

# 10 Multimedia Content Management and Distribution

## 10.1 Production Chains for Streaming Media

## 10.2 Streaming Technology – Push Model

## 10.3 Streaming Technology – Pull Model

## 10.4 Scalability of Multimedia Distribution

### Literature:

Gregory C. Demetriades: Streaming Media, Wiley 2003

Tobias Künkel: Streaming Media – Technologien, Standards, Anwendungen, Addison-Wesley 2001

Troncy/Huet/Schenk, Multimedia Semantics - Metadata, Analysis and Interaction, Wiley 2011

# Multimedia Delivery, Streaming

- Delivery types for audio and video content:
  - *Download and Play:*  
Content downloaded completely, then played back
  - *Streaming Media:*  
Playback starts before content is downloaded
    - *Progressive Download:*  
Playback is started while download is still in progress.  
Download rate independent of program bit rate.
    - *True Streaming:*  
Almost “real-time”: Playback rate roughly the same as data delivery rate;  
Small delay between send and receive event of data packet
- Subtypes of True Streaming:
  - *Static File Streaming:*  
Delivery of pre-recorded media files.  
Often also called *on-demand* delivery (e.g. *Video on Demand*)
  - *Live Streaming*

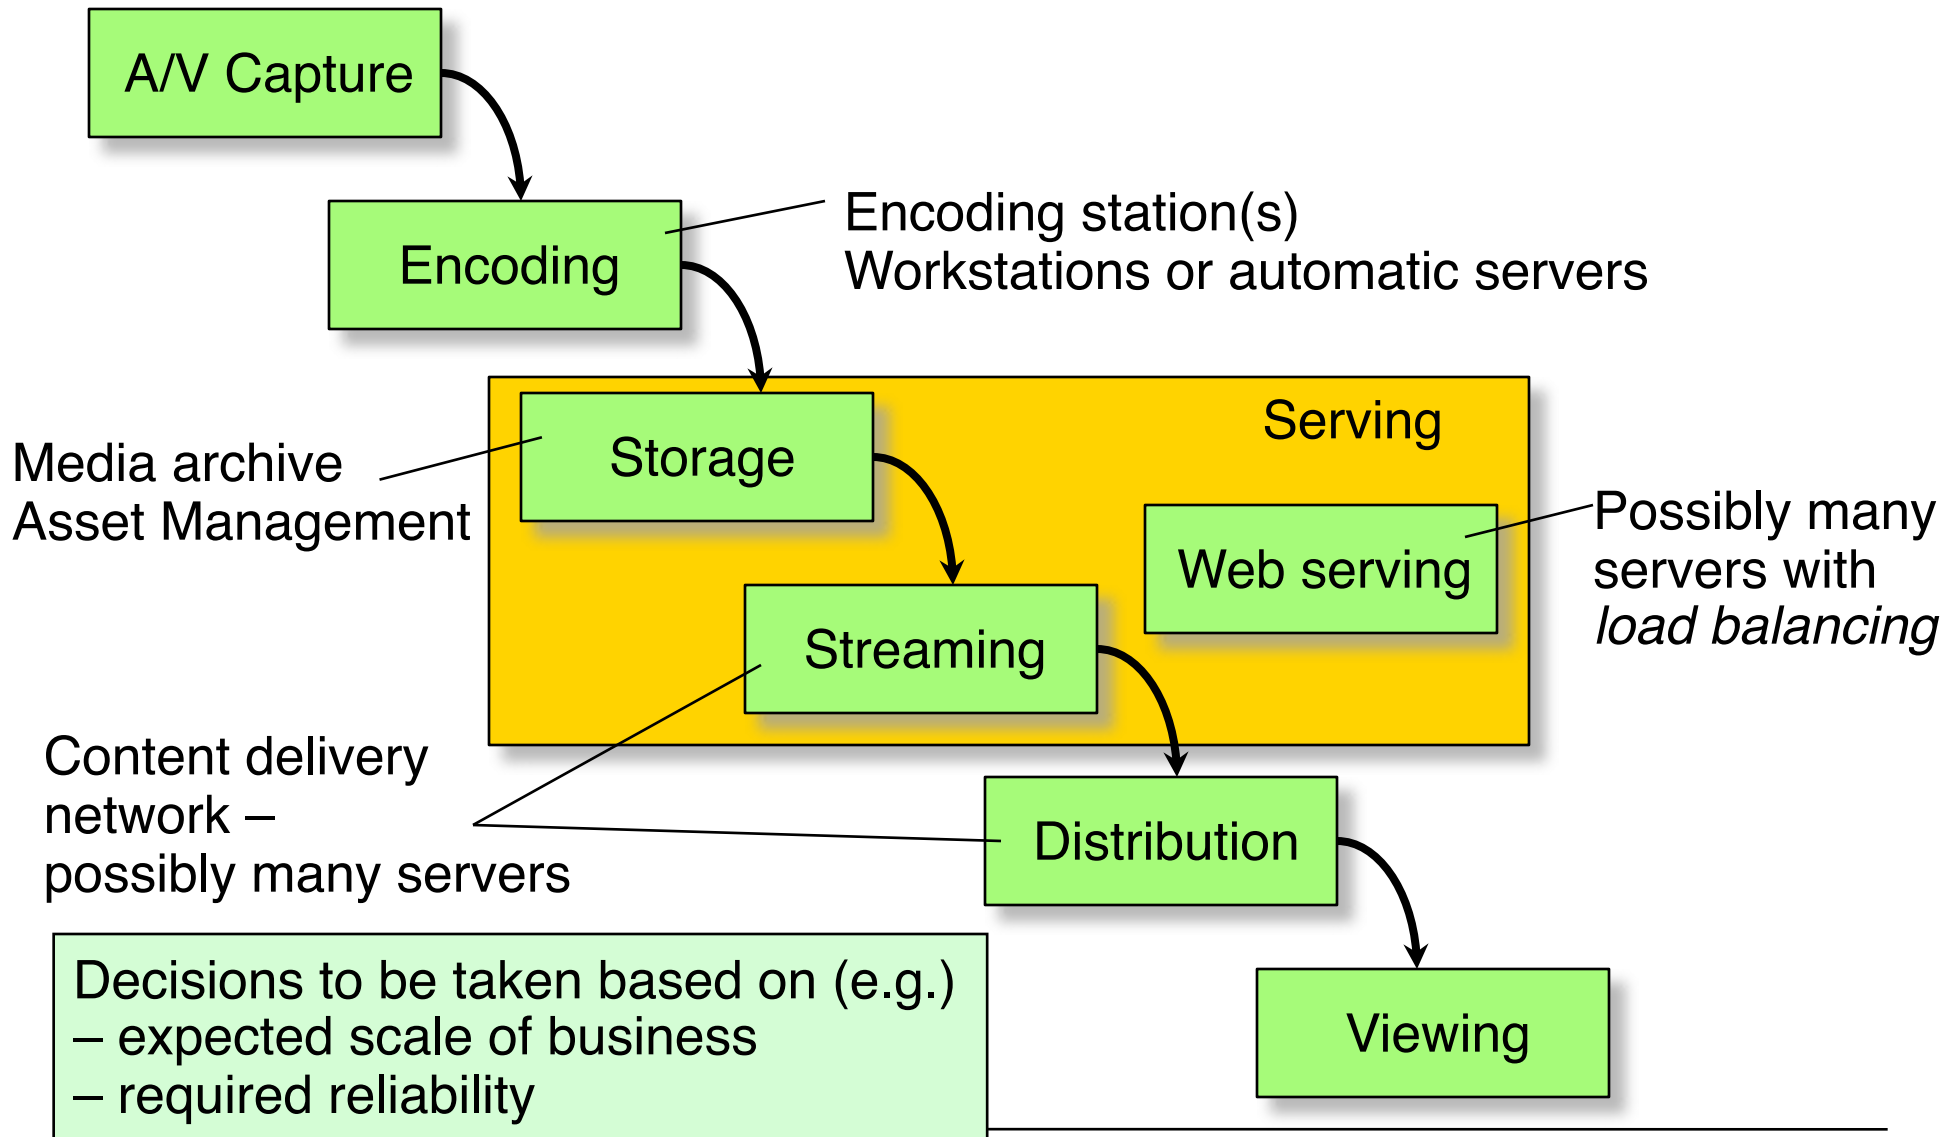

---

Based on material from [www.streamingalliance.org](http://www.streamingalliance.org)

