Detection of harmful social bots

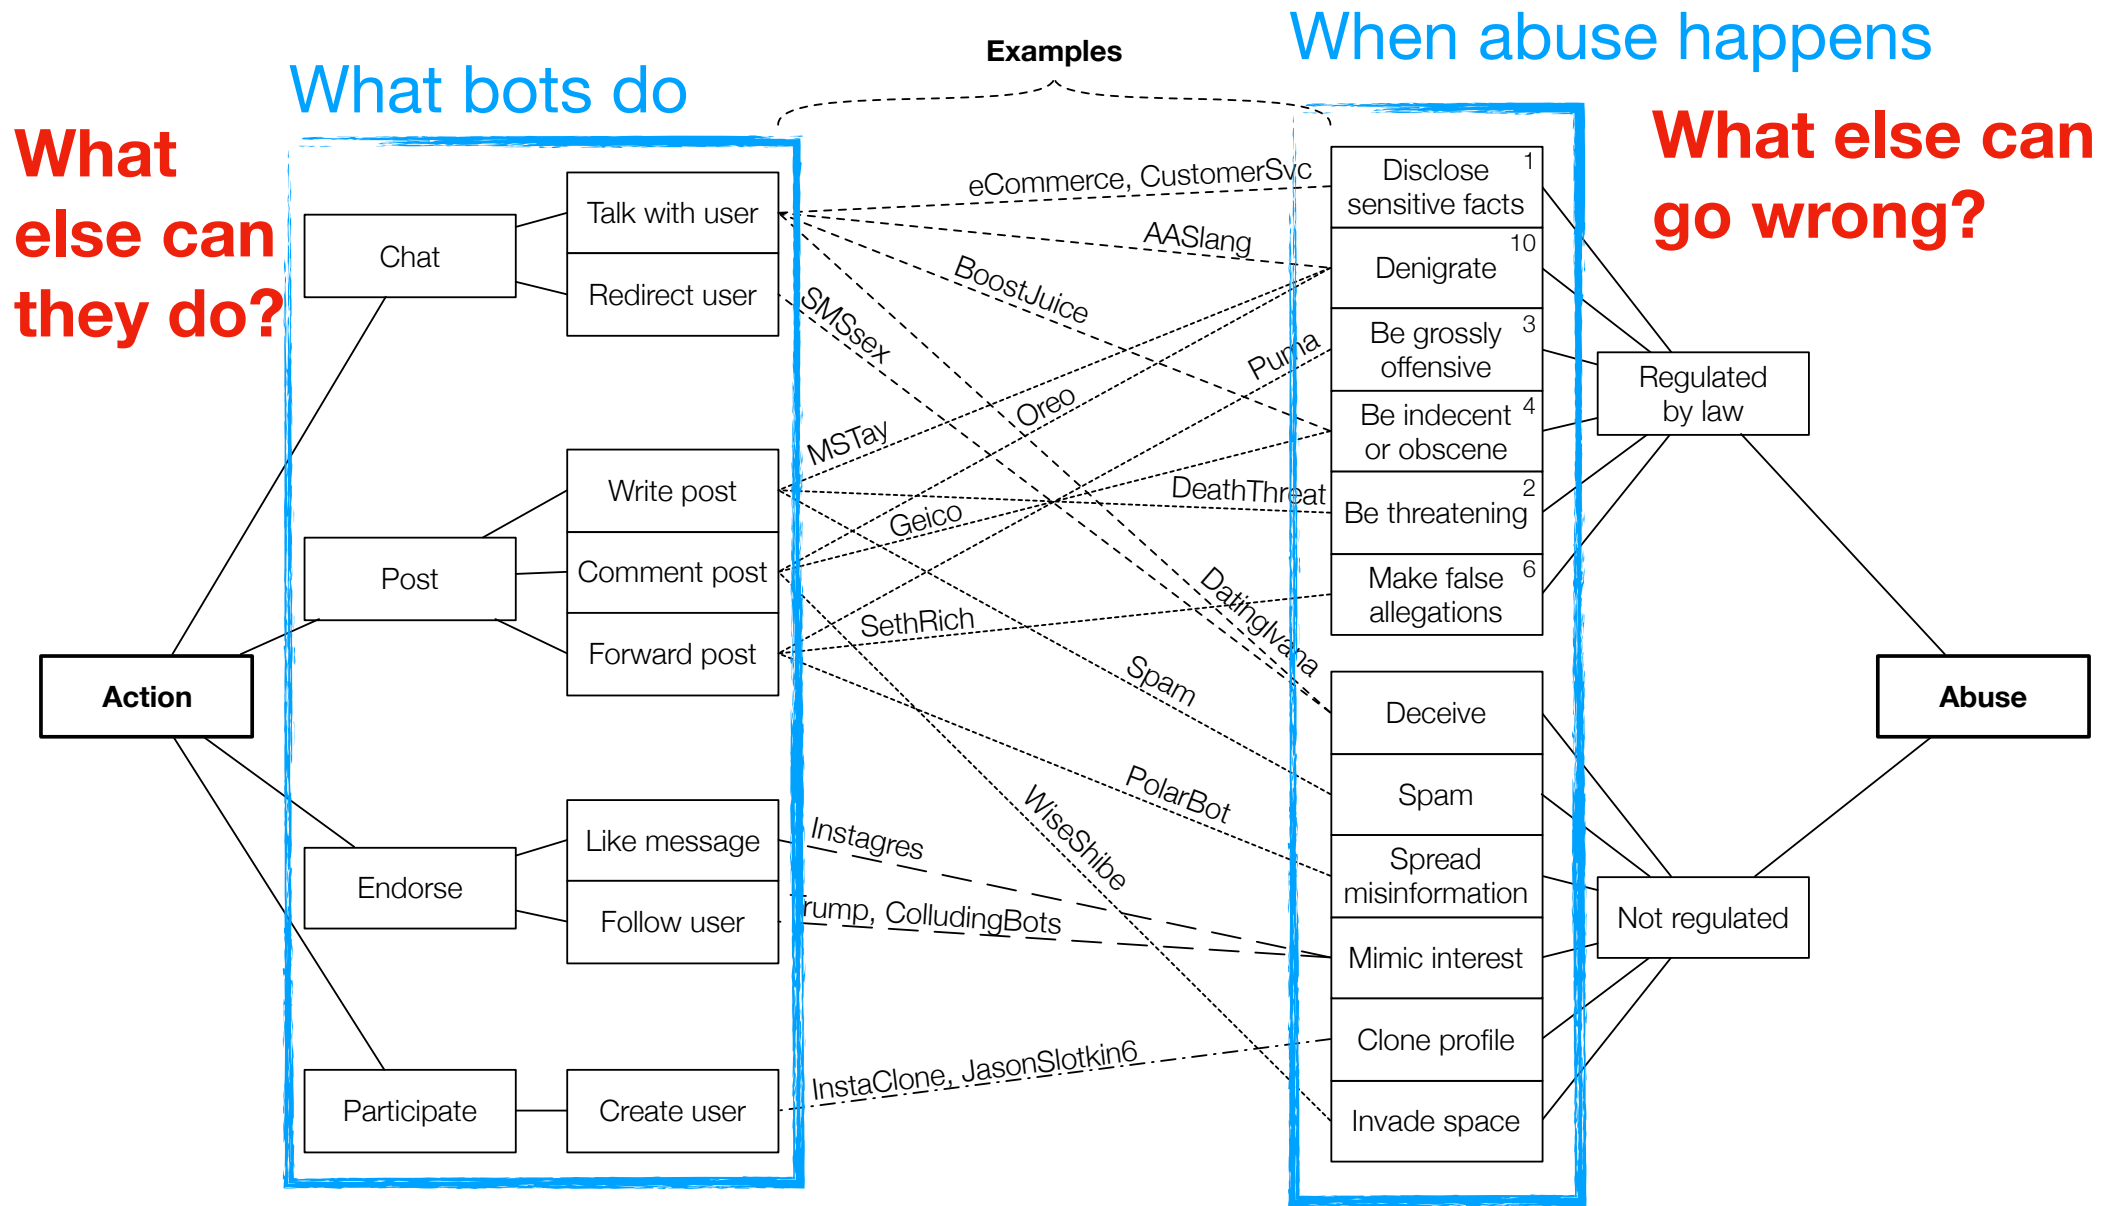

Identification of harmful communication patterns

Conversational screen readers

Domain-specific content extraction

(Social) Bot = algorithmically driven entity that behaves like a human in online communications

Empirical study shows: bots may cause **harm** to humans

Detection of harmful social bots

Tweets

Account

How do we identify and classify bots according to the harm they may cause?

