (https://soa.cmu.edu/march/)

48-631 Fabricating Customization

Fall
to be created by the department
Prerequisite: 48-205

48-634 Architectural Theory & Contemporary Issues

Fall
This graduate seminar explores important writings and ideas being discussed in architecture today in relation to "Design Ethics," one of the central pedagogies of the SoA and the M.Arch program. Theory is framed not primarily as design principle, but as a critical framing device to investigate the dominant forces and paradigms engaging architecture today, in the academy, the profession, and the community. Architecture is considered as both material technology and social agenda, a driver of inequality but also potentially a social justice machine, a high-tech, economic, ecological, and political change-agent. The focus is on current discourses, processes, and contexts rather than on the history of theory, or the latest buildings or architects. The seminar examines a different theme each week, with topics that vary annually to acknowledge the dynamic nature of the profession, environment, and global contexts. The work of the seminar will focus on readings, weekly presentations and discussions about the sources. For additional units, students may elect to do a research paper on a theoretical aspect of architecture that connects to the co-requisite course "Situating Research" and might lead to a thesis or grant proposal.

Course Website: https://soa.cmu.edu/march (https://soa.cmu.edu/march/)

48-635 Environmental Systems: Climate & Energy in Buildings

Fall: 9 units
Our commitment to designing net zero energy and indeed carbon positive buildings and communities is critical to environment equity and the UN Sustainable Development Goals. This course introduces architectural design responses for energy conservation and natural conditioning, human comfort, and the site-specific dynamics of climate. The state of the art in building energy conservation and passive heating and cooling technologies will be presented in lectures and supported by readings and assignments. An overview of energy flows in buildings and energy design standards is illustrated by lectures on building energy conservation successes, and emerging demands for a broader definition of sustainability. To understand the significance of architectural design decision-making on energy consumption and comfort, students will compile a professional energy consultant's report for a residential-scale building, designing the most viable energy conservation retrofit measures for their client from siting, massing, organization, enclosure detailing, opening control, to passive system integration and management.

Course Website: https://soa.cmu.edu/march (https://soa.cmu.edu/march/)

48-636 Architecture & Agency

Spring: 9 units
Coming Soon

48-637 Structures/Statics

Spring: 9 units
We examine structural types, structural behavior, material behavior, and construction constraints that underlie our design of buildings, emphasizing the need for a designer to envision a complete 3-D structure. We mostly build "orthogonal structures" constructed in horizontal and vertical planes, requiring high-strength modern materials such as steel or reinforced concrete, comprising roughly 75-80% of the course. This is complemented by "geometric structure" where the three-dimensional shape dictates function; prominent examples include membranes, cable nets, historic masonry domes, and shells. Geometric structure is characterized by "form-finding." Statics underlies all topics, and our treatment is consistent with NCARB expectations.

Course Website: http://soa.cmu.edu

48-638 Structural Design 2: Materials and Analysis

Fall and Spring: 9 units
This course introduces fundamentals of strength of materials, computational modeling of structures and basic Finite Element (FE) analysis. This is a hands-on, skill-building course about learning how to translate a conceptual design intent into a computational structural model, then apply material and boundary condition constraints to analyze and understand structural behavior. These learning goals are achieved through three components: lab exercises, workshops and group design projects. Through a series of lab exercises, the students will learn the fundamental structural properties of standard construction materials (masonry, steel, concrete and timber), and learn how to perform basic calculations to understand the behavior of simple structures made of those materials under various loading conditions. Lab exercises are accompanied by hands-on workshops, where the students learn a specific computational tool or skill that will enable them to translate the lessons learned from the lab exercises into a computational design environment. The knowledge learned from the labs, together with the skills gained from the workshops, are then synthesized into group projects where the students will have an opportunity to apply and test what they have learned. Basic knowledge of statics and structural design is expected, and the students are assumed to have taken Structural Design 1 at CMU or an equivalent, introductory structural design course from another institute. Structural Design 2 is the second of three courses of the Structural Design curriculum offered at Carnegie Mellon Architecture.

48-640 M.Arch Studio: Praxis II

Spring: 18 units
Architecture transforms and shapes relations between individuals, communities, objects and environments. Praxis II will continue to understand architecture as a modulator of complex cultural and historical flows, but will aim to do so by intensively exploring, evaluating, and expanding the role that tectonic cultures and their associated modes of architectural expression play in shaping our world. Through a non-linear, multi-scalar, iterative design process, small teams will develop and refine detailed architectural assemblies attuned to methods of construction, craft, and labor practices; to the role of structural configurations in organizing the spatial distribution of occupancies and human experiences; to how envelopes regulate and respond to thermal and visual performance while also participating in aesthetic discourse; to ecological synergies and impacts; to modes of participation in carbon culture, including environmental management systems, commuting culture, and other patterns of integration with urban context; and ultimately to the disciplinary imperative to integrate/orchestrate these multiple systems. Students will develop design skills while negotiating the complex issues of site, program, climate, aesthetics, and performance. Students will use a range of technologies, such as daylighting and radiation simulation, and Virtual Reality, for designing spaces that respect the natural environment and engage human perception.

Course Website: http://soa.cmu.edu

48-641 History of Modern Architecture

Spring
This course investigates the global history of modern architecture and theory across the 20th century. We ask critical questions about the canon, the changing nature of history and theory, the biases embedded in terms like "modernism," "progress," and "Non-Western," and the deep legacies of colonialism, globalization, extractivism, and capitalism in which modern architecture so actively participated. The course loosely works backward in time to explore major movements and monuments of the Euro-American avant-garde and so-called "heroes" of modernism, but also diverse responses to modernity, including popular, tropical, vernacular, indigenous, and even anti-architecture around the world, including increasingly the Global South. The course content changes slightly every year to acknowledge the evolving understanding of the subject, but also to keep up with changes in architectural education, the discipline of architectural history, and professional practice, as well as changes in global culture, social context, and our student aspirations.

Course Website: http://soa.cmu.edu

48-642 History of Asian Architecture

Spring: 9 units
This course is intended to serve as an introduction to the evolution of urban spaces and the function of the architecture in South Asia, China, Korea and Japan. It is organized chronologically and will examine the impact of indigenous philosophical principles on the organization of villages, capital cities, and religious centers. The course will begin in the Indus Valley where complex urban planning along with public and private architecture flourished from 2600-1900 BCE. We will examine South Asian Hindu and Buddhist cave monasteries as well as freestanding Hindu temples and identify the salient architectural forms that identify each type. We will then move to China where the earliest villages were arranged according to ideas about nature and the organizing system of fengshui. By the earliest Chinese dynastic period, urban planning and building placement were beginning to be codified according to Confucian and Daoist ideals. Later Chinese imperial centers were consciously designed according to Confucian regularity and hierarchy in order to make visual statements about power. We will then move to consider urban organization and Buddhist temples in China, Korea to Japan where South Asian and Eurasian models were adopted and adapted. The examination of the Japanese warrior culture will include castles, new ideas in residential architecture, the Pleasure Quarters, and retirement villas. Contemporary architecture will be addressed through individual and group projects that will investigate specific structures and situate the buildings within the cultural and historic circumstances that led to their creation.

48-643 Color Constructs

Spring: 9 units
In this course you will study and experiment with the relationships and perception of space and form through two- and three-dimensional optical experiments using color. Lectures, discussions, and field trips will delve into color theory particularly focused on the work of artist, designer, and educator Joseph Albers, look at culturally defined use of color, and its experience. In keeping with Albers definition of color theory as a hands-on experiential and experimental process of creating relationships through perception students will work on skills needed to craft compelling images using linear, planar and volumetric assemblies in digital and analog media. Initial weekly exercises will cover principles of color relativity, intensity, temperature, etc., and consider various principles of graphic perception including but not limited to vibrating and vanishing boundaries, figure ground reversals, and the illusion of transparency. Through this process you will gain an understanding of the use of color in the graphic representation of designs, patterns, diagrams and architectural representations that will inform the use of color in transforming the perception of space. The final assignment will be a three-dimensional color structure.

48-644 M.Arch Pre-Thesis

Spring: 3 units
This 3 unit course is designed for B.Arch and M.Arch students a year before their final Spring semester. The course develops an understanding of research methods, and explores the formation of ideas for architecture thesis projects. Many directions of architectural thinking (spatial, material, ideological and procedural), will be discussed and in framing a theoretical position we will see how an architecture thesis can use a creative process to discover and express findings in relation to large questions and to disciplinary discussions. This is a required course for Fall Thesis Seminar in F23 (9units) and Spring Thesis ASOS S24 (18units).

Course Website: http://soa.cmu.edu

48-647 Materiality and Construction Systems

Spring: 9 units
This course introduces students to contemporary methods of construction and draws attention to the materialization of architectural intent. It foregrounds the historical, technological, and conceptual basis of construction systems to understand the building as a process and cultural artifact. The course provides an overview of established and emerging construction systems to reveal how and why building processes are utilized. Materials and methods of construction are positioned as both constraints and affordances, each with distinct spatial, structural, environmental, economic, and aesthetic concerns. Through lectures, readings, and detailed analysis, students will learn about the construction of fundamental architectural conditions, including foundations, walls, frames, envelopes, and roofs. Production methods, spanning the vernacular to the digital will introduce cultures of building and design for manufacturing considerations.

Course Website: http://soa.cmu.edu

48-649 Design Leadership

Spring: 6 units
This graduate seminar will explore architecture and adjacent creative fields for design leadership models to fuel future-forward speculation. How might we shape leadership and culture in a new design era?

Course Website: http://soa.cmu.edu

48-651 Vector Visions: Introduction to Image Processing and GenAI for Designer

Fall: 3 units
This mini-course integrates computer vision and generative AI for students in architecture, urban design, sustainable design, and related fields. It covers fundamental image processing and generative AI concepts like GANs and Diffusion models. Through hands-on projects, students will process and manipulate image data from buildings to urban landscapes. Students will build a solid understanding of image processing and discover its crucial role in emerging AI technologies. By the end of the course, students will be able to apply these skills to real-world design challenges, using tools such as Python, TensorFlow, and OpenCV.

48-652 Pixels to Photons: Introduction to Stable Diffusion and Projection Mapping

Fall: 3 units
This mini-course bridges parametric design, generative AI, and interactive visualization. Students will explore Grasshopper's parametric capabilities with Stable Diffusion, progressing from basic setups to advanced techniques. The focus then shifts to TouchDesigner, enabling the creation of dynamic projection mappings with Stable Diffusion outputs. Students will learn to build responsive environments, animate images, and develop real-time systems for design representation, gaining skills in computational design and AI-assisted creativity. By the end of the course, students will be able to create interactive projection mappings and animate images using Stable Diffusion, transforming digital parameters into captivating architectural visualizations and experiences.

48-658 Constructing Value(s): Economies of Design

Spring
This course explores the systems of economic, political, social, and regulatory forces driving the production of contemporary architectural projects. It critiques these systems, examines alternatives, and tests interventions in pursuit of value propositions outside of the bottom-line driven norms of late capitalism. What do design economies driven by equity, circularity, ecology, pluriversality look like? Through lecture and discussion, real world case studies in both for-profit and non-profit sectors, both locally and internationally, students explore the process of project development from multiple perspectives and gain insight into dynamics that determine if, how, and when projects are realized as well as relationships among various stakeholders, including architects, developers, and communities.

Course Website: http://soa.cmu.edu

48-667 Material Histories

Fall and Spring: 9 units
Materials affect the way we engage with a building and carry cultural meanings connected with complex histories, deeply and at times messily intertwined with the social, political and ecological context. In this seminar we will look at the history of the architecture of the last two centuries by following the thread of the history of materials. We will discuss the ways in which buildings of the past and the practice of architecture were affected by which materials were available, how they were produced, and the craft required to work them. We will reflect on how architects interpreted, manipulated, or added to those meanings through their own work. Materials' lifecycles and the networks of extraction, production, transportation, and reuse had an impact on the built environment in the past, just as they do today. We will learn from historical examples to assess the consequences of the choices we make as designers. Finally, we will critically engage with the presence of history as a layer of complexity embedded in the material itself - an effect that is compounded in the practice of reuse of materials with patina, marked from their past use.

48-668 Sankofa Bamboo Greenhouse

Fall
COMING SOON.

48-670 MArch Thesis

Spring: 18 units
Coming Soon.

48-674 History of Architecture in the Islamic World- A Primer

Fall and Spring: 9 units
An introduction to the architecture of the lands where Islam spread over the centuries, this course aims to provide a basic understanding of major epochs and regional variations. We will learn the function and meaning of the most important building types, examine how these types changed over time to adapt to the needs of changing societies and consider influences and exchanges with other traditions. We will examine the historical context within which art and architecture developed and explore critically the lingering signs of those traditions in contemporary society.

48-676 Connected Communities: Technology, Publics, Politics, and Participation

Intermittent: 6 units
This seminar examines how smart and connected technologies can be designed for neighborhoods, what considerations are involved, and what effects such technologies create for communities. We will introduce and critically examine the relationships between smart systems with the places, infrastructures, histories, politics, publics and problems that surround them. To do this, we will survey topics across research and practice across different domains. These will reveal approaches, methods and design factors to designing systems for communities, as well as the challenges created when computing becomes a non-human participant in communities and publics. The first five weeks of this mini-course will introduce a series of topical readings, cases, guest lectures, case studies, and design exercises. The rest of the course will invite students to investigate topics and contexts of interest to them. By the end of the course, students will be familiar with the socio-technical considerations for designing systems for places and publics.

48-677 Hines Competition

Intermittent: 3 units
This course is for graduate students participating in the prestigious national Urban Land Institute (ULI) Hines competition. This is an intensive real estate and urban design competition that will take place January 9 - January 23rd. Optional pre-competition preparation workshop sessions will be offered the week prior to January 9th. The course itself includes delivering and sharing competition entries and completing a post-competition survey. The purpose of the competition and companion course is for cross-disciplinary teams of graduate students to work collaboratively to create a complex urban design and real estate proposal on a real site in North America. Competition entries include a narrative, drawings and financial analysis. Each team will select and work with a design faculty advisor(s). This course is typically required for Masters of Urban Design (MUD) students. Previous real estate course work or knowledge is preferred. All registrants will be wait-listed until their teams have been registered with ULI (deadline December 9th). Please contact the coordinator Valentina Vavasis to participate.

Course Website: https://americas.uli.org/programs/awards-competitions/hines-student-design-competition/

48-682 Advanced Structural Design: Computational Explorations

Fall: 9 units
"This course introduces advanced topics in computational structural design and analysis. Through various form-finding algorithms and design methodologies, the students will learn how to use structural geometry as a key design driver to shape efficient and expressive forms. Typologies of structures that will be explored include but are not limited to: compression-only shell structures, tension-only membrane structures, compression-tension combined structures and fully spatial, non-manifold structures. Then, simple structural optimization techniques will be introduced and used to refine and improve the initially form-found geometries. Lastly, the class will also investigate various strategies for developing structurally-informed fabrication geometry. The course is organized around a series of hands-on workshops and several design projects throughout the semester, each addressing specific computational tools and design objectives. While the tools and methods that will be used in the course are digital, each project will emphasize physical fabrication and making, and therefore deliverables will always include both digital results and physical models. This is not an introductory course, and we will not be introducing basics of coding or structural analysis. Interested students are expected to have completed all required structural design courses in their respective curriculum at CMU or at previous institutions, and have a high-level understanding of all fundamental structural design concepts and ideas. The students will also be expected to have extensive experience in Python coding (comfortable writing their own geometric algorithms; we will not be using Grasshopper)."

48-685 Design and Documentation in Revit

Spring
This course will guide you through the process of designing in Revit from the schematic, conceptual design phase, to the construction document phase. The course will start with basic concepts moving on to more advanced topics. Layering information and how much to incorporate into the model, based on stakeholders and end users, will be discussed. Capturing the essential information from the BIM model will be explored to develop presentations, bidding documents, and construction documents to relay relevant information to clients, consultants, and contractors. We will discuss when it is imperative to model in 3D and when to overlay 2D linework detail. Real-time rendering techniques that streamline the design process will be explored using Enscape. The skills learned from this course will help you understand the phases of design and documentation in the Revit environment.

48-686 Systems, Cybernetics, Conversation

Spring: 12 units
Across many design disciplinesarchitecture and computational design, media and interaction design, design of services and organizationsmethods for grappling with complex adaptive systems is now table stakes. Furthermore, design today demands profound, authentic attention to equity, human and non-human living systems, climate and environment, sustainability and ethics. Overall, designers must have skills to collaborate in cross-disciplinary teams. An encompassing framework for these disparate disciplines and domains of 21st-century design is the transdisciplinarity (or "antidisciplinarity") of Cybernetics. Cybernetics can be understood as the study of "systems with purpose", whether machines or living things, including their unpredictable interactions. Central to Cybernetics is conversation as a mechanism of design, inclusivity, participation, innovation, and the impetus to action. The course offers systems frameworks and models of conversation that are also relevant to Designing for the Internet of Things (48-675), Inquiry into Computation Design (48-727), and Design Studies: Systems (51-277). Class time balances readings, discussion panels, and guest conversations with executing assignments that involve systems modeling; creating conditions for designing that are participatory and inclusive; and prototyping in a range of media (installations, screen-based interactivity, physical prototypes, workshops, etc.) that offer responses to global wicked challenges.

48-692 Shaping Daylight Through Simulation and Virtual Reality

Fall: 9 units
Light is one of the critical aspects of valued architectural spaces, influencing ambiance, the overall atmosphere, and occupant perception, whether positively or negatively. In this course, we will explore the quantities and qualities of light. We will study how we can design with and for light while understanding the paradox of lighting designthat it is both science and art. Digital design and simulation tools will be augmented with virtual reality (VR) to extend quantitative measurements of lighting to include qualitative aspects of light such as its influence on occupants' subjective impressions of a space, wellbeing and comfort.

Course Website: http://soa.cmu.edu

48-699 Environmental Racism, Injustice, & Unfreedom: Lessons for Architecture

All Semesters
Environmental racism refers to the disproportionate concentration of environmental harms in low-income communities of color (particularly Black and indigenous communities) through the systematic workings both historic and ongoing of white privilege and white supremacy. More broadly, environmental injustices also include restrictions to environmental resources and infrastructures, and the unjust placements and displacements of communities of color resulting from uneven development. In this seminar we will examine the histories of environmental racism and injustice through close reading of literature from a range of fields including Environmental Justice, urban political ecology, Black geographies, and indigenous studies. We will ground our conceptual understandings through a closer look at ongoing environmental justice issues in Braddock and North Braddock, including through dialogue with local advocates and community members. Through the course of the semester students will develop a case study focusing on air pollution in the Mon Valley region, working collaboratively to produce an annotated bibliography of atmospheric pollution and community action.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-701 Entangled: Remaking Nature from the Picturesque to the Hypernatural

All Semesters: 9 units
This seminar questions how we perceive, represent, and reconstruct our world in relation to evolving concepts of "nature" and their manifestation in architecture, art, and landscape. It is focused on the intellectual trajectories that define ecology and environment to arrive at the paradigm shift theoretician Donna Haraway has termed natureculture. We will first familiarize ourselves with historical ways of seeing "nature" and how this has formed the landscapes of the Anthropocene. This will help us put a critical lens on land, environmental and ecological art, ecoventions, architectural living systems, biomimicry, biophilia, and projective ecologies while we consider the influence of gardens, responsive landscapes, hyper-natures, and artificial ecologies in changing the way we design and build. We look for not only relevance but joy and beauty in practices that highlight the relation between desire, responsibility, more-than-human wellbeing, and ecological justice. This may help us build notions of care and stewardship and an understanding traditional and emergent cultural constructs that can define an eco-centric practice which shapes building futures. The course surveys texts from a range of topics including ecological aesthetics, architecture, art, landscape urbanism, and ecologically focused philosophy and theory. It includes weekly readings, discussions, presentations, and visual or written deliverables. Open to graduate and undergraduate students in Architecture and allied fields.

48-706 Urban Design Studio II: Urban Systems

All Semesters: 18 units
Optimistic assessments about Pittsburgh's livability mask a complicated reality where prospects for health and well-being are starkly differentiated along lines of race, class, and gender. Environmental harms, underpinned by the ongoing legacies of industrial production, extraction, and segregative planning, create a toxic combination adversely impacting human health, ecology, and community futures. These challenges necessitate multidisciplinary, collaborative, and emancipatory approaches to knowing the built environment, and community-centered methods in urban design that attend to the local histories, embodied knowledges, and political ecologies of life in toxic systems. This studio will expand on MUD students' understanding of neighborhood-scaled urban design through the examination of urban systems and systemic processes, focusing on the infrastructures of toxicity, and modes of local action against them. It will be anchored in an ongoing collaboration with North Braddock Residents For Our Future, a grassroots organization which has led the opposition to unconventional gas drilling and environmental injustice in Braddock and North Braddock and surrounding communities.

Course Website: http://soa.cmu.edu

48-709 History and Future of Interaction Design

All Semesters: 12 units
The history of Interaction Design (IxD) is far richer than what is visible from today's tech. Many great ideas have been mangled and even lost. By making prototypes inspired by this history, we reach new insights and illuminate a future of promises and perils. In this course you begin by mining historical IxD innovations by building prototypes in a modern vernacular that forefront lost contributions. In 3 sprints you render a powerful but lost essence in the form of a concept storyboard, video, or clickable prototype. Thus you explore the History of IxD. To explore the Future of IxD, you are invited to invent itby developing your own vision in the design of a final project prototype with the focus and scope that you control. Coursework is partly historical review and largely designing and producing prototypes in a studio setting, especially suited for backgrounds in interaction design, computational design, responsive architecture, media, or coding.

48-711 Paradigms of Research in Architecture

Spring
Architectural "research" by many practitioners is often limited to precedent studies and/or intuitively evaluating alternative design solutions and materials. Deeper analytical activities risk being perceived as unnecessary overhead expenditures. On the other hand, "architectural" research by many scholars is often confined to laboratory settings or so esoteric that the findings are of little use to practitioners. This course challenges the false dichotomy between these two frames and provides an introduction to a wide range of research strategies including Experimental, Simulation, Quantitative, Qualitative, Correlational, Interpretive-historical, Logical Argumentation, Case Study, and Mixed Methods. Throughout the semester there will be guest lectures from faculty who will share their expertise, successful research strategies and methods, innovative ideas for future research, and the results of their current and past research. Students will apply a variety of research paradigms and methods to their research interests, improve their verbal and visual presentation skills, and prepare a research proposal presentation with a problem statement, literature review, methodology/methods, anticipated findings, and bibliography.

Course Website: http://soa.cmu.edu

48-712 Graduate Seminar 2: Issue of Global Urbanization

Intermittent
Abstract: By 2050 the number of urban dweller across the world will double. The seminar is an investigation into the future of cities focusing on three existential challenges: the escalating environmental crisis, growing social inequity and technological dislocation. In the face of these wicked problems, we will address the role and agency of designers and planners, decision makers and citizens in tackling what Jeremy Rifkin describes as the Third Industrial Revolution and how to lay the foundational infrastructure for an emerging collaborative age. These issues are explored through contemporary writings and case studies that situate urban transformations in the US within a broader global context, with a specific focus on the political as articulated through the negotiation of top-down planning and bottom-up behavior of cities. The seminar course will revolves around reading reflections, in-class presentations and student moderated discussions on theories and case studies of global urbanization. This is a 3- or 6-unit course that requires attendance at one 1.5-hours class per week. The extra credits involve a more extensive final paper. Students from diverse disciplines are welcome in this seminar. Key Topics: Global Urbanization, Uneven Growth, Political Economy, Ecological Urbanism, Resilience, Cosmopolitan Localism, Smart Cities, Commons. Course Relevance: An understanding of theories and practice of urbanism in global developments. Course Goals: The seminar provides an understanding of the social, political, economic and environmental forces at play in shaping our built environment and reflects on the role and agency of designers and planners can have in building more resilient and sustainable cities.

Course Website: http://soa-cmu.edu

48-713 MUD Urban Ecology

Fall: 9 units
Urban ecology describes the complex relationships between humans and our environment and is bound by an understanding of system dynamics. Urban ecology draws from our understanding of urban settlements and the cultural values that shape them, as well as our conception of ecology as the resources and flows that support biotic systems. Urban ecology situates humans and our activities as part of a dynamic and living environment that is more continuum than a dichotomy. This class will examine the shifting regimes of urban ecology and equip students with skills and core concepts that enable them to lead or contribute to transition through design. As designers we are trained to see patterns and #8212;urban ecology asks us also to see processes and to speculate on effects and possible outcomes. This course will discuss the systems and the logics that create the patterns, and we will explore how our design process may be different when dealing with the ambiguity and uncertainty of systems design. We will learn the fundamentals of systems dynamics modeling as it applies to the design of historical and contemporary landscapes, infrastructure, and spatial practices at the macro-, meso-, and micro-scales.

Course Website: http://soa.cmu.edu

48-715 MSCD Pre-Thesis 1

All Semesters: 6 units
This seminar introduces graduate students in Computational Design to the rudiments of graduate level academic research, and offers a space to discuss inchoate research methods, questions, and projects in the field. Assignments require students to gain familiarity with past and current research in the field in order to distinguish different research traditions, practices, opportunitiesand pitfalls. An emphasis is placed on the materialities and socio-technical infrastructures of computing.

Course Website: http://SOA.cmu.edu

48-716 MSCD Pre-thesis II

All Semesters: 6 units
With the notion of "critical technical practice" as a touchstone, this graduate-level seminar draws from across design, media, and science and technology studies to cultivate an awareness of the discursive and political dimensions of technology in design, and to guide participants in the formulation of a graduate thesis in computational design. Through readings, discussions, written assignments, and presentations participants develop the skills to identify and refine a research question, situate it within a wider scholarly conversation paying attention to ethical citational practices argue for its relevance, and creatively engage with conceptual and methodological research challenges. As a final deliverable, participants produce a thesis proposal and present it to faculty and students.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-720 Planning by Design: Campuses, Waterfronts, Districts, and Cities

Spring
In responding unprecedented challenges of density, information, equity, and climate change, cities continue to define and design "districts." Waterfront, historic, arts, innovation and ecodistricts draw on models including on university/corporate campuses, neighborhoods, main streets, and downtowns. How can cities remake districts in that are viable in terms of engagement and opportunity? How can they be meaningful and inclusive in a society that appears to be increasingly less place-based? Through presentations, case studies, and the semester project, students will develop strategies to respond to these challenges.

Course Website: http://soa.cmu.edu

48-721 Building Controls and Diagnostics

Intermittent: 12 units
The course will introduce students to collecting and processing data acquired from building systems and evaluating their performance. It will discuss the basics about control systems, including both traditional control logics, like rule-based control and model predictive control, and advanced control logics like reinforcement learning based control. Proficiency in Python and maturity in mathematics is required. Knowledge of website design and reinforcement learning is recommended.

Course Website: http://soa.cmu.edu

48-722 Building Performance Modeling

Fall
This graduate-level course examines the emergence of computation as a pivotal concept in contemporary architecture and design through a selection of design theories and practices responding to the so-called "computer revolution". An aim of the course is to explore computation beyond particular technologies and tools, and to cultivate an awareness of design technologies as cultural artifacts shaping disciplinary identities and worldviews, and shifting conceptions of design, creativity, nature, body, and place. The semester is divided into two-week thematic modules, often with computational design faculty participating as guests covering topics derived from their own research. Each module includes readings and a short team-based project expanding on the topic introduced. Topics include among others shape grammars, tangible interaction, responsive environments, cybernetics, and architectural robotics. The course also introduces participants to the rudiments of academic research, in particular to the elements and structure of an effective research paper. Participants practice reading and responding to both historical documents and contemporary research related to each topic, and develop a critical understanding of a rapidly expanding landscape of hybrid practices, theories, and research methods linked to computational and interactive forms of creative practice.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-723 Performance of Advanced Building Systems

Spring
Advanced Building Systems Integration This is a graduate level course that focuses on commercial building performance achieved through systems integration. In lectures, class discussion, and student projects, we will explore the topic of building performance, the design and technical strategies that support sustainable high performance; the design, construction and operation processes that are likely to produce sustainable high(er) performance buildings; and the current state of theory versus practice. The course assumes a basic understanding of buildings' impact on the environment, of building design and materials performance, and the calculation of building heating and cooling loads. On that foundation, we will examine the concept of systems integration and how this approach can sustain the occupants and the environment far better than conventional design, construction and operation. Although US climate, building conventions and codes will be our reference point, we will broaden our discussion by using examples and data from many other countries. An essential aspect of our exploration will be identifying successful built projects and examining the factors that may have allowed those projects to succeed. If this course meets its objectives, students who successfully complete the material will understand and be able to discuss sustainable building performance characteristics, will understand the systems integration approach and how it differs from conventional approaches to building design, and will know how to positively affect architectural and engineering decisions to support the design, construction and operation of sustainable high performance buildings.

48-724 Scripting and Parametric Design

Intermittent: 10 units
This course prepares students for modeling geometry through scripted development of parametric schemes primarily for design applications that is, to introduce students to basic scripting in geometrical modeling environment with a focus on algorithms relating to form making and to reinforce and extend basic concepts of parametric modeling. Contemporary approaches to modeling geometry are computational reflected in designers wanting much more control over the generative process by varying parameters, in turn, enhancing the efficiency with which they navigate design variations, analyze design artifacts and explore design manifestations. This course has two parts: firstly, to supply the basics of object-oriented programming and algorithmic thinking using Python language constructs, and secondly, to supply the basics of scripting generative form making specifically, by customizing procedures for generative design via scripts in GhPython in conjunction with Rhino/ Grasshopper objects. A number of different form-making algorithms are explored, e.g., fractals, rule-based models, cellular models, agent- based models, and optimization- based models. The course consists of lectures, computer instruction and weekly assignments. Prior exposure to Rhino/ Grasshopper is required.

48-725 Graduate Real Estate Development

Fall
This course teaches the fundamentals of real estate development in the U.S. You will learn about the real estate development process and the social, economic and regulatory context in which land use and real estate development take place. We will learn about project team members and processes; market research; site constraints and zoning; basic project budgeting and types of funding sources. We will also discuss social equity issues related to land use, including affordable housing, racial segregation and economic inequality. This course typically includes international students which allows us to learn from each other and compare real estate and land use issues in various countries. The primary objective of this course is for students to understand how these issues might affect their professional and personal lives, whether they become designers, contractors, engineers, public policy professionals or real estate developers. The course includes learning terminology, reading current news articles, and completing a team project, sometimes with a Pittsburgh-based client. Students will have the first two weeks of class to select nine or 12 credits; 12 credit students will complete additional work. Open to graduate students from any school including SoA, Tepper and Heinz Undergraduates with instructor permission only

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-729 Sustainability, Health and Productivity to Accelerate a Quality Built Environmen

Fall
Given the United Nations Sustainable Development Goals and the growing demand for sustainable design, professional practices are "tooling up" around the world to deliver high performance and environmentally responsible buildings, infrastructures and communities. However, investments in 'green', high performance building solutions and technologies are still limited by first cost decision-making, and life cycle tools are still largely inaccessible to professionals. This course explores the relationship of quality buildings, building systems, infrastructures and land-use to productivity, health, well-being and a sustainable environment. The course begins with a series of lectures on high performance enclosure, mechanical, lighting, interior and networked building design decisions and extends to sustainable communities and infrastructures. The course engages students in the research literature that relates these building design decisions to multiple cost/performance impacts, including: energy, carbon, facilities management, organizational change, technological change, attraction/retention (quality of life), individual productivity, organizational productivity, salvage and waste (the circular economy), tax and insurance, and critically to environmental and human health.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-731 Sustainable Design Synthesis Prep

Spring
Synthesis Prep is an intensive course designed to help students refine their research plan and prepare for their synthesis project. Over the course of the semester, students will develop a research plan, present their research goals and findings, and author a preliminary report. With a refined timeline and deliverables, students will evaluate the efficacy of their approach and update their plan as necessary. The course will provide students with a comprehensive understanding of their area of study, with critical excerpts organized and professionally cited. Through field work, simulation, and analysis, students will initiate new contributions to ensure that the Synthesis methods, timeline, and deliverables are feasible within the Spring semester.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-733 Environmental Performance Simulation

Intermittent
"Design of a boat is optimized for sail-driven locomotion. Buildings should be able to sail using free energy if wind, air, sun and internal heat sources to temper indoor environment", Brendon Lewitt. Based on this viewpoint, this course introduces fundamental knowledge in building physics in relation to a range of environmentally responsive building design principles and computational approaches for increased resiliency for human habitability with minimal reliance on mechanical systems. EPS course refreshes some of the fundamental building physics topics such as building thermodynamics (heat and amp; mass transfer mechanisms), photometric quantification of light and luminous environment, human visual and thermal comfort, thermal modeling and the principles of generating electricity from sunlight (photoelectric effect). EPS course outlines a series of environmental design principles with emphasis on evidence-based design approaches and reviews of building case studies are evaluated against actual buildings in operation. Focus is also given to integration of multi-valent environmental design strategies into the early stages of performative architectures. EPS also introduces state-of-the-art architectural design and amp; research oriented environmental performance simulation and amp; visualization tools, methods and techniques (based on the algorithmic/parametric modeling ecosystem of RHINO-Grasshopper-DIVA-ArchSIM -Ladybug-Honeybee programs). Computational introductions will be accompanied with pre-established/seed workflows which are ready for future adaptation and extension by the students.

48-737 Detailing Architecture

All Semesters: 9 units
"This course examines the role of the architectural detail in the formation/ thematic development of a work of architecture and how the detail reinforces the theoretical position of the architect.

Course Website: http://soa.cmu.edu

48-738 Special Topics: Ecological Footprints

Fall: 6 units
The Ecological Footprint is a measure of the demand that human activity puts on the biosphere. More precisely, it measures the amount of biologically productive land and water area required to produce all the resources an individual, population, or activity consumes, and to absorb the waste they generate, given prevailing technology and resource management practices (Global Footprint Network 2010). This course will engage students in the metrics and impacts of our collective consumption and waste of: -Energy -Materials (Cradle to Cradle) -Food -Water -Transportation -The Integration of Systems towards Quality of Life Starting at the global context, this course will address challenges/opportunities to advance regenerative practices, improving our relationship to nature. Learning from international best practices, we will continue to explore ecological footprints at the global, national, regional, city, neighborhood, building and individual scale. The course will be based on lectures and readings, with assignments and student presentations to fully explore each of the footprint characteristics. Experts on water, energy, materials, food and other resources have been invited to lecture. By mid semester, an application project will be selected for ecological footprint analysis and the development of design, engineering, and operational guidelines towards reducing that footprint. The potential application projects include: the CMU campus footprint and Donner House retrofit; the Energy Innovation Center and education of the trades in reducing our regions footprint; or a new Net Zero building for Carnegie Mellon University. This will be a collaborative effort.
Prerequisite: 48-305

48-739 Making Things Interactive (Graduate)

Fall: 12 units
In this hands-on design-build class you will learn the skills to embed sensors and actuators (light, sound, touch, motion, etc.) into everyday things (and places etc.) and to program their interactive behavior using a microcontroller. You'll also dive into the fields of VR/AR/MR and experiment with combining these disciplines with physical computing. Through weekly exercises and a term project the class will introduce basic analog electronics, microcontroller programming, projection mapping and virtual reality; as well as exploration into using kinetics and materials to make the things you design perform. Emphasis will be on creating innovative experiences. The graduate edition of this course will require additional work including a paper that can be submitted to a peer-reviewed interaction design conference such as CHI, UIST, or TEI. Students from all disciplines are welcome: but please note that the class demands that you master technical material. Experience in at least one of: programming, electronics, or physical fabrication is strongly recommended.(Participants will provide their own supplies and materials.)