# Streaming Delivery Chain for Audiovisual Media

# Hardware in the Streaming Delivery Chain

# Digital Asset Management

- Very similar acronyms:
  - Digital Asset Management DAM
  - Media Asset Management MAM
  - Rich Media Asset Management RMAM
  - Digital Media Management DMM
- Basic idea:
  - To make the right media material (*media assets*) available for each specific use, in the right version and the right format
- Integration technology:
  - Workflow integration
  - Integration with various media processing tools
  - Integration with content management and syndication solutions

# Encoding

- Format conversions
  - E.g. analog/digital conversion
  - E.g. downscaling of picture size
- Compression
  - Adequate for player capabilities and typical transmission bandwidth
- Indexing
  - Analyzing internal structure
- Metadata creation
  - Possibly including digital rights specification

# Encoding and Transcoding

- Audio and video needs to be converted for streaming delivery
  - Compression, proprietary formats
- *Transcoding*: Conversion of media files from one format to another
- *Repurposing*: Using existing content for new purposes
  - e.g. using TV ads as streaming content

# Automated Transcoding

- Example 1: Multiple Formats
  - TV Broadcaster
  - Repurposing into streaming media for Web-based Video-on-Demand
  - Live capturing, encoding (e.g. MPEG)
  - After program end: transcoding to different bit rates, delivery to streaming server
- Example 2: Flipping on Demand
  - Media archive for a cable channel to be made available through Web
  - Media kept in single, high-quality format
  - On demand (request), files are transcoded, watermarked, streamed
- Example 3: Collaboration Distribution
  - Large company working on marketing materials
  - One rough cut of a new commercial to be distributed to 100 clients with varying quality expectations and platforms
  - *Content distribution service* transcodes according to client requirements
- Example product: Telestream Vantage ([www.telestream.net](http://www.telestream.net))

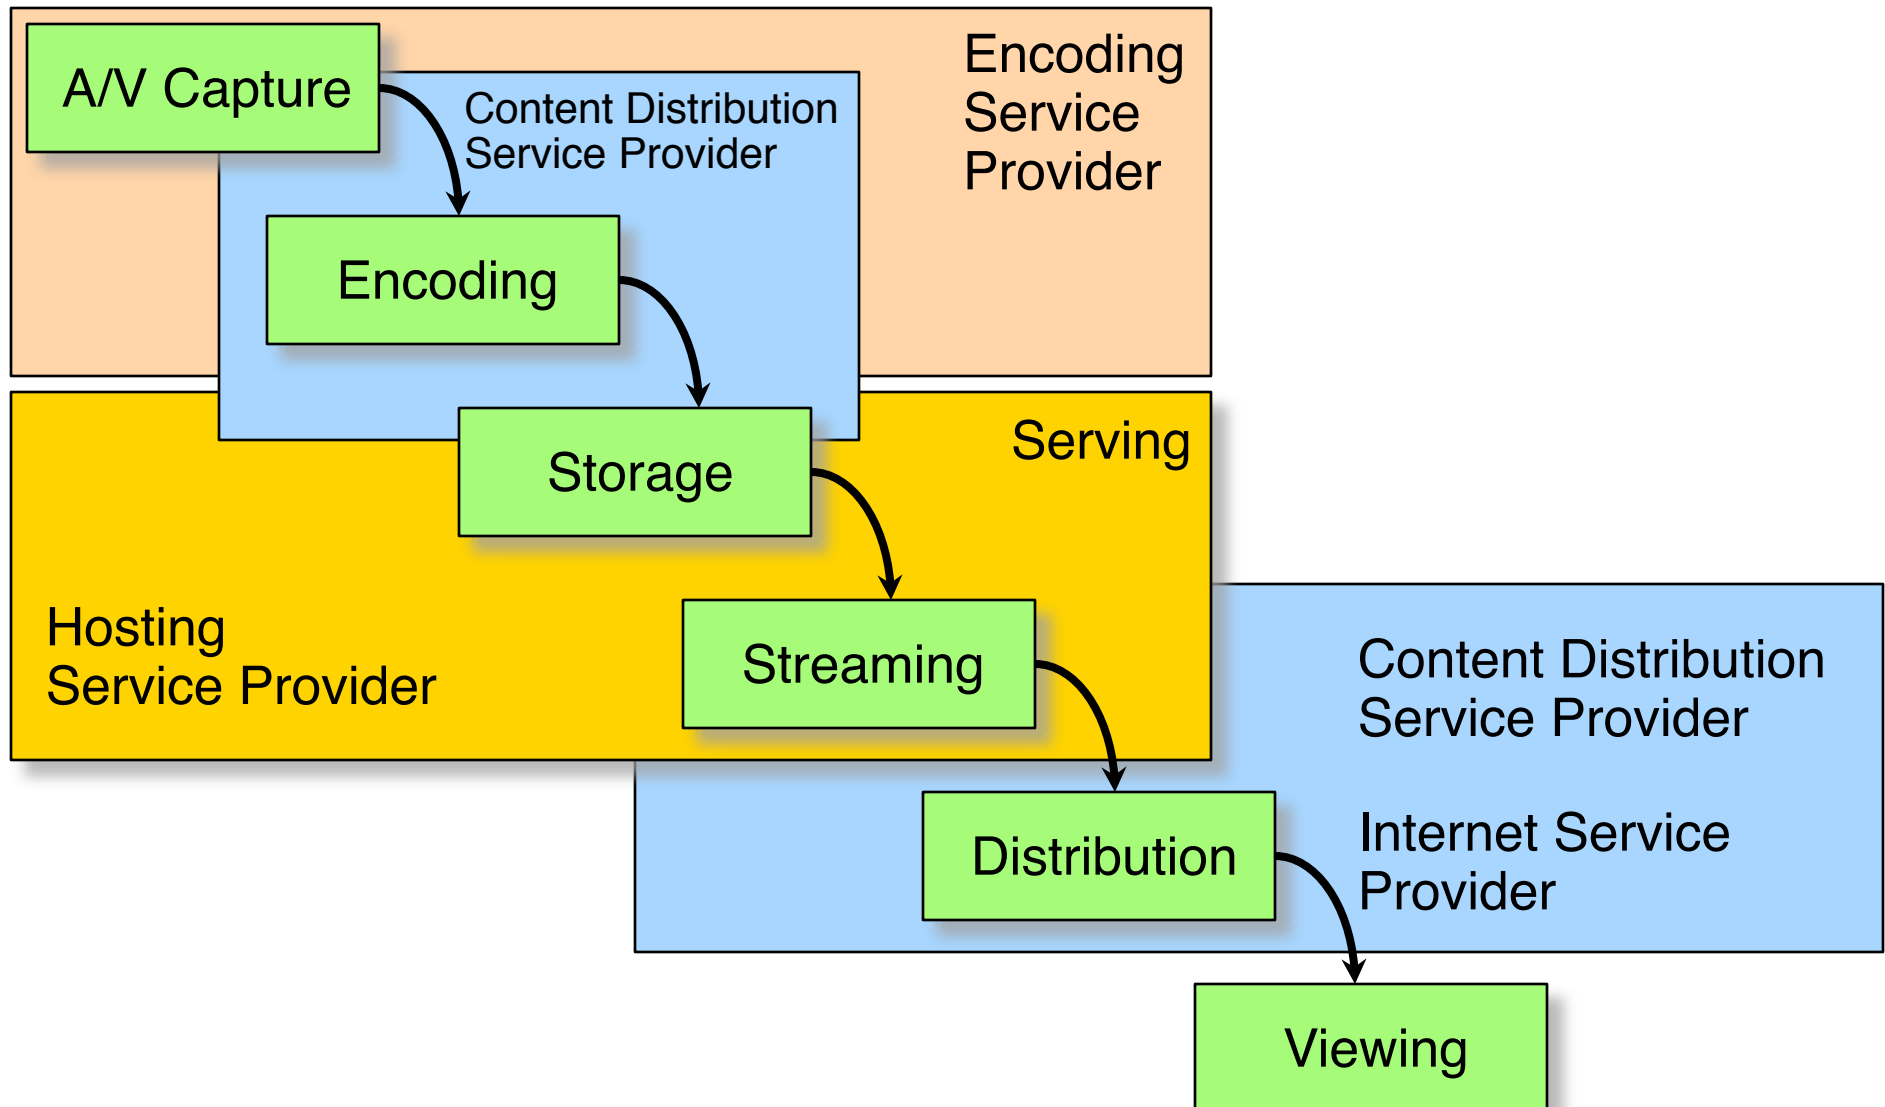

# Distribution

- Key topic: Quality of Service (QoS)
  - Determining realizable bandwidth, delay, jitter
- Key concepts:
  - Overprovisioning
  - Detailed reservations (“Integrated Services”, reservation protocol RSVP)
  - Traffic classes (“Differentiated Services”)
  - Resource management layer
  - Solutions based on specific network technologies
    - » E.g. ATM (Asynchronous Transfer Mode)