What has been done so far?

Not Safe For Work

The image shows a screenshot of a Twitter profile for a user named Elizabeth Little (@rs_mia). The profile has a pink header background. The profile picture is a circular image of a woman in a red shirt and blue shorts. The bio reads: "Do you like fast? Come in! go9to.pro/rs_mia4AuR". The location is "Novi Sad" and the join date is "maggio 2010". The profile has 79 tweets, 14 followers, and 373 media posts. A tweet from Elizabeth Little (@rs_mia) dated 1 mar says: "Hello! How are you? Rate my site in bio! 🍌🍌🍌". The tweet includes a link to "Traduci il Tweet". The right sidebar shows "Chi seguire" with users Jimmy Hill (@jimmyhill32) and Dazz Kishor (@dazzraven). Annotations with black boxes and white text point to various elements: "Profile picture stolen from existing people (usually women)" points to the profile picture; "Personalized profile preferences aimed at emulating actual users" points to the pink header; "Catchy profile description paired with unsafe URL" points to the bio; and "Tweets aim to redirect users to untrusted URLs" points to the tweet content.

Profile picture stolen from existing people (usually women)

Personalized profile preferences aimed at emulating actual users

Catchy profile description paired with unsafe URL

Tweets aim to redirect users to untrusted URLs

News-Spreader

Propagandistic profile picture and tile

Propaganda hashtags and messages in description

High number of interactions

Lots of (political) news retweeting

Spam-Bot

Profile picture with corporate logo

Profile tile with catchy messages

Corporate link in description paired with messages of job offers (product sales)

High number of tweets with high frequency

Repetitive tweets aimed at spamming URLs

Fake-Follower

**Optional profile picture
(usually missing)**

**Poor profile
customization**

**Poor
description
(usually
empty)**

**Low number of content posting (usually null)
Following as main interaction**

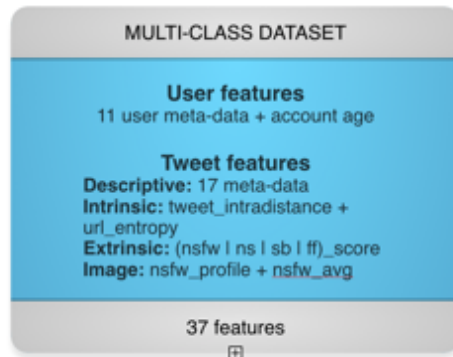

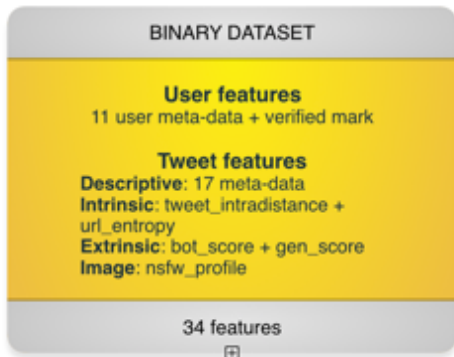

**Optional (re)tweeting
activity**

BOTBUSTER

ALL-GRAIN

Batch size: 5 gallons (19 liters)
Brewhouse efficiency: 72%
OG: 1.054
FG: 0
IBUs: 25
ABV: 7% ABV

MALT/GRAIN BILL

8 lb Pilsner malt
1 lb flaked corn
1 lb flaked rice

HOPS AND ADDITIONS SCHEDULE

.17 oz Mosaic [12.25% AA] at 15 minutes
2.5 oz Mosaic [12.25% AA] at Whirlpool
7.5 oz Mosaic [12.25% AA] at Dry Hop

YEAST

Neutral Ale yeast
.65 ml Amyloglucosidase

DIRECTIONS AND BREWER'S NOTES

Social Kitchen and Brewery's brewmaster Kim Sturdavant says: "I would encourage folks to add the enzyme to the mash at 143 - 146 to not denature the enzyme. The equivalent of 20mls / 100ml of the enzyme 1/3 of the way into mashing to ensure the mash isn't too hot to denature the enzyme. The mash should have an hour-long rest to let the enzyme do its work."