48-743 Introduction to Ecological Design Thinking

Intermittent: 9 units
This seminar offers an overview of scholarly, design-based and research-based approaches to issues of ecology and sustainability in architecture and urban design. The seminar intends to question contemporary paradigms of sustainability within the built environment and includes inquiries from different disciplinary perspectives ranging from history, theory, technology, engineering, art and design. The goal of this seminar is to offer a platform for critical thinking, in-depth discussion and analysis of actionable methodologies related to sustainability, and procedures relevant to the shaping of our physical environment and social systems. Composed of a series of lectures, readings and short assignments, this seminar will lead students through a diverse collection of interdisciplinary views and positions towards defining what is our understating of sustainability today, and what is a role of large scale ecology within the constructed environments. Students will be introduced to a wide overview of technical, analytical, practical, theoretical and intellectual inquiries that will help them to navigate varied fields of expertise and enable their future investigation of innovative sustainable strategies for the built environment. This seminar will consist of majority of lecture sessions and 2 project review sessions, spread across the fall semester. Each session will introduce set of readings and/or a small exercises related to the lecture theme. The invited lecturers come from both: academia and practice. Invited speakers' areas of research and design work feature diverse approaches to issues of sustainability and technology. This seminar serves as a platform for development of a cross-disciplinary theoretical foundation to investigate varied methodologies towards sustainable design practice.

48-745 Design Fabrication

Fall and Spring: 9 units
Design Fabrication is a project based seminar exploring the application of Computer Aided Manufacturing (CAM) in architecture. The course meets in the School of Architecture's Design Fabrication Lab (dFAB), which serves as a context to better understand the interconnected affordances of building materials, machine processes, and modeling software for design thinking. During the semester students receive hands-on introductions to dFAB equipment, including laser cutting, cnc routing, and 3D printing. Concepts will be explored and tested through iterative making/prototyping. Course Focus The course focuses on Transdimensional Fabrication, a manufacturing framework that forefronts design thinking across space and time. A growing array of approaches in contemporary architecture are motivated by this focus (e.g. flat pack, 4D printing, metamaterials, kinetic architecture, robotic origami, design for disassembly, etc.). We will investigate Transdimensional Fabrication concepts through three that forefront design translations: 2D 3D, Space Time, Assembly Reconfiguration Disassembly

Course Website: http://soa.cmu.edu

48-746 Shape Machine

Fall: 9 units
A shape machine is any computational technology that fundamentally expresses the way shapes are represented, indexed, queried and manipulated. In this course the shape machine is based on visual rules (shape rules) grounded in symbolic rules (programming language instructions) to provide a robust technology to individuals who use drawings and visual models to develop and communicate their ideas. A shape machine is intended to be a computational, visual and disruptive technology for shape cognition and computing, which intersects with such fields as design, artificial intelligence, computer science, and mathematics. We consider a particular kind of shape machine - spatial grammars - which have their origin in formal grammars for spatial composition. Grammatical approaches to designing offer an alternative to traditional approaches. The goal of grammars is not to produce a single design as the final outcome, but, rather, to provide an understanding of the underlying spatial relations that come into play in an eventual design. For nearly three decades, grammars have been studied extensively to understand style in architecture, engineering, design, fine art and ornament. Recently, there has been an increasing application of grammatical ideas to other disciplines. Specifically, there is resurgent interest in implementing shape grammars for application. This is the focus of this course.
Prerequisite: 48-724

48-749 Special Topics in Computational Design

Intermittent: 6 units
Today's wicked challenges are many-dimensional and fundamentally intractable, yet countless members of our university have great passion to confront them. Systems thinking and rigorous approaches to complex adaptive systems are required to model the nested entanglements across social, technical, and environmental contexts. However, the required systemic models and their underlying principles are not available in approachable form and have generally not been expressed in terms of wicked challenges. To address this gap, students in this seminar take part in researching and designing a global public colloquium called Colloquies for Transgenerational Collaboration to be held in hybrid mode in Fall 2023 at CMU. The unique organizing principle is to proceed from the concerns, worldview, and values of grad students and rising faculty, who will then be paired with local and international practitioners in systems, cybernetics, and wicked design challenges. The resultant public conversations will become the basis for on-going design and co-creation, to be documented and widely shared to benefit future researchers.

48-750 Design & Redesign of Capital Cities

Fall: 9 units
This architectural and urban design history course examines the cultural histories of the design and redesign of world cities. The scale of urban interventions we will look at varies greatly, from the macro-scale of designing totally new capitals to the micro-scale of altering small nodes within a city. We explore the relationship between form and culture by considering political, social, economic, and aesthetic forces that have shaped the public realm of urban as well as suburban spaces. We focus on recognizing and understanding the rationale behind the design, re-design, and use of culturally important urban spaces during their own time, making periodic forays into the issues that influence those spaces today. Non-majors are welcome.

Course Website: https://soa.cmu.edu/courses (https://soa.cmu.edu/courses/)

48-752 Zero Energy Housing

Fall: 9 units
Are you interested in designing or renovating the high-performance multifamily housing of the future? Would it surprise you to know that despite numerous successful single-family projects, only a limited number of successful multistory, multifamily zero examples exist? Creating multifamily housing that reaches net zero or carbon neutral goals is challenging since occupant behavior can influence the outcome as much as building design and construction. Yet multifamily housing is an essential typology to address rapid development and urbanization. Take on the challenge of creating high performance housing for our net zero future by exploring the technical and social demands of multifamily zero energy design or renovation. 48-752 is a graduate level course designed to support that goal. Through lectures, outside research, discussion, and a final applied project, you'll explore the design approaches, codes, policy, technology, and energy infrastructure options that can help you achieve the housing performance we know is essential for a sustainable future.

Course Website: http://soa.cmu.edu

48-753 Intro to Urban Design Media

Fall: 6 units
This course explores new forms of media and representation in Urban Design. The seminar is a project-based course consisting of bi-weekly exercises and reading assignments. Students will adopt their own hometown as the primary site for their analysis and representation. Throughout the semester, students are tasked with identifying a specific subject unique to their site of inquiry. They will then analyze, interpret, and re-represent their subject through a variety of media, including collages, maps, images, renders, matrices, animated GIFs, and AI-generated imagery. Consideration will be given to drawing/image quality, technique, and aesthetics.

48-755 Introduction to Architectural Robotics

Fall: 9 units
This course provides a practical, hands-on introduction to the application of industrial robotics in architectural and related construction domains. It also provides students with the necessary knowledge and safety protocols to work in the architectural robotics lab at CMU SoA. Through lectures, labs, and project work you will learn the industrial robotic fundamentals of on-line programming, off-line programming, simulation, end-of-arm-tool (EOT) development, workcell development, and interacting with peripheral sensors. This course is a prerequisite for more advanced engagement with the lab equipment through SoA courses, student thesis projects, and research. No prior knowledge of industrial robotics is required to succeed in the course. Students should have basic knowledge of Rhinoceros 3D modeling and visual scripting in Grasshopper. Prior programming experience is recommended, but not required. All students should exhibit careful attention to lab safety policies and the determination to test ideas through physical making and iteration.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-756 Project Planning and Reporting

Fall
The goal of this course is to expose the class to advanced project scheduling methods and familiarize the students with the primary reporting practices as performed in the construction industry such as change management, resource charts, and project status reports. The course objectives are as follows: 1. Outline and discuss the established practical approaches of planning and reporting; 2. Demonstrate the dynamic nature of construction projects stemming from inherent uncertainties. 3. Hone a student's adaptability to the dynamism of the process while delivering construction projects. This course will include both discussions on assigned topics and a studio-based collaborative group project. In order to provide a real-world experience to the students the second half of the semester will feature a group project focused on tracking a construction project with varying situational scenarios such as changes in resources and scope creep. Throughout the semester there will be one midterm and intermittent homework with the final deliverable being a "close out" document, which would essentially be a compilation of all the work during the semester projects.

Course Website: http://soa.cmu.edu

48-758 Responsive Mobile Environments (Grad)

Intermittent: 12 units
As part of this project-based course, we'll get hands-on with emerging technologies, concepts and applications in the Internet of Things through a critical lens. We'll prototype everyday intelligences and design smart and connected devices that examine and speculate on the strange, supernatural, and mystic qualities of the smart home. The first half of the semester will introduce students to building connected devices and intelligent spaces through technical development workshops, readings, applied explorations, and guest lectures. The second half of the semester will be organized as an applied collaborative project.

Course Website: http://rme2021.daraghbyrne.me

48-759 Value Based Design Introduction

All Semesters
This course will teach students the importance of Value Based Design across all project types and amp; delivery methods. The student will receive a firm grasp on the roles of each project stakeholder in a range of small to large construction projects.

Course Website: https://soa.cmu.edu/

48-763 Protean Systems: Sustainable Solutions for Uncertain Futures

Intermittent
Uncertainty perpetually plagues the built environment. The inability of our buildings and cities to adapt to shifting circumstances has led to an enormous amount of waste. Throughout the semester we will explore various types and scales of change and each week we will review various concepts such as Mass Customization, Computationally Responsive Environments and amp; Facades, Open Building, Shearing Layers of Change, Adaptive Reuse, Metabolism, Persistence, Preservation, Circular Economy, Design for Deconstruction and amp; Reuse (DfD+R), and Repair/Maintenance. To deepen our understanding of the concepts students will present group case studies each week and apply their understanding of the concept(s) to a project of their choosing as a design exercise or develop a detailed, individual case study report. Students in this course will: Compare many ways architects have attempted to deal with change in the past. Analyze the effectiveness of specific precedents over time. Diagram how anticipated and unanticipated forces of change impact architecture. Design innovative protean solutions of your own. The course welcomes students from all SoA and SoD undergraduate and graduate programs.

Course Website: https://soa.cmu.edu/courses#graduate (https://soa.cmu.edu/courses/#graduate)

48-764 BIM for architects: Leveraging Revit Parametric Design to Empower Innovative Arc

Fall
Building Information Modelling (BIM) has the potential to empower design by allowing architects to consider many design options, analyze the project while designing, and communicate the design to the client for feedback to allow an informed decision-making dialogue. The course will offer hands-on experience working with Autodesk Revit on an architectural BIM project. Students will gain the ability to leverage parametric abilities of Autodesk Revit program for a better preliminary design process. The course will focus on learning advanced parametric modelling techniques in Revit, and exploring analytic possibilities available for architects in early stages of the design: quantitative program area analysis, energy analysis, lighting analysis, initial cost analysis. This course is directed at graduate students, fourth and fifth-year undergrads are welcome as well. Basic knowledge of Revit modeling is required, either from 48485, 48568 (the Revit 3-unit section), 12711, or other background approved by the instructor.
Prerequisites: 48-485 or 48-568 or 12-711

48-770 Introduction to Machine Learning in Design

Spring
With the recent blooming of artificial intelligence (AI) and machine learning (ML) came a renewed interest in how these technologies may impact architecture and other creative practices. Introduction to Machine Learning in Design introduces students to this emerging field, giving them the tools to make their own machine-learning-based design tools by adapting state-of-the-art models, developing new models, and understanding how data shapes machine learning algorithms. Throughout this course, students explore two main fields of machine learning and their potentials in design and making problems: Unsupervised Generative Models, Natural Language Processing. Students will be introduced to the fundamental concepts of each field and get hands-on experience with state-of-the-art research and tools to implement them. Prospective students should have strong Python programming skills. Prior basic familiarity with Machine Learning is a plus. Taking Fundamentals of Programming (15-112) or school of architecture courses such as Design + Computation 1 or Scripting and Parametric Design before taking this course is strongly recommended but not mandatory.

Course Website: http://soa.cmu.edu

48-779 Processes of Digital Design Fabrication

Intermittent: 3 units
Digital Fabrication techniques are well established and widely used across all stages of design to production. Contemporary pre-occupations with materiality, ornament, digital craft, and surface topology are tethered to the affordances of these workflows and their direct connection to digital design methods. The impact of these processes reverberates across scales and around the globe, its presence undeniable. Off-site, prefabrication techniques are increasingly reliant upon computational methods to achieve greater control and precision, while recasting traditional design to production workflows. The architects traditional conveyor of design intent, the working drawing, and its conventions of plan and section are increasingly supplemented with machine and robot code. Meanwhile the jobsite and field construction of buildings remains a largely human endeavor, reliant upon the skill of local labor to assemble the many components that constitute a building to produce the one-off piece of architecture. This tension between the promise of the factory floor and the messy reality of the job site reflects the evolving nature of construction and its regimes of labor. Building construction is an industry in flux rooted in traditions that pre-date the emergence of computation, yet also in the midst of digital disruption as seen in advancements in onsite architectural robotic fabrication. Lest they succumb to greater marginalization, architects must engage these transformations and leverage their design affordances. Practitioners should be versed in the basic principles of digital fabrication and understand its affordances and potential influence upon the design process. Translations from drawing and model to building increasingly rely upon these modes of production. Emerging practitioners must be capable of engaging these modes of communication and leveraging these techniques in the realization of their design intent.

48-781 Spatial Analysis in Infrastructure Planning

Spring
A Geographic Information System (GIS) provides storage, retrieval, visualization, and analysis of geographically referenced data. GIS provides analytical tools to investigate spatial relationships, patterns, and processes of location-based data such as cultural, demographic, economic, environmental, health, physical, social, and other phenomena. GIS creates digital twins (virtual representations) of natural and built environments and integrates many types of digital models. GIS topics include geographic concepts (projections and map scales), map design, geodatabases (importing spatial and attribute data, geocodes, table joins, and data aggregation), spatial data processing, digitizing, data mining, multivariate cluster analysis, drive and walk time networking, raster GIS, spatial statistics (proximity and hot spot analysis), animation, and 3D GIS. CAFM (Computer Aided Facility Management) and IWMS (Integrated Work Management Systems) topics include space and asset management, building operations, environmental health and safety, and real property. The course includes in-person and asynchronous video lectures to learn important GIS concepts and a brief introduction to work management systems. Software tutorials cover leading GIS software from Esri Inc. Applications include ArcGIS Pro, ArcGIS Online, ArcGIS Map Viewer, ArcGIS Story Maps, and Dashboards. Subject areas are related to architecture, engineering, construction management, building performance, environmental health, sustainability, public policy, urban design, and planning.

Course Website: http://soa.cmu.edu

48-783 Generative Modeling (GRAD)

Fall and Spring: 9 units
This course introduces students to the fundamentals of generative modeling using computer aided design as practiced in the field of architecture. Core competencies will be developed through modeling projects and software intensive labs, while a broader critical framework for conceiving of contemporary and historical parametric practices will be encouraged through periodic lectures. Emphasis will be placed on careful consideration of digital mediums and developing a sense of craft related to digital modeling in the hope that students will become conscientious makers and consumers of digital content. Students will be encourage to understand and apply algorithmic problem solving to the many design constraints encountered in architecture. The course will explore the relationship of parametric workflows to design thinking and will situate contemporary trends in a broader framework of computational design. The course will also forefront complex form-making as a response to bio-mimicry, systems thinking, and mass-customization. Rather than positioning parametric modeling as a disruption of historical architectural design process, the course will encourage students to consider how new tools might augment the discipline's historical commitments to orthographic projection, perspectival drawing, and physical modeling.

48-786 Portfolio & Resume Preparation

Fall and Spring: 3 units
Portfolio is a unique document that showcases your professional and academic journey through various media and interfaces. Portfolio's capacity to represent a body of work and as a storytelling tool is emphasized in this course. The course proposes a fresh way of thinking about portfolio types and their content. Portfolio is a document through which you invite an audience to explore mediums of your creative thinking, forms of imagination, sense of materiality and possibilities of shaping the real conditions. The course deals with curating the content, editing your portfolio, resume, cover letters and work sample design. We shall look at myriad drawing types, layouts, typefaces and get into technicality of workflow, project sequence and details of the portfolio. In each session we shall select a particular content of the portfolio and discuss through presentations, diagrams, key references and students and amp;#39; work. Each project has its prompt, is unique in terms of its scale, modes of investigation and tools of representation. A successful portfolio shows diverse tools of thinking and communication.

48-788 Proseminar in Computational Design

Fall: 6 units
No course description provided.

48-795 LEED

Spring: 6 units
If you're interested in sustainable infrastructure and community design, have you considered how "green" strategies may vary around the world? Are there universal goals for the design of sustainable transportation, water systems or energy infrastructure, or must green goals and design approaches be adapted to a national or local context? 48795 A4, LEED, Green Infrastructure and Community Rating in Global Context, is a graduate level mini-course that compares global community and infrastructure rating systems to gain perspective about sustainable infrastructure development and community design. The course uses two rating systems and #8212;the US Green Building Council's Leadership in Energy and Environmental Design (LEED) Cities and amp; Communities Rating System and the Institute for Sustainable Infrastructure (ISI) Envision Rating Systemas springboards for exploration and discussion of other world rating systems that address these topics. We'll consider how the goals and implementation of a rating system may reflect the national context in which the system was created and discuss emerging issues that may be omitted from these rating systems. The course provides a foundation for taking USGBC's LEED Green Associate and/or LEED Accredited Professional exams, or the ISI Envision Sustainability Professional exam and is designed to hone your critical thinking about sustainable urban design and infrastructure development in a global context.
Prerequisite: 48-315

Course Website: http://soa.cmu.edu

48-801 Office Visits

Fall: 6 units
Each candidate will arrange with their home office a virtual 'visit' for members of the degree program and organize presentations of the projects, methodological challenges, recurring problems, best and worst practices within the context of their office experience. Asynchronous Course Delivery (Fall 2014) - and gt; September 18, through December 7, 2014 Online Synchronous Course Conclusion (Fall 2014) - December 8-11, 2014

48-802 Principles of Research I

Fall: 6 units
Candidate's current knowledge of problems, methods and outcomes based on their professional work. Overview of the eight knowledge areas as existing disciplines and their potential place in them. Asynchronous Course Delivery (Fall 2014) - and gt; September 18, through December 7, 2014 Online Synchronous Course Conclusion (Fall 2014) - December 8-11, 2014

48-803 Areas of Practice

Fall: 6 units
Candidate presentations of area(s) of expertise summarizing the methods and problems that are prevalent; using case studies to establish a situated approach to research. Asynchronous Course Delivery (Fall 2014) - and gt; September 18, through December 7, 2014 Online Synchronous Course Conclusion (Fall 2014) - December 8-11, 2014

48-804 International Exchange I

Fall: 12 units
Conduct workshops for collaborative research and information exchange meetings with EU cohorts visiting from the Universit and #233; Toulouse III - Paul Sabatier, Doctoral Programs in Architecture. Asynchronous Course Delivery (Fall 2014) - and gt; September 18, through December 7, 2014 Online Synchronous Course Conclusion (Fall 2014) - December 8-11, 2014

48-805 Directed Study I

Fall: 6 units
Prepare the first publishable article under the supervision of the advisor, based on the current professional practice record of the candidate. Submitted to a committee of faculty for approval. Asynchronous Course Delivery (Fall 2014) - and gt; September 18, through December 7, 2014 Online Synchronous Course Conclusion (Fall 2014) - December 8-11, 2014

48-809 International Exchange II

Spring: 12 units
Visit Universit and #233; Toulouse III - Paul Sabatier, Doctoral Programs in Architecture and participate in collaborative research and information exchange meetings with EU cohorts, based on the cohorts current knowledge base culled from their practice experience. Asynchronous Course Delivery (Spring 2015) - January 18, through May 13, 2015 and #8212; Online Synchronous Course Conclusion (Spring 2015) - May 14 through 17, 2015

48-810 Comparative Analysis of US and EU Practices

Spring: 6 units
Practices in the building sector vary considerably in the US versus the EU. The instructor will provide a rich collection of national and international initiatives in the AEC domains and include a stimulating series of site visits to important installations in the area. Asynchronous Course Delivery (Spring 2015) - January 18, through May 13, 2015 and #8212; Online Synchronous Course Conclusion (Spring 2015) - May 14 through 17, 2015

School of Art

Charlie White, Head
Location: College of Fine Arts 300
www.art.cmu.edu/ (http://www.art.cmu.edu/)

The School of Art’s undergraduate program bridges traditional studio practice with the experimental practices of new and unconventional media. The School offers two tracks for undergraduates—the Bachelor of Fine Arts (BFA) degree and the four interdisciplinary degrees collectively known as the BXA Intercollege Degree Program—along with a minor in art.

The program provides focused foundational instruction over the first year that builds toward a broad range of individualized study in the following three years. In their first year, students experience a wide array of intensive medium-specific studio courses, developing both technical skill and critical thinking. Following the completion of their foundation year, students direct their study across four primary concentrations with the freedom to pursue either in-depth study, hybrid study across concentrations, or specialized practices. Throughout the entire curriculum, the program emphasizes a conceptual approach to artmaking, challenging students to expand their ideas of artmaking and reconsider art’s possibilities.

The four primary concentrations are:

I. Drawing, Painting, Print Media, and Photography

II. Sculpture, Installation, and Site Work

III. Electronic and Time-Based Work

IV. Contextual Practice

Studio courses comprise over sixty percent of the course of study and academic courses comprise the remainder.

The School of Art occupies over 50,000 square feet of fabrication facilities, multi-purpose classrooms, media-specific studios and workshops, student and faculty studios, presentation rooms, and exhibition spaces, offering students access to both traditional and state-of-the-art tools. All juniors and seniors have dedicated, independent, 24-hour studio space.

The School’s distinguished faculty includes pioneers in computer animation and new media; artists and scholars exploring the complexity of queer thought and culture; and emerging practitioners confronting some of society’s most pressing issues. Throughout the program, these professors provide one-on-one support and feedback, helping each student foster an individualized artistic practice.

The program emphasizes an interdisciplinary approach to learning and art making, and students are encouraged to take advantage of the many resources of the College of Fine Arts and of the University. These include: the IDeATe network, the STUDIO for Creative Inquiry, the Miller Institute for Contemporary Art, and the Center for Arts in Society, among many others.

Graduates from the School of Art pursue diverse careers paths including traditional studio practice, animation, game design, positions with leading technology companies, and founding their own start-ups.

Using five categories of courses, the curriculum presents art-making in a unique manner which respects tradition and encourages innovation. The course categories are:

I . Foundation Courses
II. Intermediate Studios
III. Advanced Studios
IV. Critical Studies Courses
V. University Academic Courses

I. Foundation Courses

In their first year of study, students take a total of six foundation studio courses, exploring a range of mediums and conceptual processes. These studios ensure that all students have an exploratory experience with all of the media resources of the school. They also serve as preparation for intermediate and advanced studio work.

In addition, the Art First-Year Seminar introduces you to facilities, faculty, staff, resources, and many opportunities you can access within Art and the broader university. All first-year students take the seminar together, allowing you build a strong community that will help you develop as an artist during your time at CMU and beyond.

II. Intermediate Studios

Students take a minimum of six Intermediate Studio courses of their choosing in preparation for Advanced Studios in their junior and senior years. Intermediate studios will build on foundational knowledge and allow students to direct their studies to those mediums and topics most strongly of interest.

III. Advanced Studios

Students take a minimum of six Advanced Studio elective courses in their junior and senior years. These courses address specialized studio work in one of the four artistic concentration areas in the school, which are:

- Drawing, Painting, Print Media, and Photography (DP3)
- Sculpture, Installation, and Site Work (SIS)
- Electronic and Time-Based Work (ETB)
- Contextual Practice (CP)

In addition, students complete another six studio courses, which can be either Intermediate or Advanced Studios. This allows for significant exploration and integration across mediums within the program.

A minimum of four courses must be taken in one of these concentration areas. One of the intermediate or advanced courses can be a studio-based course within the College of Fine Arts, IDeATe, or additional programs.

IV. Critical Studies Courses

Students are introduced to critical studies in the spring of their first year, taking Foundations: Critical Studies. After the first year, students take four elective critical studies courses to broaden their knowledge and inform their studio practice. Critical Studies courses are discussion-based seminars examining theoretical texts in relation to periods of artistic practice. Readings will introduce students to the historical and critical background of the themes discussed in class and familiarize them with the varied methodologies and argumentative styles proper to art criticism, critical theory and philosophy.

V. University Academic Courses

Ten academic courses outside of Art and Computing @ Carnegie Mellon are required.

First Year

In the first year of study the student is expected to complete the following three requirements:

- Core@CMU (99-101)
- One First-Year Writing option
- One Global/Cultural Studies elective

For First-Year Writing, the student selects one of the two full-semester courses, (Interpretation and Argument (76-101) or Advanced First Year Writing: Special Topics (76-102)), or two of the three half-semester writing courses (Writing about Literature, Art and Culture (76-106), Writing about Data (76-107), or Writing about Public Problems (76-108)).

The Global/Cultural Studies electives include but are not limited to the following courses:

57-173	Survey of Western Music History	9
57-306	World Music	9
57-480	History of Black American Music	6
76-337	Intersectional Feminism	9
70-342	Managing Across Cultures	9
76-221	Books You Should Have Read By Now	9
76-232	Introduction to Black Literature	9
76-239	Introduction to Film Studies	9
76-241	Introduction to Gender Studies	9
76-386	Language & Culture	9
79-145	Genocide and Weapons of Mass Destruction	9
79-201	Introduction to Anthropology	9
79-202	Flesh and Spirit: Early Modern Europe, 1400-1750	9

79-205	20th Century Europe	9
79-208	Witchcraft and Witch-Hunting	9
79-211	Modern Southeast Asia: Colonialism, Capitalism, and Cultural Exchange	9
79-223	Mexico: From the Aztec Empire to the Drug War	9
79-234	Technology and Society	9
79-240	Development of American Culture	9
79-242	African American History: Reconstruction to the Present	9
79-244	Women in American History	9
79-245	Capitalism and Individualism in American Culture	9
79-261	The Last Emperors: Chinese History and Society, 1600-1900	9
79-262	Modern China: From the Birth of Mao ... to Now	9
79-263	Mao and the Chinese Cultural Revolution	9
79-265	Russian History: Game of Thrones	9
79-266	Russian History and Revolutionary Socialism	9
79-267	The Soviet Union in World War II: Military, Political, and Social History	9
79-275	Introduction to Global Studies	9
79-280	Coffee and Capitalism	9
79-283	Hungry World: Food and Famine in Global Perspective	9
79-343	Education, Democracy, and Civil Rights	9
79-345	Roots of Rock & Roll	9
79-350	Early Christianity	9
79-377	Food, Culture, and Power: A History of Eating	9
80-100	Introduction to Philosophy	9
80-250	Ancient Philosophy	9
80-251	Modern Philosophy	9
80-253	Continental Philosophy	9
80-254	Analytic Philosophy	9
80-276	Philosophy of Religion	9
82-xxx	Any Languages, Cultures, and Applied Linguistics course	

After First Year

The student must take one course in each of the following academic areas or “options”:

- Humanities and Languages or “Culture Option”
- Math, Science, Computer Science and Engineering or “Technical Option”
- History, Psychology, Economics or “Social Science Option”

The student must then take at least three additional courses from one of the academic areas/options listed above.

Finally, the student must take two additional, but unspecified, academic electives.

In selecting courses for the university academic component of the curriculum, students are encouraged to complete a cluster of courses that appeals to and develops their interests as emerging artists. In the process of taking their university electives, students can often simultaneously earn a minor.

Bachelor of Fine Arts (B.F.A.) Curriculum

Minimum units required for B.F.A. in Art 384

Below is the recommended distribution of courses in the four-year B.F.A curriculum. After the freshman year, students may begin to choose university electives. After the first semester of the sophomore year, students have more options regarding the sequencing and selection of their coursework.

First Year

Fall		Units
60-104	Foundations: Art First-Year Seminar	6
60-110	Foundations: Time-Based Media	10
60-131	Foundations: Sculpture	10
60-150	Foundations: Drawing	10
76-10X	First-Year Writing	9
99-101	Core@CMU	3
		48

Spring		Units
60-101	Foundations: Risk, Agency, Failure	10
60-107	Foundations: Critical Studies	9
Select two of the three Foundation Media Courses:		20
60-120	Foundations: Digital Media	
60-135	Foundations: Sculpture II	
60-170	Foundations: Paint/Print	
xx-xxx	Cultural/Global Studies elective	9
		48

Second Year

Fall		Units
60-2xx	Intermediate Studio Elective	10
60-2xx	Intermediate Studio Elective	10
60-2xx	Intermediate Studio Elective	10
60-3xx	Critical Studies Elective	9
xx-xxx	Academic Elective	9
		48

Spring		Units
60-200	Sophomore Review	0
60-2xx	Intermediate Studio Elective	10
60-2xx	Intermediate Studio Elective	10
60-2xx	Intermediate Studio Elective	10
60-3xx	Critical Studies Elective	9
xx-xxx	Academic Elective	9
		48

Third Year

Fall		Units
60-xxx	Intermediate or Advanced Studio Elective	10
60-xxx	Intermediate or Advanced Studio Elective	10
60-xxx	Intermediate or Advanced Studio Elective	10
60-3xx	Critical Studies Elective	9
xx-xxx	Academic Elective	9
		48

Spring		Units
60-xxx	Intermediate or Advanced Studio Elective	10
60-xxx	Intermediate or Advanced Studio Elective	10
60-xxx	Intermediate or Advanced Studio Elective	10
60-3xx	Critical Studies Elective	9
xx-xxx	Academic Elective	9
		48

Fourth Year

Fall		Units
60-401	Senior Studio	10
60-4xx	Advanced Studio Elective	10
60-4xx	Advanced Studio Elective	10
xx-xxx	Academic Elective	9
xx-xxx	Academic Elective	9
		48

Spring		Units
60-402	Senior Studio	10
60-4xx	Advanced Studio Elective	10
60-4xx	Advanced Studio Elective	10
xx-xxx	Academic Elective	9
xx-xxx	Academic Elective	9
		48

Sophomore Reviews

Students give an overview of their work at the midpoint of their four-year course of study. At the end of the sophomore year, students undergo a faculty review of their work to date in the program.

Art Majors Minoring or Double Majoring in Another Department

About a third of current B.F.A. Art students pursue a minor or a second major. If students are contemplating this option, they must discuss their plans with academic advisors from the minor or second major department as well as with the School of Art academic advisor.

Study Abroad

Art students are encouraged to spend either a semester of their junior year, or a summer before or after their junior year, in one of many available international programs. These programs include university sponsored and exchange programs in which a student's financial aid package remains in effect, and programs sponsored by other institutions.

Programs with other Pittsburgh Institutions

Art students are eligible to take courses at the nearby University of Pittsburgh's History of Art and Architecture Department, and at the Pittsburgh Glass Center. Established agreements with these institutions and other Pittsburgh colleges, universities or centers offer cross-registration opportunities at no additional expense to the student.

BXA Intercollege Degree Programs

BACHELOR OF COMPUTER SCIENCE AND ARTS (BCSA)

BACHELOR OF ENGINEERING STUDIES AND ARTS (BESA)

BACHELOR OF HUMANITIES AND ARTS (BHA)

BACHELOR OF SCIENCE AND ARTS (BSA)

Carnegie Mellon University offers a degree program that combines an Art Focus (12 courses) with a focus in the College of Engineering, the School of Computer Science, the Dietrich College of Humanities and Social Sciences, or the Mellon College of Science. The Assistant Head of Academic Affairs in the School of Art advises BXA majors in selecting courses in the Art Focus. A description of these three programs, and a list of requirements and electives, can be found in the in the BXA Intercollege Degrees Program section (p.) of this catalog.

Art Minors

Students from other colleges and departments are eligible to pursue a minor in art. A minor requires six courses in the School of Art, selected from a list of requirements and electives as described in the Minors Offered by the College of Fine Arts section (p. 209) of this catalog.

Master of Fine Arts (M.F.A.) Degree

The School of Art offers a three-year program leading to a Master of Fine Arts in Art. This is a unique program designed to connect art-making to the university at large, and to Pittsburgh communities and organizations. Information about this program is available at the School of Art website (http://www.art.cmu.edu/mfa/overview/).

Master of Arts Management (M.A.M.) Degree

The College of Fine Arts and the Heinz College School of Public Policy and Management co-sponsor a Master of Arts Management degree. Students admitted to the M.A.M. degree program in their junior year may complete both a Bachelor of Fine Arts degree and a Master of Arts Management degree in five years. Students interested in this graduate degree should consult with advisors early in their undergraduate program.

Pre-College Program

The School of Art offers a Summer Pre-College Program, with both three- and six-week options.This program is designed to prepare the college-bound high school student for college level work in art. Information is available at the Summer Pre-College site (https://www.cmu.edu/pre-college/).

Full-Time Tenure Track Faculty

LYNDON BARROIS JR., Assistant Professor of Art – MFA, Washington University in St. Louis; Carnegie Mellon, 2020–

KIM BECK, Associate Professor of Art – M.F.A., Rhode Island School of Design; Carnegie Mellon, 2004–

ELIZABETH CHODOS, Assistant Professor of Curatorial Practice, Director of Miller Institute of Contemporary Art – M.A., School of the Art Institute of Chicago; Carnegie Mellon, 2017–

JOHANNES DEYOUNG, Assistant Professor of Art – M.F.A., Cranbrook Academy of Art; Carnegie Mellon, 2018–

ISLA HANSEN, Assistant Professor of Art – M.F.A., Carnegie Mellon University; Carnegie Mellon, 2019–

RANEE HENDERSON, Assistant Professor of Art – M.F.A., Bard College; Carnegie Mellon, 2023–

KATHERINE HUBBARD, Assistant Professor of Art – M.F.A., Bard College; Carnegie Mellon, 2019–

ANDREW JOHNSON, Associate Professor of Art – M.F.A., Carnegie Mellon University; Carnegie Mellon, 2004–

JONGWOO JEREMY KIM, Associate Professor of Art History and Theory – Ph.D., Institute of Fine Arts at New York University; Carnegie Mellon, 2018–

LING-LIN KU, Assistant Professor of Art – M.F.A., University of Texas at Austin; Carnegie Mellon, 2022–

GOLAN LEVIN, Professor of Art – M.S., Massachusetts Institute of Technology; Carnegie Mellon, 2004–

CLAYTON MERRELL, Dorothy L. Stubnitz Professor of Art – M.F.A., Yale University; Carnegie Mellon, 1998–

PAOLO PEDERCINI, Associate Professor of Art – M.F.A., Rensselaer Polytechnic Institute; Carnegie Mellon, 2009–

RICHARD PELL, Associate Professor of Art – M.F.A., Rensselaer Polytechnic Institute; Carnegie Mellon, 2008–

MELISSA RAGONA, Associate Professor of Visual Culture and Critical Theory – Ph.D., State University of New York at Buffalo; Carnegie Mellon, 2003–

BRITT RANSOM, Associate Professor of Art – M.F.A., University of Illinois at Chicago; Carnegie Mellon, 2022–

SHARMISTHA RAY, Assistant Professor of Art – MS/MFA, Pratt Institute; Carnegie Mellon, 2023–

JON RUBIN, Professor of Art – M.F.A., California College of Arts and Crafts; Carnegie Mellon, 2006–

SUZIE SILVER, Professor of Art – M.F.A., The School of the Art Institute of Chicago; Carnegie Mellon, 1999–

CHARLIE WHITE, Regina & Marlin Miller Head, Professor of Art – M.F.A., Art Center College of Design; Carnegie Mellon, 2016–

ALISHA WORMSLEY, Assistant Professor of Art – M.F.A., Bard College; Carnegie Mellon, 2024–

IMIN YEH, Assistant Professor of Art, Director of Foundational Studies – M.F.A., California College of the Arts; Carnegie Mellon, 2016–

Full-time Joint Appointments

JAMIE GRUZSKA, Special Faculty and CFA Photography Administrator – M.F.A., University of Buffalo;

DYLAN VITONE, Associate Professor, School of Design – M.F.A., Massachusetts College of Art; Carnegie Mellon, 2006–

Visiting Faculty

MARIA ELENA VERSARI, Visiting Professor of Art History and Theory – Ph.D., Scuola Normale Superiore;

Research and Teaching Faculty

YOKO SEKINO-BOVÉ, Assistant Teaching Professor of Art – M.F.A., University of Oklahoma; Carnegie Mellon, 2023–

School of Art Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

60-101 Foundations: Risk, Agency, Failure

Spring: 10 units
Foundations: Risk, Agency, Failure is a transdisciplinary research-based studio course introducing you to the many ways that artists challenge conventions, experiment, and take risks through their artwork. The class will have theory-driven prompts with no specific medium requirements, and encourage you to explore the wide range of approaches to making that constitute artistic research. You will explore foundational questions like: What can art uniquely do in the world? How can you playfully work with subjects and materials that are foreign and unfamiliar? How do you define success as an artist? How do you embrace failure as a productive part of the artistic process? How do you become comfortable breaking and remaking rules in art? The class will set up a structure for you to explore productive failure, encouraging you to take risks in a supportive environment and ultimately help you explore their own agency as cultural producers in the world.

