Taking STMV From a “Hero” Simulation to a “Routine” Simulation with GPUs

- The STMV project was a turning point
  - Preparing STMV models and placing ions tremendously demanding computational task
  - Existing approaches to visualizing and analyzing the simulation began to break down
- It was already clear in 2006 that the study of viruses relevant to human health would require a long-term investment in **better parallel algorithms and extensive use of acceleration technologies in NAMD and VMD**
- **These difficulties led us to accelerate key modeling tasks with GPUs**

VMD Electrostatics: Our First Use of CUDA

- **CUDA 0.7: Spring 2007**

Getting Past the “Chicken and the Egg”

- GPU clusters still rare circa 2009-2011, most were not quite big enough to be used for large scale production science yet … but the potential was definitely there
- Performance and power efficiency benefits were seen for NAMD, VMD, others, on ever larger node counts
- Larger GPU accelerated systems were on the horizon