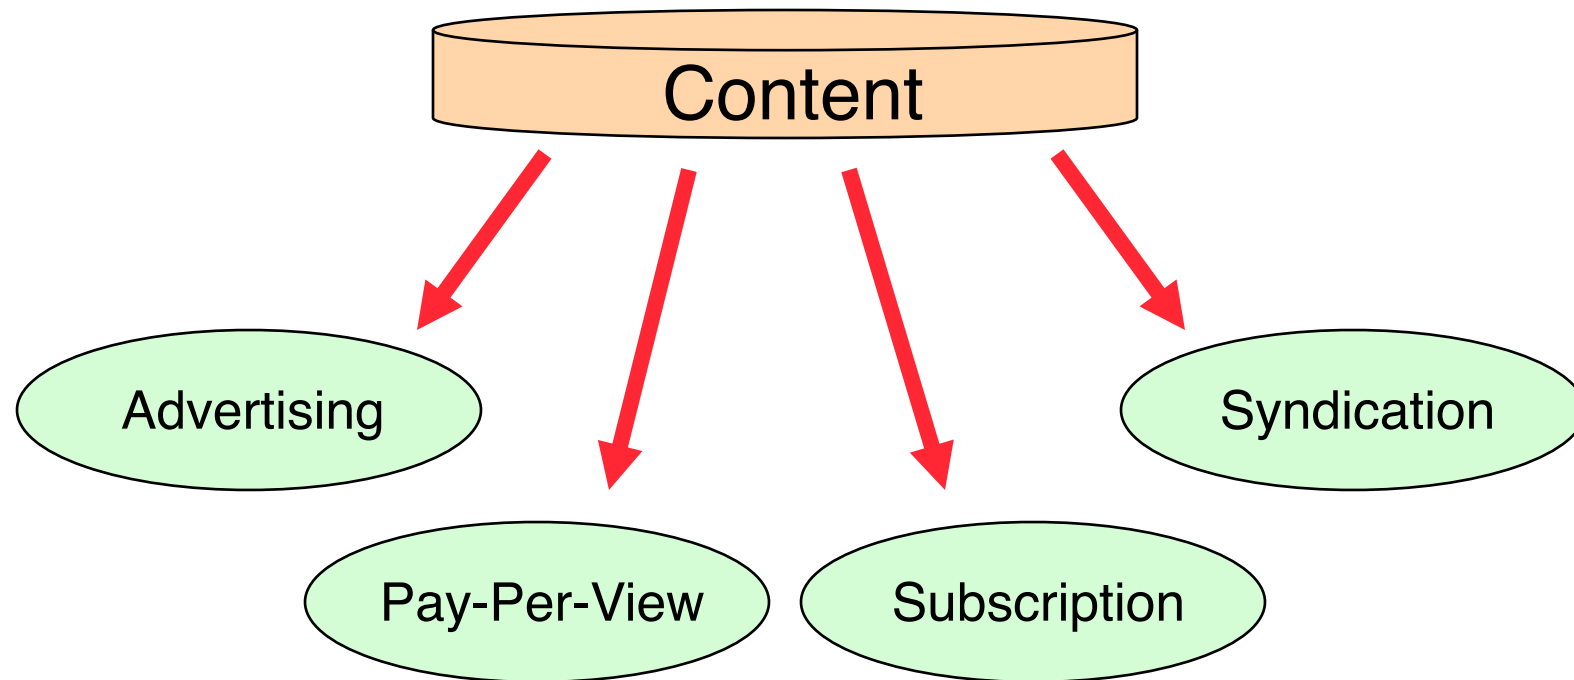

# Organisations in the Streaming Delivery Chain

# Content Monetization

- There are several traditional models for gaining a return on investment on content
  - Network-based media enable the integration of all models

# 10 Multimedia Content Management and Distribution

10.1 Media Production Chains

10.2 Streaming Technology – Push Model

10.3 Streaming Technology – Pull Model

10.4 Scalability of Multimedia Distribution

Literature:

David Austerberry: *The Technology of Video & Audio Streaming*,  
Focal Press 2002

Stephan Rupp, Gerd Siegmund, Wolfgang Lautenschlager:  
*SIP – Multimediale Dienste im Internet*. dpunkt 2002

A. Begen, T. Akgul, M. Baugher: *Watching Video over the Web*,  
Part I: Streaming Protocols, *IEEE Internet Computing*,  
March/April 2011

# Push and Pull Models for Streaming

- Push model (e.g. Darwin Streaming Server):
  - Session-level connection established between server and client
  - Server continues sending packets *downstream* to client
  - Server listens to commands given by client (see later for protocols)
  - True real-time data distribution
  - Adaptive bandwidth control
- Pull model (e.g. YouTube):
  - Session-level connection established between server and client
  - Server is idle as long as client does not request data
  - Client continues requesting packets from server (e.g. by HTTP)
  - Playback starts after a certain client-side buffer level is reached
  - Essentially “progressive download”, enhanced in modern approaches (see later)

# IP and TCP

- Internet Protocol
  - Network communication protocol (ISO layer 3)
  - Packets transferred from address to address (through routers)
  - Main problems:
    - » Variable network latency
    - » Packet order on arrival may be different than on sending
    - » Packets may be lost
- Transport Control Protocol (TCP)
  - Connection establishment (by “three-way handshake”)
    - » Connections are sequences of associated IP packets
  - Sequencing of bytes with forwarding acknowledgement number
  - Non-acknowledged bytes are re-transmitted after a defined time period
  - Flow control
- For audio/video streaming:
  - Retransmissions (and associated delays) are harmful
  - Lost packets can be tolerated to some extent

# UDP

- User Datagram Protocol (UDP)
- Extremely simple transport protocol over IP
  - Connectionless (TCP: connection-oriented)
  - Unreliable (TCP: reliable)
  - No flow control (TCP: has flow control)
- Contents of a UDP datagram:
  - Ports used by application program
  - Checksum
- Basically adequate for media data transport
  - In particular for **push**-model true streaming
  - Very efficient, protocol overhead of TCP avoided
  - Flow control and handling of packet loss have to be handled by higher protocol layer

# Real-Time Transport Protocol RTP

- Transport protocol specifically developed for streaming data
  - IETF (Internet Engineering Task Force) RFC (Request for Comments) 1889
- RTP usually carried over UDP
- Used for **push** model of media transmission mainly
- Very important:
  - **RTP does not at all change the way how IP packets are transferred in the network!**
  - To achieve “Quality of Service”, additional network technologies are required (see above)
- Early uses of RTP:
  - Apple QuickTime architecture
  - RealSystems streaming architecture
- RTP still supported in state-of-the-art systems