60-104 Foundations: Art First-Year Seminar

Fall: 6 units
Foundations: First-Year Seminar is a critical aspect of beginning your experience as a School of Art Student. This course introduces you to the school's many facilities, equipment, opportunities, staff, and faculty that will be essential resources for you throughout your four years at CMU School of Art. You will build community with your entire first year cohort, both BFA and BXA students, as you share 24 hour access to the Foundations Studio, a multi-use shared studio space that will support your studio coursework during your first year. Through lectures and panel discussions, you will explore various methods of artistic research and forms of making that support today's creative citizens. Through hands-on demonstrations, you will learn technical skills and gain access to equipment that will prepare you for academic and artistic success at CMU and beyond.

60-105 Cultural History of the Visual Arts

Spring: 9 units
Have you ever felt that you liked an artwork but couldn't explain why? Do you have questions about art that you were always afraid to ask? This course is conceived to give students the tools to feel at home when visiting a museum and talk about art in social, business and academic settings. It is organized over two semesters, but students can take only one of the two courses. Cultural History of the Visual Arts I (in the fall) covers the period from the 1500s to the 1800s and features masterpieces and lesser known works in Western and Non-Western art, organized chronologically and by theme. Some of the topics we will study include the controversy surrounding Leonardo's and Michelangelo's works, the role of censorship in the arts, the development of perspective experiments and visual theories from Antiquity onward, the concept of landscape and the status of the artist in the Ming dynasty, the impact of colonialism and post-colonial identity in South American Art, the rediscovery of Pompeii and Herculaneum and the Egyptian craze in the 1800s, the world of Opera and ballet, and the Impressionists' ideas of what an artwork should be. The course also includes museum visits that will be organized taking in consideration the students' schedule. No prerequisite required and open to students from all disciplines.

60-106 Cultural History of the Visual Arts - the Modern Period

Spring: 9 units
Have you ever felt that you liked an artwork but couldn't explain why? Do you have questions about art that you were always afraid to ask? This course is conceived to give students the tools to feel at home when visiting a museum and to talk about art in social, business and academic settings. It is organized over two semesters, but students can take only one of the two courses, or both, in any order they prefer. Cultural History of the Visual Arts -The Modern Period (offered in the spring) covers the period from the 1800s to the 2000s and features masterpieces and lesser-known works that define our idea of what art is and what role it has in society. Some of the topics we will study include the invention of a "modern" ways of seeing in Japanese art; the impact of science, film and photography on the Impressionists; the myth of the artist as a savage, a fool, and a prophet; the creation of ideal homes for common (and uncommon) people; the meaning of the avant-garde; and the many ways in which artists and politicians experiment with art and architecture in order to control our minds and emotions. The course also includes museum visits that will be organized in relation to the students' schedules. No prerequisite required and open to students from all disciplines.

60-107 Foundations: Critical Studies

All Semesters: 9 units
Foundations: Critical Studies is a seminar course that expands your historical knowledge concerning contemporary art and human experience in society. Through critical reading and writing, you will learn how the role of artistic research contextualizes the conceptual creativity of your studio practice. This course involves close reading and discussions of a wide range of texts, from foundational theory to short stories, nonfiction, poetry, exhibition reviews, artist interviews, curatorial essays, and excerpts from scholarly monographs. Today's visual artist will find that writing is a key to future professional opportunities and that research, writing, and theory are integral parts of artmaking. This course integrates analytical reading and research-based writing into your creative process.

60-110 Foundations: Time-Based Media

Spring: 10 units
Foundations: Time Based Media introduces you to audio and video production software, equipment and techniques into your interdisciplinary studies in art. Projects explore the making and critiquing of moving-image and audio across a variety of contexts, and takes an active approach in learning how to produce your own new media work using both standard and experimental production techniques. You will build comprehension of related histories and theories; explore the meanings and consequences of ubiquitous broadcast and social media; and learn how to interrogate and wield media paradigms to challenge their influences in our lives.

60-120 Foundations: Digital Media

Spring: 10 units
Foundations: Digital Media is a practical introduction to expanded modes of creative practice made possible by the computer. In this studio course, you will develop the skills and confidence necessary to produce interactive, generative, and immersive artworks; discuss your work in relation to current and historic praxes of electronic art; and engage new technologies critically. Topics will include no-code and low-code approaches to: internet art, immersive world-building, and environmental storytelling; generative art and experimentation with learning machines; creative interventions and performance in social platforms; and the development of branching narratives and games.

60-125 IDeATe: Introduction to 3D Animation Pipeline

Fall and Spring: 12 units
This class will explore computer animation as it pertains to a professional animation production pipeline. The course is designed to give students exposure to key job descriptions that align to the animation industry. Topics covered include: character design, world building, storyboarding, digital sculpture, look development, rigging, layout, animation, cinematography, lighting, and rendering. These topics are taught in 2-4 week sprints that allow a student to learn the fundamentals of each craft. In a mixture of class lectures, critiques, and training workshops, students will become acquainted with the necessary skills needed to create their own characters and animations. By completion of the course, students will be familiar with industry-standard best practices and ready to take advanced courses related to animation, vfx, and video game related pipelines. This course specifically offers insight on how the craft of animation is always evolving at top studios such as Walt Disney Animation Studios, Pixar, and Industrial Light and Magic.

Course Website: http://cmuanimation.weebly.com/

60-126 Introduction to Performance Capture and Rendering

Intermittent: 6 units
[IDeATe course] This mini is designed for those interested in the growing world of performance capture and visual effects. Utilizing the advanced motion capture facilities at Carnegie Mellon and the Kinect, students will learn how to capture motion from performance and apply it to CG characters and objects. While this technique is found in many video games and vfx movies, it has the ability to create endless possibilities within the realm of computer graphics and experimental animation/art. Students will also become more familiar with the process of rendering to create the necessary polish for their animations/visualizations. CG Lighting, camera work, and material shading are just a few of the many topics covered in this course.
Prerequisites: 15-104 Min. grade C or 62-150 Min. grade C

60-128 IDeATe: Real-Time Animation

Fall: 10 units
An introductory course that explores improvisational strategies for making animation within real-time computer graphics frameworks. Advancements in motion capture technologies, real-time 3D computer graphics engines, and visual programming tools for AV synthesis provide open frameworks for the exploration of animation in spatial and interactive contexts. Studio work will explore real-time animation in a variety of contexts, including screen-based interaction, site-specific installation, and spatial immersion. Conceptual frameworks drawn from the histories of video art, animation, and immersive media design will inform collaborative group work and class discussion. Students without the prerequisite may register by instructor permission.

60-131 Foundations: Sculpture

Fall: 10 units
Foundations: Sculpture I is an introductory studio course in concepts, techniques, and tools for the fabrication of three dimensional physical works. The studio course introduces both digital and physical fabrication methods to translate ideas and materials into 3D forms. We will cover measuring, drawing, planning, pattern making, and construction techniques for cardboard, fabric, recycled materials, and a variety of mixed media; as well as the use of additive materials like paper clay. Through technical demonstrations, assignments, and hands-on explorations, students will learn how to make use of equipment in our sculpture labs such as laser cutters, sewing machines, and a variety of hand tools. Concepts explored as a group include physical and sensorial properties such as scale, weight, and materiality; as well as deconstruction / disassembly, reconstruction / reassembly , transformation, translation, function, dysfunction, and utility. Our experiments will prompt us to consider relationships between objects, bodies, spaces, and society; as well as between technology, craft, form, and language; ultimately exploring how to use the making of 3D objects as both a communicative tool and a practical tool for life. No prior knowledge or experience in the field is required to take this course. No prior knowledge or experience in the field is required to take this course.

60-135 Foundations: Sculpture II

Spring: 10 units
Foundations: Sculpture II is an introductory studio course in concepts, techniques, and tools for the fabrication of three dimensional sculptural works in wood and metal. This studio course introduces physical fabrication methods to translate ideas and materials into 3D forms. We will cover measuring, drawing, planning, subtractive and additive processes, joinery techniques for wood and metal, and a variety of materials in combination with these construction techniques. Through technical demonstrations, assignments, and safe hands-on explorations, students will learn how to use equipment located in our woodshop and metal shop, including major saws and sanders, hand tools, metal saws, and MIG welders. This class will explore concepts and histories related to functional object-making and utility; as well as sculpture in relation to space and site. Through presentations, readings, and class dialogue, students will be introduced to contemporary artists working across 3D physical media and installation, with special attention to the relationship between idea and materiality. Our experiments will prompt us to consider relationships between objects as architectures, bodies, spaces, and society; as well as between technology, craft, and language; ultimately exploring how to use the making of 3D forms as a communicative tool.

60-136 Ceramics for Non-Majors

Intermittent: 10 units
An introduction to three-dimensional form in clay, with access to our ceramics facility and kiln firings. Skills covered include hand building, sketching and modeling for larger fireable clay forms, throwing on the wheel, and basic glazing techniques. Discussions will include contemporary artists working in ceramics, as well as historical examples, and various approaches and techniques for working in clay.

60-137 Physical Computing for Non-Majors

Intermittent: 10 units
TBA

60-141 Black and White Photography I

Fall and Spring: 10 units
This course will teach you the basic craft of photography from exposure of the negative through darkroom developing and printing to print finishing and presentation. Content includes student presentations, class discussions, shooting assignments, darkroom sessions and class critiques. We will concentrate not only on the technical aspects of photography, but also the aesthetics of seeing with a camera. The course concentrates on photography as a fine art and #8212; what is unique to it and the concerns that are shared with other visual arts, such as composition, tonal values, etc. and aims to equip students with an understanding of the formal issues and the expressive potentials of the medium. Use your own 35 mm camera, or borrow one from us for the semester. Students are responsible for the cost of photo paper and film, and a lab fee is charged for the course.

60-142 Digital Photography I

Fall and Spring: 10 units
This course explores digital photography and digital printing methods. By semester's end students will have knowledge of contemporary trends in photography, construction (and deconstruction) of photographic meaning, aesthetic choices, and the use of color. Students will learn how digital cameras work, proper digital workflow, RAW file handling, color management and Adobe Photoshop. Through the combination of the practical and theoretical, students will better define their individual voices as photographers. No prerequisites.

60-150 Foundations: Drawing

Fall: 10 units
Foundations: Drawing is a vital foundation for your interdisciplinary studies in art. This course will concentrate on the traditional elements of drawing and design: structure, line, shape, texture, motif, gesture, value and composition. You will be introduced to figure drawing, portraiture, perspective, and media experimentation. By the end of the semester, you will understand the importance of drawing as a visual language as well as a means of thinking. You will be expected to expand your mindset of what constitutes drawing and apply skills, knowledge and ideas from other studio classes and academic studies to your work.

60-170 Foundations: Paint/Print

Spring: 10 units
Foundations: Paint/Print introduces you to color, paint, printed multiples, and digital imaging to expand upon the techniques, concepts and materials used in contemporary two dimensional image making. You will work predominantly in drawing and painting (water based media), but will also have opportunities to experiment with screen printing, risograph, image transfers, and digital output. With an emphasis on material exploration, you will investigate how scale, medium, and color support or distract from the intention of your artwork. You will think about how contemporary artists do visual research in our image and media saturated world, and what it means to appropriate, collage, produce memes, and/or publish in multiple media. Working in multiples and in series, you will practice working iteratively, producing deeper visual exploration of your artistic concept and intention.

60-200 Sophomore Review

Fall and Spring
Students present their work and their ideas about their work to a faculty committee. A successful review is required for advancement to the junior year. Although this is a non-credit course, it is required of all Art (BFA, BHA, BSA, and BCSA) sophomores.

60-201 Intermediate Studio: Social Practice

Fall: 10 units
In recent years, socially-engaged art projects that invite exchange, imagine new social relationships, and provoke individual and collective action have gained increasing prominence. These projects can double as a barter network, a walking tour, a residency program, a protest, or even a post-natural history museum. Rather than being the result of a solitary artist working within an isolated studio, social practice projects are driven by the desire to connect, to look outside oneself in meaningful and tangible ways, and to impact daily life within specific communities. Through the production of work that intersects with a variety of publics, students in this class will use their art practice as a means for directly engaging with the world around them.

60-203 Intermediate Studio: Museum as Resource

Intermittent: 10 units
This course, held within the Carnegie Museum of Art, will explore the museum as a resource for research, experimentation, and development. Students will investigate the ways museums can intersect with their creative disciplines and fields of study, and look at how its unique combination of internal and external assets can be utilized within their practice. We will look beyond the museum as a platform for exhibition and programing, and instead consider its functionality as a classroom and a laboratory. We will approach our time in this course as a research residency, prioritizing exploration and idea development. We will study the history of museums as sites of research for humanities, arts, social sciences, and STEM, and consider how as community art spaces, they're also sites of wonder and play. There will be readings, presentations, class discussions, visits from museum staff and working artists, and creative projects. Students will collaborate but also work toward the development of an individual project.

60-204 Futures

Intermittent: 10 units
In Futures, students will be asked the question, "what if?" Looking backwards and forwards students will grapple with what futures might be possible, impossible, desirable, undesirable and more. Throughout the class, students will explore critical and imaginative world-making and utopian, dystopian, and ambiguous scenarios from a variety of perspectives through the act of making. In addition to speculating and inventing futures, students will explore various histories of the future - through mythologies, origin stories, science fiction, futurist movements across cultural contexts, and more. Students will respond to theory-driven prompts and are encouraged to take risks and explore a variety of different approaches to art-making, as each assignment will not have a specific medium requirement.

60-208 Alternative Photography: Contemporary Antiquarian Printmaking

Intermittent: 5 units
This course will explore alternative photographic techniques and concepts in an effort to extend the boundaries of the photographic image. Through the course we will investigate contemporary digital imaging techniques and apply them to turn-of-the-last-century hand-applied emulsions. Subjects covered are digital imaging, digital negative printing and workflow, hand-applied emulsions, alternative uses of Polaroid photography, and concepts and theory of the still image. As we move through the course we will also consider the theory and history of photography and create images that are not standard in today's imaging practices. A diverse range of contemporary photographic work will be presented to increase students' visual awareness and understanding of the possibilities inherent in the medium. Through work/review sessions, students will evaluate their own ideas and judgments in pursuit of a well-communicated image.

60-211 Intermediate Studio: Sound + Vision - Intro to Audiovisual Art

All Semesters: 10 units
Sound + Vision is an introduction to the analysis and making of visual music, music video, expanded cinema and sound design for moving image media. Through presentations, screenings, demos and workshops students will study the influences of sound on the perception of space and time, and the impact audiovision has on our experience of moving image media. Working on their own and in small groups, students will complete short sound experiments and develop a variety of audiovisual projects.

60-212 Intermediate Studio: Creative Coding

Intermittent: 12 units
This is an intermediate level course in "creative coding": the use of programming and computation within the context of the arts. Ideal as a second course for students who have already had one semester of elementary programming (in any language), this course is for you if you'd like to use code to create art and #8212; AND you're already familiar with the basics of programming, such as for() loops, if() statements, objects, and arrays. Students will develop or deepen the skills and confidence to produce interactive, generative, and computational artworks; discuss their work in relation to current and historic praxes of computer art; and engage new technologies critically. Through rigorous programming exercises, students will develop mastery over the basic vocabulary of constructs that govern static, dynamic, and interactive form, with the aim of applying these skills to problems in creative explorations of transmediality, connectivity, generativity, and immersivity.

60-213 Intermediate Game Studio: Real Time 3D

Intermittent: 10 units
Game Studio: Real Time 3D is a hands-on intermediate course focused on immersive environments, world building, character creation, and real time experiences at the boundaries of gaming. On a conceptual level we'll look at practices within digital art and independent game development: virtual architecture and sculpture, walking simulators, avatar-based performances, and other playable media. On a technical level the course will introduce you to 3D modeling for real time applications (using Blender) and game engine workflows (using Unity) as a scaffolding for advanced courses. Students will work individually. Experience with game engines and 3D modeling is not required.

60-214 Photography and the Narrative of Place

Intermittent: 5 units
This half-semester course will use photography to develop understandings of our surrounding environments. Students will choose a single location to work in, photographing and researching its function in the community, its history, and its relationship to broader concepts and similar spaces. Weekly assignments will require students to work with a variety of photographic methods to construct a narrative that derives meaning from the complex connections between people, objects and the spaces they inhabit. Throughout the course, students will strengthen their understanding of the ways in which these tangible and abstract elements of our environments work together through in-class exercises, weekly discussions and critiques. The course work will culminate in a portfolio of the completed project. The class will study work and books by notable and emerging figures in the medium, including Robert Adams, Carolyn Drake, Roy DeCarava, Rinko Kawauchi, Alec Soth, Carrie Mae Weems, Zoe Strauss, Gregory Halpern, and Susan Lipper. Required readings will include essays and short stories by Wendell Berry, Rebecca Solnit, Teju Cole, Joan Didion, and Georges Perec.

60-216 Animated Storytelling:

Intermittent: 10 units
This course offers an interdisciplinary exploration of the interrelationships between literary and cultural productions, and the art of animation. It combines traditional humanities research in literature, history, and religion with contemporary digital humanities and visual storytelling techniques. Topics offered under this title include "Chinese Mythology and Animation" and "Chinese Ghost Stories and Shadow Play". "Chinese Mythology and Animation": In addition to close reading and critical examination of Chinese mythological tales, their social, historical and cultural origins and modern adaptations, this course also encourages students to create their own "mythological stories" through creative writing, animation, digital storytelling, and immersive media projects. "Chinese Ghost Stories and Shadow Play": Through reading and analysis of the 17th-century literary masterpiece, Strange Tales from a Chinese Studio, this course examines the mystical and often overlooked world of Chinese ghost literature and culture. Through practical studio work, students will explore techniques in traditional Chinese shadow play in relation to a broad cultural survey of world heritage shadow play traditions and contemporary media arts affordances. Students are encouraged to create their own ghost stories using various mediums.

60-217 Intermediate Studio: Experimental Hybrid Film - Video and Animation

Intermittent: 10 units
Digital production and post-production technologies have made hybrid moving images that combine live action, animation and image processing ubiquitous. Collage aesthetics and processes are present even in moving image media that appear naturalistic. While developing proficiency in Adobe After Effects and other production and post production tools, students explore the experimental world-building and storytelling possibilities of hybrid moving image media production. The course is structured around technical tutorials and workshops, screenings/discussions, and the creation of hybrid films combining animation, live action, and 2D/3D art. Artists whose work we will look to for inspiration include Yuge Zhou, Shana Moulton, Tabita Rezaire, Rachel MacLean, Chitra Ganesh, Jee Young Lee, Sondra Perry, Miwa Matreyek, Saya Woolfalk, Jacolby Satterwhite, Nunavut Animation Lab, Alex DaCorte, Grace Nayoon Rhee, Nam June Paik, Wangechi Mutu, Joo Young Choi, Cecile B. Evans, Ryan Trecartin, Oskar Fischinger, Karel Zeman, Sin Wai Kin, Winston Hacking, Russ Murphy (RUFFMERCY), Jordan Belson and many others.

60-218 IDeATe Portal: Real-Time Animation

Fall: 10 units
An introductory course that explores improvisational strategies for making animation within real-time computer graphics frameworks. Advancements in motion capture technologies, real-time 3D computer graphics engines, and visual programming tools for AV synthesis provide open frameworks for the exploration of animation in spatial and interactive contexts. Studio work will explore real-time animation in a variety of contexts, including screen-based interaction, site-specific installation, and spatial immersion. Conceptual frameworks drawn from the histories of video art, animation, and immersive media design will inform collaborative group work and class discussion. Students without the prerequisite may register by instructor permission.

60-219 Intermediate Studio: Stop-Motion Animation

Spring: 10 units
This intermediate animation studio explores principles and techniques of stop-motion animation. Students will explore a range of materials and methods through hands-on animation studio practice. Coursework emphasizes creative content production, experimentation, critical thinking, and collaboration. Pioneering works of historical avant-garde animation inform exercises and project prompts, drawing upon rich global histories and a wide spectrum of practitioners. A combination of rigorous studio practice, historical exposition, and theoretical discourse will equip students with the practical techniques and critical tools required to advance new dimensions in stop-motion animation. Studio work emphasizes collective productions that engage the principles of animation, material sensitivities, and expressive puppetry performance. Historical and theoretical examples guide coursework and class discussion. Screenings, practical tutorials, readings and discussions, will expose students to historical frameworks and contemporary currents in stop-motion animation, equipping students with a variety of conceptual, methodological, and technical resources.

60-220 IDeATe: Technical Character Animation

Fall: 10 units
Technical Character Animation is a deep dive into the fundamental concepts of character animation and "The Illusion of Life." This course will focus on building a foundation of body mechanics that demonstrate weight, balance, and authenticity. Through a series of strategically designed modules, students will gain a command of the 12 principles of animation, beginning with a ball bounce to more advanced block, spline, and polish workflows. This course is designed to give students exposure to the art of movement as it is done by animators in the fx, film, and game industries.

Course Website: http://tcacmu.weebly.com/

60-221 Intermediate Studio: Animation Workshop

Intermittent: 10 units
This is an open animation studio for students who want to improve existing animation skills and develop a personal animated short. The class will introduce a variety of techniques and concepts for animation production. Using both 2D and 3D tools, animation will be explored through short assignments designed to develop diverse skills and ideas. Each student will develop and produce a short animation. The class will engage in discussion and critique of each other's work along with examples of historic and contemporary animation.

60-222 Intermediate Studio: Digital Animation

All Semesters: 10 units
This is an open animation studio for students who want to improve existing animation skills and develop a personal animated short. The class will introduce a variety of techniques and concepts for animation production. Using both 2D and 3D tools, animation will be explored through short assignments designed to develop diverse skills and ideas. Each student will develop and produce a short animation. The class will engage in discussion and critique of each other's work along with examples of historic and contemporary animation.

60-223 IDeATe Portal: Introduction to Physical Computing

Fall and Spring: 10 units
This practical project-based course covers the basic technical skills (including electronics, programming, and hardware) needed to build simple interactive objects with embedded behavior using the Arduino microcontroller. A sequence of projects challenge students to apply their technical skills in creative ways. For the final project, the class works with a local group of older people who serve as design clients; students conjure and build them functioning custom interactive assistive devices of a practical or whimsical nature. Sensor inputs covered include an ultrasonic ranger, thermometer, light sensor, and human inputs like buttons and knobs; outputs to affect the world include actuators such as motors, LED lights, speakers, and haptic feedback devices. This introductory portal course has no technical prerequisites. Readings and guest speakers address topics including design, disability, and aging. See courses.ideate.cmu.edu/60-223/s2018/work for examples of prior student projects. Contact rzach@cmu.edu with any questions about the course. Students are encouraged to also take the micro course 99-353 IDeATe CAD and Laser Cutting.

Course Website: https://courses.ideate.cmu.edu/60-223 (https://courses.ideate.cmu.edu/60-223/)

60-224 Intermediate Game Studio: Interactivity

All Semesters: 10 units
Game Studio: Interactivity is a hands-on intermediate course focused on innovative and expressive forms of play, game design, and interactive storytelling. Structured as a series of short assignments, the class will involve the radical transformation of ordinary games into meaningful, original, or even impossible artworks, as well as the creation of narrative experiences at the boundaries of gaming. The course will cover basic elements of game design, common programming patterns in game development, and code-less game-making tools. Students will mostly work individually. No programming experience is required.

60-225 Intermediate Studio: Drawing with Machines

Intermittent: 10 units
This is an intermediate studio course in experimental drawing, generative art, computational design, and mechatronic mishegoss. Working at the boundaries of creative code, automation, physical materials, and gestural mark-making, we will explore personal and peculiar new approaches to digital imaging; the development of ultra-niche workflows as a mode of creative practice; and the use of algorithms and machine collaborators as nontraditional intermediaries between mind, hand, and paper. Drawings will be created using AxiDraw plotters and a variety of other specialized robots. Interested students should have JavaScript and/or Python programming experience equivalent to an introductory course such as 15-104, '110 or '112.

60-230 Intermediate Studio: Metals

Fall: 10 units
This course explores a variety of contemporary and traditional approaches to metal fabrication metal with a focus on hot and cold connecting mechanisms. Basic and intermediate metal fabrication techniques will be covered in this class, other sculptural media and connecting strategies will be developed on an as needed basis to accommodate individual projects and inquiries. Students will participate in self-directed research, assigned topic presentations, reading and group discussions, field trips, in addition to hands-on assignments and projects. Students can also incorporate additional non-metal materials of their choice to their projects. The goal for this course is to develop a stronger understanding of metal, it's history and role in the contemporary art in order to broaden your visual and material languages when build forms and to choose to put your sculptures together through deep and meaningful ways. It is recommended that a foundations sculpture course be completed as a prerequisite for this class.

60-232 Intermediate Studio: Interactive Objects

All Semesters: 10 units
Interactive Objects is an intermediate sculpture course that explores the concepts, techniques, and tools behind making interactive, responsive, or kinetic art works using physical computing and basic robotics. This studio course introduces students to building circuits, programming with arduino and processing, and integrating human-computer and human-object interaction into sculptures and installations. Through technical demonstrations, assignments, and hands-on explorations, students will build circuits, experiment with various sensors and actuators, program microcontrollers, re-wire existing electronics, and better understand electrical current and conductivity in order to harness it to create responsive elements and motion. Students in this course will be given priority access to the tools and equipment in our physical computing lab, as well as learn how to integrate these tools with our other digital fabrication facilities, including laser cutters and 3D printers, as well as our soft sculpture lab. Students will be expected to do technical assignments as well as individually-motivated self-driven projects based on research and ideas they find personally interesting and compelling. Our research, experiments, and projects will prompt us to consider the relationship between the digital and the physical; as well as the relationships between objects, bodies, technologies, spaces, cultures, and societies. No prior knowledge or experience in the field is required to take this course.

60-233 Intermediate Studio: Soft Sculpture

Intermittent: 10 units
Soft Sculpture is an intermediate studio course that explores the concepts, fabrication techniques, and history behind the creation of sculptural works of art made with fabric, fibers, and soft materials. In this class, we will discuss and demonstrate intermediate sewing and seaming techniques; pattern-making and pattern-following techniques for shapes, experimental forms, and garments; needle-felting and wet felting for wool; loop and cut pile tufting; inkjet printing on fabric; and some basics of weaving, and / or knitting / crochet, as well as embroidery, all with special attention to combining both hand-making and digital techniques when applicable. Projects in this class may include, but not be limited to: fabric forms with armatures; inflatables; stuffed forms; puppets and kinetic soft sculpture; wearables / garments / costumes; woven, tufted, or embroidered tapestries and quilts; and a variety of other experimental soft sculptures. As a class, we will discuss and share relevant art historical and contemporary examples of artists and artworks making use of fabric and fibers, as well as relevant texts and theory. Concepts explored as a group include the transformation of 2d pattern to 3D form; relationship of wearable works to the body and performance; the history of fabric and fiber craft in relationship to gender studies and underrecognized craftspeople; and ideas surrounding transformation and the relationship between craft and technology.

60-234 Intermediate Studio: Ceramics

Intermittent: 10 units
This course is a comprehensive introduction to the craft of ceramic art. Students will investigate clay as an art material for personal expression. The primary emphasis is on studio work leading to a portfolio of finished pieces by the end of the semester. The goal of this course is that students will be able to create expressive, three-dimensional clay forms with the proper understanding of the materials and process. The topics include, but are not limited to, various construction techniques such as soft and hard slab, pinch, coil, and wheel-throwing. Also, surface treatment techniques such as texturing and underglaze painting will be introduced. Discussions will include contemporary artists working in ceramics as well as historical examples and various approaches and techniques for working in clay.
This course will consist of demonstrations and lectures, research/writing assignments in and out of class, as well as work time. Students will develop a body of work within the context of the projects to express their individual voice. This course requires students to participate in critiques to analyze their own and others' work and identify strengths and weaknesses while promoting artistic growth and the exchange of ideas. No prior experience in clay is required.

60-236 Intermediate Studio: Mixed Media

All Semesters: 10 units
How Do Things Connect? Even when a sculpture may appear to be made with a single material there are often complex connections between many elements that are intended to either be visible or invisible. How do physical connections between materials and objects affect our visual experience? Can the ways pieces connect create or reinforce meaning in an object? Might you need to invent your own forms of joinery for a sculpture? This class focuses on a variety of contemporary approaches to making mixed media sculpture with an emphasis on how things connect both physically and conceptually. Students will learn a wide range of techniques for assembling dissimilar materials including hot and cold metal joints, wood joinery, adhesives and kinetic and flexible joints. Basic metal fabrication and intermediate wood constructing techniques will be developed on an as needed basis to accommodate individual projects and inquiries. Through in-class practice, assignments, research, presentations, readings, and critiques students will take on self-directed projects that explore how things connect in a deep and meaningful way. The goal for this course is to develop a stronger understanding of materials in order to broaden your options when considering how you choose to put your sculptures together. Connections between parts are just one more aspect of developing your own personal visual language. It is recommended that a foundations sculpture course be completed as a prerequisite for this class.

60-237 Intermediate Studio: Electronic Sculpture

All Semesters: 10 units
Interactive Objects is an intermediate sculpture course that explores the concepts, techniques, and tools behind making interactive, responsive, or kinetic art works using physical computing and basic robotics. This studio course introduces students to building circuits, programming with arduino and processing, and integrating human-computer and human-object interaction into sculptures and installations. Through technical demonstrations, assignments, and hands-on explorations, students will build circuits, experiment with various sensors and actuators, program microcontrollers, re-wire existing electronics, and better understand electrical current and conductivity in order to harness it to create responsive elements and motion. Students in this course will be given priority access to the tools and equipment in our physical computing lab, as well as learn how to integrate these tools with our other digital fabrication facilities, including laser cutters and 3D printers, as well as our soft sculpture lab. Students will be expected to do technical assignments as well as individually-motivated self-driven projects based on research and ideas they find personally interesting and compelling. Our research, experiments, and projects will prompt us to consider the relationship between the digital and the physical; as well as the relationships between objects, bodies, technologies, spaces, cultures, and societies. No prior knowledge or experience in the field is required to take this course.

60-240 Unfolding Environments: The Intersection of Person and Place

Intermittent: 10 units
In this course students will use photography to develop projects that study our social environments and personal landscapes. This studio explores the ways photography can combine form and concept to derive meaning from place. Students will be assigned two projects for the semester. The first will be a brief study of a familiar space. The second will comprise the remainder of the semester, concentrating on a single location of the student's choosing. Students will photograph and research their chosen place's function, its history, and its relationship to broader concepts and comparative spaces. A series of prompts, readings, lectures, and critiques will help students build their project and develop new ways to approach their subject matter as they create a long-form narrative.

60-241 Black and White Photography II

Fall and Spring: 10 units
Black and White Photography II continues developing your technical skills in analog photography by introducing medium and large format cameras and prints. Large format view cameras remain the state of the art in control and quality in both film and digital photography. These cameras as well as unusual panoramic and pinhole cameras will be supplied. This course emphasizes aesthetic development and personal artistic growth through individual tutorials and group critiques, and will help to build professional level photography skills. Additional topics include digital printing and negative scanning, advanced monotone printing methods, and a focus on exhibition and folio presentation. Students are responsible for the cost of photo paper and film, and a lab fee is charged for the course.
Prerequisites: 60-141 or 62-141

60-242 Digital Photography II

Intermittent: 10 units
Digital Photography II combines digital and analog processes in both color and black and amp; white. Students will gain experience with digital workflow, analog to digital conversion, virtual drum scanning and large format digital printing. Topics include trends in contemporary photography, professional practices, project development, narrative and serial work, and portfolio presentation. Students will be expected to develop their own self-directed projects throughout the semester culminating in a cohesive portfolio of their work. Readings, assignments, artist visits, critiques and discussions will give context to the practical work and help develop a wide ranging familiarity with the subjects.
Prerequisites: 60-142 or 60-141 or 62-142 or 62-141

60-244 Contemporary Photo Theory

Intermittent: 9 units
Because, you know, the photographs are more a question than a reply. (Sebastiao Salgado) A photograph is a moral decision taken in one eighth of a second, or one sixteenth, or one one-hundred-and-twenty-eighth. (Salman Rushdie) This seminar investigates current topics in photography and the image; our goals are twofold: identification of photo theory as it applies to current practice from both the viewpoint of maker and consumer. The course is designed to address philosophical issues for photographers working now and will favor conversation over written work; students are expected to fully participate in critical analysis and discussions. Readings include works by Roland Barthes, Stephen Shore, Susan Sontag, Hollis Frampton, John Szarkowski, Robert Adams, Italo Calvino, Berenice Abbott, John Berger and James Elkins. No pre-requisites.

60-245 Portrait Photography

Intermittent: 10 units
Portraiture maintains a unique standing in photography for its direct and collaborative relationship between an individual and a photographer. This course will examine this relationship and the larger contexts which provide the conceptual framework for deriving meaning and understanding from an image of another person. We will study the theoretical and practical aspects of portrait photography in both studio and environmental settings, providing students with an understanding of the genre by developing both technical and conceptual skill sets. Students will utilize analog and digital equipment, learn studio lighting techniques, develop approaches to working with natural light, and explore methods of printing and presentation. Students will gain knowledge in the development of portraiture through the work of notable figures in the medium's history and contemporary field, including August Sander, Dorothea Lange, Walker Evans, Dawoud Bey, Milton Rogovin, Rineke Dijkstra, Zoe Strauss, Susan Lipper, Justine Kurland, Stefan Ruiz, Larry Sultan, Carrie Mae Weems, Roy DeCarava and Alec Soth. Class discussions, readings and critiques will provide an outline for completing both single and serial image assignments.

