LUMINARY Memo #123

To: Distribution
From: D. Eyles
Date: 18 November 1969
Subject: More About Delta-Guidance

Delta-guidance is running in AMELIA 11 (as also in some of the earlier revisions). which in other respects is just like LUMINARY 130, which was just released as 1C.

Here are the patches required:

location	old	new	symbolic	new
05, 2310	bad word	03641	ECADR	TTT/8
31, 2213	62325	63770	BZMF	31, 3770
31, 3770	unused	34755	CA	ZERO
31, 3771	unused	55610	TS	FWEIGHT
31, 3772	unused	55611	TS	FWEIGHT +1
31, 3773	unused	12325	TCF	THDUMP

On the next page is given the initialization which is different from that for LUMINARY 130. See Luminary Memo #115 for a description of the new parameters. Note that DELTTTAP has been eliminated since the initial TGO for P64 equals P63's final TGO. The values given are Allan Klumpp's latest. The only number not given is RPCRTIME which should be set equal to TENDBRAK to make the LR antenna reposition at high-gate.

Runs on AMELIA have disclosed several interesting facts:

(1) Forward redesignations of the landing site, for instance a 10000 foot downrange noun 69 input at the start of P64, can cause pulse-outs, as well as cause the LM to pitch forward from the vertical. Large backward redesignations also cause pulse outs, but this is not unexpected.

(2) A lateral velocity noise spike at TGO = -50 in P64 of 1.5 f/s after incorporation causes oscillations in roll. This is the problem cured for LUMINARY 1A by adding coefficients containing LEADTIME to the guidance equation (see Luminary Memo # 97). Maybe crafty choosing of A and B will clear this up, averting the necessity of putting back LEADTIME, which would be hard.

(3) It is confirmed that large downrange redesignations in P63 (via noun 69) cost no fuel - 50000 feet at the start of the burn was tried and actually less propellant was used.

Some plots are appended: first and second the thrust and pitch profiles of the nominal run for the interesting ways they differ from the old style, and third the roll (strictly CDUZ) in response to the lateral velocity noise spike.