# Current Example of Live Streaming

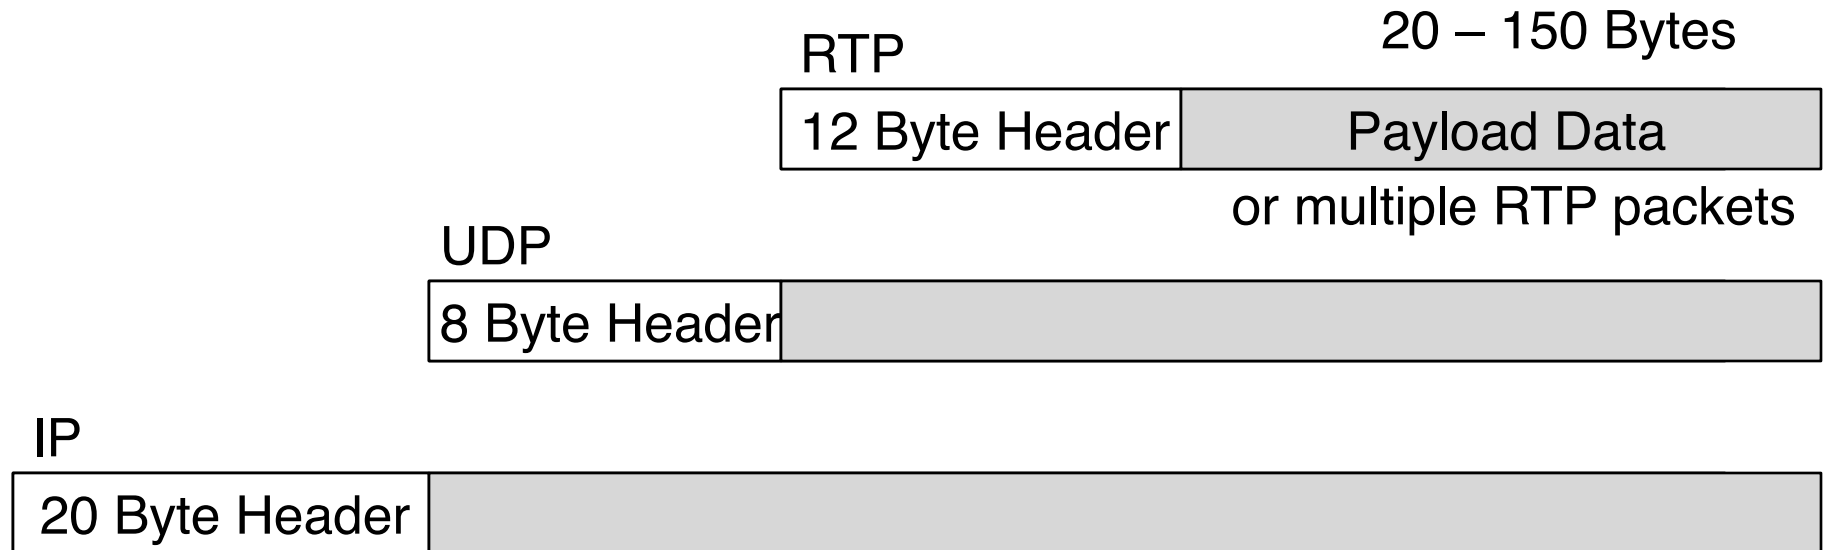

Live H.264  
encoder

On-board and Remote Proxy Recording over RTP/RTSP

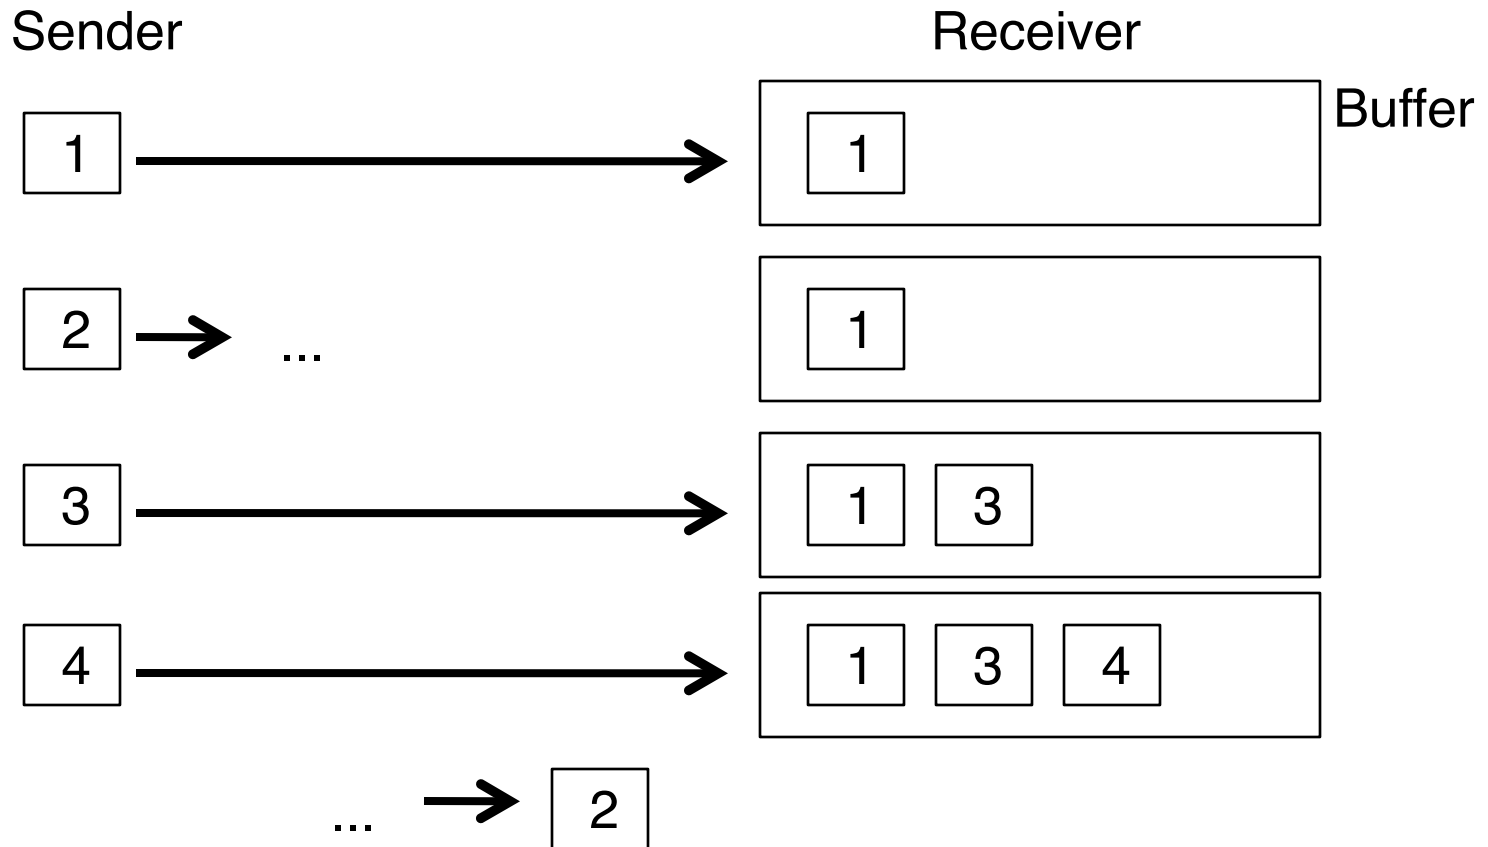

Source: [teradek.com](http://teradek.com)

# RTP Packets and Other Protocols

- IP Header:
  - Source address, destination address, length, time to live, ...
- UDP Header:
  - Port numbers (source and target processes), length, checksum
- RTP Header:
  - Codec type, sequence number, timestamp, synchronization source

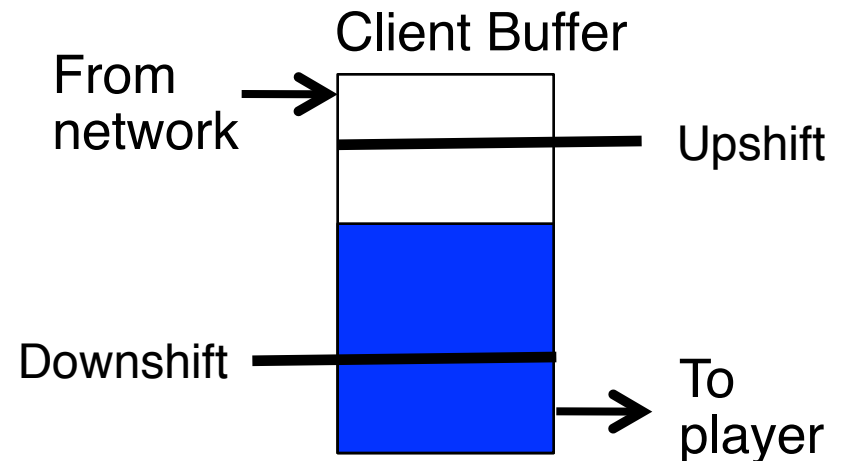

# Jitter and Loss Compensation

- Options for application on receiver side:
  - Wait (*not* adequate), repeat last packet (1), interpolate (between 1 and 3)
  - Missing audio information is difficult, missing video can be compensated