60-250 Intermediate Studio: Painting

Fall: 10 units
This course serves as an introduction to technical, conceptual and historical practices of painting. Through a variety of painting experiences and presentations using oil media, students progress from observational exercises and exposure to materials and techniques to developing personal processes, imagery and ideas. Class sessions include technical demonstrations, illustrated lectures, personal and group critiques.
Prerequisites: 60-157 or 60-150

60-251 Intermediate Studio: Print Media

Fall: 10 units
Printmaking is a process based medium that produces multiples of original artworks. Students will create four works on paper using the following printmaking approaches: Relief (carved), Intaglio (engraved), Lithography (planographic), and Screen Printing (stencil). Each technique's unique set of materials, processes and aesthetics will be explored. This course focuses on traditional tools and processes, but will include utilization of digital images and sources through a critical lens. While primarily focused on the learning of fundamental techniques, the class will also also expose students to ways that Print Media can be a tool (physically and conceptually) in contemporary practice. Open to sophomores in the School of Art, or by instructor permission.
Prerequisites: 60-157 or 60-150

60-252 Intermediate Studio: Color

Intermittent: 10 units
In this course, students will learn to employ a wide range of color theories and color systems through hands-on exercises and studies. Studies will be done primarily in paint, with some use of collage and digital media. These exercises will be aimed at mastering a variety of color approaches that will be applicable to each student's own artistic practice. Students will develop, based on their own interests, a cohesive body of work in which to practice and expand on the skills learned through the directed exercises. Studio work will be augmented by lectures, demonstrations, critiques, readings and critical discussion of writings about color.

60-253 Intermediate Studio: Fundamentals of Figuration

Intermittent: 10 units
This studio-based figuration course is designed to introduce students to the fundamentals of the figure. This class will provide a solid understanding of how to begin working with the human form in space. Students will learn how to block out and establish the major structural masses of the body through gesture drawing. We will learn to look "through" the body, understanding its logical underpinnings through rigorous study of anatomy and physiology, both by lecture and observation. Students will work from the skeleton, draw and paint musculature, and spend extensive time working from the live model or models. Both dry and wet media are encouraged: graphite, charcoal, metal point, colored pencils, pastels, ink, watercolor and gouache can be openly explored in this course.

60-254 Intermediate Studio: Photography

Intermittent: 10 units
A photograph captures a moment of time and freezes it in place. In this introductory course, students will reflect on their own lives, capturing people, places and things, through portraiture, interior space, landscape and still lifes. We will consider the formal qualities of light, composition, color, sequencing, editing and print as we take, shape and print our own digital photographs. The course will be framed by field trips, readings, discussions and presentations that look at how artists make photographs.

60-255 Intermediate Drawing Studio: Trails of Touch

All Semesters: 10 units
We will emphasize technical aspects of traditional and performative drawing that is the compulsion to leave tangible traces of our presence. The sensual interaction of body as instrument in contact with a surface will be explored and analyzed as we develop our perceptual, conceptual and imaginative skills. Experimentation in and devotion to our studio practice will extend our capabilities and heighten our sensitivity to a diverse range of materials and methods of mark making and rendering. Scratching, scraping, scoring, caressing, stroking, burnishing, brushing, dragging, wiping, scrubbing and erasing are some of the means through which we will record our observations, thoughts and feelings on a wide range on substrates. Formal presentations, technical demonstrations, visiting lectures, museum trips, and film screenings complement studio time devoted toward independent and class projects. Material fee for reduces cost for special papers and supplies like silver point, traditional gesso, large paper rolls etc.

60-258 Intermediate Studio: Screenprint

Intermittent: 10 units
This course is a comprehensive and intensive study of Serigraphy (screenprinting), one of the most versatile and contemporary of printmaking techniques. The course is focused upon the mastery of this process. Students will explore multiple methods of image making (from hand-drawn to digital imaging) and will be introduced to CMYK printing. The emphasis of this course is on artistic work on paper, but will also be exposed to the ways that screenprint can work across a wide range of different media: from 2D (paper, canvas, cloth) to 3D (book forms, sculpture, installations) and utilizing printed multiples in participatory and exchange based artworks.

60-260 Intermediate Studio: Imaging

Fall: 10 units
TBA

60-263 Intermediate Studio: Graphic Novel

Intermittent: 10 units
In this course, students will critically and creatively engage with the medium of comics to learn how to better communicate their ideas in this format as well as challenge its boundaries. A substantial portion of the course will focus on familiarizing students with the basics of storytelling in a sequential narrative format and creating opportunities for students to discover, hone and explore their own voice and style. In addition to creating new work, students will also explore the history of comics and the origins of the "modern" graphic novel. Students will also be exposed to both graphic and non-graphic artists whose works has challenged and redefined the genre. We will explore these artists in order to understand how our own work borrows from and draws upon a rich lineage. Students will also be expected to think beyond the commonly accepted notions of comics and to question the relevancy of their work in this medium. Finally, each student will produce a new body of work that will culminate in the production of a 4-5 "page" "sequential" narrative.

60-276 Photography and the Ephemeral

Intermittent: 10 units
Photography and the Ephemeral is an interdisciplinary photography course designed for students of various disciplines interested in exploring the relationship between images and the ephemeral: things that last only a short moment in time. Throughout the semester students will explore different themes and ways to approach ephemeral imagery such as; still lifes, installations, performances for the camera, and the short-lived nature of images both physical and digital. Participants explore these themes through weekly presentations, discussions, assignments, and critiques.

60-277 Constructing Meaning with Photographs

Intermittent: 5 units
Constructing Meaning with Photographs will discuss ways in which multiple images can be used to expand upon and clarify the intended message of individual photographs and a visual series in whole. Throughout this half-semester studio course, students will work through a variety of approaches to image sequencing and editing. At the start of the course, students are expected to have a significant body of completed work or an easily accessible archive of print resolution images (100+ images) to work with for out of class assignments. Using their archive, they will edit sequences for different presentation methods including gallery exhibitions, books and zines, websites, linear displays, and print portfolios. Weekly in class editing exercises will conceptually correspond with out of class assignments to allow for experimentation and conversation around different approaches to photographic sequencing. Lectures, readings, guests, exhibition visits, and book presentations will provide additional support for understanding how to use photographs in series to build meaning.

60-278 Infinite Rooms: Photography and Installation

Intermittent: 10 units
Infinite Rooms is an interdisciplinary photography course designed for students of various backgrounds interested in exploring the relationships between place, images, and installation. This course will investigate the methodologies of how a place is documented, constructed, and imagined in photographs. This class will introduce a critical survey of images, films, and texts from artists who work at the intersection of installation and images. Throughout the semester various prompts will introduce different frameworks for thinking about photography and installation, such as the dramatic; the psychological; and the personal. Students will utilize digital and analog equipment, learn how to use a large-format view camera, learn studio lighting techniques, develop approaches to working with natural light, and explore methods of printing and presentation.

60-279 Photography and the Ineffable

Intermittent: 10 units
This course explores the relationship between photography and the indescribable, intangible, and hard-to-see. From the spiritual, to the sublime, to the abstract; we will review different frameworks for thinking about the ineffable and how it relates to photographic work. Students will explore these themes through weekly presentations, discussions, assignments, writing workshops, and critiques. We'll look at artists who think critically about photographic representation and investigate a heightened sensorial interpretation of the world. This class will encourage experimental methods and approaches to photography.

60-333 IDeATe: Animation Rigging

Spring: 10 units
Animation Rigging explores processes for building digital skeletons and control systems to drive computer animated forms. This course investigates vital techniques and concepts to create expressive, fully articulated characters for computer animation, film, and game production. Beginning with rigging fundamentals, coursework will advance through various systems and methods that are needed to convey motivated movement and expression in a variety of character forms. Certain key topics include kinematics, joint orientations, driven keys, direct connections, space switching, corrective blend-shapes, custom attributes and graphic user interfaces (GUIs), skinning and deformation. Additionally, coursework provides an introduction to scripting methods for rig creation, including expressions, Python, and MEL. Students will be provided a valuable range of tools that meet production standards for animated film and game creation, as well as a necessary conceptual framework to enable complex problem solving at all levels of rig creation. Anyone interested in the artistic and technical sides of computer animation are encouraged to enroll. Previous experience with Autodesk Maya/3D animation is preferred.

60-335 IDeATe Special Topics in Animation: Story Development

All Semesters: 6 units
IDeATe Special Topics in Animation: Story Development provides insight and strategy for animated storytelling in film and media production. This mini- studio seminar draws upon diverse historical examples to highlight storytelling strategies across cultures and production paradigms. Over this seven-week course, students will develop their own original stories in the forms of scripts and pitch packets, to be later produced as animated content. Discussion and critique will cultivate storytelling skills with greater understanding for audience, form, and cultural context, providing essential tools for communication through animation.

60-337 IDeATe Special Topics in Animation: Storyboarding

All Semesters: 6 units
IDeATe Special Topics in Animation: Storyboarding focuses on the translation of stories and ideas into sequential image boards for animation. This mini-studio seminar exposes the visual grammar of filmic storytelling through analysis and production of storyboards and animatics. Over this seven-week course, students will develop their own original storyboards and animatics to be later produced as animation. Analysis of historical examples will reveal strategies for storytelling through sequential narrative and animation. Discussion and critique will cultivate storytelling skills with greater understanding for audience, form, and cultural context, providing essential tools for communication through animation and design.

60-343 Professional Practices in Photography

Intermittent: 10 units
This studio course will introduce students to the working methods of professional photographers and artists. For the first half of the course students will develop a substantial body of visual work. They will then use that work in the second half of the semester to produce portfolios across a variety of media (digital, print, web, exhibition, etc.). Throughout the process they will develop skills in constructing and completing projects, cultivate their personal vision and aesthetic tastes, explore methods of disseminating their work to larger audiences, establish time management and planning around long form projects, and acquire an understanding of the marketing, outreach and community building necessary for working artists to build and sustain a career.
Prerequisites: 62-141 or 60-141 or 62-142 or 60-142

60-350 Professional Development for Creative Practices

Fall and Spring: 9 units
This course is intended to expose students studying in creative fields to the basic principles, skills and functions of business used every day in creative practices and industries. Supporting a creative practice - whether an individual studio practice, a temporary collaboration or commission, or an incorporated business or non-profit - all require a foundational knowledge of basic organizational, legal, and financial structures and practices. Throughout this seminar-style course, students can expect to develop a starting knowledge of basic business concepts; learn a foundational understanding of ethics and best practices in business; develop problem-solving skillsets and methodologies for managing creative projects and programs; and practice applying these learnings to their own creative practices. Topics covered will include, but are not limited to: basic business structures; intellectual property; Contracts and employment; methods for generating income and fundraising; financial management and taxes; marketing and communications; negotiation and compromise; and elements of business strategy development. This course assumes no prior background in business education or administration experience.

60-351 Entering the Artworld: Mapping a career path in an uncharted artworld

Intermittent: 9 units
Building a career as an artist is a nuanced endeavor that looks different for each individual. Unlike other fields, where a set professional structure ushers graduating students into a career, the artworld is self-navigated. This course gives artists a foundational understanding of the multifaceted profession they are entering, where they will learn about key support structures like museums, commercial galleries, DIY spaces, residencies, and much more. They will also train in a wide range of concrete skills, including writing artist statements, creating a network, building an online presence, and pricing an artwork. The goal of this class is to give students the awareness, skills, and resourcefulness they need to chart their own course as a studio-based fine artist in an artworld that's ever-changing.

60-352 NOISE: Toward a Critical Theory of Sound and Hearing

Intermittent: 9 units
This seminar will explore audio art in its widest sense: sound sculpture and installations, radio art, the soundtrack, just about anything audible but not conceived as music. Special focus on the production (and reception) of sound by artists, amplifying those creative efforts that, in having explored acoustics, soundscapes, and listening, might also serve to inspire students to incorporate sound in their own work. Contemporary critical theory, by and large, is still glaringly silent on aurality and auditory phenomena; it seriously fails to consider sound as an object of study, instead focusing quite exclusively on visual culture (film, TV, video, computer screens, which are, of course, technologies of vision and sound). This seminar will address this roaring silence by examining some suggestive but disparate theoretical work related to sound and by engaging with a range of artistic practices that explore the production and reception of sound itself.

60-353 Critical Studies: Media Performance - History, Theory, and Contemporary Practice

Intermittent: 9 units
During the last decade of the twentieth century, new technologies have transformed the way we think about live performance. By examining the use of media (analog and digital) across the areas of sound/music, dance, theater, performance art, gaming, and installation, this course will traverse multiple theories and practices of performance history. With an eye to how changing theories of performativity have influenced how artists think about what it means to "perform," this seminar, in a sense, will be engaged in both philosophical and aesthetic research about how technology has changed the conventions of performative artistic practice. What was the role of technology in the dematerialization of the object of art? How have ideas about virtual, parallel worlds changed the way artists think about the "performing body?" If technology once acted as a prosthetic device, increasing an artist's sensual and perceptual world, what happens to the role and impact of an artist's work in the seemingly inert realms of programming or the increasingly autonomous areas of Robotic Intelligence? What does art look like in a post-internet age?

60-356 Critical Studies: Once Upon A Time: A Survey of International Fairy Tale Film

Intermittent: 9 units
Fairy tales have been a part of cinema from the very beginning. Since George M and #233;li and #232;s' 1899 Cinderella, filmmakers from around the globe have continuously returned to the genre not only for escape into enchanted worlds, but also for social critique, with stories of injustices avenged, class oppression overthrown and gender roles expanded. This course decenters the conception of the genre fixed by Disney and Hollywood to examine fairy tale films from around the world. We will encounter a poetics and politics of wonder in international films about transformation, wish-fulfillment and reversals of fortune that deliver a situated counterpoint to the hegemony of a colonizing and commercialized poetics of magic. The transformative power of fairy tales can be approached from a variety of perspectives. We will analyze how stories themselves function as shape-shifters, morphing into new versions of themselves as they are retold and as they migrate into other media. Beyond looking at the films as texts we will consider the affective qualities of how their formal and aesthetic aspects create wonder, delight, humor, anxiety and terror. What are the stakes of the fairy tale's varied transformations today, for whom? In this class we will watch and discuss films, stories and historical and critical texts. Films screened and discussed include: Kwaidan (Japan, 1964), To Sleep With Anger (USA, 1990) El Laberinto del Fauno (Mexico-Spain, 2006), Green Snake (Hong Kong, 1993), Peau d'Âne (France, 1970), Tropical Malady (Thailand, 2004) Sampo (Finland/Soviet Union, 1958) and many more. Assignments include: short written responses to the films and readings, study group activities, and one collaborative creative research project.

60-357 Critical Studies: Nation's Nature - Art, Environment and the American Landscape

Intermittent: 9 units
This course will explore how representations of the American landscape create an ever-shifting national identity. Slogans like "Make America Great Again" trade on nostalgia and a desire for a fixed narrative but ignore the experience of marginalized groups. The actual environment, meanwhile, is being destroyed by the same people who use it as a symbol of power and purity. From painting to photography, print, animation, sculpture and social practice, we will consider how art has fueled or challenged nationalism, patriotism, American exceptionalism. Readings in historical texts, narrative essays and cultural geography, along with discussions and presentations will provide art students a broader context for their own research.

60-359 Critical Studies/Adv. ETB: Playful theory: critical topics in game culture

Intermittent: 9 units
This hybrid seminar course combines games studies, game criticism, and research-based art to examine the history, contexts, and frontiers of play. Digital and analog games will be approached through a variety of lenses: games as culture, systems, technologies, commodities, etc. While not geared toward the technical development of videogames, the coursework will include creative projects beyond writing and discussion. The goal is to provide conceptual tools to enrich your design/art practice and tackle a variety of academic topics in a playful but rigorous way.

60-362 Critical Studies: Art Writer: Writing as Object, Criticism, and Experiment

Intermittent: 9 units
ART WRITER will strive to bring together the intersecting discourses of artists' use of writing as an object, exploring experiments by artists, poets, novelists and critics who use language and theory as invention. The idea of experiment implied here emphasizes the urgency that art writing moves beyond its own history, beyond the received understanding of its proper practices in order to propose new modes of critical reflection. The form and material force of language will be explored through the conceptual and critical work of Harryette Mullen, Fatimah Asghar, Jamaica Kincaid, Ta-Nehisi Coates, Frances Stark, Kathy Acker, Samuel Delaney, Trisha Low, Glenn Ligon, Brian Kim Stefans, Pajtim Statovci, Tan Lin, Adam Pendleton, just to name a few. International projects of Art and Language, Fluxus, the Dark Room Collective, Los Contempor and #225;neos, as well as more recent iterations will be investigated/researched. This is a writing intensive seminar with experimentation at its core. Members will workshop their writing: revise, rethink, perform, and publish.

60-364 Critical Studies: Decolonize Now!

Intermittent: 9 units
This course explores ways to "delink" artmaking and its history from the "colonial matrix of power." Examining critical discourses surrounding decoloniality, as well as post-coloniality, students will test and complicate foundational concepts such as hybridity, empire, migrant subjectivity, consciousness of the Borderlands, post-occidental reason, pluriversality, and transmodernity. Over the duration of the semester, students will be tasked to form a corroborated viewpoint of their own in relation to theoretical texts by Walter D. Mignolo, Frantz Fanon, Okwui Enwezor, Gloria Anzaldúa, Rey Chow, Hamid Dabashi, Gayatri Chakravorty Spivak, Rob Nixon, Michael Hardt and Antoni Negri, Edward Said, Homi Bhabha, Paul Gilroy, and others. Artists under consideration may include H and #233;lio Oiticica, Walid Raad, Tavares Strachan, MLT Collective, John Akomfrah, Dahn Vo, Trinh T. Minh-ha, Lubaina Himid, Jimmie Durham, Jeannette Ehlers, Martine Gutierrez, Coco Fusco, Lorraine O'Grady, Judy Baca, and ASCO. Exhibitions such as The Other Story: Afro-Asian Artists in Post-War Britain (1989-90), All the World's Futures, Venice Biennale (2015), Verboam and #233;rica (2017), Decolonizing Appearance (2018), Memories of Underdevelopment: Art and the Decolonial Turn in Latin America, 1960-1985 (2018), May You Live In Interesting Times, Venice Biennale (2019), The Warmth of Other Suns: Stories of Global Displacement (2019), and When Home Won't Let You Stay: Migration through Contemporary Art (2019) are crucial in understanding the framework of this class. Remember Anzaldúa's words: Because I, a mestiza, continually walk out of one culture and into another, because I am in all cultures at the same time, alma entre dos mundos, tres, cuatro, me zumba la cabeza con lo contradictorio. estoy norteada por todas las voces que me hablan simult and #225;neamente.

60-365 Critical Studies: Queer Power in Art Theory

Intermittent: 9 units
Queer power is a form of (anti-)knowledge that demystifies phallogocentrism and neuters heteronormativity. This class examines how queer theories empower - and can originate in - art making and its history. Over the course of the semester, students discuss recent publications in the field such as Rogers Brubaker's trans: Gender and Race in an Age of Unsettled Identities (2016) and Paul B. Preciado's Testo Junkie: Sex, Drugs, and Biopolitics in the Parmacopornographic Era (2013). Students also investigate recent exhibitions exemplifying oppositional epistemology such as Trigger: Gender as a Tool and a Weapon (The New Museum, 2017-18) and Hide/Seek: Difference and Desire in American Portraiture (National Portrait Gallery, 2011). Interweaving the canons of queer thoughts with newer voices such as Lee Edelman, Tim Dean, and Maggie Nelson, this class contextualizes Paul Mpagi Sepuya, Tschabalala Self, Wu Tsang, and other artists who embody queer power today.

60-369 Critical Studies: DEEP FAKE, AI and Beyond: Posthumanism & Contemporary Art

All Semesters: 9 units
Is Post-humanism just another kind of humanism? Is the idea of difference at risk when thought is no longer attached to a body? What are the possibilities of imagining a queer phenomenology - or a transhumanism that challenges the limits placed on gendered, sexualized, racialized and so-called "able" bodies? How are our concepts of affect and authenticity being transformed by ideas of robotic and artificial intelligence? What are the various forms of subjectivities generated by machine-learning enabled media? How are constructions of "cheapfakes," "shallowfakes," and "deepfakes" posing ethical dilemmas in information and world-making landscapes? This seminar hopes to excavate such questions and many more produced by examining the competing and shared perspectives developed by contemporary artists and critical theorists across posthumanist, transhumanist and new materialist paradigms.

60-372 Critical Studies: The Precarious Body in Contemporary Art

All Semesters: 9 units
This seminar will examine images and projects in contemporary art that deal with debates concerning ideas that had already begun brewing in the 1980s and early 90s, that addressed issues of institutional violence circulating under the guise of "discourse," or that delved into ideas of difference and alterity through the notion of "abjection." More recently, the idea of precarity has taken central stage as a way of thinking through, and taking action against, the kinds of structural oppression that deems certain groups of people vulnerable to repeated forms of aggression, poverty, illness, and displacement without protection. We will also explore a seemingly opposite corollary: the SUPERCLEAN a trope that exploits the capacity of certain technologies to present hygienic forms of representational violence at the level of the digitally manipulated image. We will read the work of Tung-Hui Hu, Zuzana Kovar, Judith Butler, Claudia Rankine, Pamela Lee, Frantz Fanon, Sarah Ahmed and study the projects generated by artists, such as Lygia Clark, H and #233;lio Oiticica, Superflex, Anicka Yi, Mika Rottenberg, Carolyn Lazard, Katherine Behar, Trisha Baga, Hito Steyerl, among others, as a way of interrogating these State mandated structures of material and psychic repression. A major part of the course will examine how contemporary artists responded, acted, and producedaddressing the precarious body as the site for political and aesthetic resistance.

60-374 Critical Studies: Picturing Asian America

Intermittent: 9 units
Asian American art is not Asian art. Asian art is not Asian American art. The conditions in which we make art in the United States have always been unique: our art has evolved to be antiracist, anti-patriarchal, and for the sake of the undercommons. Expanding oppositional consciousness, the historical context for our exploration and inquiry is enriched by Asian American literature and film; we welcome and renew the lessons of our shared minor feelings. This class also celebrates the Asian American history of collaboration with other BIPOC (Black, Indigenous, and People of Color) communities and the tradition of intersectional artmaking against the hegemonic canon.

60-378 Critical Studies: Science Fiction Film

Intermittent: 9 units
Science Fiction Cinema offers an idiosyncratic survey of the science fiction film genre. More than just a form of entertainment, science fiction is a powerful tool for exploring our hopes, fears, and dreams about the future. This class reveals how science fiction films often grapple with philosophical and ethical questions about the nature of humanity and our place in the universe. Together we will explore how filmmakers have used the science fiction film genre to explore both the timeless human condition and the complex issues of their time. In addition to studying the films themselves, we will consider the various cultural, social, political, and technological contexts in which they were created as well as how the films have themselves influenced society and culture. Additionally, we will examine the creative and technical innovations that filmmakers use to create stunning and thought-provoking works of art. Throughout the course, we will watch and analyze a variety of science fiction films, from international and independent productions like "World on a Wire", "Stalker" and "Advantageous" to blockbuster and studio productions like "Nope", "The Wandering Earth" and "The Matrix". Through weekly readings, film screenings, and class discussions, students will learn to analyze film as a creative medium of social commentary and critique. Assignments will include personal written responses to the films and readings, visual essays, and creative projects.

60-384 Critical Studies: Ecstatic Experience: Experimental Film & Video History/Theory

All Semesters: 9 units
"An Ecstatic Experience" is the name of Ja'tovia Gary's six-minute film made in 2015 that takes the idea of "ecstasy" and flips it on its head implying a radical reversal of pain and suffering into an affirmation of resistance and freedom. This seminar focuses on complex, risky experiments within both historical and contemporary practices of experimental video and filmmaking in which ideas about the ecstatic are explored across filmic and new media materiality, immersion, duration, sound design and mark-making. Reaching back to the kinds of ecstatic models used during the sixties and seventies, fluctuating between feverish dream-states, psychedelic trips, orgiastic burlesques, impassioned revolutionary plans (Nam June Paik, Paul Sharits, Ben Van Meter, Carolee Schneemann, Kenneth Anger, Stan VanDerBeek, Black Audio Film Collective), and racing forward to the legacy of that period, we will view and discuss a vast range of artists, such as New Red Order, Wu Tsang, Peggy Ahwesh, Leslie Thornton, Kevin Jerome Everson, Ja'tovia Gary, Cauleen Smith (just to name a few). Questions we will explore include: What does it mean to experiment? How have temporal, spatial and political parameters shifted? What new models have problematized and replaced earlier ecstatic models of media-inspired social change and experimentation?

60-385 Crit. Studies: Visual Pleasure - Patterning & Ornamentation in Contemporary Art

All Semesters: 9 units
In his influential essay, "Ornament and Crime," Adolf Loos questioned the use of ornaments based on a notion of progressive history, in which the past is subordinated to the future. Modernism universalism coated as purity and functionalism relegated notions of excess to the past, along with it, visual pleasure, ornamentation, patterning, and the use of saturated color in art, architecture, and design. This course focuses on the recovery of color, patterning, and ornamentation in contemporary art led by non-western, women, queer, and/or BIPOC artists as a resistance to western 'order' which deems these aesthetics 'primitive,' 'feminine,' and 'irrational.' We will use contemporary art, artistic movements, and artists as case studies to study how ornamentation and patterning can form networks of resistance by foregrounding visual pleasure and by underscoring healing and joy as ways to be in the world. There will be 2 guest lectures from artists, curators, and/or art historians and weekly readings. Artists to be discussed include Chris Ofili, Raqib Shaw, Guadalupe Maravilla, Mickalene Thomas, Saya Woolfalk, Devan Shimoyama, Nick Cave, Xenobia Bailey, Joyce Kozloff, Judy Chicago, Barbara Chase-Riboud, Valerie Jaudon, Miriam Schapiro, El Anatsui, Monir, and many others.

60-398 Critical Studies: Social History of Animation

Intermittent: 9 units
Social History of Animation will investigate the history of animation from early experiments with trick film through the development of major studios, to independent animation, web based work and emerging forms. Animation will be analyzed and discussed in relation to the social movements and technological innovations that affected animators and their work. This class will read related texts and view examples from around the world to explore animation as a means for personal expression and as a reflection of the context in which they were made.

60-399 Art History/Theory Independent Study

Fall and Spring: 9 units
A tutorial course in which an Art student works individually on a self-generated project under the supervision of a School of Art faculty member. Prior to enrolling in Independent Study, the student must complete an "Independent Study Proposal" form (available in the bins on the 3rd floor of CFA) which is signed by the faculty member and the Assistant Head of the School of Art. Prerequisite: Art junior or senior status, or by instructor permission.

60-400 Senior Review

Spring
Students present their work and their ideas about their work to a faculty committee. This review affords graduating students the opportunity to analyze and summarize their work, and to engage a faculty committee in discussion about issues that face an artist preparing to enter a career in art. Although this is a non-credit course, it is required of all Art (BFA, BHA, BSA and BCSA) seniors.

60-401 Senior Studio

Fall: 10 units
The primary goal of Senior Studio is to create a context for students to develop and realize an ambitious and self-defined creative project. With the guidance of faculty, each student will pursue their own artistic goals and develop their ability to sustain focused artistic activity while developing their own voice. Additionally, Senior Studio will help students to: Foster a community and shared sense of purpose in an atmosphere of mutual support, critical dialog, knowledge exchange and camaraderie; Cultivate and apply professional practice skills by preparing for life after graduation; Participate in studio visits with a multidisciplinary team of faculty, visiting artists and critics; Collaboratively produce a successful Open Studio event on the last day of the semester.

60-402 Senior Studio

Spring: 10 units
Students continue a comprehensive two-semester capstone project. Each student pursues an ambitious and cohesive body of work with guidance by a team of School of Art faculty. Multimedia, multidisciplinary, and collaborative work is encouraged. Studio work is supplemented by group critiques, workshops on writing, professional presentation skills, career preparation, and technical instruction as needed.

60-403 Senior Critique Seminar

Fall and Spring: 10 units
Senior Critique Seminar comprised of group discussions that analyze the conceptual and aesthetic frameworks that surround each student's individual studio practice. The course supports independent inquiry, mature studio practice and both an in-depth critical reading of visual art and an increased comfort in the articulation of ideas and processes. Each student can expect two or more hour-long critiques throughout the semester, paired with ample time for individual studio work. These course discussions will also be informed by the Visiting Artist Lecture series and concepts and concerns carried from studio and academic seminar classes.

60-406 Advanced ETB: Internet Resistance

Intermittent: 10 units
Through booms and crashes, colonizations and disruptions, IPOs and LOLZ, Internet has been a spectacular laboratory of social conflict. But what can artists do on the net beside tweaking their pitiful portfolios and sinking into social media malaise? What is the function of the network in the age of pervasive surveillance, fake news, and filter bubbles? How to Internet under the First Troll President of the United States? Internet Resistance is both a schizo-seminar about critical issues in cyberculture and a trans-media studio to develop terrible ideas for the networked society. http://internetresistance.molleindustria.org/
Prerequisites: 60-110 or 60-210

60-407 IDeATe: Experimental Sound Synthesis

Spring: 9 units
This is a course that will guide students into the world of experimental approaches to music and sound production, with particular emphasis in some of the key practices and concepts developed in the 20th and 21st centuries. We will examine a variety of ways in which sound works are made and perceived; understanding the historical perspectives and critical viewpoints of each approach through the application of hands-on practicum. The topics covered in the course are divided into three large areas: the art of sound, the use of technology in the production of sound works, and the creation of interdisciplinary sound installation. Students from different disciplines will work together to collaborate on the designing, prototyping and execution of a series of ambitious projects in response to the topics covered in class.

Course Website: https://courses.ideate.cmu.edu/57-344 (https://courses.ideate.cmu.edu/57-344/)

60-408 Advanced ETB: Expanded Cinema

Intermittent: 10 units
Expanded Cinema is an innovative course that redefines the traditional boundaries of cinematic expression. Through hands-on experimentation with real-time analog and digital audiovisual systems, students will create multimedia performances, live cinema and immersive nightlife experiences. Through a combination of theoretical inquiry, practical experimentation, and creative production, students will interrogate and expand the possibilities of cinematic experience. Collaboration lies at the heart of expanded cinema, often involving interdisciplinary partnerships between filmmakers, visual artists, musicians, performers and technologists. In this course, students will have the opportunity to collaborate with their peers from diverse backgrounds, fostering a spirit of experimentation, dialogue and collective exploration. Tools and techniques students will work with include hardware video switchers, multi-camera production, video synthesis, projection mapping, real-time compositing and special effects, experimental sound and music, Hydra, Cables GL, Touch Designer and more.
Prerequisite: 60-110

60-410 Advanced ETB: Moving Image Magic: Visual Effects and Motion Graphics

Intermittent: 10 units
Fly like Harry Potter, fall into Alice's looking glass, create new worlds, or take a head-trip into the inner reaches of your subconscious. It's all possible in Moving Image Magic! This course serves as an introduction to the creation of extraordinary cinematic visions using a variety of analog and digital tools and techniques. These include: digital compositing, miniatures, motion tracking, rotoscoping, matte painting, puppets and motion graphics. Primary software tools are After Effects and Photoshop with forays into, Motion, Resolve, Logic and Smoke. Prerequisites: Electronic Media Studio: Introduction to the Moving Image or instructor permission.
Prerequisite: 60-110

60-412 Interactive Art and Computational Design

Intermittent: 12 units
This is an advanced studio course in arts-engineering and new media practice, with a special emphasis for Spring 2016 on mapping and information visualization using geographic data. Topics surveyed in the course will be tailored to student interests, and may include: experimental interface design, locative and mobile media, data-driven activism, image processing and computer vision-based interactions, and other topics. Through a small number of exploratory assignments and a public capstone project, students will bolster interdisciplinary problem-solving abilities and explore computation as a medium for curiosity-driven experimentation. Enrolling students are expected to have demonstrable programming skills, without exception, beyond the level of an introductory class such as 15-112. Although the course will provide technical overviews of major visualization toolkits (including D3, Processing, and openFrameworks), assignments may be executed in the student's preferred programming environment. Graduate students should register for section 51-882, 60-712, or 62-726, which meets with the undergraduate sections 60-412 and 51-482.
Prerequisites: 15-110 or 60-112 or 15-112

60-413 Advanced ETB: Real-Time Animation

Intermittent: 10 units
An exploratory studio that considers improvisational strategies for making animation within real-time computer graphics frameworks. Advancements in virtual production, real-time computer graphics engines, and visual programming tools for AV synthesis provide open frameworks for the exploration of animation in spatial and interactive contexts. Studio work will explore real-time animation in a variety of contexts, including screen-based interaction, site-specific installation, and spatial immersion. Conceptual frameworks drawn from the histories of animation, video art and Expanded Cinema, and immersive media design will inform collaborative group work and class discussion. Students without the prerequisite may register by instructor permission.
Prerequisites: 60-110 or 60-210

60-414 Advanced ETB: Animation Art and Technology

Spring: 12 units
Animation, Art, and Technology is an interdisciplinary, Art and Computer Science, cross-listed course. Faculty and teaching assistants from computer science and art teach the class as a team. It is a project-based course in which interdisciplinary teams of students can produce animations across platforms from single channel to augmented reality. Most of the animations have a substantive technical component and the students are challenged to consider innovation with content to be equal with the technical. The class includes basic tutorials for work in Maya and Unity leading toward more advanced applications and extensions of the software such as motion capture and algorithms for animating cloth, hair, particles, and immersive technologies.
Prerequisites: 60-333 Min. grade C or 60-220 Min. grade C or 60-110 Min. grade C or 60-125 Min. grade C

60-415 Advanced ETB: Animation Studio

Intermittent: 10 units
This is an open animation studio for students who want to improve existing animation skills and develop a personal animated short. The class will introduce a variety of techniques and concepts for animation production. Using both 2D and 3D tools, animation will be explored through short assignments designed to develop diverse skills and ideas. Each student will develop and produce a short animation. The class will engage in discussion and critique of each other's work along with examples of historic and contemporary animation.
Prerequisites: 60-125 Min. grade C or 60-220 Min. grade C or 60-333 Min. grade C or 60-110 Min. grade C

60-416 Advanced ETB: Documentary Storytelling

Intermittent: 10 units
In this class students will develop projects which use a variety of narrative concepts to convey stories in new ways. We will begin with a core practice around video, audio, and expand into internet media, performance, physical media and installation. Emphasis will be placed on story structure and strategies for choosing a media most appropriate to the narrative as well as the desired audience. Works by Janet Cardiff, Errol Morris, Spalding Gray, Werner Herzog, Laurie Anderson, This American Life and others will be mined for inspiration. With permission of instructor. We will also examine and discuss a range of historical and contemporary strategies employed by art makers who have used forums from on-line and virtual spaces to physical and site specific venues to expand and explore the relationship between the art object and the audience.
Prerequisite: 60-110

60-417 Advanced ETB: Video Art

Intermittent: 10 units
In this advanced studio course, students will focus on creating experimental works of video art exploring a variety of both historical and contemporary approaches to the field. Building from their prior foundational moving image courses, students will have the opportunity to dive deeply into an array of formal and conceptual approaches to the medium. Throughout the semester, students will produce several major assignments focused on the production of video artworks exploring visual effects and abstraction, documentary forms and video essays, performance-for-video, generative video, and multichannel media installation. Each assignment will be supported through relevant video and audio technical demonstrations. Additionally, all the major assignments will be supported by reading and screening homework, benchmark check-in assignments, workshops, visiting artist lectures, and in-progress meetings and amp; critiques. This class will give students the opportunity to independently explore their evolving material and conceptual interests within the language of video and allow students to develop their own research and fabrication strategies unique to their ideas with a supportive community operating in dialogue throughout the planning, making, and exhibiting process. The class will culminate in a public screening event at the end of the semester.
Prerequisite: 60-110

60-419 Advanced ETB: Experimental Game Studio: Digital Playgrounds

Intermittent: 10 units
A hands-on intermediate course focused on immersive environments, world building, and real time experiences pushing the boundaries of gaming. On a conceptual level we'll look at practices within digital art and independent game development: virtual architecture and sculpture, walking simulators, avatar-based performances, interactive art, procedural animation, environmental storytelling. On a technical level the course will introduce you to 3D modeling (Blender), game engine workflows and scripting (Unity) forming a scaffolding for advanced Electronic and Time-based courses.