"The other option would be to add the enzyme to the kettle while lautering, then hold off on heating the kettle until all wort is in and has 30 minutes of contact with the enzyme at around 145 degrees (lower would be fine, too)."

"I know a lot of homebrewers just throw grain on top of all their mash water, so this option makes more sense to them. I preferred not to mash this way, when I was a homebrewer... I think the conversion temp is more consistent adding grain and water at the same time, I also like being able to react to the consistency so I can end up with the thickness I want."

"The enzyme will denature in the boil, but it's already done its work."

"That would all mean that the amylo in the fermentation is no longer needed. I'm finding better results with fermentation character and hop aromatics by having no enzyme present in the fermentation."

Lastly, it is very important to add nutrient to the boil as well as 1/2 way through fermentation (with something like BSG's Startup) since the wort will be almost entirely glucose, there is not a lot of nutrition for the yeast.

The Grist

The grist described by California brewers is either entirely pale malt or pale malt with only the slightest amount of specialty malts. Do not include crystal malts (or dextrine malts) in your formulation as these add body and sweetness to the beer, the opposite of what you are trying to achieve. Either US 2-row pale malt, English 2-row pale malt, or a European Pilsner malt could be used as the base malt. Small amounts of either Munich or Vienna malt could enhance the malt character without adding body or sweetness. The complex carbohydrates ("dextrins") in all the malts will be greatly, or entirely, converted to simple sugars, but the malt flavors from the husks of the kilned base malts will persist.

Higher gravity beers are going to be harder to dry out. And, even if you accomplish that, they are more likely to seem like "rocket fuel" than beer. I would suggest shooting for an OG in the high pale ale range (SG 1.045-1.060) to low IPA range (SG 1.056-1.070). However, there are no rules here, so feel free to experiment.

The Mash

There are several ways to produce highly fermentable wort that will yield a dry beer. A single infusion mash at the low end of saccharification range (148-162 °F/64-72 °C), say 148-150 °F (64-66 °C), will produce a dry beer. Stirring the mash well a few times and extending the mash time to 90 minutes may help a bit. A step mash with a lengthy rest — 15 minutes to 2 hours — around 140 °F (60 °C) will produce an even drier beer.

Tomorrow, I'll describe [how to use the enzyme amyloglucosidase](#) to make a bone dry beer.

Thesis/project proposals

Are you looking for a project for your Master thesis or for some other project you would like to carry out during your studies, for example for the BSc course Progetto di Ingegneria Informatica? Below you can find some **research topics** I am or would like to work on. All these can be turned into projects and theses and are meant to allow you to get a glimpse behind the scenes of the work of a professor and to show you that there is more than teaching in a university. Methodologically, typically these topics are to be approached using a **data science** and/or **web/software engineering** methodology.

If you spot something you like, [drop me an email or get in touch with me!](#) I'll be happy to discuss possible options to work together. Also, yes, you can work in groups of two and write and present your thesis together.

What you need: programming skills, knowledge of web technologies, data management skills, a brain and passion.

What you get: new competences, a thesis (or tesina), a project, personal satisfaction and recognition of your work.

Writing your thesis: yes, a thesis is also about writing and writing skills. Here some thoughts on writing and a possible [template for your thesis](#).

Harmful social bots

Topics: social bots, social networks, data science, ethics

Bots are algorithmically driven entities that behave like humans in online communications. They are increasingly infiltrating social conversations on the Web or in chat apps. If not properly prevented, this presence of bots may cause harm to the humans they interact with, e.g., they may offend or discriminate people. The goal of this research is to understand which types of harm and which abuses may happen, whether abuses can be considered intentional or not, whether it is possible to prevent them and, if yes, how.

Research questions and possible thesis/project topics

- **Bot detection:** Given a specific type of abuse, e.g., discrimination, spamming or mimicking interest, how can we identify bots that may be vulnerable to this type of abuse? Answering this question requires following a data science methodology and may require the use of machine learning and AI algorithms, online/reinforcement learning techniques, network analysis techniques, and similar. Different social networks may be studied. The expected output are algorithms or methods able to classify social network accounts based on the harm they may cause.
- **Code analysis:** Here the idea is to start from the code of bots shared online, e.g., in GitHub, and to study which abusive code patterns can be identified, which effects they may have, and how to spot bots that implement them. Again, answering these questions requires a data science approach and may imply the