# Adaptive Transmission Rate Control

- Application-level mechanism
- Define “downshift” and “upshift” thresholds on buffer (possibly several)
- Downshift:
  - Buffer is close to drain (“underrun”)
  - Server should select lower-bitrate encoding (less quality)
- Upshift:
  - Buffer is close to be full (“overrun”)
  - Server can try to select higher-bitrate encoding (better quality) (if network can support that)
  - Alternatively server may switch to lower transmission rate
- Communication between client/server required!
  - No longer in mainstream use (see next section)

# Session Description Protocol (SDP)

- IETF Standard (RFC 4566) 2006
- Description mechanism for multimedia communication sessions
  - announcement, invitation, parameter negotiation
- Defines:
  - media components (and their types) belonging to a session
  - alternative formats available for media components
  - session profiles
- Applicable for various purposes
  - for conferencing examples see later chapter
    - » in streaming: announcement of available options from server to client

# Real-Time Control Protocol RTCP

- RTCP controls the transmission (not the setup of connection)
- RTCP periodically sends monitoring information to all participants in a streaming session
- Main functions of RTCP:
  - Feedback on QoS of transmission
    - » Information for adaptive codecs, e.g. whether problem is local or global
  - Identification of sender by “canonical name”
    - » Helpful when synchronization source changes
    - » Supports lip synchronization between audio and video
  - Number of participants in a session
    - » Adaptation of sending rate of RTCP control information to number of participants, to avoid network overload
  - Transmission of additional information, e.g. names of session participants