Course Website: http://mycours.es/

60-422 Advanced ETB: Experimental Animation

Spring: 12 units
[IDeATe course] This class will examine animation production from the student's perspective. Animations that explore both form and content will be developed and discussed. Topics will include; non-linear narrative, visual music, puppetting, non-traditional materials, manipulation of motion and performance capture data and immersive environments.
Prerequisites: 60-110 or 60-220 or 60-333

60-425 Adv. ETB: (Im)Possible Worlds: 2D Animation, Motion Graphics and Visual Effects

Intermittent: 10 units
While developing proficiency in Adobe After Effects (and other tools) students will explore the experimental worldbuilding and storytelling possibilities of hybrid moving image media. This course is structured around technical tutorials and workshops, readings and screenings, the creation of collaborative and individual moving image projects, discussion and critique. Some of the themes we will explore include "The Fantastic" as expressed in the genres of horror, science fiction and fantasy. Artists whose work we will look to for inspiration include Jacolby Satterwhite, Shana Moulton, Rachel MacLean, Rachel Rose, Charles Atlas, Sondra Perry, Max Almy, Nam June Paik, Stan Van Der Beek, Zach Blas, Laurie Anderson, Cecile B. Evans, Ryan Trecartin, and many others.

60-428 Advanced ETB: Drawing with Machines

Intermittent: 12 units
This is an advanced studio course in experimental drawing, generative art, computational design, and mechatronic mishegas. Working at the boundaries of code, automation, physical materials, and gestural mark-making, we will explore personal and peculiar new approaches to digital fabrication; the development of ultra-niche workflows as a mode of creative practice; and the use of algorithms and machine collaborators as nontraditional intermediaries between mind, hand, and paper. Units in this course include: rule-based art and conditional design; chance and stochastic composition; real-time interaction and contingency; asemic cartography; synthetic automatism and ersatz perception; and more. Through rigorous exercises in freestyle computing, participants will develop skills in the control of machines by (e.g.) AxiDraw, Line-Us, Scribit, Rotrics, and Universal Robots to govern line, texture, tone, shape and mass in a variety of wet and dry drawing media. Interested students should have a portfolio of creative visual work, and programming experience equivalent to an introductory course such as 15-104, '110 or '112. Enrollment by permission of instructor.

60-429 Advanced CP/ETB: Digital Worlds: Making and Performing in Digital Contexts

Intermittent: 10 units
In this class students will look at digital spaces including social media, chatrooms, online galleries, phone applications, YouTube, 3D renderings, massively multi player online games, and more to produce works that respond to the specificity of these terrains. There is a rich history of site specificity and contextual practice in the physical world; this class will consider parallels in computer-based environments. In addition to theory and research components, students will develop a variety of technological skills in video production, webcasting, audio editing, gif animation, 3D modeling, and more in this course.
Prerequisite: 60-110

60-430 Advanced SIS: Open Sculpture

Intermittent: 10 units
This is a project-based studio class that allows for student-driven development of an artistic practice in 3D media, installation, site specific work, and systems. Ours is a widely inclusive and experimental definition of "sculpture." Aspects of making such as scale, medium, materials, methods, processes, and concept are unconstrained in projects assigned, while time and site become the more specific lens through which artistic peers may engage in group dialogue over common constraints. Through lectures, readings, discussion, individual meetings, hands-on-making, and group critiques, students will develop their abilities to brainstorm, make proposals, and turn ideas into action. Artists will build 3 to 4 major projects from start to finish, develop a working artist's statement and bibliography, and hone their individual sense of creative identity through the development of personal research interests, aesthetic sensibilities, and their own critical language surrounding common themes through their projects. An emphasis will be placed on extremely contemporary art, and students will make frequent presentations on new art works relevant to class discussions, as we develop our own class database of sculptors, fabricators, media artists, installation artists, makers, and thinkers. The concepts we will explore as a group include physical and sensorial properties such as scale, weight, balance, materiality, and connectivity; relationship of form to context and site; function, transformation, translation, iteration, and interactivity; and the continued relevancy of hand-making and physical construction in an era of post-industrial post-internet capitalism.

60-431 Advanced SIS: Installation

Intermittent: 10 units
This course explores a broad range of sculptural issues concerning the practice of Installation Art. This Studio course will primarily emphasize immersive environments (but not necessarily), given the circumstances of remote learning and one's bedroom as studio, or a similar venue, small and intimate may be more appropriate. Students expected to involve an ensemble of elements: objects, (found, purchased, reused, appropriated), made from an array of any kind of materials including natural materials; combined with time-based media; video, audio, performance, light etc. to create relationships within a particular space possibly as a 'site specific' venue in order to immerse the viewer within. Consider the notion of an immersive stage set, and the importance of documentation, 'Fabricated To Be Photographed, Video graphed, Digitally Imaged and/or Performed In.' Emphasis is on research about "place" and the proposal process for a specific context. Various artists, strategies, methods and materials will be investigated through projects, readings, lectures, visiting artists and discussions. Exercises and gestures are assigned initially, then students are expected to propose and establish their own projects/practice later in the semester.

60-433 Advanced SIS: Ceramics

Intermittent: 10 units
In this class, advanced ceramic students will investigate clay as an art material for personal expression. Students will build on their technical skills using materials and processes appropriate to their concepts while developing aesthetic sensibilities using historic and contemporary references in ceramics and other arts. Each student has the option to direct their own projects with guidance by the instructor upon demonstrating a complete understanding of the various construction skills and surface treatment techniques used in the medium. Students are expected to learn how to organize their projects and practice time management to generate and complete projects within the given time. Course work supports the development of a body of work to be used as a professional portfolio. Students are required to participate in critiques that analyze their own work and that of other artists and class participants to identify strengths and weaknesses in research and promote the growth and exchange of ideas. This class will consist of demonstrations and lectures as appropriate, research/writing assignments in and out of class, as well as work time. Students are required to develop a body of work within the context of the projects to express their individual voice.

60-435 SIS: Metals

Intermittent: 10 units
Studio focus on fabrication using light metalworking techniques including forming, joining, and finishing. Metalsmithing and jewelry techniques will be explored in the context of sculptural issues. Metal stretching, forging, brazing, texturing, small scale casting and coloring are also presented. Slides looking at small scale metalwork, as well contemporary sculpture using metal techniques will be presented periodically. Metals provided include copper ,brass, and bronze sheet and wire. Materials fee will also cover silver solder and other expendables. This is a repeatable class that will add to the tools and techniques acquired in earlier metals classes while expanding individual growth within the concept and context of sculpture.

60-437 Advanced CP/SIS: Environmental Sculpture

Intermittent: 10 units
Studio focus on sculpting with the environment. Includes object making, installations and site work with an emphasis on ecological themes: eco-material use and reuse, growing systems, environmental impact and a variety of other related issues. The semester is structured with initial exercises and a series of small gestures that lead to a major project. Students are required to explore and to develop proposal making skills in order to implement a site-specific project; either real or virtual. Students to produce a project complete with a well-documented outcome to include: visual representation, research and written descriptions.

60-440 Advanced SIS: Sculpture After the Internet

Intermittent: 10 units
Hito Steyerl asked, "Is the internet dead? ...[it is] completely surveilled, monopolized, and sanitized by common sense, copyright, control, and conformism... what happened to the internet after it stopped being a possibility?" This course assumes it is the artist's role to find and create possibilities in all contexts, and investigates what it means to create new possibilities by making physical objects, experiences, sculptures, installations, and systems in an era post-internet. As a project-based experimental lab, this class asks students to navigate back and forth between digital and physical creative tool sets to create new works. We will take inspiration from the history, theory, ideologies and technologies surrounding the internet, as well as from artists, animators, and engineers working on and around the internet today. We will explore issues surrounding automation, digital fabrication, and online maker / fabricator culture as tools to be used, but also as socio-political forces. Other concepts we will explore as a group include the relationship between body and technology; cybernetics, robotics, AI, and the uncanny valley; the relevancy of hand-making and physical construction post-automation; "image-objects;" scripted spaces; the producer-consumer continuum; the divisiveness and productiveness of online subcultures; anonymity; accessibility of information and production tools; and the spatial and temporal effects of inhabiting both digital and physical worlds. If we understand our current epoch as an era dominated by onscreen and networked experiences, this course investigates what it means to embrace, explore, explode, celebrate, negate, critique, reverse, or oppose that through the making of sculpture, broadly defined. This course assumes knowledge of at least very basic 3d modeling, and/or physical computing, and/or coding, and/or 3d media fabrication/construction techniques.
Prerequisites: 60-131 or 60-130 or 60-212 or 60-210 or 60-134 or 60-133 or 60-132

60-443 Adv. SIS: Special Topic

Intermittent: 10 units
In this course, students will learn both synthetic and natural dyeing techniques from dye painting, to mordant printing, to eco printing batik, tie-and-dye, indigo dyeing and more. Through readings, we will also explore the human quest for color throughout time - from the exploitation of flora and fauna to profiteering journeys across seas. The aim of this course is to introduce students to a variety of methods of dyeing that they may choose to incorporate into their current or future work, and leave with a new eye toward the origins, importance, and cultural significance of color.

60-446 Advanced SIS: Expanded Theater Fusion Studio

Intermittent: 10 units
[IDeATe collaborative course] As the boundaries between theater, art, entertainment and everyday life continue to expand through engagement with new technologies, it is critical that emerging artists and technologists be provided with the tools, language, and vision to thrive in the new millennium. Expanded Theater will reanimate classical modes of performance with media, networks, robotics, locative applications, and mobile systems. Considering theater as an ancient technology of mass participation and social cohesion, this fusion studio explores how emerging technologies can expand upon the basic theatrical relationships in new and culturally relevant ways. Collaboration and integration of design, media and storytelling is critical to this approach. Experimentation with new forms can reanimate the basic values of theater; the essential nature of a live event, the possibility of visionary spectacle, and the creation of meaning in dialogue with an audience. Expanded Theater is an opportunity to explore avenues outside of traditional theatrical production modes and beyond each student's individual discipline. The curriculum combines resources from Carnegie Mellon's Schools of Art and Drama, Integrative Design, Arts, and Technology (IDeATe), the Emerging Media Masters (EM2), Computer Science, the Robotics Institute, and their collaborators across the university in a new configuration. Expanded Theater will explore domains ranging from site specific and networked-based performance and interventionist practices, to pervasive social media technologies and their influence on interpersonal communication. The goal is to investigate contemporary languages that allow authors, actors and technologists to collaborate in ways that push beyond our present understanding of theatrical production and reception. This course alternates between two modes of research and design.

60-447 Advanced CP: Art at the End of the World

Intermittent: 10 units
The world is awash today in stories that anticipate an end to the world as we know it. These daunting narratives often anticipate techno-apocalypse, global pandemics, runaway climate change and mass extinctions. Their scale can appear to dwarf the actions of individual humans, and yet this is exactly where the work of the artist is proportionally most significant. Artists write the myths that help us understand the present, and create the monuments that explain the present to the future. They sound the alarm anew when sympathetic ears have grown deaf, and most importantly, they invent hopeful futures that were previously beyond imagination. Students in this course will learn significant historical and contemporary "end times" narratives, both utopian and dystopian, as well as the cultural responses to them. We will be using these as launching points for creatively engaging with our present apocalyptic predicaments. Students will visit regional locations that provide real-world grounding for these stories. They will use joy, introspection, humor, and courage, to create works using the full range of artistic expression from the highly ephemeral to the timeless. This course may never be offered again.

60-450 Advanced DP3: Drawing

Intermittent: 10 units
Figurative art retains aspects of the 'real' world as its subject matter. It has recognizable forms; it shapes, makes likenesses, and represents. Typically, 2D figurative work creates illusionistic depth to create spaces in which narratives occur and are portrayed. Within this realm, our course is unrestrained. All of our observations are valid, stories equal, feelings freed, fears unleashed and proclamations promoted. Projects across painting and drawing are drawn from both perception and invention and include working from the live model. The class will consist of studio time, critique, readings, discussion and museum/gallery visits.
Prerequisites: 60-160 or 60-157 or 60-150

60-451 Advanced DP3: Figurative Drawing

Intermittent: 10 units
This advanced course delves deeply into the artistic representation of the human body, drawing on art historical references to contextualize our relationship with the human form. Through intensive study and practice, students will develop a nuanced understanding of how artists throughout history have interpreted the body, and how these interpretations have shaped cultural and societal perspectives. Emphasis will be placed on refining our "looking" skills, honing our ability to observe and interpret the human figure with precision and sensitivity. Students will explore a variety of techniques and approaches to figure drawing, with the goal of developing a personal style and expressive voice. Central to the course is the question: What are we trying to say with our representations of the human body? Through critical analysis and thoughtful experimentation, students will explore this question, gaining a deeper understanding of the power and significance of figurative art.

60-452 Advanced DP3: Color

Intermittent: 10 units
In this advanced course, students will learn to employ a wide range of color theories and color systems through hands-on exercises and studies. Studies will be done primarily in paint, with some use of collage and digital media. These exercises will be aimed at mastering a variety of color approaches that will be applicable to each student's own artistic practice. Students will develop, based on their own interests, a cohesive body of work in which to practice and expand on the skills learned through the directed exercises. Studio work will be augmented by lectures, demonstrations, critiques, readings and critical discussion of writings about color.
Prerequisites: 60-160 or 60-157 or 60-150

Course Website: https://sites.google.com/andrew.cmu.edu/colorcourseclaytonmerrell/home (https://sites.google.com/andrew.cmu.edu/colorcourseclaytonmerrell/home/)

60-453 Advanced DP3: Painting

Fall and Spring: 10 units
This course is designed to help promote a painter's development, both conceptually and technically. It encourages students to expand their ideas through a diverse set of projects. Through research and studio experimentation, students will explore issues of scale, surface, materiality, process and performativity in painting. They will also consider notions of the "picturesque" and how non-artistic disciplines can inform painting. Lectures and assignments are designed to enrich the painter's conceptual and technical base and to promote creative growth.
Prerequisite: 60-250

60-454 Adv Studio: Small Things:Quiet interventions, Miniatures & the Power of Everyday

All Semesters: 10 units
This advanced studio class allows for the interdisciplinary exploration of historical, critical, craftbased, and conceptual issues surrounding the Small. The course will look at global and historical examples of small objects and the impulse for humans to make miniatures. It will consider site specific installations and interventions that are often not easily viewable. It is very easy for a large object, an expensive object, to make a big visual and/or social impact. What does it mean to work on a humble scale and with ephemeral and/or accessible materials? How does working small allow for generosity, play and adaptability? This is an interdisciplinary advanced studio course. Students will predominantly work in their own studios and bring their own practice/techniques and research to our conversation.

60-460 Advanced DP3: Paint/Print

Intermittent: 10 units
Paint/Print encourages creative exploration of the boundaries between print media and painting through material investigation, thereby eliminating any assumed hierarchy between the two modes of working. Painting and printmaking are open to the use of traditional and extreme image making methods including observational and fictional representations, abstraction, collage, installation, digital drawing/painting or other conceptual premises relevant to the successful presentation of privately held concerns in image-making. Emphasis will be on experimentation with both material and image. The class will consist of studio time, critique, readings, and discussion.
Prerequisites: 60-250 and 60-251

60-461 Advanced ETB: Experimental Capture

Intermittent: 12 units
This is an interdisciplinary studio course in expanded media practices that arise from using devices and algorithms to "capture" the world. We will explore experimental workflows, ranging from no-tech and low-tech to emerging and state-of-the-art techniques, in order to capture, model, and share new representations of people, objects, places and events. Through self-directed research projects, students will develop systems to capture a wide variety of phenomena, and creatively share the media they collect. We will cover a wide range of techniques and artistic practices that incorporate immersive, panoramic, high-speed, multiscopic, and multispectral imaging; depth sensors and 3D scanners; motion capture systems for gestures of the face, body, hand, and eye; computer vision and machine learning techniques for detection, tracking, recognition and classification; and other unusual, forgotten, and nascent technologies for transducing the unseen, ephemeral, and otherwise undetectable.

60-462 Advanced DP3: Painting Matter & Substance

Intermittent: 10 units
This course will be a hands-on investigation of the material, tangible, and physical aspects of painting. Students will learn how to make and use various paints, supports and grounds including oil paint, egg tempera, encaustic, watercolor/gouache, distemper, casein and fresco (in addition to other materials based on student interest). The working properties of various additives to and combinations of these media will be examined and experimented with. Technical issues affecting longevity will be addressed and experimentation will be encouraged. Students will investigate the work of other artists with a forensic "How did they do that?" approach. The second half of the semester will be devoted to studio work focusing on the ways in which each student's personal vision can be embodied and expanded in one or more of the above media.
Prerequisites: 60-150 and 60-250

60-464 Advanced DP3: Expanding the Graphic Novel

Intermittent: 10 units
In this course, students will critically and creatively engage with the medium of comics to learn how to better communicate their ideas in this format as well as challenge its boundaries. A substantial portion of the course will focus on familiarizing students with the basics of storytelling in a sequential narrative format and creating opportunities for students to discover, hone and explore their own voice and style. In addition to creating new work, students will also explore the history of comics and the origins of the "modern" graphic novel. Students will also be exposed to both graphic and non-graphic artists whose works has challenged and redefined the genre. We will explore these artists in order to understand how our own work borrows from and draws upon a rich lineage. Students will also be expected to think beyond the commonly accepted notions of comics and to question the relevancy of their work in this medium. Finally, each student will produce a new body of work that will culminate in the production of a 4-5 "page" "sequential" narrative.

60-466 Advanced DP3: Publishing as Artistic Practice

Intermittent: 10 units
This course will look at the history of artist multiples from artist books and zines, mail and subscription based practices, and editioned objects. Students will be introduced to techniques in traditional bookbinding, zine making as well as design and layout an artist book for mass publication. Studio work will focus on materials and processes that can be found and done at home as well as designing projects that utilize print-on-demand product services. We will be looking at contemporary artist's multiples that exist over a wide range of media, from fine art prints, sculptural and digital editions, and even performance and participatory work conceptualized as a multiple. We will discuss the economy and business structure behind independent publishing, looking into contemporary artists who are running their own presses, an emergence of art book and zine fairs, and envisioning alternative distribution opportunities for our artworks.
Prerequisites: 60-258 or 60-251

60-468 Advanced DP3: Print Media - Sculpture, Installation Screen Intensive

Intermittent: 10 units
This advanced print media course is a screen-printing intensive that moves print out of editioned works on paper. Students will utilize the multiple to create immersive wall installations, participatory social sculpture, objects that act as interventions, and hand-printed yardage that can be used in soft sculpture and/or wearable forms. Students will challenge their screen-printing techniques and the scale and reach of their printed matter. Projects will concern the role of ornamental design within socio-political-cultural frameworks and the role of "hand-made" within exchange and gift economies. Projects will problematize artworks in relationship to the human body: as wearer, as laborer, and as consumer.

60-470 Advanced DP3: Painting The Unconscious

Intermittent: 10 units
This course explores the threshold between the seen and unseen using a broad range of painting styles, techniques, and materials to explore the unconscious mind. Drawing upon a range of spiritual and occult practices, including tarot, surrealist games, automatic drawing, and color meditations, this class offers students the opportunity to explore processes that unlock the imaginative potential of the unconscious and adapt them to painting. Through a series of readings, presentations, field trips, and critiques, the class will gain knowledge of the practices and histories behind the unconscious in art and learn how to harness 'chance' more intentionally into their painting practice. This is a studio-based course in which emphasis is placed on independent research and studio productivity. We will discuss artists like Hilma af Klint, Remedios Varo, Leonara Carrington, Wassily Kandinsky, Austin Osman Spare, Ithell Colquhoun, Elijah Burgher, Xul Solar, Ghulam Rasool Santosh, Jesse Bransford, Elizabeth Insognia, Hilma's Ghost, Myrlande Constant, and Betye Saar as well as artistic movements including Symbolism, Surrealism, Transcendental Painting Group, and Neo Tantra Painting.

60-471 Advanced DP3: Photography/Print Workshop

Intermittent: 10 units
In this course in Photography and Print, students will develop semester-long individual projects in contemporary photography, printmaking, artists' books and/or multiples. Students will work in photography and amp;/ or print media, with an invitation to use either studio-based processes (intaglio, lithography, screenprint, photography lab) or work with hand-printing, digital or nontraditional approaches (monotype, stamps, stencils, rubbings, relief, digital photography). This will culminate in a capstone book, supported by the School of Art. Readings, discussion, critique, and visiting artists will enhance our conversation and research. As a workshop, this course is for students who are ready to explore their work more deeply and create ambitious self-driven projects.

60-472 Advanced DP3: Mutable Landscape

Intermittent: 10 units
With camera in hand, students will explore, document and invent a sense of place in Pittsburgh. Informed by photographic history and landscape studies, students will develop their own portfolios of digital prints. As a CFA Interdisciplinary photography course, students will be encouraged to consider their photographs in the medium of their home department, and in some cases as a starting point for projects in other materials. No prerequisites.

60-474 Advanced DP3: Photobook

Intermittent: 10 units
In this course, we will create books that explore visual narrative, sequencing, and sculptural form through the medium of photography. Additionally, we will consider the roles of image and text as well as design, editing, printing and binding. Our work will be informed by the history photobooks and artists' books, including by Ed Ruscha, Sophie Calle, Andres Gonzalez, Tommy Kha and Rinko Kawauchi. Lectures and field trips to book collections will guide our work too.

60-475 Advanced DP3: Open Print

Intermittent: 10 units
This advanced Print Media course focuses on student-driven development of a studio practice focused on contemporary print, multiples and distributed art. In this class, individuals will continue to build on technical skills and concepts, and the interdisciplinary applications of both, through self-directed, individual approaches. This course is for advanced students of art, ready to focus on larger-scaled, conceptually and formally ambitious projects that are formed from long-term investigations.
Prerequisites: 60-473 or 60-475 or 60-474 or 60-476 or 60-468

60-476 Advanced DP3: Serigraphy (Screenprinting)

Intermittent: 10 units
This course is a comprehensive and intensive study of Serigraphy (screenprinting), one of the most versatile and contemporary of printmaking techniques. The course is focused upon the mastery of this process. Students will explore multiple methods of image making (from hand-drawn to digital imaging) and will be introduced to CMYK printing. The emphasis of this course is on artistic work on paper, but will also be exposed to the ways that screenprint can work across a wide range of different media: from 2D (paper, canvas, cloth) to 3D (book forms, sculpture, installations) and utilizing printed multiples in participatory and exchange based artworks.

60-478 Advanced DP3: Photography Stands Up

Intermittent: 10 units
The value of a photograph is most often centered on the work it takes to construct an image but the work of photography does not stop there - printing out an image may also be the first step in building something else entirely. Photography Stands Up will treat the photographic print as a necessity, explore the photographic print as an object and most importantly consider the photographic print as a starting point for creating a significant work. After the past year of remote learning this course has a clear goal of getting students out of their seats, off the computer and away from the screen. This course will demand that we be active with our bodies and driven both conceptually and materially with an emphasis on experimentation as we vacillate between both digital and analog methodologies. We will explore printed photographs as objects that we may bend, fold, scratch, weave, dye, reconfigure and incorporate into future photographs. This course will introduce students to non-traditional methods of working in the Black and White Darkroom and will require students to print their images out on a regular basis using both the darkroom and digital print facilities. We will also explore the vast resource of the shooting studio, which we will use collectively during in class workshops - focused on putting our theories into practice. Participation in this course will grant students access to a digital camera and tripod to use for the duration of the semester and this tool will be a key component to in class workshops.

60-487 Advanced CP: The Amateur

Intermittent: 10 units
If a contemporary artist can truly do and be anything, how come so much art looks the same? More and more contemporary artists are pushing beyond the conventional media and methods of the art world by strategically operating as "professional" amateurs. The term amateur reflects a voluntary motivation to create as a result of personal passion for a particular activity, regardless of expertise or authority. For the artist, embracing the role of the amateur allows for the use of any profession, institution, or social activity as a possible material within their creative practice. This includes artists who "perform" as amateur preachers, psychologists, geneticists, politicians, and exotic dancers; artists who create amateur institutions like sanitariums, circuses, hair salons, talk shows, and planetariums; and artists who collaborate with professional hypnotists, ornithologists, stunt coordinators, ventriloquists, and diplomats in order to manifest their work. Students in this class will work on self-defined projects that utilize the role of the amateur as a critical method for expanding the breath and reach of their art practice into new forms and venues. With faculty mentorship, each student will be responsible for developing their projects through independent research, apprenticeships, and collaborations with experts in fields relevant to their work. Workshops, lectures, and in class critique of ongoing work will look at contemporary trends related to amateurism in art practice, theory, and the world at large. This class is not about being an amateur artist, but about being a serious artist who uses amateurism as a tool. Thus the class is only open to students with ???

60-491 Advanced CP/ETB: Art AFTER The End Of The World

All Semesters: 10 units
Taught by Prof. Rich Pell (School of Art BSA Faculty Advisor and founder of the Center for PostNatural History). This course will take students on a deep dive into our mythological, scientific and artistic understanding of world-changing catastrophic events, from the earliest human stories up to the present moment. Film and writings, fiction and non-fiction will inform a critical conversation about the important role of artists in these times. Contemporary research in science and critical theory will inform the development of unique self-defined creative practices that embrace our most durable human qualities of joy, empathy, humor, and courage. Field-trips (virtual and/or RL) will fuel group discussion and the development of new artistic works open to any media.

60-493 Advanced CP: Out There - Post-Studio Practice

Intermittent: 10 units
Since the Dada movement began to erode the importance of institutional validation, artists have consciously chosen to operate outside of a studio context in a variety of ways. The eighties saw the emergence of movements and artist-run organizations intent on removing institutional barriers for art practice, enabling performance, civic engagement, social and political intervention, and myriad other approaches to feed the dialogues surrounding art and culture. This class will consider the philosophical, ideological, aesthetic, and political motivations, which influence such artists and organizations and will look at writers who have provided a corresponding critical framework. Students will engage in research and reading to develop their own project(s), using the class as a space for dialog and development, and the time outside of the class as the space for execution and manifestation.

60-497 Advanced Studio: Science Fiction

Intermittent: 10 units
"There is nothing new under the sun, but there are new suns." - Octavia E. Butler "As the industrialized world undergoes daily transformations through the application of techno science to every aspect of life, science fiction has become an essential mode of imagining the horizons of possibility." - Istvan Csicsery-Ronay In this course students explore science fiction as expressed across media including film, television, music, contemporary art, literature, comics and games. Students will work in the medium(s) of their choice using the tactics of science fiction to investigate themes and topics including but not limited to: Utopia/Dystopia, Robots and A.I., Extraterrestrial Life, Speculative Design, Afrofuturism, Genomics, Transhumanism, Indigenous Futures, Posthumanism, Ecology, Climate Change, Space Travel, Time Travel and Alternative Histories.

60-499 Studio Independent Study

Fall and Spring
A tutorial studio in which an Art student works individually on a self-generated project under the supervision of a School of Art faculty member. Prior to enrolling in Independent Study, the student must complete an "Independent Study Proposal" form (available in the bins on the 3rd floor of CFA) which is signed by the faculty member and the Assistant Head of Academic Affairs of the School of Art. Prerequisite: Art Junior/Senior status and by instructor permission.

60-590 Internship

All Semesters
Art Internships are open to all BFA, BHA, BSA and BCSA Art students. Internships may take place with appropriate individuals or organizations within or outside of Carnegie Mellon University. The requirements for an internship are in the School of Art Handbook (available at the School of Art website). Prior to being enrolled for an internship, students must complete an Internship Proposal Form, which defines the goals of the internship. This form must be signed by their site supervisor and approved by the Assistant Head of the School of Art. Forms are available in the bins on the 3rd floor of CFA. Junior and Senior Art majors only.

School of Design

Eric Anderson, Interim Head
Location: Margaret Morrison Carnegie Hall 110
design.cmu.edu (http://design.cmu.edu)

Design at Carnegie Mellon

Design is the thoughtful activity that humanizes our environment through visual communication and the shaping of products that help us in our daily lives. Whether in magazines and books, posters and exhibitions, video and film, human-computer interactions, or any of the myriad of everyday products such as furniture, consumer goods, vehicles, or medical equipment, designers play an important role in shaping the form and content of our experience.

Designers are concerned with aesthetics, but they are equally concerned with serving people. This requires more than skill in the fine arts. It also requires knowledge about the needs, desires, expectations, and capabilities of human beings. It requires skills of observation and interpretation that help us understand the people that we want to serve. More than this, however, designers must also understand the technological issues that stand behind effective products. They must understand the materials, tools, and production processes of the modern world. An education in design is an education for the mind as well as the eye and hand.

The undergraduate program enables students to develop specialized skills in the areas of Product (Industrial) Design, Communication (Graphic) Design and Design for Environments (design for physical and digital environments), while providing them with a solid foundation in design studies. Students study systems thinking; the ability to see and solve problems at multiple levels of scale, and situate their work within larger social and environmental contexts.

The over-arching theme of the curricula is *design for interactions*, which acknowledges that ‘ecologies’ of products and communications often come together within complex physical *and* digital environments. Coursework balances making and theory with the integration of new, emergent technologies. Students are encouraged to explore the scope of design as well as the responsibility and ethics involved in the design of interactions between people, the built world, and the environment.

The curriculum is one that provides students with the ability to customize their degree: they may choose to specialize in one of three areas offered (Products, Communications, Environments), but also have the option of combining any two, to create a unique, interdisciplinary design degree.

The undergraduate curriculum also introduces students to three important areas of design focus: design for service, design for social innovation and transition design. These represent both new and established design approaches to framing and solving problems. In their senior year, students bring their disciplinary specialty (communications, products or environments) to projects that are situated within the areas of design for service and/or design for social innovation.

The School offers a Bachelor of Design with tracks in Communications, Products, or Environments.

Communications

The ability to communicate and shape meaning is one of the most powerful and ubiquitous forms of design in today’s world. Students learn to design effective communications across a wide variety of media that *always* exist within complex webs of interactions between people, products, and environments. Areas of study include narrative and storytelling, information design, and a variety of analog and digital visualization techniques. Students develop the ability to identify specific audiences and communicate to them through effective visual, verbal and aural communications that educate, inform and delight.

They study the dynamic and ‘emergent’ characteristics of communications in a globally networked society where technologies and modes of individual and mass communication are constantly changing. Students learn systems thinking and engage in an iterative, multi-disciplinary and collaborative design process that involves research, observation, prototyping and rigorous evaluation. Students develop the ability to identify and communicate to specific audiences through effective visual and verbal communications that educate, inform, delight and invite participation.

Products

Students learn to design products and their interactions within the context of human needs and they develop a deep understanding of the ways in which products shape behavior. Our curriculum acknowledges that no product exists in isolation—it is *always* part of a larger system comprised of people, communications and environments. Within the context of design for service, products exist as ‘touchpoints’ in a service ecology. For this reason, students learn systems thinking and engage in an iterative, multi-disciplinary and collaborative design process that involves research, observation, modeling/prototyping and rigorous evaluation.

Students are introduced to current production and manufacturing processes as well as sustainable approaches, such as cradle-to-cradle, lifecycle analysis and the use of new, more environmentally friendly materials. The School has a well-equipped analog and digital prototyping facility where students work with traditional materials such as wood and metal and learn to design and prototype using CAD software and 3D digital printers.

Environments

Students learn to design for complex environments that exist in the digital, physical and multi-modal realms. Most of the products and communications we interact with are situated within complex physical spaces (our homes, classrooms, places of business, shopping malls, even amusement parks). We also interact with complex online environments such as large websites, social networking and virtual reality environments. And increasingly we interact in ‘smart’ physical spaces with multi-modal communications in a combination of the analog and the digital.

In our curriculum, environments are seen as integrated and dynamic systems that require the design of interactions at multiple levels of scale. Students acquire a diverse set of skills that includes a deep understanding of spatial relationships, designing *with* and *for* emerging, multi-media technologies and an understanding of the cognitive challenges presented by multi-modal spaces.

Students who focus on the design of environments delve deep into systems thinking and systems dynamics and spend time learning to collaborate and lead within multi-disciplinary teams (solving large problems involving complex spaces almost always involves teams of people from different disciplines).

Design Minor Program

The School also offers a minor in Design for well-qualified students. Further information on the minor program is provided here (https://design.cmu.edu/about-our-programs/undergraduate-degrees/minor-design/).

The Design Curriculum

Minimum units required for Bachelor of Design	360

The design curriculum is for students who are interested in full-time undergraduate study leading to entry-level professional employment or advanced graduate study in the areas of Communication Design, Product Design, or Design for Environments. The first year is a period of discovery, where students explore studio projects and supporting courses in the ideas and methods of design practice as well as courses in design studies. The second and third years are a period of concentration and development primarily within the student's area(s) of specialization. The fourth year is a period of integration and advanced study, with studio projects involving teams of students from all areas of design. There are studio courses throughout all four years, supported by departmental electives in the ideas and methods of design practice and other courses in the history, theory, and criticism of design. In addition, the School also requires all students to take a substantial number of general education courses offered by other departments throughout the university. General education is an essential part of the education of a professional designer.

Foundation Year

In their first year, students are introduced to all three areas of design specialty: Product (Industrial), Communication (Graphic) and digital and physical Environments. Here, they explore these unique and complementary areas of design and gain a wide range of skill sets such as systems thinking, iterative process, collaboration and visualization, and work in both two and three dimensional materials as well as digital media.

At the end of their first year, students are given the opportunity to begin to focus their interests in two of three design areas (products/communications/environments) and will eventually decide upon a single area of focus or a dual path of study.

This is the first-year curriculum for all design students.

First Year

Fall

Studio		Units
51-101	Studio: Survey of Design	10
		10

Ideas and Methods		Units
51-121	Visualizing	10
		10

Design Studies		Units
51-175	Design Studies: Place	5
51-177	Design Studies: Histories	5
		10

General Education		Units
76-101	Interpretation and Argument	9
85-102	Introduction to Psychology	9
or 85-211	Cognitive Psychology	
or 85-241	Social Psychology	
88-120	Reason, Passion and Cognition	9
99-101	Core@CMU	3
		30

Spring

Studio		Units
51-102	Design Lab	10
		10

Ideas and Methods		Units
51-122	Collaborative Visualizing	10
51-132	Introduction to Photo Design	10
		20

Design Studies		Units
51-176	Design Studies: Futures	5
51-178	Design Studies: Experience	5
		10

Humanities & Social Sciences	**Units**
One course in the Dietrich College of Humanities & Social Sciences	**9**

Second Year

Following the first-year program, students select two out of three areas of interest: Products[P], Communications[C], Environments[E]. In the fourth semester students select one of the two areas to study more deeply. Students investigate the relationships people form with designed artifacts and the roles that physical, visual, and digital forms play in our lives. They apply what they learn to the design of products, communications, and environments that facilitate interactions. Students are also required to take general education courses to gain a broad vision of many disciplines and fields of knowledge that are relevant to design.

Second Year

Fall

Studio		Units
51-225	Communications Studio I: Understanding Form & Context (Pick two)	4.5, 4.5
or 51-245	Products Studio I: Understanding Form & Context	
or 51-265	Environments Studio I: Understanding Form & Context	

Ideas and Methods		Units
51-227	Prototyping Lab I: Communications (Pick two corresponding labs)	4.5, 4.5
or 51-247	Prototyping Lab I: Products	
or 51-267	Prototyping Lab I: Environments	
51-221	Color for Communications, Products, Environments	9
or 51-229	Digital Photographic Imaging	
or 51-242	How Things Work: Mechanics and Electronics	

Design Studies		Units
51-277	Design Studies: Systems	5
51-279	Design Studies: Cultures	5
		10

General Education		Units
xx-xxx	Academic Elective	9
		9

Spring

Studio		Units
51-228	Communications Studio II: Designing Communications for Interactions	9
or 51-248	Products Studio II: Designing Products for Interactions	
or 51-268	Environments Studio II: Designing Environments for Interaction	
		9

Ideas and Methods		Units
51-239	Prototyping Lab II: Communications	9
or 51-249	Prototyping Lab II: Products	
or 51-269	Prototyping Lab II: Environments	
		9

Design Studies		Units
51-282	Design Studies: Persuasion	5
51-284	Design Studies: Power	5
		10

General Education		Units
xx-xxx	Academic Elective	9
xx-xxx	Free Elective	9
		18

Third Year

In the fifth and sixth semesters, students may choose to continue their fourth semester area of focus, or they may choose to study their second area of study from the third semester. Students study how design functions at various levels of scale and degrees of complexity situated in specific contexts. They design products, communications, and environments that function as cohesive systems that live within the built and social worlds.

Third Year

Fall

Studio		Units
51-323	Communications Studio III: Designing for Complex Communication Systems	10
or 51-343	Products Studio III: Designing for Complex Products Systems	
or 51-363	Environments Studio III: Designing for Complex Environment Systems	
		10

Ideas and Methods (Select two Design Electives)		Units
51-xxx	Design Elective	9
51-xxx	Design Elective	9
		18

General Education		Units
xx-xxx	Academic Elective	9
xx-xxx	Free Elective	9
		18

Spring

Studio		Units
51-330	Communications Studio IV: Designing Communications for Social Systems	10
or 51-350	Products Studio IV: Designing Products for Social Systems	
or 51-360	Environments Studio IV: Designing Environments for Social Systems	
		10

Ideas and Methods (Select two Design Electives)		Units
51-xxx	Design Elective	9
51-xxx	Design Elective	9

General Education		Units
xx-xxx	Academic Elective	9
xx-xxx	Free Elective	9
		18

Fourth Year

In the senior year, students work to identify their next steps in professional practice, entrepreneurship, or in academia. They apply their design skills and knowledge to client-based and/or self-defined projects that focus on the design of services or social innovation.

The fall semester features the Design Research Studio, a semester-long project where students work in teams applying skill and knowledge learned in Products, Communications, and/or Environments. In the spring the Capstone Project challenges students to work independently on a semester-long project, deepening their understanding of service or social innovation design principles.

Fourth Year

Fall

Studio		Units
51-481	Senior Design Studio	12
		12

Ideas and Methods (Select one Design Elective)		Units
51-xxx	Design Elective	9
		9

General Education		Units
xx-xxx	Academic Elective	9
xx-xxx	Free Elective	10
		19

Spring

Studio		Units
51-480	Design Capstone Project	12
		12

Ideas and Methods (Select one Design Elective)		Units
51-xxx	Design Elective	9
		9

General Education		Units
xx-xxx	Free Elective	15
		15

Other Requirements

General education courses should be selected from other departments throughout the university. Students are strongly advised to select a balanced set of general education electives-in addition to Interpretation and Argument, Humanities & Social Sciences Elective, and Introduction to Psychology - from three broad areas of study: arts and humanities, social and behavioral sciences, and natural sciences and engineering, including mathematics. While free electives may include studio courses in other departments, academic electives are non-studio (lecture) courses in other departments. Specific recommendations (and general requirements) for electives in all of these areas are available from advisors in the School of Design. The School places strong emphasis on the value of general education for personal growth as well as professional development. General education electives allow a student to obtain a minor in another department or program, such as business, human-computer interaction, IDEATE, engineering, professional and technical writing, or architecture.

Students may enroll for no more than 18 units of independent study courses, and no more than one independent study per semester. A minimum 3.0 GPA is required for independent study. Independent study is permitted only in the third and fourth years of the program. Proposals for independent study courses must be developed jointly by the student and a faculty advisor. Guidelines are available from the School.

A minimum GPA of 2.0 is required to maintain Professional Program status. Grades lower than “C” in required Design courses will result in academic probation, suspension, or drop from the School of Design.

Full-time students are required to enroll for a minimum of 36 units per semester, with 45 units required for expected degree progress (typically five courses per semester). The minimum number of units required for graduation in Design is 360.

Academic Standards

The design curriculum adheres closely to the fundamental professional entry-level standards established by the two leading national design organizations: the American Institute of Graphic Arts (AIGA) and the Industrial Designers Society of America (IDSA).

Applications

The School of Design accepts applications from students who are completing secondary education or who wish to transfer from within Carnegie Mellon University. The School also accepts applications from students who wish to transfer from other institutions. Students applying for the program are asked to submit a digital portfolio as evidence of design ability. This is considered in balance with evidence of academic ability, based on secondary school grades, SAT scores, class rank, and letters of recommendation. The School also accepts applications for the design minors program for a limited number of spaces. Details are available on the Design website.

Emeriti Faculty

JOSEPH M. BALLAY, Professor Emeritus – M.F.A., Carnegie Mellon University; Carnegie Mellon, 1970-2002–

DAN BOYARSKI, Professor Emeritus – M.F.A., Indiana University School for Design, Kunstgewerbeschule, Basel, Switzerland; Carnegie Mellon, 1982-2018–

CHARLEE MAE BRODSKY, Professor Emeritus – M.F.A., Yale University; Carnegie Mellon, 1978-2022–

THOMAS L. MERRIMAN, Teaching Professor Emeritus – B.F.A., Carnegie Mellon University; Carnegie Mellon, 1985-2020–

Faculty

ERIC ANDERSON, Professor & Interim Head – M.A., Ohio State University; Carnegie Mellon, 1998–

MARK BASKINGER, Professor – Ph.D, Royal Melbourne Institute of Technology; Carnegie Mellon, 2003–

JONATHAN CHAPMAN, Professor – Ph.D, University of Brighton; Carnegie Mellon, 2017–

WAYNE CHUNG, Professor – MID, University of the Arts; Carnegie Mellon, 2007–

DINA EL-ZANFALY, Assistant Professor – Ph.D, MIT; Carnegie Mellon, 2019–

KELSEY ELDER, Assistant Professor – M.F.A., Cranbrook Academy of Art; Carnegie Mellon, 2022–

BRUCE HANINGTON, Professor – M.E.Des., University of Calgary; Carnegie Mellon, 1998–

SUNKI HONG, Assistant Professor – M.F.A, Iowa State University; Carnegie Mellon, 2023–

KRISTIN HUGHES, Associate Professor – M.F.A., Virginia Commonwealth University; Carnegie Mellon, 2001–

TERRY IRWIN, Professor – M.S., Schumacher College; Carnegie Mellon, 2009–

HAEYOUNG KIM, Assistant Professor – M.Des, Harvard University Graduate School of Design; Carnegie Mellon, 2023–

MARK MENTZER, Professor – B.F.A., Carnegie Mellon University; Carnegie Mellon, 1975–

DAPHNE PETERS, Assistant Teaching Professor – M.Des., Elisava, Escola Superior de Disseny; Carnegie Mellon, 2017–

STACIE ROHRBACH, Professor – M.GD, North Carolina State University; Carnegie Mellon, 2003–

DANIEL ROSENBERG , Assistant Professor – Ph.D, Massachusetts Institute of Technology; Carnegie Mellon, 2021–

PETER SCUPELLI, Associate Professor – MDes & Ph.D, Carnegie Mellon; Carnegie Mellon, 2011–

STEPHEN J. STADELMEIER, Associate Professor – M.S., Cornell University; Carnegie Mellon, 1977–

ANDREW TWIGG, Associate Teaching Professor – B.A., Allegheny College; Carnegie Mellon, 2014–

DYLAN VITONE, Associate Professor – M.F.A., Massachusetts College of Art; Carnegie Mellon, 2004–

BRETT YASKO, Assistant Teaching Professor – B.A., The American University, Washington D.C.; Carnegie Mellon, 2019–

MATT ZYWICA, Associate Teaching Professor – B.F.A., University of Illinois; Carnegie Mellon, 2014–

Special Faculty

ASHLEY DEAL, Special Faculty – M.Des, Carnegie Mellon University; Carnegie Mellon, 2016–

GIDEON KOSSOFF, Special Faculty – Ph.D, University of Dundee, Scotland; Carnegie Mellon, 2017–

RAELYNN OLEARY, Special Faculty – M.Des, Carnegie Mellon University; Carnegie Mellon, 2016–

School of Design Courses

About Course Numbers:

Each Carnegie Mellon course number begins with a two-digit prefix that designates the department offering the course (i.e., 76-xxx courses are offered by the Department of English). Although each department maintains its own course numbering practices, typically, the first digit after the prefix indicates the class level: xx-1xx courses are freshmen-level, xx-2xx courses are sophomore level, etc. Depending on the department, xx-6xx courses may be either undergraduate senior-level or graduate-level, and xx-7xx courses and higher are graduate-level. Consult the Schedule of Classes *(*https://enr-apps.as.cmu.edu/open/SOC/SOCServlet/*) each semester for course offerings and for any necessary pre-requisites or co-requisites.*

51-101 Studio: Survey of Design

Fall: 10 units
Students will conduct activities that will help them notice design in the world, investigate how it works, and describe their thinking about design, through photography, video capture, sketching, note-taking and modeling. They will work through projects in various ways as a means of 'testing-out' and reflecting on command design approaches. This course is for undergraduate design majors only.

51-102 Design Lab

Spring: 10 units
Introduce concepts and methods to familiarize students with a range of analog and digital modes of working across products, communications, and environments. Students will use desktop modeling and comping methods to familiarize them with a range of basic materials to build confidence in using and manipulating material to represent ideas. This course is for freshman Design majors only.
Prerequisite: 51-101

51-121 Visualizing

Fall: 10 units
This course introduces basic drawing and sketching techniques including figure-ground translation, 2 pt perspective construction, storyboarding for explanation, diagramming for clarification, field notation for recording through guided exercises, demonstrations, and short projects.

51-122 Collaborative Visualizing

Spring: 10 units
This course introduces frameworks of notational, exploratory and explanatory sketching using collaborative methods and exercises to cooperatively communicate design ideas. This course is for undergraduate design majors only.
Prerequisite: 51-121

51-132 Introduction to Photo Design

Spring: 10 units
Using a digital camera, students learn how to extend their 'seeing' with the camera, both in the world and in a shooting studio. Through shooting assignments student will understand how to: deconstruct image meaning and aesthetical choices, construction of photographic meaning and aesthetics, an understanding of color and how color delivers meaning, how a photographic studio works, proper digital photographic workflow and contemporary trends in photography. Intended for Design Majors, or permission of the instructor.
Prerequisite: 51-101

51-171 Placing

Fall: 10 units
This course will explore the context in which students study design. Using primarily photography, students compare where they are from to the bioregion of the Ohio Valley of Western Pennsylvania and the history of the steel town, Pittsburgh. Students also learn about the modern Western emergence of design as a profession and discipline, and map the edges of current design practice by interacting with local professionals.

51-172 Systems

Spring: 9 units
This course explores how to understand complex phenomena by creating models of interrelations between components. Students learn soft systems diagramming as well as the systems thinking associated with ecologies, integrative science and socio-technical regimes. Students also learn how to see design as a way of making interventions into leverage points in a system in order to transform its functions.

51-173 Human Experience in Design

Intermittent: 9 units
Design touches, and can profoundly affect, people's lives. But why? And how? This course begins with a broad definition of what design is (and can be). We'll see how design is about the process as much as it is about the final product. We'll look at how the end user interacts with what is designed. And we'll discuss how designers need to think beyond the actual artifact to what lies behind it. We'll touch on design theory, design practice, design responsibility and even some design history. And through a series of guest lectures, explorations of other designers' work, field trips, viewings, class discussions and projects, we'll try to determine just what design is and what designers do.

51-175 Design Studies: Place

Fall: 5 units
"Place" introduces you to place-based design thinking. It trains your senses to perceive all that is designed and sustains everyday human lifestyles, especially those infrastructures and services invisible to city dwellers in the built environment. In addition, you will recognize relations between natural and artificial worlds. Coursework covers methods to evaluate individual and collective environmental and social impact at a regional and local level through techniques that develop capacities to reveal dynamic relationships among elements.

51-176 Design Studies: Futures

Spring: 5 units
"Futures" frames design in a temporally-extended, systemic context. It offers essential perspectives, practices, and competencies that are increasingly called for as designers progress in their work and careers, and as the design field evolves to acknowledge its significant powers and responsibilities. You will explore numerous futures methods, which support designers through ideation and storytelling, problem-finding and framing, brief formulation, project coordination, and collaboration. Coursework includes engagement with readings and videos, hands-on creative workshops, and visual prototyping and sketching.

51-177 Design Studies: Histories

Fall: 5 units
Histories explores a plurality of design histories extending beyond the dominant, Anglo-European story of Design. Through a series of guest lectures, critical readings, and offsite explorations, you will expand your understanding of histories, which evolve and change over time in the context of broader social, technological, environmental, economic, and political developments. Coursework includes exploring, developing, and documenting diverse historical perspectives of a research interest of your choice. Final projects will culminate in a presentation of student work.

51-178 Design Studies: Experience

Spring: 5 units
Experience explores how design touches peoples lives, and shapes their materials and non-material worlds. Through a series of lectures, viewings, and class discussions, we'll try to determine just what design is and what designers can do. We will explore contrasting definitions of design, and get to know it as an experientially-rich process. Well examine how users and audiences interact with what is designed, and debate the designers responsibility to consider what lies behind it. Coursework includes individual and team projects exploring design's role in shaping our experience of the world.

51-208 Research Methods

Spring: 4.5 units
Learn how to select, conduct, and develop appropriate research methods for understanding and discovering contextual information and behaviors of human participants.

51-215 Making Short Films

Intermittent: 3 units
The objective of this course is to provide students with a practical, technical and theoretical foundation in video work. Students leaving this class will have gained knowledge of developing a moving picture from start to finish. Students will learn storyboard, plan, production, and post-production video. Equally importantly students will start to develop their own visual aesthetics in the creation of 1 short moving pictures. The primary software for this course is Adobe Photoshop, with which students will explore construction, combination, manipulation, input, and output of video as a means of narrative creation. This Micro course will run between 5-6 weeks. The instructor will fly into Doha for a short period of face-to-face classes, centered around a Saturday. Enrolled students should expect two 90-minute face-to-face classes during the week before or after this Saturday date, as well as four 90-minute evening (6-7:30 pm) video classes over the duration of the Micro course (typically two before the campus visit, and two after, although instructors can change this). Specific dates will be confirmed in the syllabus closer to fall semester.

51-221 Color for Communications, Products, Environments

Fall: 9 units
This course will explore the fundamentals of color through the implementation of various media as they apply to their use in communication and expression in design. While this course does not deal with color theory per se we will spend time on the causes and effects of color interaction, color contrasts, color harmonies and color strategies for the effective use of color in our visual design work. We will use both nature and man made constructs to discuss how color affects what we see and its effect on our visual world. Short exercises and longer- term projects will be the vehicles of our explorations. This course is for Sophomore Design Majors.
Prerequisite: 51-122

51-223 Color for Communications & Products

All Semesters: 9 units
This course will explore the fundamentals of color through the implementation of various media as they apply to their use in communication and expression in design. While this course does not deal with color theory per se we will spend time on the causes and effects of color interaction, color contrasts, color harmonies and color strategies for the effective use of color in our design work. We will use both nature and man made constructs to discuss how color affects what we see and its effect on our visual world. Short exercises and longer- term projects will be the vehicles of our explorations. This course is for Sophomore Design Majors.

51-225 Communications Studio I: Understanding Form & Context

Fall: 4.5 units
Giving form to messages and information using type, color, and images will be the focus of this introductory studio in Communication Design. Understanding the connection between content, intent, and form will be the goal of every project and exercise. Principles of hierarchy, chunking, sequence, clarity, and visual voice will guide work for the screen and the printed page, in dynamic and static forms.
Prerequisite: 51-122

51-227 Prototyping Lab I: Communications

Fall: 4.5 units
Learn the core methods and tools of visual communication design, with a focus on Adobe CC: particularly InDesign, Illustrator, Photoshop, Prototyping tools, and After Effects. The learning of software ideally will align with the activities conducted in the Communications Studio. This is a requirement for Design sophomores studying Communications.

51-228 Communications Studio II: Designing Communications for Interactions

Spring: 9 units
At its most basic level, Communication Design conveys ideas and translates concepts into visual form. This form needs to be such that an audience will want to look, engage and (hopefully) learn. To get there, you will need to develop your process. Your own unique path. This is not easily done. It's also not prescriptive. There isn't one defined straight path. It's more like a wild and crazy zig-zag. A goal of this course is for you to give yourself permission to wander beyond the areas you're comfortable withto not be afraid of stretching beyond where you think you may be capable. And to develop your own individual process. We will work on a series of four print-based and interactive projects. You will broaden your understanding of color, scale, hierarchy, typography, grid systems and how to make things that both communicate and resonate with your audience. Everything we design is an opportunity to make work that is compelling, memorable and moving. This is a required course for all SoD Sophomores who are pursuing the Communications track.
Prerequisite: 51-225

51-229 Digital Photographic Imaging

Fall: 9 units
The objective of this course is to provide students with a practical, technical and theoretical foundation in digital imaging. The primary software for this course is Adobe Photoshop, with which students will explore construction, combination, manipulation, input, and output of image as a means of narrative creation. Through project critique and other discussion, we will also consider the aesthetic and political implications of the emergence of this and other new electronic imaging technologies.

51-231 Calligraphy I

All Semesters: 9 units
Working with pure unadorned Roman letterforms, this course introduces students to the theory and practice of hand-generated letters, employing a variety of mark-making tools. This course provides an in-depth understanding of the basic principles and techniques of the art of formal writing. Rhythm, texture and composition are achieved through routine, elementary exercises using geometric forms, demanding concentration and manual discipline with the development of hand-eye coordination. The function, use, and harmonious sequencing of letterforms is taught through weekly projects. Awareness of rhythm, texture and letterform structure is achieved through routine exercises. Drills, demonstrations, discussions, individual and class critiques are on-going. Additional related topics and activities introduced in class include books: binding and design. A brief introduction to the historical development of our Western alphabet is provided through film, slides, demonstrations, with discussion of twentieth-century type designs. Students also gain exposure to letter vocabulary, paleography, monoprints, words and punctuation, classical page design, publication design-past and present, and calligraphy's role in design today. Thinking with hands and eyes, the manual placement and spacing of letters practiced in this course awakens sensitivity and judgment in the designer.

51-232 Calligraphy II

All Semesters: 9 units
This course serves as a continuation and deeper investigation of topics explored in Calligraphy I, where students tackle advanced problems in calligraphy and lettering. The introduction of new hands is to be decided by the student and instructor. Prerequisites: 51231
Prerequisite: 51-231

51-236 Information Design

Fall and Spring: 9 units
This studio course focuses on teaching a basic visual design process from ethnographic research through ideation to finished artifact. Students will work individually and in teams to gain proficiency in applying specific design techniques to information design challenges. Students will attend lectures to gain new perspectives, engage in projects to learn through making, conduct readings to balance theory and practice, participate in critiques to verbalize their views and consider alternate perspectives, join in discussions to develop shared understanding, give presentations to communicate their thinking, and complete tutorials and learn software for additional insight.

51-239 Prototyping Lab II: Communications

Spring: 9 units
Program simple websites as a means of learning basic HTML 5.0 and CSS; prepare documents for digital and print production using Adobe InDesign, Illustrator, Acrobat; learn basics of UX prototyping
Prerequisite: 51-227

51-240 Design, Brands, & Futures: Service Design Approaches and Pivots

Intermittent: 3 units
This micro will introduce students to service design and help students develop skillsets and knowledge that will serve them in their particular area of study. This includes ways of analyzing existing businesses and services, empathizing with multiple stakeholders in a complex system, and developing ideas for ways that existing businesses and services could adapt and evolve to emerge from the pandemic more resilient. Students will also use the power of storytelling to develop presentations that communicate their ideas in compelling ways.

51-241 How People Work

Fall: 9 units
51241 How People Work: Human Factors (ID/CD Lab I) This course is a general introduction to the field of human-centered design and applied human factors. It centers on the understanding of physical, cognitive, and emotional human needs and desires, including methods employed to acquire this information and translate it into useful criteria for the design and evaluation of products. Lecture, discussion, lab exercises, and projects are employed. Required of all sophomore design students. Others admitted by permission of instructor only.

51-242 How Things Work: Mechanics and Electronics

Intermittent: 9 units
This course investigates the basic principles of mechanics and electronics. Through the combination of lectures, investigations, and lab experiments, students develop simplified representations of complex systems. The skills of freehand drawing, mechanical drawing and three-dimensional models are employed and developed during the project sequence. Instructor permission required for non-Design majors.

51-245 Products Studio I: Understanding Form & Context

Fall: 4.5 units
This mini-semester course takes students through a progression of exercises and projects that investigate how object forms can relate to people through reasons of looks, feel, function, make, and preference. The understanding of context plays a role as the system of internal and external factors and conditions that cause people to interact a particular way through how they recognize, handle, move, and perform activity with the form and material of an object. Drawing and physical modeling become essential tools for the planning, development, and communication of these ideas.
Prerequisite: 51-102

51-247 Prototyping Lab I: Products

Fall: 4.5 units
The course will consist of introductions, demonstrations and solutions to introductory aspects of SolidWorks. Forming foundation skills in CAD-based communication and problem solving will be emphasized.

51-248 Products Studio II: Designing Products for Interactions

Spring: 9 units
This course provides essential methodologies for the conceiving, planning, and realization of three dimensional objects and is coordinated with the Prototyping Lab 2 course to provide for an experiential understanding of the relationship between designing and making. From an operational standpoint, this course gives primacy to the material object to probe its characteristics more deeply and to critically explore an object's role as part of the assemblage of interaction and experience. Students will develop three-dimensional visual literacy, emphasizing the relationship between form factors and overall visual/physical impact in service of supporting human interactions. Through a hands-on approach, this course covers the "how" and the "why" of product/object development through the primary lens of "design for interactions."
Prerequisite: 51-245

51-249 Prototyping Lab II: Products

Spring: 9 units
This course introduces students to high fidelity modeling techniques through a series of machines, processes, and or methods to simulate desired form, scale, and proportions.
Prerequisite: 51-247

51-251 Digital Prototyping

Fall: 4.5 units
A half-semester laboratory mini-course introducing 3D modeling software. Each class meeting consists of an introduction to and demonstration of specific aspects and functions of SolidWorks software. At the end of each class session, work related to the covered topic(s) will be assigned for completion by the next class meeting. This course is a requirement for all ID majors. Instructor permission required for non-ID majors.

51-252 Design, Brands, and Futures: Design Thinking for Sustainable Change

Intermittent: 3 units
Design Thinking is a powerful process that expands creative potential and drives sustainable innovation. Work with CMU Design faculty and acquire powerful creative tools that you can immediately put into practice as an agent of sustainable change.

51-256 Design, Brands, and Futures: Designing Product and Service Identities

Intermittent: 3 units
In this course, students and I will delve into investigating social and cultural patternsboth historical and contemporarywhich guide effective approaches to branding products and services. For example, what helps people feel happy, accomplished, confident? What do they wear? What do they eat? Where do they gather? What do they do for enjoyment? What do they value? Students will work to align their discoveries to the graphic forms, colors, typography, and taglines that they create as part of a comprehensive branding strategy, which they will base on a product or service of their own choosing. Students will achieve these goals by engaging in a creative process where they will sketch, iterate, test, and refine graphic symbols and typography using conventional paper and pencils as well as Adobe Illustrator. Throughout the course, we'll also discuss communication trends and the role technology plays in shaping how and where brands appear in our everyday lives. Based on what they learn, students will propose various forms that their graphic symbols may take and brainstorm contexts in which they may appear. For example, how might their concepts appear in motion in a video viewed on a phone, or on the side of a food truck? Through this process students will explore the affordances and limitations of various mediums and contexts and test the flexibility of the branding systems the create.

51-257 Introduction to Computing for Creative Practices

Intermittent: 10 units
This course is an introduction to Java programming for designers, architects, artists and other visual thinkers, using the popular "Processing" Java toolkit for interactive graphics. Intended for students with little or no prior programming experience, the course uses interaction and visualization as a gateway for learning the traditional programming constructs and the fundamental algorithms typically found in a first course in programming. Students will become familiar with essential programming concepts (types, variables, control, user input, arrays, files, and objects) through the development of interactive games, information visualizations, and computationally-generated forms. Because of limited space, only Design majors may take this course. Students following an IDEATE concentration or minor should register for 15-104.

51-261 Communication & Digital Design Fundamentals

Fall: 9 units
A one-semester course that introduces non-majors to the field of communication design. Through studio projects, lectures, and demonstrations, students become familiar with the visual and verbal language of communication designers, the design process, and the communicative value of word and image. Macintosh proficiency required. This course (or 51262) is required for Design minors.

51-262 Design Center: Communication and Digital Design Fundamentals

Spring: 9 units
A one-semester course that introduces non-majors to the field of communication design. Through studio projects, lectures, and demonstrations, students become familiar with the visual and verbal language of communication designers, the design process, and the communicative value of word and image. Macintosh proficiency required.

51-264 Product Design Fundamentals: Design for Interactions for Products

Spring: 9 units
In this one-semester studio-like course non-majors are introduced to product design from the product designer's point of view. Through studio projects, lectures, and discussions, students will learn approaches to defining and visualizing product concepts for mass production. Case histories and the analysis of existing products will supplement hands-on experience in developing product concepts. This course is required for all Design minors.

51-265 Environments Studio I: Understanding Form & Context

Fall: 4.5 units
This mini course will teach you the elemental strategies for designing meaningful, narrative-driven spaces and experiences. Through projects looking at the world as it is today and speculatively 10 years in the future, you will develop your ability to think through the relationship between time, space, scale, materials, and technology. You will use what you learn in 51-267 (Prototyping Lab 1: Environments) to develop both analog and digital high-fidelity artifacts that communicate the interactive experiences you have designed. This course is a requirement for Design students who wish to study Environments during their time at SoD.
Prerequisite: 51-102

51-267 Prototyping Lab I: Environments

Fall: 4.5 units
This mini course will provide you with practical skills to aid you in the design of interactions in environments and how to communicate your ideas to others. These include low-fi prototyping, rapid making, high-fidelity scale models, digital 3D modeling, typography in space, UI/UX strategies, augmented reality (AR) prototyping, basic electronic prototyping, and the development of concept videos. Building upon what was learned in your first year, you will continue to use Adobe Photoshop and Illustrator, while also being introduced to Adobe AfterEffects, Aero, and SketchUp. This course is a requirement for Design students who wish to study Environments during their time at SoD.
Prerequisite: 51-102

51-268 Environments Studio II: Designing Environments for Interaction

Spring: 9 units
Introduce students to the concept of resonant environments that provide meaningful physical and virtual experiences; utilize a range and combination of analog and digital tools for high fidelity output.
Prerequisite: 51-265

51-269 Prototyping Lab II: Environments

Spring: 9 units
Explore simple reactive and interactive programming as a means to support virtual and hybrid digital/physical environments.
Prerequisite: 51-267

51-271 How People Work

Fall: 9 units
Introduction to human-centered principles of design, including physical, cognitive, and emotional human factors. Capacities and limitations of people affected by design are learned through the study of known principles and user research. The course is delivered through a series of combined lectures, readings, hands-on lab activities, and a team project applying human-centered field research methods and design.

51-272 Cultures

Spring: 4.5 units
Explore the sociotechnical aspects of the many identity based differences between people. These differences may be not only cultural, but also related to gender, age, class, race etc. The course will survey critical theories that are useful for understanding how difference both constructs, and is constructed, by systems, practices and things. Students will also explore different frameworks and strategies for exploring questions of difference, and to think critically around the ethical and political implications for design interventions.

51-277 Design Studies: Systems

Fall: 5 units
"Systems" prepares you to design for, and within, complex systems. You will make use of systems theory and experiment with systems-thinking techniques to interpret and illustrate how ecological, social, and cultural systems operate at different levels of scale. You will also learn to identify leverage points within a system, and design ways to intervene that creates openings for norms, behaviors, attitudes, and habits. Coursework includes exposure to theoretical frameworks, analysis of case studies, and complexity mapping projects to analyze and represent the world from scalar and systemic perspectives.

51-279 Design Studies: Cultures

Fall: 5 units
"Cultures" immerses you in ways in which societies shape design, and how design shapes societies in return, rooted in historical and philosophical origins of identities and cultures. We will explore various aspects of human difference and relate them to the designed, material worlds we inhabit. Coursework involves reflective practices to connect theoretical, personal, and contextual understandings of the themes exposed, to explore meaning, purpose, and values that represent you as a person and as a designer.

51-282 Design Studies: Persuasion

Spring: 5 units
"Persuasion" develops your capacity to put across your message, to get other people to understand you, to value your work, and to want to work with youskills that will be central to your career, both inside and outside of design. Understanding what persuades you and othershow we are influenced by other people, by media, by technology, by our environment, by designis a critical skill to develop in better understanding yourself, your design practice, those around you, and society more widely. Coursework includes a series of persuasive, exploratory exercises including filmmaking and exhibition of speculative work.

51-284 Design Studies: Power

Spring: 5 units
"Power" explores the concepts of politics, the political, and the powers that intertwine with design. You will delve into the mesh conformed by plural forms of knowledge, wisdom, power, and designs. A deepening into matters of ideology allows us to think critically about how designed artifacts are the embodiment of ideology; having the power to influence what people think, and shape their aspirations, desires, and values. You will be exposed to emerging design practices and theories that harness the power of design for social change with sociocultural and ecological mindsets. Coursework includes facilitation of activities for the collective analysis of topics at the intersection of design and power.

51-317 Publication

Intermittent: 9 units
For this course you will arrive on Day 1 with a story that you want to tell. You will then spend the semester iterating, designing, producing, publishing and, finally, putting your publication out into the world in a compelling, memorable and designerly way. Your publication can take the form of a substantial book, a series of smaller booklets or zines, a film, an interactive experience, a piece of public art, a combination of two or more of these or something else entirely. As long as it can be disseminated beyond the classroom and campus. This course will only work for those who have an idea. You must come into this course with a firm grasp of the story you want to tell, how you want to tell it and who you want to tell it to. There is only one project for this course. It will be robust and multi-faceted and you will only have 13 weeks to make it. So you need to be ready to go from the start. The first class will be dedicated to hearing your pitch for what you want to do. It will then be determined if you should stay on the roster.

51-318 Design Center:Community Rituals & Civic Ceremony: Building immersive experiences

Intermittent: 4.5 units
This course combines social games and physical techniques from public theatre with contemporary design practices in the immersive experience industry to examine group rituals and civic ceremonies from ancient Mesopotamian, Mesoamerican, and Asian traditions. Participants will create and perform original civic ceremonies that harness group energy to "enchant" their surroundings, their belongings, and each other.

51-319 Digital Photography in the Real World

Intermittent: 4.5 units
DIGITAL PHOTOGRAPHY IN THE REAL WORLD Photographers are active observers. They look until they see what they want others to see -then they compose and click the shutter. In this course students will walk streets with their cameras. They will learn how to use their cameras to better understand what they believe is important, beautiful, and/or intriguing in the world. They will also learn how to communicate their imagery to others through screen-based and print output. Assignments range from accurately describing reality, to showing aspects of life that should be improved, to making images for purely aesthetic reasons. There are two main goals to this course: learning the fundamentals of operating a digital camera and producing digital output; and, learning to become better 'seers' in the world. Students must own a camera but no prior photographic experience is necessary.

51-321 Design Center: Photographic Narrative

Intermittent: 9 units
Most photographs tell stories. We see photographs in newspapers, magazines, snapshot albums, on the web, in books, and in posters. In these contexts photographs often work with words to convey meaning, whether they are shown with captions, news stories, or just with titles. Photographs can work without words, too, to create purely visual narratives. In this course, students will make a photo narrative and determine how it will be seen. Students may make photo books, for example, or decide that their images will be seen digitally on screen. While students are making photographs, we will explore the rich traditions of photographic story-telling that range from the world-oriented work of photo-journalist W. Eugene Smith to the documentarians such as Walker Evans, Nicholas Nixon, and Alec Soth. We will look at photographers, too, who construct fictional worlds, such as Duane Michals, Cindy Sherman, and Gregory Crewdson. As students make their own narratives, we will look at the interplay between words and photographic images; how images are paced and scaled to create rhythm; how photographs are sequenced to tell stories; and other formal elements involved in creating visual narratives. 12-15 students. Prerequisite-a college level photography course.

51-322 Advanced Digital Imaging

Intermittent: 4.5 units
Building on the technical skills and methods of communicating narrative learned in Digital Imaging Advanced Digital Imaging takes communication to the next level of resolution with particular concern in artifact creation. Students explore historical and groundbreaking means of content delivery.

51-323 Communications Studio III: Designing for Complex Communication Systems

Fall: 10 units
Gain a greater understanding of how to craft communications that resonate with specific people by researching topics/audiences/contexts, by developing/iterating/testing concepts, and by investigating deeply the nuances of typographic form/image/sequencing of interactions; learn how to craft graphic form to express ideas that are not dependent on the reading of words themselves; continue to develop communication systems
Prerequisites: 51-228 and 51-225

51-324 Basic 3D Prototyping

Spring: 4.5 units
A half-semester laboratory mini-course introducing a range of materials, methods, and workshop techniques by which designers prototype designs in three dimensions. Basic competence in shop techniques is established by bringing to realization a series of simple artifacts. Studio and model shop tools are required; lab fee. For Design students only.

51-326 Communication Systems Design for Social Equity

Intermittent: 9 units
This course will take a systems approach to understanding issues related to social equity and justice and will explore the creation of effective communication strategies for specific audiences across a range of analog and digital platforms. In this class students will explore and discuss the meaning of "social equity and justice" and explore its many facets through 1) assigned readings and discussions; 2) research on the problem and the stakeholders affected by it; 3) and the design of a communication system. A review of communication design from historic social equity movements will introduce the course. Students will work in teams to select a social justice issue, and map both the problem and the stakeholder groups affected by it in order to identify target audiences for the communication system. Over the course of the semester, students will formulate content and messaging for use in a range of communications that work together as a system such as brief tweets and messages + images for online platforms, concepts for apps, brief videos as well as print applications such as posters, brochures etc. The final result will be a multi-pronged campaign to raise awareness and motivate action with respect to a social justice/equity problem. Class will meet once a week for 2 hours and 50 minutes. Students will be asked to work in Miro and other online collaborative platforms. This course will be offered remotely.