# Real Time Streaming Protocol RTSP

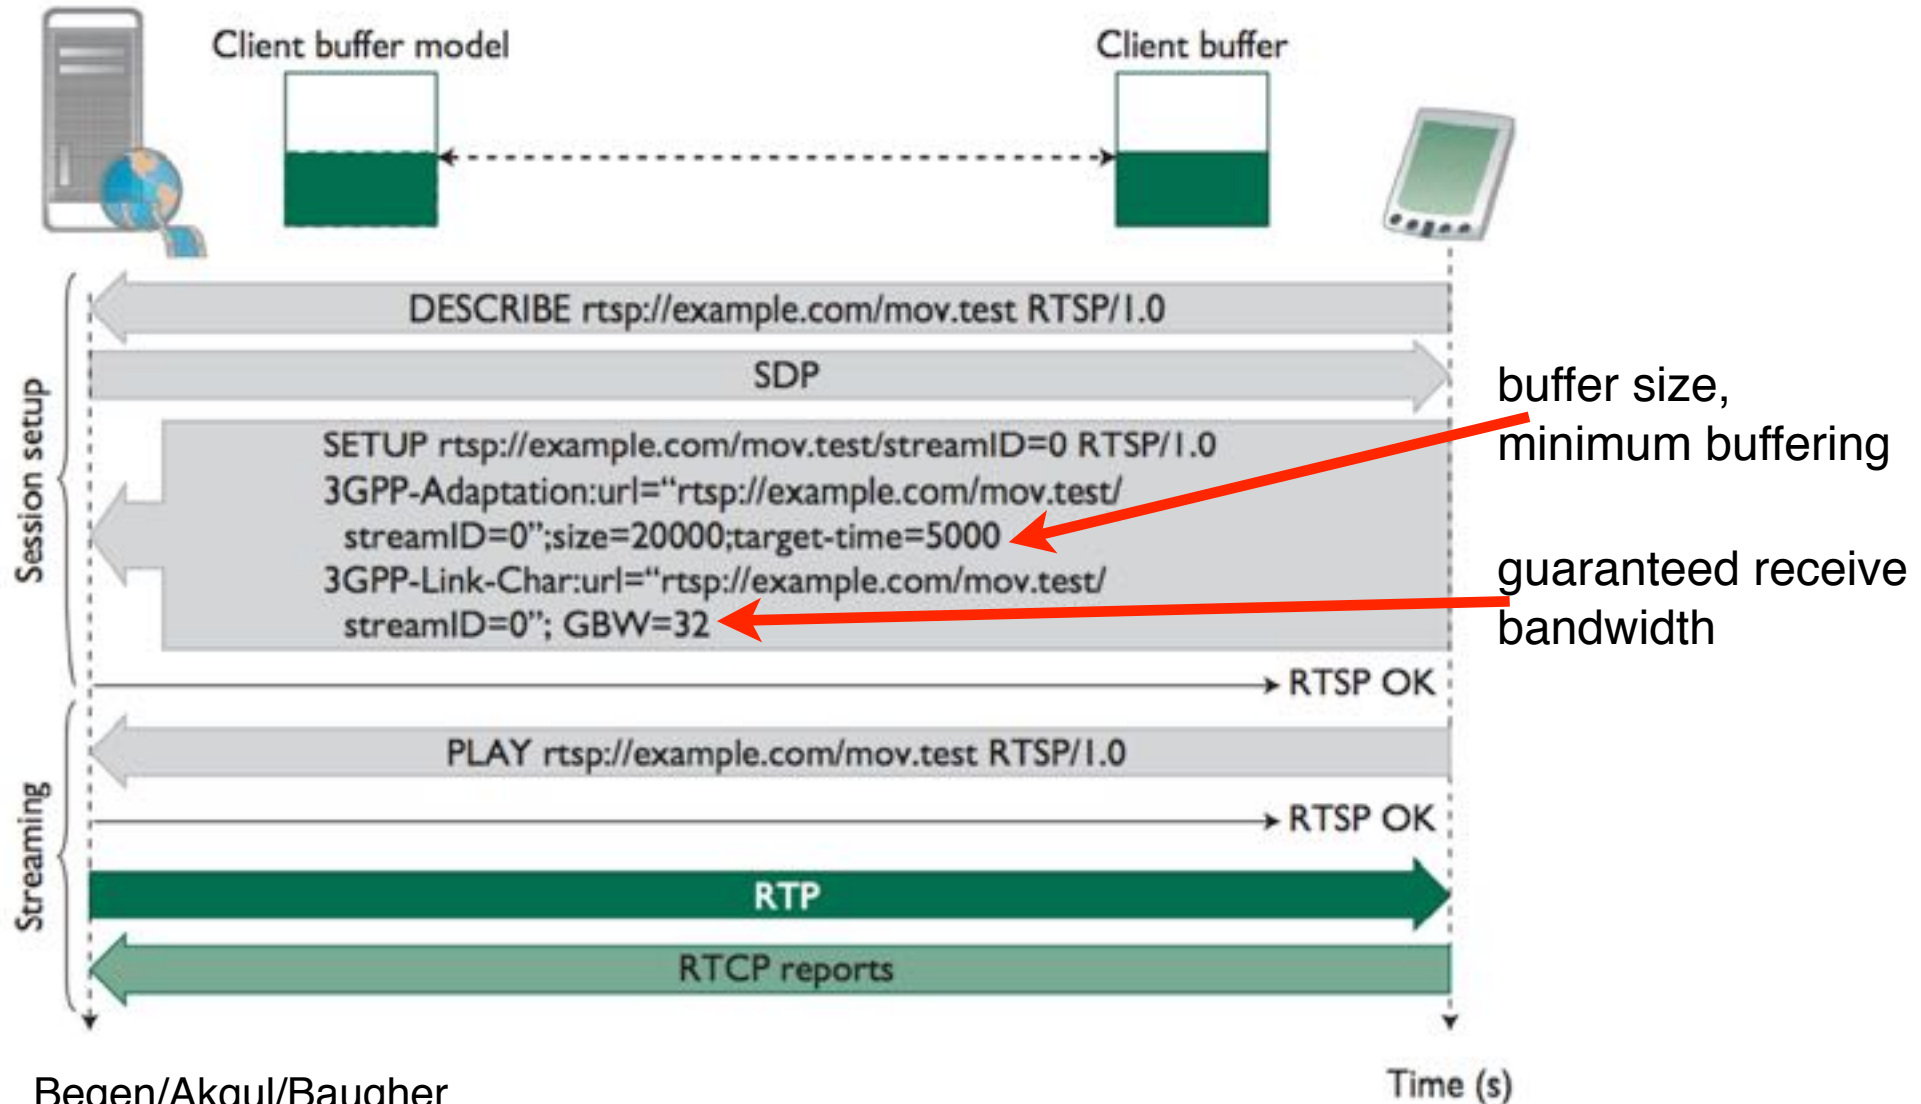

- Client-server multimedia presentation protocol, designed specifically for streamed media
  - IETF (Internet Engineering Task Force) RFC (Request for Comments) 2326 (“MMUSIC” work group), 2004
  - “The Internet VCR remote control protocol” ([www.rtsp.org](http://www.rtsp.org))
  - Independent of the use of RTP for transport
  - Syntactically similar to HTTP 1.1 (carried over TCP or UDP)
- Main operations supported by RTSP:
  - Transport & capability negotiation (DESCRIBE, SETUP)
    - » e.g. disallowing a “seek” function
  - Session control (SETUP, REDIRECT, TEARDOWN)
  - Control of media playback (PLAY, PAUSE, PING)
  - Invitation of a media server to a conference

# RTMP, RTMPT, RTMPS, ...

- "Real-Time Messaging Protocol"
  - Variants: Tunneling (through HTTP), secure transmission...
- Adobe-proprietary protocols
  - Mainly used for Flash-based players
  - Open format, specification freely available

# 3GPP Bitrate Adaptation

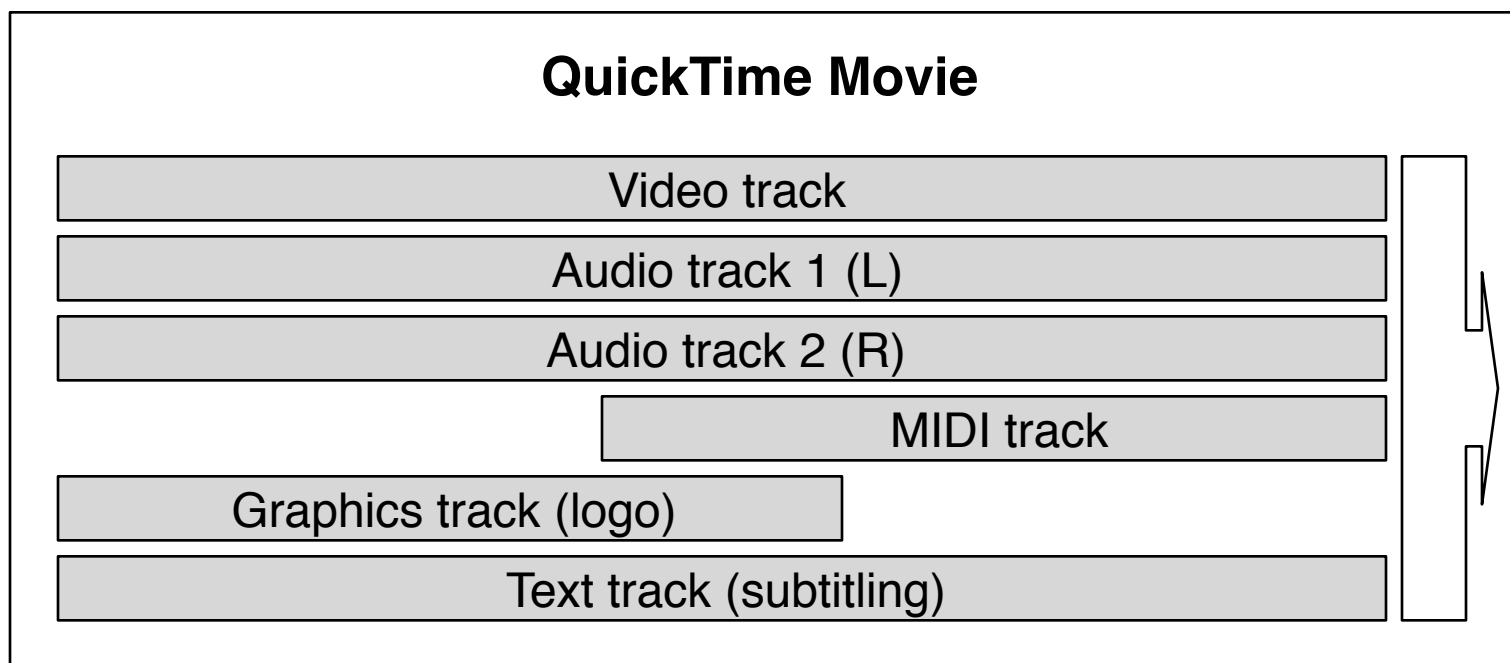

Begen/Akgul/Baugher

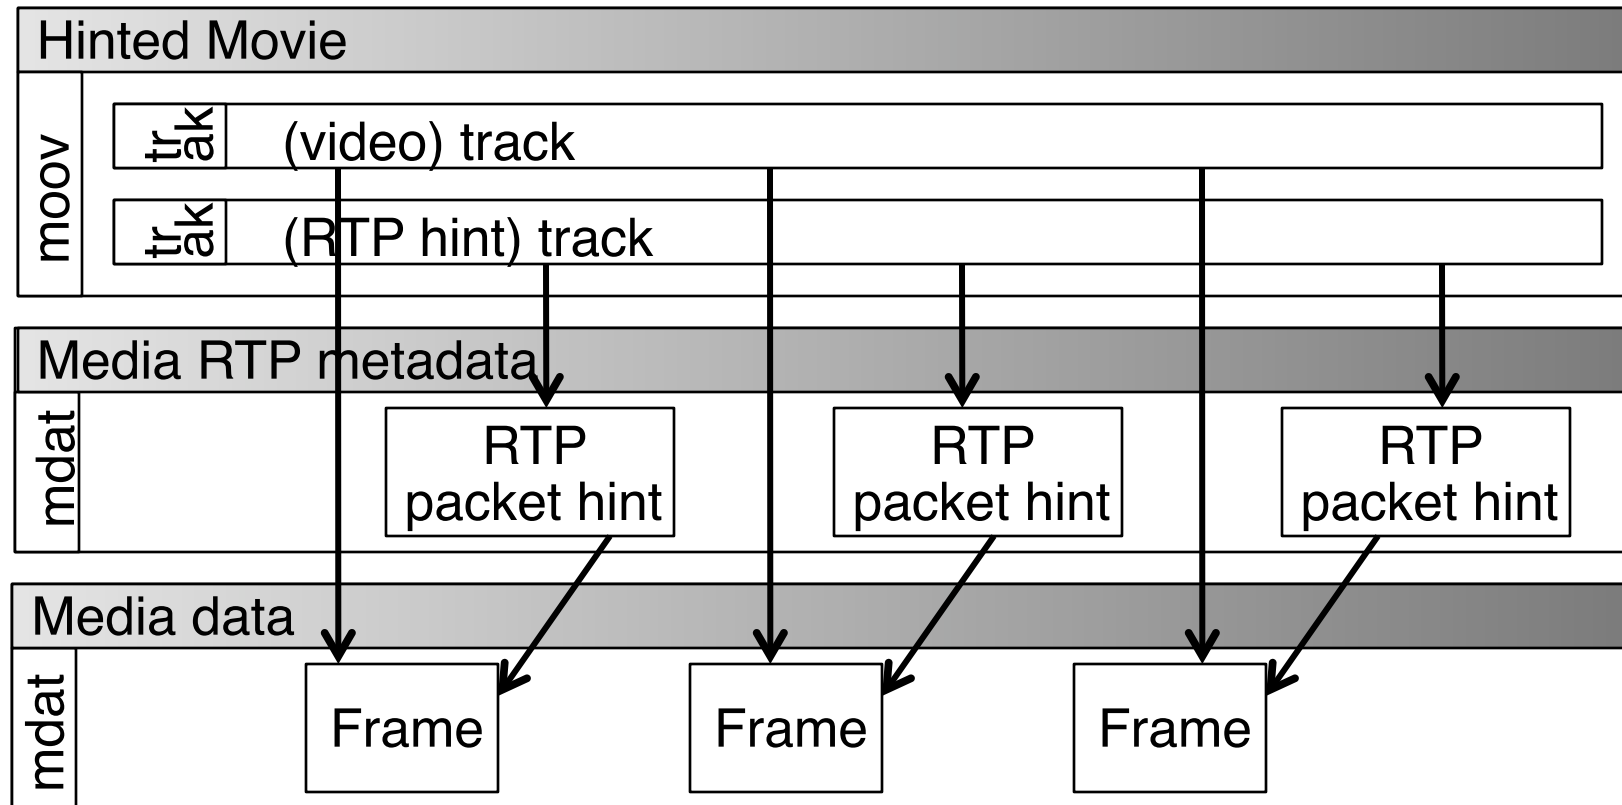

# Example File Format: QuickTime Movie Files

- Modular and flexible architecture
  - Multimedia files organized in tracks
  - Example:

# Hint Tracks in QuickTime and MPEG-4

- Hint track gives server software pointers to the RTP information to serve the relevant media chunks
- Concept from QuickTime, integrated in MPEG-4 (streaming)

# 10 Multimedia Content Management and Distribution

10.1 Media Production Chains

10.2 Streaming Technology – Push Model

10.3 Streaming Technology – Pull Model

10.4 Scalability of Multimedia Distribution

Literature:

A. Begen, T. Akgul, M. Baugher: Watching Video over the Web, Part I: Streaming Protocols, *IEEE Internet Computing*, March/April 2011

I. Sodagar: The MPEG-DASH Standard for Multimedia Streaming Over the Internet, *IEEE Multimedia*, Oct/Dec 2011

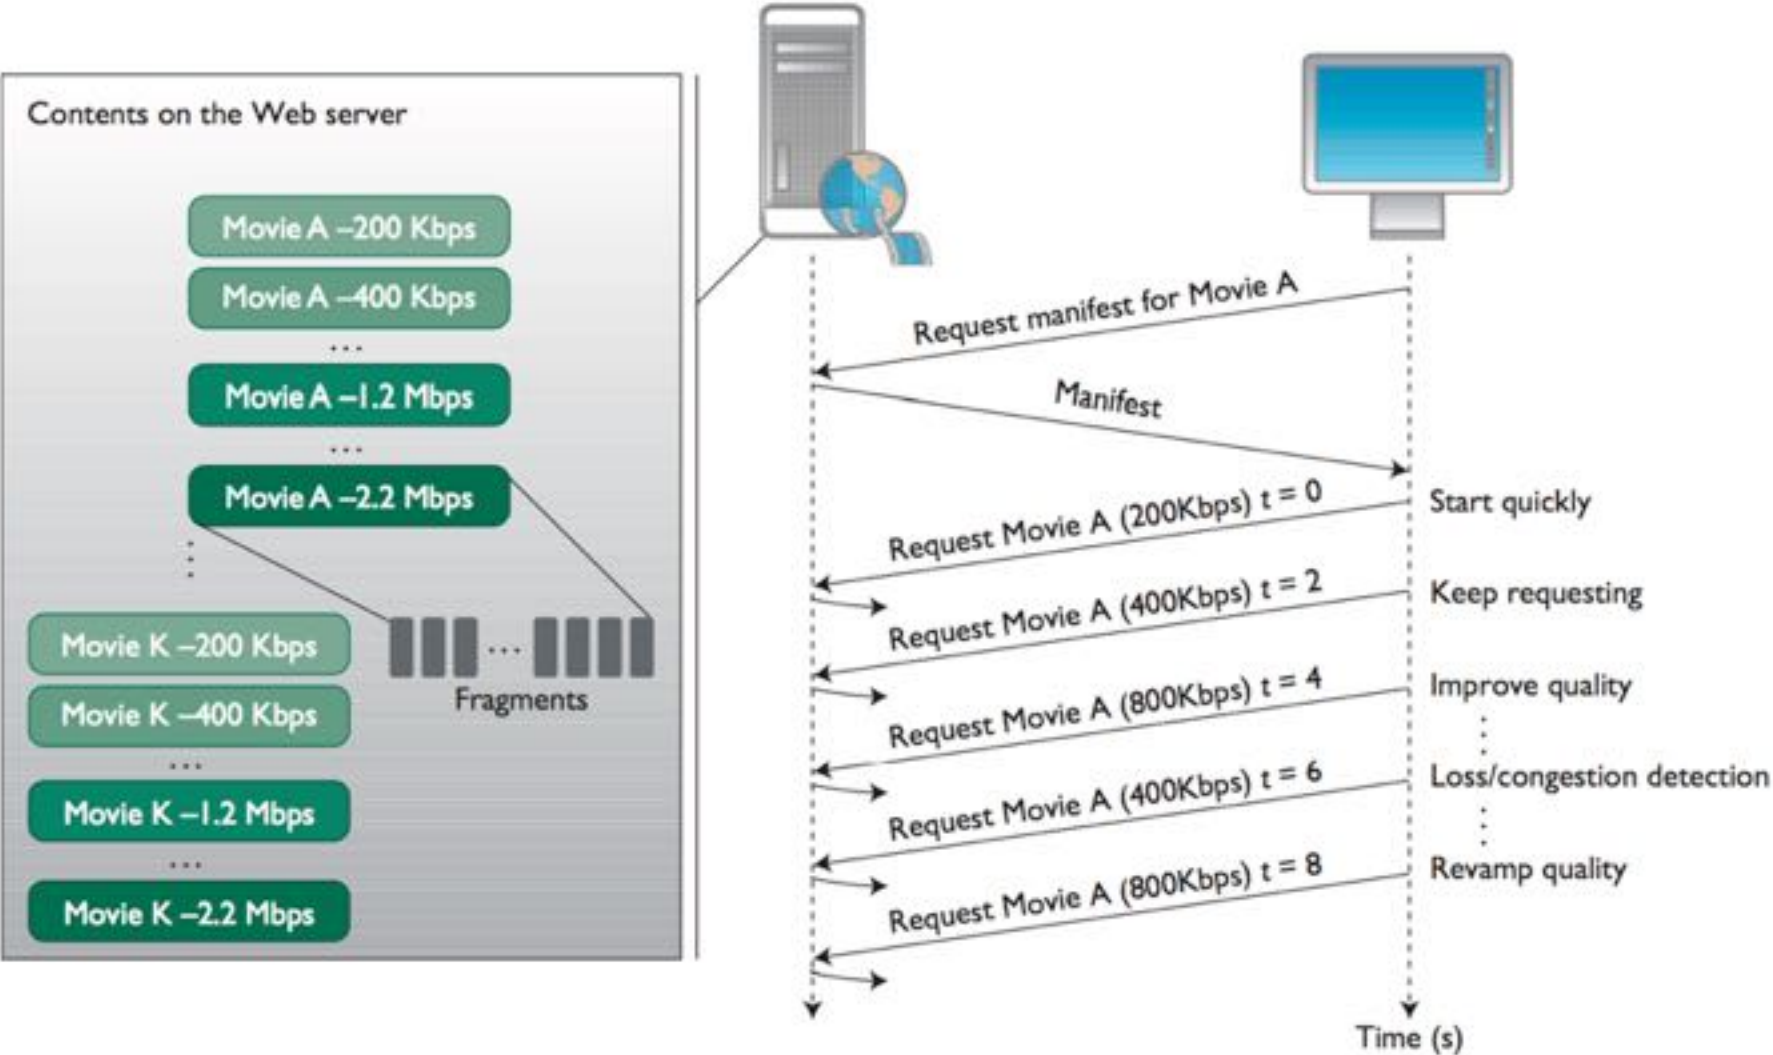

# Trend Towards Pull-Model Streaming

- Internet video around 2009, alternatives:
  - Push-model, server-centric streaming with bitrate control (e.g. RealPlayer)
  - Progressive download (pull-model) without bitrate control (e.g. YouTube)
- Disadvantages of push-model streaming:
  - Firewalls, NAT devices etc. support HTTP ports but often not other protocols
  - Server responsibility for bitrate adaptation is problematic for scalability
- Disadvantages of pull-model progressive download:
  - Unpredictable quality of experience, in particular frequent stalling of video
  - Legal issue: Progressive download may produce full (temporary) copy of file
- Technology evolution:
  - Generally higher network speed, better support for larger chunks of data
  - HTTP caching infrastructure
- How to create a scalable hybrid approach?
  - Pull-model, HTTP-based like progressive download
  - Adaptive bitrate control