51-327 Design Center: Introduction to Web Design

Fall: 9 units
This class will introduce the basics of designing and building websites, the fundamentals of HTML5 and CSS3, and responsive design approaches to assist students in creating semantically sound web pages that can be viewed across a variety of platforms, devices and browsers. The class will help students understand the constraints and advantages of working with the web, with this course focused on technically pragmatic solutions for making websites. Students will also be exposed to content management systems and topics such as responsive web design, research, and information architecture. Upon completion, students will be capable of designing, creating, launching and managing their own web sites. Your own laptop is required, with the following software installed: Adobe CS6 or later, as well as other open-sourced software. This course is for Design Majors only, or by special permission of the instructor.

51-328 Design Center: Design for Digital Systems

Intermittent: 9 units
Through tools and methods of user experience research and ideation, Design for Digital Systems uses web-based technologies to create functional prototypes for digital systems. Through demos, exercises, and a team-based trans-disciplinary project, students will use design thinking, industry-standard UX software, and code to identify, propose, and generate novel ideas for user problems. Students will learn advanced HTML and CSS, along with basics of database-driven web platforms using server-side technologies such as PHP and databases. The course is focused on screen-based interactions, but not exclusively so; it considers what technologies are viable today while leaning into the future to solve problems. Experience with HTML, CSS, and JavaScript is recommended but not required. This course replaces 51328 and 51828 Advanced Web Design. There may be a lab fee for non-design students.

51-330 Communications Studio IV: Designing Communications for Social Systems

Spring: 10 units
As the final course in a sequence of studio courses for Communication Design majors, this one builds on everything learned previously. Apply skills/knowledge learned in researching, developing, evaluating, refining communications to multi-facetted communication challenges that warrant the design of multiple communication pieces that span diverse mediums (in print and digital platforms) and function as a system; learn how to design for futuring (parts of the system yet to be determined) and for co-design where parts of the system are made for growth through contributions from audiences. This course is required of Communication Design majors in the School of Design.
Prerequisite: 51-323

51-331 Advanced Calligraphy I

All Semesters: 9 units
This course serves a continuation of study in the discipline of calligraphy. (It meets at the same time as Calligraphy I.) Students may take one of two directions in the course. (1) Enlarging their repertoire of scripts, contemporary or traditional, for use in limited areas of work such as book or display work, or (2) Concentrating on more intensive problem solving using a limited repertoire of scripts such as Roman, Italic, Sans Serif. Prerequisites: 51232
Prerequisite: 51-232

51-332 Advanced Calligraphy II

All Semesters: 9 units
This course serves a continuation of study in the discipline of calligraphy. (It meets at the same time as Calligraphy II.) Students are encouraged to tackle advanced problems or work with the instructor to determine new directions of study. Prerequisites: 51331
Prerequisite: 51-331

51-333 Design Center: Collaboration by Design

Intermittent: 9 units
In Collaboration by Design, we'll be working on improving the ways we collaborate. Through this hybrid seminar/project-based studio, we'll explore ideas to improve collaboration in formal and informal contexts, along with intra-, inter-, multi-, and trans-disciplinary settings. We'll be exploring how issues such as personal values and goals, intimacy and independence, team dynamics, constructive criticism, and others affect the way we work together. Students can expect reading assignments, class discussion, informal (low stakes) writing projects and presentations, and team-based exercises and projects in which we share and apply our learning and develop ideas. Note: students taking this course will help set the topics and curricular trajectory for the course in collaboration with the instructor, so from day one we'll start the work of defining what we'll do, together.

51-336 The Non-Selfie

Intermittent: 9 units
The Non-Selfie: using the camera to record, probe, and understand one's own and another's behavior This course is the opposite of the selfie, but it uses the camera to record human behavior, both your own and another's. Designers need to be good human observers in order to design for human needs. Designers also need empathy. This course aims to deepen sensitivity to others by first better understanding ourselves. Informed by Manfred Max-Neef's classification of fundamental needs and other relevant materials, we will create two in-depth photo-essays, the first being a study of ourselves, the second being a study of someone who is unfamiliar to us. In the first half of this course, while looking at the tradition of self-portraiture in photography and other media, we will be making in-depth photographic stories of ourselves. In addition to photographs, we may make scans of objects, include personal artifacts and anything else that may contribute to building an in-depth self-portrait. In the second part of the semester, we will apply what we learned to a person who we do not know, in hopes of bringing new insights and methods to understanding for another. In addition, we will look at the rich literature that exists in documentary photography about representing "the other." By the end of the semester, each student's work will be made into a hand-made Japanese stab book of two volumes: a volume on oneself, and one on another. The skills learned in this course are immediately relevant to becoming a good designer. Digital camera is necessary, and knowledge of camera operation, Photoshop and InDesign is helpful.

51-338 Documentary Photography

Intermittent: 4.5 units
Documentary Photography: the Social and Built Landscape Documentary photography explores issues, often social, humanistic and/or political, in man-made culture. This course examines the work of nineteenth, twentieth, and twenty-first century documentarians while students photographically investigate their own topics. Among the many ethical areas of a documentarian's concern, the course examines (through looking at the documentary tradition and through the student's own work) the following: the photographer's relationship to the subject; the choices involved in representing the subject; the act of selectivity in framing the subject; the reasons for making documentary photographs; the intended audience for documentary photography; and the appropriate final display of the photographs? Extensive shooting, printing, and library research. Prerequisite: A beginning photography course, or by the permission of the instructor.

51-341 How Things are Made

Fall: 9 units
This course will provide a breadth of knowledge for current manufacturing, materials, and processes encountered in the industrial design field. There will be an emphasis on actual production/manufacture methods and not rapid prototyping methods. The class will consist of various lectures, media, electronic tools, and on-site visits to enable an understanding of how mass production affects design and design decisions. Industrial Design Juniors and amp; Seniors or permission of the instructor.

51-343 Products Studio III: Designing for Complex Products Systems

Fall: 10 units
This course provides a framework for understanding core practices of the product design profession by placing it in relation to other disciplines and their influences on mass manufacture of goods; students will use a design process to identify problem/s, map a process in which tangible artifacts are made to learn more about the interaction between object, person, space, and context Prerequisites: 51-245 and 51-248
Prerequisites: 51-248 and 51-245

51-344 Advanced Digital Prototyping

Spring: 6 units
This course is an advanced course using SolidWorks computer modeling. It is a prerequisite for Production Prototyping. This course is intended for undergraduate Design majors.
Prerequisites: 51-324 or 51-245 or 51-249

51-346 Production Prototyping

Spring: 6 units
This course is the 2nd half of Advanced Digital Prototyping, using your work in SolidWorks to produce hard models. This course is for undergraduate Design majors.
Prerequisites: 51-249 or 51-324

51-347 Drawing from Nature

Intermittent: 9 units
Drawing From Nature This course is about observing and making images of things growing, crawling, flying, swimming etc. Observations will be made firsthand in the field, supported with relevant research in topic areas with the aim of deepening personal understanding of all things biological. Issue surrounding natural forms such as behavior, locomotion, adaptation, the environment and systems will also be investigated. We will work in tandem on refining our abilities in communicating what we discover through the process of drawing. A variety of visualization methods will be covered i.e. analytical drawing, visual notes, and diagramming to name a few. We will be using a variety of basic drawing and digital media to develop our work as we uncover aspects of form, structure and surface. Guest speakers will present work they have done in areas such as botany, biology, and environmental studies to name a few. A majority of the work will be done in the field and will then be developed in the studio. A final project will be assigned that will challenge you to develop a concept along with a compelling form(s) that communicates what you have uncovered about nature to a variety of audiences. This course builds on your experiences from First Year drawing and introduces several more advanced visualization methods. This course is intended for Junior and Senior Design Majors.

51-349 Visual Notation/Journaling

Intermittent: 9 units
Visual notation is the graphic equivalent of taking written notes. While the camera is a valuable and at times indispensible tool for recording what we see, the camera cannot make visible mental concepts. Nor can it discover and display underlying structures, create hierarchies, explain organizational schema or concepts that are not easily seen or understood. This course is about making visual notes in order to become fluent in your abilities to observe, record and interperate. Through daily entries in a journal you will work in several content areas i.e. mapping, natural and built environments and systems to name a few. A good portion of the work in this class will be conducted in the field using the resources available to us such as the museum, zoo and architectural sites. You will also be challenged to incorporate your notes as tools for communicating design concepts, implementing project development and presentations. The course will rely on the use of a variety of simple drawing tools and electronic media. Several visualization methods will be introduced and the work will build on the drawing experiences from First Year drawing. This course is intended for Junior and Senior Design Majors.

51-350 Products Studio IV: Designing Products for Social Systems

Spring: 10 units
This course challenges students to build their own design and research process to identify and frame the scale and scope of a problem/opportunity, and place it in relation to the wider system (social, cultural contexts); projects will require synthesizing a range of inputs to develop proposals for future working and living.
Prerequisite: 51-343

51-352 Product Design: Influences on and trends within: 1900 to Present

Intermittent: 4.5 units
A personal perspective on some of the prominent influences and trends in the field of product design since its inception as a recognized commercial discipline, some 100 years ago. The growth of mass-production, its development from craft-based making origins, the impact of technological developments, two world wars, the presence of visual media and advertising, and other cultural waves and trends all show themselves in the products we design, desire, produce and inspire us. Through a series of talks, readings, presentations and a few guest speakers, the class will take a less-than-formal approach to looking at how we got from where we were then to where we are now. There will be discussions, writings, and a visual, notated journal to track your thinking, express your reactions, and thoughts, and the beginnings of a visual archive to take with you after the course ends. An interest in product as a window into cultural thinking is recommended, but not required. Writing, sketching, and searching skills are recommended for participants. Assessment is based on participation, engagement, and the building of a personal archive. 15 students maximum. Preference given to P track undergraduates

51-355 Experimental Sketching

Intermittent: 4.5 units
Experimental Forms of Sketching fall 2011 Advancing design drawing philosophy and application This 7 week mini course seeks to expand our experiences with interpreting forms of drawing quality within the process of sketching. This approach will explore semantics of rendering with mixed media, sensitivity of representational perspective, form building, and sequence evolution, within drawing developments that stimulate emotional connections with a viewer. Through exploring and testing variables, we will use the nature of drawing behavior processes to expand the interpretive significance of abstract idea forms. These "drawing idea forms" will be represented throughout a range of abstract levels from literal to highly figurative. Interpretations will derive from a variety of themes involving design, life, and nature and expressed on paper as objects, scenes, and story persuasions.

51-357 Stuff That's Optional: People at Play

Intermittent: 9 units
Stuff that's optional: People at play Unlike our necessary work that provides sustenance for self and dependants, our recreation is optional and chosen. Products that support recreation are, likewise, an option. Soccer balls, kayaks, daypacks, fly reels, chess sets, running shoes; for that matter, the entire recreational industry is based on election. Our lives are better off for it; play is good for us. In this studio/ project course we will investigate play as an aspect of human endeavor. There are readings, discussions, and sessions aimed at gaining an understanding of the field. We will then respond by searching out and framing design opportunities, ideate and propose, refine and test. We will make stuff as teams and individuals that help us further define what it means to be humans at play. This course is intended for Junior and Senior Design Majors.

51-359 User Experience Research and Design

Intermittent: 9 units
The course intent is to develop appropriate user experience of tools and technology for a projected time frame or context of use. The need to understand people's stories, their lives, and how they want to live determines what interfaces, products, and systems should be developed. Student teams will work together to create appropriate user interactions and experiences which are supported by the design of tools and/or technology. This integrated course will utilize rapid prototyping as the basis for the creation of these proposed tools and products. This course is intended for junior, senior, graduate level students, Non-Disclosure Agreement and other legal agreements may be part of the requirements. Proficiency in one or more of these visualization methods: freehand sketching, computer visualization in 2D graphics, motion graphics and/or 3D solid or surface modeling. By Instructor Approval if NOT in Design. Please forward statement of intent to Instructor.

51-360 Environments Studio IV: Designing Environments for Social Systems

Spring: 10 units
Develop high fidelity proposals and demonstrations of multi-modal hybridized physical-digital environments based on rich information content and principles of user experience design.
Prerequisite: 51-363

51-361 HyperSENSE: Augmenting Human Experience in Environments

Intermittent: 9 units
We make sense of the world using our bodies, and just as we shape the environments around us, they also shape our experiences and senses. We will look in this course at how we can create physical and digital interactions that bridge the gap between humans and built environments to augment our senses. We will explore and introduce new roles of computational design and making in embodied sense-making, including human perception and cognition. We will apply methods and practices that form the basis for embodied interaction design. We will create projects that materialize these interactions using research-through-design and iterative design methods. Students choose the themes for their final projects or join an ongoing research project. Students in this class will work in groups to create installations in space controlled by human actions or wearable pieces that augment the body. Course deliverables include participating in reading discussions, a main project, and a publishable paper documenting the theoretical approach, creative process and findings. The instructors will help students publish their papers or pictorial in upcoming design conferences if students ask for help. Some possible themes for these projects could be: An installation that materializes a human presence in a remote space; a remote collaboration work tool or a wearable piece that enhances a certain human sense, and/or alters the perception of a specific space.

Course Website: https://embodiedcomputations.org/teaching (https://embodiedcomputations.org/teaching/)

51-362 Environmental Typography: Experiments in Space, Place & Identity

Intermittent: 9 units
This course explores the creative opportunities for typography in the physical environment. Through both individual and team projects, we experiment with dimensionality, material, color, and form. Design experiences that consider scale, interaction, and experimental type. Learn theories, concepts, and strategies related to wayfinding. And lastly, give form to identities through color, material, form, and typographic systems.

51-363 Environments Studio III: Designing for Complex Environment Systems

Fall: 10 units
Provide a framework and tools for designing for environments using experience design methods as a means to address the plurality of digital/physical hybrid environments
Prerequisites: 51-268 and 51-265

51-364 Drawing Spaces

Intermittent: 9 units
The natural and built environment will comprise the subjects of inquiry in this course. We will investigate systems of spatial and physical organization as found in the landscape in various forms and structures from forest to farm and from tent to tenement as examples. The intersection of these systems found in accessible locals will be investigated in the field through on site drawings using simple media and sketchbooks. These studies will then form the basis for the iteration of more developed images depicting environments both existing and imagined. Some time will be spent on observing people and various life forms as they populate and interact within these spaces to various ends.

51-365 Creative Technology Sprints

Intermittent: 9 units
In this course, we will take computational approaches to explore information design in space. Students will consider the interactivity and readability of information when creating data-driven systems. They will learn Javascript programming and use P5.js for their interactive systems. There will be three projects: 1) Speech-responsive Kiosk; 2) Immersive Space using Projection; and 3) Data Visualization using Holo Lens. There is no prerequisite for this course, but basic understanding of typography and information design is expected.

51-367 Design Center: Computational Design Thinking

Intermittent: 9 units
In this course, we will explore creative coding in the context of communication and interaction design and use it as a primary medium to consider form, content and context for designing systems. Specifically, we will use computation as process and material for perceiving and generating forms through crafting the relationships between input and output. In other words, we will create artifacts computationally by designing formations through constructing algorithms and manipulating parameters for recognizing, deconstructing and generalizing patterns across solutions. There will be three group projects to explore the following concepts: 1) Rhythms and Patterns, 2) Structures and Relationships, and 3) Conditionals and Events. There is no prerequisite for this course, but strong understanding of typography, grid, and visual system is expected. In addition, since coding is an integral part of this course, it is assumed that you already have prior experience with programming or will spend time outside of class to learn and understand the basics on your own (links to online tutorial videos will be provided).

51-368 Moving Pictures

Intermittent: 9 units
The objective of this course is to provide students with a practical, technical and theoretical foundation in video work. Students leaving this class will have gained knowledge of developing a moving picture from start to finish. Students will learn how to storyboard/scamp, plan/scout, produce, and post-produce. Equally importantly students will develop their own visual esthetics through the creation of 4 short videos.

51-369 You Are Here: Identity & Place

Intermittent: 9 units
Join us to explore how designers can express the identity of places, help people navigate complex environments, and craft memorable experiences. We will spend the semester experimenting with type, color, and pattern, while pushing beyond the boundaries of 2D surfaces to also consider materiality, dimensionality, and the environmental context. We'll also learn and apply theories of wayfinding, make custom typography and utilize it to design a variety of artifacts, and discover something new about the people and places around us.

51-371 Futures I

Fall: 4.5 units
The Futures 1 course focuses on aligning near term design action with longer time horizons aimed at sustainable futures. We introduce the students to Dexign Futures. Dexign is defined as "an experimental type of design that integrates Futures Thinking with Design Thinking." A distinguishing feature of dexign in our usage is the focus on aligning current action with long-term sustainability goals. The course covers different approaches to interpreting the future: from the extrapolations of trend forecasting, through the risk assessments of scenario planning, to attempts to steering the present through backcasting. Students explore the future through utopian and dystopian fictions that are created by authors, filmmakers and themselves. Students also attempt to evaluate futures in terms of their longer-term consequences.

51-372 Persuasion

Spring: 9 units
Examine written argumentation, oral presentations, artifact exhibitions, but also branding and social media. Students learn how to position their design ideas and connect them to the people and organizations that will increase their perceived value to target audiences. A focus of the course is on argument by precedent, where students build the significance of their innovations by situating them historically.

51-373 Futures II

Intermittent: 4.5 units
This course, paired with Futures I (51371), is the second half of a semester-long deep dive into foresight/futures for emerging designers. It represents a turn from learning basic concepts and methods in the futures field, toward more advanced, applied approaches at the cutting edge of strategy, co-design, worldbuilding, and transmedia storytelling.

51-374 Preparing for Design Practice

Intermittent: 4.5 units
This course helps design students formulate individual plans for their professional practice. In a ramp-up to Confluence, the first half of the class is devoted to developing and organizing portfolios, writing and designing resumes and cover letters and practicing interviewing skills. After Confluence, the second half is devoted to self-evaluation and reflection, guest lectures by early-career and later career designers and field trips that explore various aspects of a professional design career as well as other post-graduate opportunities. This course is geared towards Seniors and MA students, but Juniors applying for internships are also welcome.

51-375 Meaning in Images

Intermittent: 4.5 units
Images abound in our culture. This course takes a critical look at many different kinds of photographic images to understand how they operate in our culture to inform, persuade, and entertain various audiences. The content for this course will be generated from looking at, thinking about and discussing issues discovered while studying well-known to lesser-known images that range from photographs used in ad campaigns, to photographs that are used in scientific representation, to snapshots in family photo albums, to photographs that are used to show social injustices, to photographs that exist in museum collections. Readings will be assigned and short writing exercises will be required throughout the semester. In addition, photography assignments will be given. Design majors will have preference. Requirement: a digital camera. 15 students, junior and senior Design Majors.

51-376 Semantics & Aesthetics

Intermittent: 4.5 units
The course will explore the principles of visual composition, proportioning systems and the rules of order as it relates to art, architecture and design. The class will involve extensive reading and discussion of these topics in class. Some project work will also be required but minimal to the reading. A reading list will be provided. Instructor permission required for non-Design majors.

51-377 Design Center: Sensing Environments

Intermittent: 9 units
Whereas UX Design is typically described as shaping the immediate environment between a user and an object/interface, this course will instruct you in techniques, methods, and vocabularies to expand the scale of your design. Course content will give students experience integrating and shaping their current work into 2-3 other levels of scale, such as a single room, building, campus, and neighborhood. Students will walk away with an understanding of environments that will expand their range of capability, fitting for interdisciplinary application within fields such as social innovation, community development, public policy, architecture, and urban design.

51-378 Developing Form with Sketches & Models

Intermittent: 4.5 units
Development of Form with Models and amp; Sketches

51-379 Spatial Computing Design

Intermittent: 9 units
In this class, we will use Motion Tracking and Spatialized Outputs to design spatial computing experiences-collective, distributed, and localized interactions in a physical environment. We will work in a classroom instrumented with infrared cameras, digital projectors, and Sound Hologram technology (Wave Field Synthesis). In Unity 3D and using a digital twin of this classroom, we will program the interactions (in C#) to be tested in the physical space. Although some of these technologies relate to AR and VR systems, we will create experiences in the physical world without the interference of screens, headphones, and/or headset devices. This project-based class focuses on advancing research through prototyping and testing working implementations. The class sessions are structured around tutorials, short lectures, working sessions, and reviews.

51-380 Experiential Media Design

Intermittent: 9 units
Experiential Media Design focuses on the theory, methodology and history behind the design, development and interpretation of experiential media systems. The class incorporates a multidisciplinary approach to the study of complex media systems as technological, political, economic, socio-cultural and personal experiences. Topics covered include media and communications theory, cultural studies, qualitative and quantitative methodology, design principles, human-computer-interaction, information visualization and representation, user studies and evaluation. Students will create and critique a variety of integrated media systems demonstrating technical competence, aesthetic knowledge, analytic rigor and theoretical relevance. This class is open to Junior and amp; Senior Design Majors, and others by permission of the instructor.

51-382 Design Center: Design for Social Innovation

Spring: 9 units
Design for social innovation is a seminar that traces the history and application of design methods to solving social problems. The course will weaver together themes from readings in design, business, public policy, technology, social service, international relations and current events. The course will review examples of successful and failed social innovations from local, regional, national and international contexts. Students will learn the role of governments, technology, funding, infrastructure, mindset, emotion, and cultural factors in addressing problems in the social sector. The course will include a real-world problem-solving component where students (in teams or individually) will write a paper, design an artifact or intervention, propose a project or conduct a short design research study that addresses a real-world problem that impacts a local community.

51-384 Design Center: Co-Designing for Social Innovation

Intermittent: 4.5 units
This course is for students considering how their work can contribute to a positive societal shift. Through a mix of lecture, readings, classroom activities and short field assignments, the course covers models of change, and methods, approaches, and skills that support the emergence of new social patterns. Such work necessarily involves diverse stakeholders, the complexity of human relationships and beliefs, and the challenges of power, conflict, exclusion and inequity. For that reason, this course helps students make first steps in preparing to facilitate creative change among diverse stakeholdersattending to the conditions for generative dialogue, listening to all voices, and hosting the long process of co-creation.

51-385 Design for Service

Intermittent: 9 units
We all have an idea of what a good service is and #8212; when everything clicks into place, when you feel a little surprised and delighted because of the thoughtfulness and smoothness. And we know what it's like when a service goes wrong and #8212; missed flight connections, sitting for too long in a doctor's waiting room, continually repeating information as you're passed around customer service representatives. So what does it take to get a service right? And how can our services best help us get things done across multiple channels? We will explore the fundamentals of service design in this project based course. This includes the tools and practices of service design, and using service design to both analyze and improve existing services, as well as develop new, compelling services. Our goals (and the objectives of this class) will be to learn service design fundamentals by hypothesizing, experimenting, building, testing our assumptions, pivoting, tweaking, and improving. Some great visitors will join us too, in person and virtually, to provide real-world insights about service design. This course utilizes interdisciplinary and mixed-cohort teams to replicate the experience of working as a service designer.

51-387 Introduction to DeXign Futures

Intermittent: 9 units
As corporations, governmental organizations, and civil associations face accelerating change in uncertain times, increasingly they are looking to designers for new ways of thinking and acting. Designers today are engaged as thought leaders, strategists, activists, and agents of change in complex socio-technical problems throughout private, public, civil and philanthropic sectors worldwide. For designers trained to shape futures defined by uncertainty and change, these exponential times represent unprecedented creative opportunities for innovation. In this course, students learn the basic design skills necessary explore the forces that drive change in the future and learn to align innovation strategically with the trajectories of those forces.

51-389 Typeface Design : Variable

Intermittent: 9 units
There is a lot of expression in font files... The challenge is in getting the possibilities out. Relatively speaking, the tools used to craft, produce, and publish typographic forms have never been more plentiful nor more accessible. Computation has fused with form-making and generative processes creating limitless formal, practical, and conceptual potential. Kinetic and dynamic surfaces and screens abound alongside the continued stabilization of variable and color font formats. Unlike experimental font formats of the past, these emerging tools have seen ever-increasing community use, adoption, and advancement. We are in the midst of a (variable) typographic tidal wave. One which will have an unfathomable impact on *how* we communicate and *who* is able to communicate. This is a special topic studio elective on variable (and color!) fonts; from methodologies to visualize variable design spaces to the practical know-how needed to craft them. We will specifically explore variability in relation to the production of type, and curiously chart the number of ways in which the tools/programs of type production can be used (and mis-used) to animate forms (letters or otherwise) in endlessly generative ways. We will navigate the relationship between the history of code, and the history of font production, to find ourselves making within the current context of variable, and color, type technologies. Primarily a studio-centric 'off-road typography' making and prototyping environment, the course's critical dialogue will focus on the transformation of language and communication through these variable design processes.

51-390 Social Interaction Design in Community

Intermittent: 9 units
The course looks at Design for Social Innovation principles and practices, Documentary Photography, and Design Research while walking the streets, talking to residents, and working with organizations in a Pittsburgh neighborhood to understand its challenges. Students will examine Social Design case studies, with a focus on Problem Reframing processes (Dorst), and Solution Amplification (Manzini), and various design-enabled Theories of Change. They will also explore histories and theories of Documentary Photography. For the project/ethnographic portion of the class, students will work in teams of two within a neighborhood, and partner with residents and organizations. These collaborations will help students see the challenges of the community from an insiders point of view, in order for them to design appropriate responses to some of those challenges.

51-392 Images and Communication

Intermittent: 4.5 units
No one doubts the value of photography as a means of recording life. Even if we don't think of ourselves as photographers, digital cameras make it easy to photograph our families, our trips, and aspects of our life that we want to remember. But beyond snapshots, can photography also teach us how to see? And how do they teach us about the world? And, what are the qualities inherent in photographs that make them effective as artifacts of communication? Does looking through the camera's viewfinder sensitize us to world and help us see more? Or, as some writers suggest, does the camera interfere with experiencing the world fully. This course explores seeing with the camera and the many issues that arise when one snaps the shutter. We will be looking at a range of different kinds of photographic images, understanding their contexts, and how to read them. Designers and other visual people use photographs extensively in their work. This course endeavors to make students more aware of their decisions and actions when making photographs as well as how to judge a photograph's effectiveness. The issues that we discuss using photographs, relate to other kinds of visual images, as well. We will be making photographs as we are discussing critical issues in photography that come out of readings. Students must own a digital camera but no prior photographic experience is necessary.

51-393 Design Studies: Object-Based Histories at the Museum

Intermittent: 4.5 units
Object-Based Histories utilizes as its primary source Extraordinary Ordinary Things, the design collection installation of more than 300 works at Carnegie Museum of Art. In a small group setting students in this elective will consider historic and contemporary designs within the museum galleries. Through close looking and conversation, we will explore designers, makers, and users and their various cultural contexts. This course takes a its premise that if objects in the world are solutions, we can learn to intuit the questions. In so doing, we gain insights into human nature, cultures, and the built environment. Students will expand their knowledge of design histories, materials, and technologies and hone their skills in visual analysis, historical imagination, and critical thinking.

51-396 Design Center: Design for Zero Carbon Lifestyles

Intermittent: 4.5 units
In this mini-course, students focus on aspects of Sustainable Development Goals: #13 Climate Action, #12 Responsible Consumption and Production, #11 Sustainable Cities and Communities, #9 Industry, Innovation, and Infrastructure, and #7 Affordable and Clean Energy. Students explore how to become the agents of change around the challenges of the climate emergency focused on the design of zero-carbon lifestyles. Projects focus on zero-carbon lifestyles on two levels: individual and campus life. This course is open to all kinds of designers ranging from architecture, art, business, computer science, HCII, engineering, psychology and so forth.

51-399 Junior Independent Study

All Semesters
Guidelines for independent study in the Design office. Proposals must be approved by faculty before registration.

51-400 Transition Design

All Semesters: 9 units
Transition Design: Designing for Systems-Level Change. This course will provide an overview of the emerging field of Transition Design, which proposes societal transitions toward more sustainable futures. The idea of intentional (designed) societal transitions has become a global meme and involves an understanding of the complex dynamics of socio-technical-ecological systems which form the context for many of todays wicked problems (climate change, loss of biodiversity, pollution, growing gap between rich/poor, etc.).Through a mix of lecture, readings, classroom activities and projects, students will be introduced to the emerging Transition Design process which focuses on framing problems in large, spatio-temporal contexts, resolving conflict among stakeholder groups and facilitating the co-creation, and transition towards, desirable, long-term futures. This course will prepare students for work in transdisciplinary teams to address large, societal problems that require a deep understanding of the anatomy and dynamics of complex systems.

Course Website: https://transitiondesignseminarcmu.net/

51-418 Diversity, Equity, Inclusion and Design

Intermittent: 9 units
In this course, students will explore Diversity, Equity, and Inclusion (DEI) issues as they relate to the School of Design to propose and possibly implement and initiate efforts to begin to address some of these issues. We will learn about the systems, structures, and tools for, by, and with Design at the intersection of DEI. Foundational lectures, discussions, and hands-on workshopscombined with a review and consolidation of precedent research and work supporting the definition and scope of DEI. Through a variety of group exercises, directed working sessions, guest lectures by subject matter experts, readings, case studies, and more, students will be guided through an intensive learning process. Students will work individually and collaboratively, including working with the full course cohort. We will ask questions such as: What do we mean by DEI? What are the opportunities and challenges within the design discipline and its pipelines? Within design pedagogy and practice? With designers and designing? What happens if we put DEI at the center of our work? How do we develop new postures and mindsets that place DEI at the forefront of the School of Design at Carnegie Mellon University?

51-419 Design Center: Design's Reverberations: Ripple Effects of Innovative Ideas

Intermittent: 4.5 units
When an idea is implemented to effect change, what happens to its context? This course provides students from different backgrounds with the opportunity to think through multiple dimensions of and orientations to the notion of solving a problem through making and theorizing. Through the lens of design-driven processes, the class will delve deeper into the conditions in which problems are solved and place focused attention on domino and ripple effects of effecting change. Students will uncover what may be brewing underneath the surface of a given context, such as the residual impact of historic events, changes to the topographical landscape of a neighborhood, connections between individual behavior change to the growth of niche cultures, sensorial shifts in the environment due to climate change, emerging instabilities in a system sparked by the implementation of an idea, amongst others. Students will use present-day contexts, such as neighborhoods or particular initiatives, as points of departure to answer the questionswhen an idea is implemented to effect change, what happens to its context? Students in this course will gain a deeper understanding of the complexities of instigating change to inform their ethos and practice.

51-420 Sensing Place through Color

Intermittent: 9 units
The world is enhanced by color in every facet of our environment, but we often overlook unimaginable color interactions. The application of color depends mainly upon a trial and error process of selection, comparison, interaction, and evaluation. This course is about learning to look at the world with color filters and exploring ways to utilize color in new and meaningful ways. Through a series of prompts, journaling exercises, and personal experiences, we will reimagine our sense of place through color.

51-421 Design Center: Data Visualization

Intermittent: 9 units
This is a comprehensive data visualization primer. In Data Visualization course students will learn how to parse and visualize data. Starting with multiple introductory exercises on the foundations of data viz, we will then investigate tools, principles and best practice by which computational design driven data visualizations are operating today. Then, students will decide on a data set of their choice (necessary complexity given), to either create a data visualization with an emphasis on telling a story, or to generate a meaningful data art piece with an emphasis on engagement and experience. Project outcomes can be expressed through a variety of forms of the students choosing, from print posters, websites to mind-bending interactive experiences. These will be documented and presented on the final crit. This course assumes that students are already familiar with elementary programming (in any language), such as for() loops, if() statements, arrays[] and functions(). Participants will use Javascript and very likely popular creative coding toolkits like p5.js, Basil.js, Snap.svg, GSAP, D3.js etc. for their projects.

Course Website: http://bit.ly/CMUDataViz (http://bit.ly/CMUDataViz/)

51-423 Pieces 2.0: Social Innovation: Desis Lab

Intermittent: 9 units
In this class, students will identify a social problem and take a holistic design approach to solving it. They will design a product/product line- anything from a set of tools to help older adults lead a more active lifestyle, to re-envisioned collateral for the Lupus Foundation Pennsylvania. After or in tandem with the creation of this product, the student will construct an image, which will entail print media, a Web presence, packaging, and photography. By creating the product and its "marketing" effort from top-to-bottom, the student will gain a diverse set of skills in design as well as a richer understanding of the product. In the end, all the pieces will come together to create a well-refined image.

51-424 Web Portfolio

Intermittent: 4.5 units
This course will provide an opportunity for students to design and code their online portfolio. The course covers basic elements of Web design along with the foundations of HTML, CSS, Javascript and Flash as components of the design process. Prior experience with HTML is encouraged but tutorials will be provided if necessary. This is not an Actionscript programming course.

51-425 Design Center: Beginning Book Arts Lab

Fall and Spring: 6 units
This is a class of basic issues regarding hand bookbinding and letterpress printing. It's purpose is to develop a basic structural sense of book forms, of flat format work and of three dimensional forms. Learning hand craft techniques, developing hand skills and the sensitivity to materials are also a goal. Binding projects assigned will target the unique nature of papers, fabrics and archival card-boards. Structural procedures and techniques will be identified with each assigned binding project. The binding projects will be: A hardcover for a paper back book, a single signature book, a multi-signature book with flat spine, and a box construction. The box project is designed and crafted to contain a small letterpress printed class edition, either in book form, or as a set of un-bound pages. The letterpress component teaches the standard issues, unique to the relief process, in press work, handset procedure of cast metal type, page form spacing, lock-up of pages in press, proofing, and production printing. Each semester a small class edition project of text content and image, in two-color registration, is designed, hand set and printed. Image generation can be by hand cut block, assembled type-high forms, or digital process to polymer plate. This class is not to be repeated.

51-426 Design Center: Beginning Book Arts Lab

Spring: 6 units
Beginning Book Arts Lab Class. 6units. (This class is a prerequisite for the Advanced Book Arts Workshop Lab Class). This is a class of basic issues regarding hand bookbinding and letterpress printing. It's purpose is to develop a basic structural sense of book forms, of flat format work and of three dimensional forms. Learning hand craft techniques, developing hand skills and the sensitivity to materials are also a goal. Binding projects assigned will target the unique nature of papers, fabrics and archival card-boards. Structural procedures and techniques will be identified with each assigned binding project. The binding projects will be: A hardcover for a paper back book, a single signature book, a multi-signature book with flat spine, and a box construction. The box project is designed and crafted to contain a small letterpress printed class edition, either in book form, or as a set of un-bound pages. The letterpress component teaches the standard issues, unique to the relief process, in press work, handset procedure of cast metal type, page form spacing, lock-up of pages in press, proofing, and production printing. Each semester a small class edition project of text content and image, in two-color registration, is designed, hand set and printed. Image generation can be by hand cut block, assembled type-high forms, or digital process to polymer plate. This class is not to be repeated.

51-427 Advanced Book Arts Workshop

Intermittent: 9 units
Students will be required to plan and design projects that relate to binding, or digital printing, or letterpress printing, or hand-setting of cast metal type. Projects utilizing a combination of all processes can be planned as well. Experimental work, or Artists' Books are also encouraged. In this class structure students will be able to plan and design projects that are complete books, with printed content, or with out content. Other flat structures, and three dimensional containers are examples of general forms that will be categorized as binding work. Students who wish to enroll in this course must have already taken Beginning Book Arts, and must also speak to the instructor directly about project ideas. Emphasis for binding is working independently with a greater level of hand craft and a sensitivity to materials. Emphasis for letterpress printing is to learn in depth, and master, the general mechanical process for doing press work. Emphasis for hand typesetting is on gaining an understanding of the system of cast metal type, and to develop a sensitivity to typographic principles. Instruction will be given on an individual basis through consultation at strategic times throughout the semester. Project evaluation will be based on the success of the project work compared to each student's written project proposal at the start of the semester. The Advanced Workshop in Book Arts can be repeated. For more complex project work this class can be continued for the following semester.

51-428 Time, Motion and Communication

Intermittent: 9 units
This course focuses on designing and presenting time-based messages on screen. The differences between paper-based and screen-based communication are discussed and become departure points for projects. Working with word, image, sound, and motion and #8212; in Adobe AfterEffects and #8212; students develop responses to a variety of project briefs. Brief histories of animation, experimental films, and title sequences, as well as experimental music provide conceptual models to our discussions. An attitude of exploration is stressed, with an emphasis on visual voice, performance, and communication. Content will include personal messages and timely information. Proficiency with AfterEffects is a firm requirement. Preference will be given to junior and senior Design students.

51-430 RE.Futuring Craft

Intermittent: 9 units
This course explores the role of craft objects in shaping material culture and material futures aiming to offer propositional and speculative concepts to future-cast craft objects within natural, societal political, economic, scientific, and technological systems. Students engage in project-based learning that simulates diverse future scenarios to critically analyze material trends and their impact on future hand-crafted product design

51-434 Experimental Form

Intermittent: 9 units
The Experimental Form Studio looks broadly at the discipline of industrial design with an emphasis on creating new paradigms for interactive objects. This course encourages an exploratory study of physical objects and artifacts and provides a creative and intellectual forum to re-imagine our relationship with objects. Each independently-themed project presents opportunities to consider embedded mechanics and technology, objects as interactive media, and experience-driven design. Experimental Form, at its most basic, is a process that blends play and inquiry in an open-ended way finding the unexpected through tinkering and trying something you don't quite know how to do, guided by imagination, curiosity, and a disciplinary skillset. In this sense, Experimental Form complements the core Product Design Studio sequence by providing a playground for intellectual discourse, experimental trial and error, and refining individual processes for designing.
Prerequisites: 51-343 or 51-311 or 51-248

51-436 Designing w/CARE:Co-Creating Solutions for Complex Care Coordination in Oncology

Spring: 9 units
What does providing healthcare to patients with complex care coordination needs mean? How do we build processes and systems to ensure patients and family members receive the care they need and want? How can design thinking help healthcare institutions improve population health, reduce costs, enhance the care experience, including the care team's well-being, and advance health equity? How can we design effective communication systems to foster patient-centered care throughout the continuum of care for all patients? It is a tremendous opportunity to gain first-hand experience through interactions with healthcare providers, patients, and their caregivers. Students from various disciplines can apply their knowledge and perspective to propose a solution for a real-world healthcare problem.

51-437 The Emerging Ecological Worldview

Intermittent: 9 units
In this seminar it will be argued that the mechanistic worldview which has permeated Western (and Westernized) thinking and society since the scientific revolution has been crumbling for several decades: its place is gradually being taken by an emerging ecological (or holistic) worldview. This worldview coheres themes such as relationality, interdependence, self-organization, diversity, pluralism, creativity, context, process and wholeness. These themes have in many ways been embodied in the evolution of natural systemsorganisms, ecosystems and the earth itselfand have enormous implications for how we inhabit the places in which we live and the planet as a whole, if we and the 'More-Than-Human World' are to flourish. We will ask what it means to 'think ecologically' and what are the implications of the ecological worldview for how systems of all kinds (technological, infrastructural, political, social, economic) are designed. Students will explore how the application of ecological principles can help us to more authentically 'inhabit' and satisfy our needs in the places in which we live, and inform strategies for designing for futures that are more sustainable, equitable and desirable

Course Website: https://docs.google.com/document/d/1l_J7yptD8-MWKsaI9SZZdRKSqmscedSHsSH3TLbSVjs/edit?usp=sharing (https://docs.google.com/document/d/1l_J7yptD8-MWKsaI9SZZdRKSqmscedSHsSH3TLbSVjs/edit/?usp=sharing)

51-438 Letterpress/Screen-printing DIY Workshop

Spring: 9 units
This hands-on class concerns creativity in two of the most essential print mediums. The Print Workshop is an opportunity to form a foundation of letterpress and screen printing arts. Within the studio space, you will have the chance to use equipment used within the art community today and some rare tools that only students of this class will have access to. You will learn the history and skills to safely navigate the 2/D Lab and the confidence and knowledge to make zines, posters, t-shirts, greeting cards, and more.

51-441 Foundation of BME Design

Fall: 6 units
This course focuses on the Product Development scope and framing of a new medical device. Students will work together in an interdisciplinary team with Biomedical Engineering students to identify medical professional or patient needs through behavioral research and participatory research methods. This course deliverable requires the team to propose the problem space and develop a design brief and plan for the following Spring semester to implement. Prerequisite: Junior level design or higher with studio training. Solid modeling or surface modeling recommended.

51-442 BME Design Project

Spring: 9 units
This course is the second in sequence of prototyping and testing a proposed medical device product. The course consists of modules for the development of a project plan, background research, hazard analysis, setting product specifications based on user requirements, detailed design and analysis, prototype development and final documentation and presentation. All products developed will respond to the needs of appropriate market segments; resulting products will be deemed safe, effective, useful, usable and desirable by those segments. Students will produce a form model, functional prototype, marketing plan, and manufacturing plan of their product. Prerequisite: 51-441 (3 units, Fall) Foundations of Biomedical Engineering Design (or permission of the instructor). Junior level design or higher with studio training. Solid modeling or surface modeling recommended.

51-446 Design For Aging

Intermittent: 5 units
The population is aging at a staggering rate. Though not the only factor, the last of the baby boomers (b. 1946-1964) are turning 60 this year (the oldest boomer turning 78). Similar aging statistics apply in the US and internationally. Implications for design are evident. Ignoring this segment of the population in the design decisions we make would not only be socially and physically detrimental; it would also overlook an enormous opportunity. In this course we will examine the broad scope of aging with an inclusive intent already established through the premise of universal design. This means challenging assumptions and stereotypes, recognizing the enormous diversity in how people age. Through readings, other media, guests, and direct hands-on experiences, we will understand and gain an appreciation for the range of changes that occur with aging, including physical and cognitive abilities, social and emotional wellbeing. While we will learn from other disciplines, the focus will be on implications for the design of products, communications, environments, and conditions for interactions in and with the world.

51-451 Fundamentals of Joinery & Furniture Design

Fall: 9 units
Intensive introduction to traditional joinery techniques and the properties of wood through the use of textbook studies and lab experiments. Emphasis placed on how these techniques and properties influence design decisions. Students will learn how to set up, sharpen and use traditional hand powered tools. This acquired knowledge will be applied in the design and realization of a piece of wooden furniture. Limited enrollment. Lab fee and material purchases required.
Prerequisite: 51-350

51-452 Furniture Design II

Spring: 9 units
A continuation of 51-451, this course explores a much broader range of issues related to furniture design. Students will identify and define in a proposal the area of furniture design they intend to investigate and then produce one or more furniture pieces developed from their findings. Materials and processes applied to the project are limited only by the resources the student can bring to bear. Assigned readings and a series of in-class discussions will focus on the influence of workmanship in design, and on how the behavior of the user is influenced by the form or esthetic language of the artifact. Lab fee and amp; material purchases required.
Prerequisite: 51-451

51-455 DeXign the Future: Human Centered Innovation for Exponential Times

Intermittent: 9 units
DEXIGN THE FUTURE: Human Centered Innovation for Exponential Times
As corporations, governmental organizations, and civil associations face accelerating change in uncertain times, increasingly they are looking to designers for new ways of thinking and acting. Designers today are engaged as thought leaders, strategists, activists, and agents of change in complex socio-technical problems throughout private, public, civil and philanthropic sectors worldwide. For designers trained to shape futures defined by uncertainty and change, these exponential times represent unprecedented creative opportunities for innovation. In this course, students explore methods and tools for design in exponential times to shape uncertain futures. Students will explore the forces that drive change in the future (i.e., social, economic, political, environmental, technological), and learn to align innovation strategically with the trajectories of those forces. The design project that drives everything else is the future of mega-metropolitan regions, the hubs of innovation where 70% of people in the world and 75% of Americans will live in 2050. In the semester long project, students create scenarios for Life 2050 in Metro 3.0, using Pittsburgh as a locus and focusing on a project within urban systems such as Sustainable Production and amp; Consumption, Lifelong Learning, Human Development and Resilient Community.

51-471 Design Center: Imaginaries Lab: Research through Design

Fall: 9 units
The Imaginaries Lab is a research studio developing design methods to explore and support people's imaginingboth new ways to understand, and new ways to live, in an increasingly complex world. This course, running over three weekends, immerses you in a creative 'research through design' project, including prototyping and using experimental design methods 'in the wild', and in depth. You will learn and develop a variety of tools for conducting innovative forms of research through design, including exploring how people think, understand and imagine complex social and technological concepts, and envision futures, and depending on your expertise or interest, will be able to concentrate on applying particular skills as part of multidisciplinary teams. For example, a project might include speculative design, ethnographic inquiry, physical computing, and novel creative methods. We will aim to turn your work into a published output for a conference or journal, so there is additionally the opportunity to gain experience in this aspect of academic research.

Course Website: http://imaginari.es

51-478 Speculative Critical Design

Intermittent: 9 units
This praxis-based course will actively engage futures research through the integration of findings from critical readings, ethnographic research, mediated storytelling and hybrid prototyping. Using techniques of inversion, defamiliarization, uncertainty scenarios, everyday practice and good old-fashioned humor, we will create objects, systems and experiences that stimulate conversation, debate and understanding. The course seeks to produce a diversity of 'what will?' and 'what if?' cultural provocations that deeply examine possible, unwanted and seductive futures. This course is open to Junior and Senior Design majors, or by permission of the instructor.

51-480 Design Capstone Project

Spring: 12 units
Learn how to work independently, applying skills/knowledge in Products, Communications, Environments to the research/definition/development/testing of a project that focuses on the design of a service or social innovation that warrants investigation; deepen understanding of service and amp; social innovation design principles and how they are put into practice.
Prerequisite: 51-481

51-481 Senior Design Studio

Fall: 12 units
As contributors to the built world, the School of Design recognizes that designers can significantly impact society and embrace the responsibility to propose new ways of seeing and exploring the numerous dimensions of any given problem space. This studio is the next stage of that preparation. Structured into three separate discipline sections communications, products, and environments each will continue to leverage and evolve its disciplinary practices, ways of working, and purview to develop positive and impactful design proposals.
Prerequisites: 51-350 or 51-330 or 51-360

51-483 Debating the Roles & Responsibilities of the Designer

Intermittent: 9 units
Designers are expected to play a role in creating aspirational lifestyles through products and services, and informing and influencing human behavior on small and large scales. However what impact does or should the designer have on our lives, our society, and culture? Through readings, discussions, and team activity, students will construct pro and con arguments and debate the role and responsibility of the designer in a critical and fun way.

51-485 Design Center: Imaginaries Lab: New Ways to Think

Intermittent: 4.5 units
In this course, we'll carry out 'research through design' projects using experimental investigative methods in the wild, focusing on new ways to think and understand in an increasingly complex world. Learn and develop a variety of tools for conducting innovative forms of research through design, focused on exploring how people think, understand and imagine complex social and technological concepts, and envision futures. By the end of the course students will have worked on an interdisciplinary research project, including with an external partner, drawing on a number of disciplinary domains, and have experience with different kinds of design research and practice, from speculative and critical design to participatory design, as well as developing the skills and experience necessary to innovate with, and deploy, those methods. This course is a complement to 51-487 Design Center: Imaginaries Lab: New Ways To Live, but is independent of it, and eitheror bothcourses can be taken without overlap (we will be doing different projects, with a different focus).

Course Website: http://imaginari.es/newways (http://imaginari.es/newways/)

51-486 Designing Experiences for Learning

Intermittent: 9 units
This course focuses on designing experiences that engage people in educational activities that enhance their learning through meaningful, memorable, and enjoyable interactions with information. Throughout the course, students investigate the intersection of design thinking, UI/UX design, cognitive studies, social sciences, instructional design, and educational pedagogy as a way of developing knowledge and skills in designing experiences for learners. Students study topics that are often difficult to grasp and collaboratively build a taxonomy of content types based on common and differentiating characteristics to identify design opportunities. Through readings, projects, and class exercises, students explore how people perceive and process information, what motivates them to learn, and what constitutes an experience. The course introduces students to traditional and emergent learning tools and methods as a means of defining affordances and limitations of various learning approaches and mediums. It also provides students the opportunity to apply what they learn through the design, testing, and assessment of learning experiences that they create.

51-487 Design Center: Imaginaries Lab: New Ways to Live

Intermittent: 4.5 units
Focusing on new ways to live and experience the world, now and in the future, we'll do practical investigative 'research through design' projects using experimental methods in the wild. Learn and develop a variety of tools for conducting innovative forms of research through design, focused on exploring how people think, understand and imagine complex social and technological concepts, and envision futures. By the end of the course students will have worked on an interdisciplinary research project, including with an external partner, drawing on a number of disciplinary domains, and have experience with different kinds of design research and practice, from speculative and critical design to participatory design, as well as developing the skills and experience necessary to innovate with, and deploy, those methods. This course is a complement to 51-485 Design Center: Imaginaries Lab: New Ways To Think, but is independent of it, and eitheror bothcourses can be taken without overlap (we will be doing different projects, with a different focus).

Course Website: http://imaginari.es/newways (http://imaginari.es/newways/)

51-489 Design Center: Designing Narratives Across Media

Intermittent: 4.5 units
This studio mini will deal with designing at the intersection of three things: developing rich worlds, i.e. experiences and narratives, understanding how different mediums work and what they do, and understanding how genres work in terms of conventions around content and form. Students will thus be exposed to thought from various disciplines like media, genre, literary and cultural theory in order to create rich, interactive worlds as part of a single design studio project. Specifically, we will be analyzing and reflecting on the phenomenon of interactivity by studying how mediums like interactive print, film and cinema, tangible board/tabletop games, and installation art can be employed using the frame of "Other" futurisms (sinofuturism, afrofuturism, indofuturism etc.) that are part of the general practice of speculative and science fiction throughout the world. We will engage with popular and fringe cultural texts and artifacts, so students should be prepared to spend time watching movies, playing games, reading books etc. in an analytic, reflexive manner in order to better understand the different strategies that authors have developed in order to evoke specific responses in their audiences. In this class, you will bring the technical skills required - the object will be to collaborate with others with complementary skill-sets in order to create one lavish, intricate transmedial project that will draw people into the depth of its world. This is not an art class - we will discuss the designerly applications of this type of work, particularly with reference to design studies, speculative/critical design, ontological design, and decolonial design. The object of the course will be to make "other" ways of designing in the world visible and experiment with the boundaries of design as a practice of cultural production.

51-493 Design Center: Decoloniality: Past, Present & Future

All Semesters: 4.5 units
The relevance of decoloniality in design. The role of media and technology in shaping and advancing particular ways of understanding the world The future of decoloniality: where do we go from here?

51-494 Design that Lasts

Intermittent: 6 units
Never have we wanted, owned, and wasted so much "stuff." Our consumptive path through modern life leaves a wake of social and ecological destruction. Sneakers worn only once, forgotten smartphones languishing in drawers, and abandoned IoT devices promising solutions to problems that don't exist. By what perverse alchemy do our newest, coolest things so readily transform into meaningless junk? This design elective investigates why we throw away things that still work, and shows how we can design products and services that last. This is a studio class, with a substantial theoretical thread woven through it. We will therefore spend about half our time on lectures, readings, and debates, and the other half on studio practice, project coaching tutorials, and group critique. The result, a journey toward an experience heavy, material light design sensibility. A vital and timely new design philosophy that reveals how meaning emerges from designed encounters between people and things, explores ways to increase the quality and longevity of our relationships with objects, and the systems behind them, and ultimately, demonstrates why design can and must lead the transition to a sustainable future.

51-495 History and Future of Interaction Design

Intermittent: 9 units
The history of Interaction Design is far richer than what is commonly known among students and teachers, practicing designers and entrepreneurs. Understanding IxD's origins and evolution helps us realize the promises and possibly avoid some of the pitfalls of IxD's future. This course blends readings, lectures, discussions, and prototyping as a means for students to experience this history as if first-hand. Students become immersed in pragmatic yet mind-expanding examples of person-machine interactions and #8212; such as MEMEX, Musicolour, Hypertext, Dynabook, Fun Palace, Colloquy of Mobiles, Architecture Machine, THOUGHTSTICKER, Architrainer, and Hypercard. Through period articles and subsequent perspectives, students research a handful of historical innovationsand then prototype key concepts from that history, forefronting what has been lost in modern commercial implementations. This offers students a hands-on experience of the history of IxD. To explore IxDs future, students are invited to invent it and #8212; to prototype their individual future vision of interactive experiences. The course is especially suitable for students with interest or background in interaction design, computational design, responsive architecture, and interactive media.

51-496 Systems, Cybernetics, Conversation

Intermittent: 9 units
Across many design disciplinesarchitecture and computational design, media and interaction design, design of services and organizationsmethods for grappling with complex adaptive systems is now table stakes. Furthermore, design today demands profound, authentic attention to equity, human and non-human living systems, climate and environment, sustainability and ethics. Overall, designers must have skills to collaborate in cross-disciplinary teams. An encompassing framework for these disparate disciplines and domains of 21st-century design is the transdisciplinarity (or "antidisciplinarity") of Cybernetics. Cybernetics can be understood as the study of "systems with purpose", whether machines or living things, including their unpredictable interactions. Central to Cybernetics is conversation as a mechanism of design, inclusivity, participation, innovation, and the impetus to action. The course offers systems frameworks and models of conversation that are also relevant to Designing for the Internet of Things (48-675), Inquiry into Computation Design (48-727), and Design Studies: Systems (51-277). Class time balances readings, discussion panels, and guest conversations with executing assignments that involve systems modeling; creating conditions for designing that are participatory and inclusive; and prototyping in a range of media (installations, screen-based interactivity, physical prototypes, workshops, etc.) that offer responses to global wicked challenges.

51-498 Design Center: What If?

Intermittent: 6 units
WHAT IF? is a media, arts, and design-led exploration of speculation, conjecture, and storytelling. Using play and worldbuilding, we will investigate science fictional constructs, conjure alternative pasts and presents, voyage to the edge of the imaginable, and blur the borders between possible and impossible. How do you build a time machine, anyway?

51-499 Senior Independent Study

All Semesters
Proposal forms are available on the Design Intranet. Proposals must be approved by faculty before pre-registration.

51-504 Design Fusion: Patterns in Nature

Intermittent: 5 units
Natural patterns have fascinated humans for thousands of years. Explore the diversity of insect visual design, from super-sneaky camouflage to the loudest warning signals; learn why patterns occur in nature and how form and function intersect in insects. Use hands-on, up-close examination of museum specimens to study and illustrate your own original bio-inspired artwork. This course is offered through the Joseph Ballay Center for Design Fusion.This course is open to those with basic drawing proficiency and Photoshop skills.

51-505 Design Fusion: Bugs and Bioinspiration

Intermittent: 5 units
How do insects build complex and efficient mechanical structures that rival human technology? What is the basic insect toolkit, and how have beetles adapted it to create glowing light, fire detectors, explosive weaponry, and color-changing armor? Explore these questions and examine the worlds most remarkable bugs up close, with specimens from the Carnegie Museum of Natural History. This course is offered through the Joseph Ballay Center for Design Fusion. This course is open to those with basic drawing proficiency and Photoshop skills.

51-506 Design Fusion: Creative Concepting

Intermittent: 5 units
Explore what distinguishes good ideas from great ideas and develop skills for ideating, developing, and visualizing a compelling concept that resonates with clients - in an agency-like environment. This course is offered through the Joseph Ballay Center for Design Fusion. Students must have visual drawing and image-making skills with access to Adobe Creative Cloud (Photoshop, Acrobat, Illustrator, etc), Powerpoint or similar presentation-making software.

51-507 Design Fusion: Designing for Presence

Intermittent: 5 units
The discipline of design is motivated by a drive to make things better. It can be very difficult, however, to maintain a genuine engagement required to address the biggest challenges we face, when our personal, social, civic, economic and environmental anxieties take so much of our energy. How can we sustainably apply our creative problem solving when we regularly feel overwhelmed? Designing for Presence helps us nurture ourselves and our connections as part of our practice of improving the world. Through a combination of readings, seminar discussion, mindfulness practices and a collaborative project, we will simultaneously fortify ourselves, cultivate empathy toward others, and explore practical design interventions to a real issue affecting the local community.

51-508 Design Fusion: Designing Data

Intermittent: 5 units
Our modern lives are flooded with data. This course provides an introduction to designing with data for non data-scientists and uses a project-based approach to explore types, formats, sources, and the visual presentation of different types of data. Students will work with a variety of qualitative, quantitative and experimental data sources. While there are no prerequisites for the course, students should have a working knowledge of some form of software that can be used to analyze and visualize data, including (but not limited to), Excel, Adobe Creative Cloud (Illustrator, Photoshop, etc), Google sheets, Apple Numbers, Sketch, Miro, Figma, etc.

51-509 Design Fusion: Drawing Linguistics

Intermittent: 5 units
Whether you are drafting a business plan, building a home, designing an app, or commissioning a piece of art, the intent and clarity of an idea is reliant on the fidelity and form of how it is communicated. Written forms of communication can be misinterpreted; existing reference imagery can be too limiting; but drawing offers an opportunity to specify exact detail and reflect the creator's imagination to the nth degree- all that is needed are the skills to capture those details. This course will explore the ways we can synthesize, distill, and communicate the essence of an idea through drawing. Prior drawing experience is not required.

51-630 RE.Futuring Craft

Intermittent: 9 units
This course explores the role of craft objects in shaping material culture and material futures aiming to offer propositional and speculative concepts to future-cast craft objects within natural, societal political, economic, scientific, and technological systems. Students engage in project-based learning that simulates diverse future scenarios to critically analyze material trends and their impact on future hand-crafted product design.

51-646 Design for Aging

Intermittent: 5 units
The population is aging at a staggering rate. Though not the only factor, the last of the baby boomers (b. 1946-1964) are turning 60 this year (the oldest boomer turning 78). Similar aging statistics apply in the US and internationally. Implications for design are evident. Ignoring this segment of the population in the design decisions we make would not only be socially and physically detrimental; it would also overlook an enormous opportunity. In this course we will examine the broad scope of aging with an inclusive intent already established through the premise of universal design. This means challenging assumptions and stereotypes, recognizing the enormous diversity in how people age. Through readings, other media, guests, and direct hands-on experiences, we will understand and gain an appreciation for the range of changes that occur with aging, including physical and cognitive abilities, social and emotional wellbeing. While we will learn from other disciplines, the focus will be on implications for the design of products, communications, environments, and conditions for interactions in and with the world.

51-818 Diversity, Equity, Inclusion and Design

Intermittent: 12 units
In this course, students will explore Diversity, Equity, and Inclusion (DEI) issues as they relate to the School of Design to propose and possibly implement and initiate efforts to begin to address some of these issues. We will learn about the systems, structures, and tools for, by, and with Design at the intersection of DEI. Foundational lectures, discussions, and hands-on workshopscombined with a review and consolidation of precedent research and work supporting the definition and scope of DEI. Through a variety of group exercises, directed working sessions, guest lectures by subject matter experts, readings, case studies, and more, students will be guided through an intensive learning process. Students will work individually and collaboratively, including working with the full course cohort. We will ask questions such as: What do we mean by DEI? What are the opportunities and challenges within the design discipline and its pipelines? Within design pedagogy and practice? With designers and designing? What happens if we put DEI at the center of our work? How do we develop new postures and mindsets that place DEI at the forefront of the School of Design at Carnegie Mellon University?

School of Drama

Location: Purnell Center for the Arts, 221
www.drama.cmu.edu (http://www.drama.cmu.edu)

The School of Drama at Carnegie Mellon University is the oldest drama program in the country. CMU Drama offers rigorous, world-class classical training in theater while providing thorough preparation for contemporary media.

As a member of the Consortium of Conservatory Theater Training Programs, the school chooses students to participate in the program based on their potential ability. Every Drama student is treated as a member of a theatrical organization and must acquire experience in all phases of the dramatic arts. Students are also asked to broaden their knowledge through courses in the other colleges of the university. The undergraduate Drama program, which incorporates approximately 200 students, leads to a Bachelor of Fine Arts in Drama. The areas available are: Acting, Music Theater, Design, Production Technology and Management, Directing (admission on pause for fall 2024 and fall 2025), and Dramaturgy. The production of plays, a natural extension of demanding class work, is our lab, and constitutes one of the school's major activities. The choice of texts used is determined by the particular needs of current students. Each semester, 15 to 25 lab productions, directed by faculty, guest directors, and advanced students, are presented in our three theater spaces. The labs range from completely mounted, full-length dramatic and musical works to more simply produced directing projects and one-acts. The Drama program is rigorous and exacting, making demands on students that necessitate good health, a willingness to work and a commitment to professional discipline at all times. Because of full daytime class work and heavy production schedules, much production preparation takes place in the evening. Drama students, therefore, are advised to live in residence halls or in the immediate vicinity of the campus.

The information contained in this section is accurate as of July 2024 and is subject to change. Please contact the School of Drama at drama-relations@andrew.cmu.edu *with any questions.*

Programs in Drama

Acting and Musical Theater Program

The Acting and Musical Theater program is designed to prepare the student for immediate entry into the profession. It is a sequence-based training program with accumulative skills building upon each other over the course of four years. It is a conservatory training course, and the curriculum focuses primarily on the technique and craft of theater. At the same time it offers skills that are applicable to all media. Courses in acting, voice, speech, movement, and theater history are integral parts of the program at all four levels. In addition to studio classes, Acting majors are required to take a number of electives outside the School of Drama to expand their intellectual curiosity and worldview. All students must demonstrate a commitment to growth, show continued progress in their work and in the knowledge of their craft, and show a respect for professional standards in discipline, quality and ethics.The first year is a discovery year and provides an introduction to basic skills-working from self, learning to play objectives and actions and the beginning of character exploration. In the sophomore year these skills are solidified and deepened as more sophisticated, verbally complex material is introduced, through a focus on in-depth scene study, both contemporary and Shakespeare. In the junior year students continue to develop their craft by investigating a variety of styles. Skills are now tested and strengthened through public performance. The senior year provides a bridge from training to the professional world and offers the opportunity to appear on the School of Drama's main stage. At the end of the senior year, students are introduced to the profession through Showcase performances in New York City and Los Angeles.The students in the Music Theater program share the training philosophy and much of the same curriculum as the acting program. In addition, they take courses particular to the demands of Music Theater. These include private voice along with training in a variety of dance techniques (Ballet, Jazz, Tap, Dunham Technique and Broadway Styles) and music theater styles and skills.

Directing Program (admission on pause for fall 2024 and fall 2025)

The John Wells Directing Program promotes creativity, intellectual curiosity, critical thinking, a broad and well-rounded understanding of the theater and leadership ability. It provides a detailed exploration of the technique of directing for stage and for camera. The curriculum is designed for those serious about the art of directing and intending to pursue a career in theater, film or television.

Course work in scenic design, lighting, media, and costume design develops the students' visual sophistication as well as an understanding of how these elements combine in practical production situations to create new worlds. Stage management skills are studied and practiced. Theater history, criticism, playwriting, new play development and theater management classes introduce the student to the wide range of knowledge necessary for directing. Participation in acting classes develop a deep understanding of the actor’s journey as well as the communication skills necessary for collaboration. There are many avenues open for practical application: scene work in class, a short film written and directed by students, studio projects and even participating in choreography events. The broad scope of the directing curriculum encourages the director's interaction with all the theatrical disciplines. Collaboration in all forms, so necessary to the art, is the goal.

Design Area

Over the first three semesters, Design students are expected to develop artistic ability in the conception and execution of scene, lighting, sound and costume design for plays of all periods under varying theatrical conditions. All undergraduate students begin with the development of visual and written communication skills. These first three semesters immerse the student in a range of collaborative and individual studies: scenery, costume, sound and lighting design fundamentals; dramatic structure and interpretation; manual and computer-based drafting; perspective and figure drawing, fundamentals of directing; production management and preparation, history of art and history of architecture and décor. Freshmen in design receive instruction in drawing and painting, three-dimensional techniques, and in the application of basic design principles through courses in drawing and design. Sophomores learn to apply design principles to the theater through research, play analysis, and studies in the fundamentals of scene, lighting, sound and costume design. The last five semesters focus the student's skills within their chosen program of concentration: Costume, Sound, Lighting, Scenic or Video and Media Design. Juniors and Seniors take specialized courses in areas of stage design and are expected to head studio and main-stage production crews. Design assignments cover various styles and periods and include the preparation of models, renderings, and working drawings, lighting storyboards, and light plots. As part of the degree work, juniors may design sets, lights, sound or costumes for a production in the Studio Theater and seniors may design sets, lights, sound or costumes for a Master's thesis show or a main-stage production. Designing for lab productions, both those that are highly resourced and those that are moderately resourced, requires a variety of creative approaches, preparing designers for a variety of real-world situations.

Production Technology and Management (PTM) Area

The Production Technology and Management Area develops the technologists and managers of the future with an intensive curriculum designed to synthesize academic development and production experience. The curriculum focuses on the production requirements of live performance, in the form of traditional theatrical presentation, while also providing exposure to television, film and emerging technology-based art forms. Integrated in a world-class research university environment, the School of Drama is uniquely positioned to contribute to the advancement of the collaborative arts. The goal of the three PTM areas is to prepare today's students to become tomorrow's leading professionals in the entertainment industry.

All undergraduate students begin with the development of visual and written communication skills. The first three semesters immerse the student in a range of collaborative and individual studies: scenery, costume, sound and lighting design fundamentals; dramatic structure and interpretation; manual and computer-based drafting; perspective and figure drawing, fundamentals of directing; production management and preparation, history of art and history of architecture and décor. The last five semesters focus the student's skills within their chosen program of concentration: Technical Direction, Stage & Production Management, or Production Technology.

Technical Direction students are offered classes in: material applications, metal working techniques, structural design, scenic crafts, fabrication design and detailing, machinery design, rigging techniques, electronic design fundamentals, automation system technology, technical management and production management. Technical Directors may take a single semester internship at an approved regional or commercial producing organization in lieu of one semester of study. Student-selected elective courses outside the School of Drama provide balance and breadth to the professional undergraduate education offered in the Technical Direction program of study.

Stage and Production Management students are offered classes in: an extensive study of stage management and production management, theater management, leadership, problem solving and business communications, in addition to classes in resource management in all technical areas. Production assignments supplement classroom learning and development throughout the program. Student-selected elective courses outside the School of Drama provide balance and breadth to the professional undergraduate education offered in the Stage & Production Management program of study.

Production Technology students are offered a variety of classes in: scenic fabrication and technology, lighting technology, audio technology, show networking, technical, production, theater and stage management and design courses within one or more design discipline. Production responsibilities for Production Technology students may include roles as Lighting Managers, Technicians and Programmers, Audio Engineers, Mixers and Technicians, Video Engineers and Technicians, Scenic Automation Technicians and Managers and Network Integrators. Student-selected elective courses outside the School of Drama provide balance and breadth to the professional undergraduate education offered in the Production Technology program of study.

Dramaturgy Program

The dramaturgy curriculum provides students with a strong background in theatrical practice, dramatic literature, and humanities. A core course of study focusing on building the skills for production dramaturgy is augmented by an English minor along with directed electives in history, foreign languages, and other non-drama courses to build a firm foundation in both theater and the liberal arts.
Students in the dramaturgy program also cultivate their intellectual prowess, analytical skills, and artistic passions through integral involvement in the School of Drama's productions. Dramaturgy students work with directors, playwrights, designers, managers, and actors in the conception and execution of productions, bringing their knowledge of theater history and dramatic structure, their skills in script analysis and contextual research, and their capacity to engage in collaborative conversation into the rehearsal room. These skills also serve dramaturgy students as they practice the art of audience engagement.
The Dramaturgy program specializes in new play development, production support, critical writing, audience engagement, season planning, and artistic leadership. The wide ranging curriculum makes it an excellent program of study for students interested in theater history and theory, playwriting, and cultural studies. Alumni from the dramaturgy program have built careers not only in theater but also in film and television as well as in arts management, in literary and casting agencies, and in education.

Theater Studies

The Theater Studies program offers students from any of the School's conservatory areas of specialized study the opportunity to continue developing their theater related skills while expanding their interests to other artistic and academic areas. This program will only be available to Drama students who have completed their sophomore year in the School of Drama (ie: two years of conservatory training). Students are required to write a proposal outlining their interests in the Theater Studies program, and the proposal must be approved by the Head of the School of Drama.

The goal of the Theater Studies program is to enable students to explore the diverse opportunities for which conservatory drama training can be a basis, and to examine the possibility of post graduate education in a new program of specialization after obtaining a BFA in Drama. As the intent of the Theater Studies program is to broaden your experiences, a semester studying abroad or participating in a recommended internship is required for one semester, either in the fall or spring. Individualized courses of study are established for each student in consultation with an appropriate faculty advisor.

Curriculum

The School of Drama curriculum is continuously reviewed and modified in an effort to provide the best conservatory experience for undergraduate students in the School of Drama. The following curriculum is subject to change. Not all requirements are listed, and units are often variable within each Area based on performances, production assignments, and individual projects.

Acting Program

First Year

Fall		Units
54-101	Acting I	10
54-011	Introduction to Alexander Technique (mini 1)	1
54-103	Speech I	4
54-105	Voice for the Stage I	5
54-107	Movement I	4
54-110	Text for Actors (mini 2, section A)	2
54-177	Foundations of Drama I (section A)	6
99-101	Core@CMU	3
54-362	Anti-Racist & Equitable Practices in Theater	6
76-101	Interpretation and Argument	9
		50

Spring		Units
54-102	Acting I	10
54-104	Speech I	6
54-106	Voice for the Stage I	5
54-108	Movement I	4
54-159	Production Practicum	6
xx-xxx	Global Persepctives	9
xx-xxx	Non-Drama elective	6-9
54-285	Alexander Technique Tutorials	1.5
		47.5-50.5

Sophomore Year

Fall		Units
54-201	Acting II	12
54-203	Voice and Speech II	4
54-207	Movement II	4
54-211	Actor Dance II	3
54-281	Foundations of Drama II *	6
54-213	Singing for Actors II (Optional)	3
62-314	The Art of Personal Finance	6
xx-xxx	Non-Drama Elective	6-9
54-209	Voice and Speech II: Practicums	3
54-285	Alexander Technique Tutorials	1.5
xx-xxx	Global Perspectives (if not taken)	
		48.5-51.5

Spring		Units
54-202	Acting II	12
54-204	Voice and Speech II	4
54-208	Movement II	3
54-212	Actor Dance II	3
54-242	Improvisation	2
xx-xxx	Non-Drama Elective	6-9
54-214	Singing for Actors II (Optional)	3
54-159	Production Practicum	6
54-285	Alexander Technique Tutorials (optional)	1.5
54-209	Voice and Speech II: Practicums (2 minis)	3
54-381	Special Topics: Feminist Theatre	6
or 54-336	Musical Theater History	
		49.5-52.5

Junior Year

Fall		Units
54-301	Acting III (mini-1 + mini-2)	10
54-305	Voice for the Stage III	5
54-307	Movement III	5