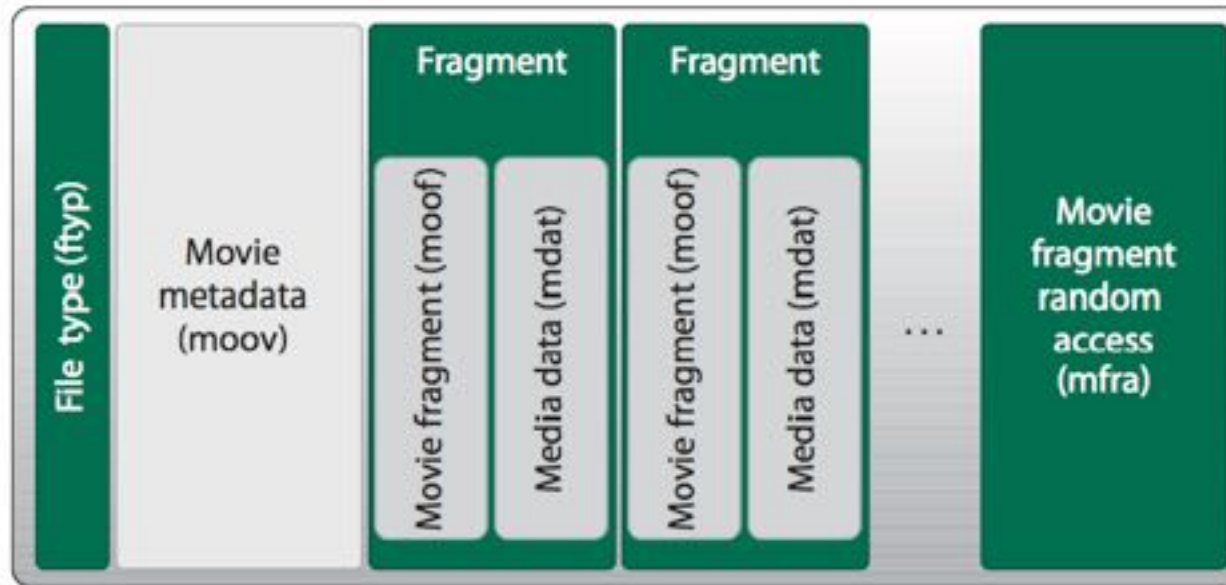

# Adaptive HTTP Streaming

- First development step:  
Independent proprietary solutions for adaptive HTTP-based streaming:
  - Apple HTTP Live Streaming
  - Microsoft Smooth Streaming
  - Adobe HTTP Dynamic Streaming
- Second development step:
  - DASH standard for adaptive HTTP-based streaming (see below)
- Basic idea: Small video file fragments
  - Fragments exist at different bit rates
  - Index file for all available fragments
  - Client requests appropriate next fragment by GET request

# Bitrate Adaptation in HTTP Adaptive Streaming

# Example: Video Fragmentation in Microsoft Smooth Streaming

MPEG4-based  
format for  
fragmented video  
(PIFF)

- Fragments always contain complete Groups of Pictures (GOP)
- Client (Silverlight-based Web player) sends requests which contain:
  - requested bitrate (version of the video)
  - requested time offset for fragment

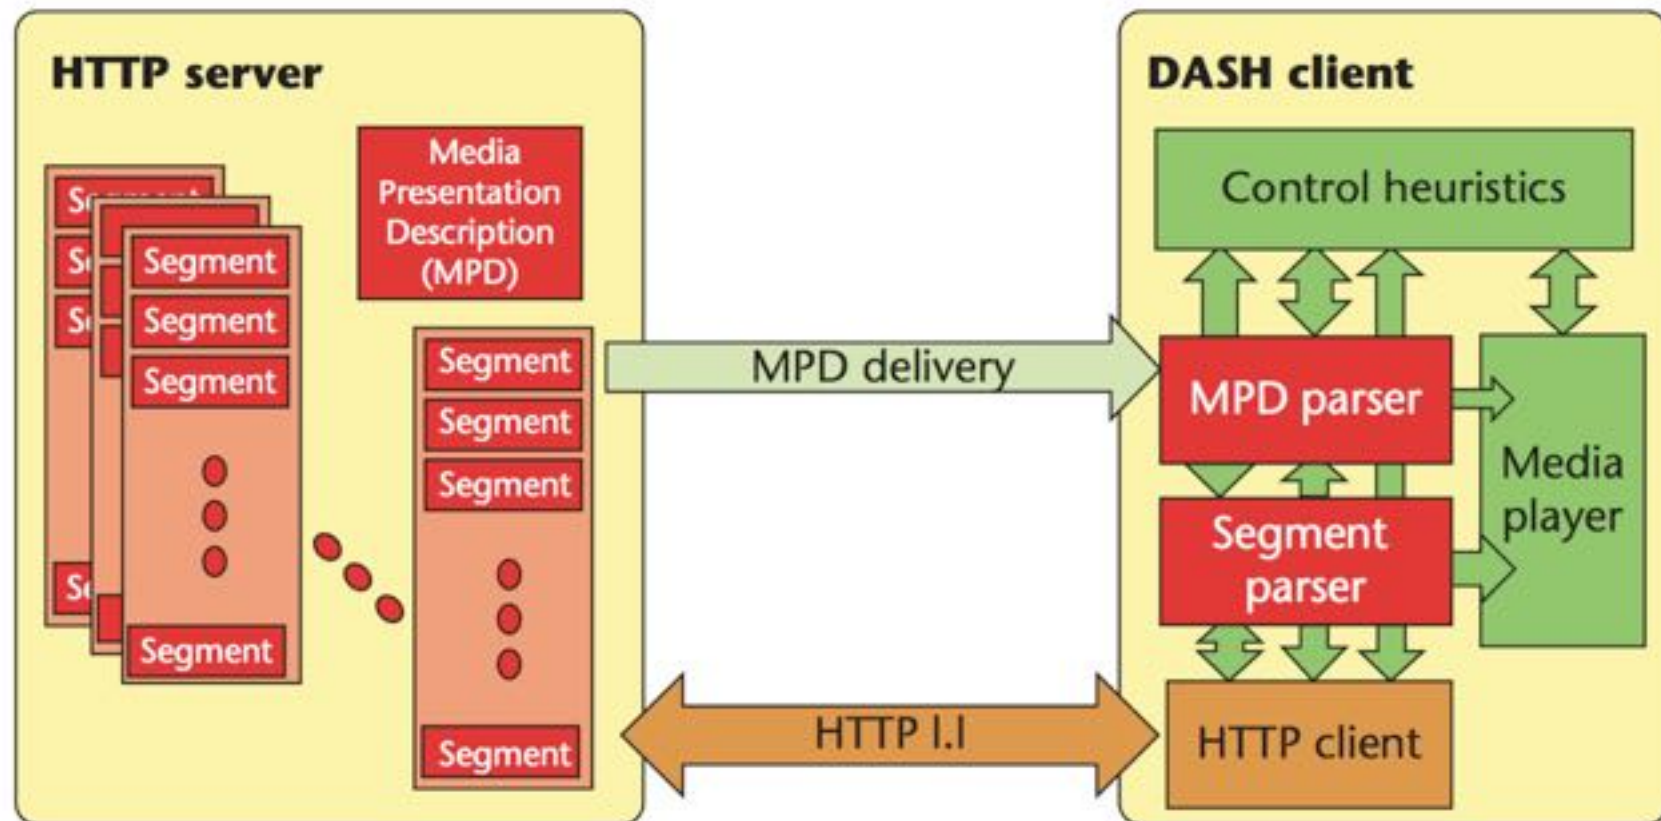

```
GET/example.host/myvideo.ism/QualityLevels(64000)/  
Fragments(video=150324) HTTP/1.1
```

Begen/Akgul/Baugher, based on [alexzambelli.com/blog/2009/02/10/smooth-streaming-architecture/](http://alexzambelli.com/blog/2009/02/10/smooth-streaming-architecture/)

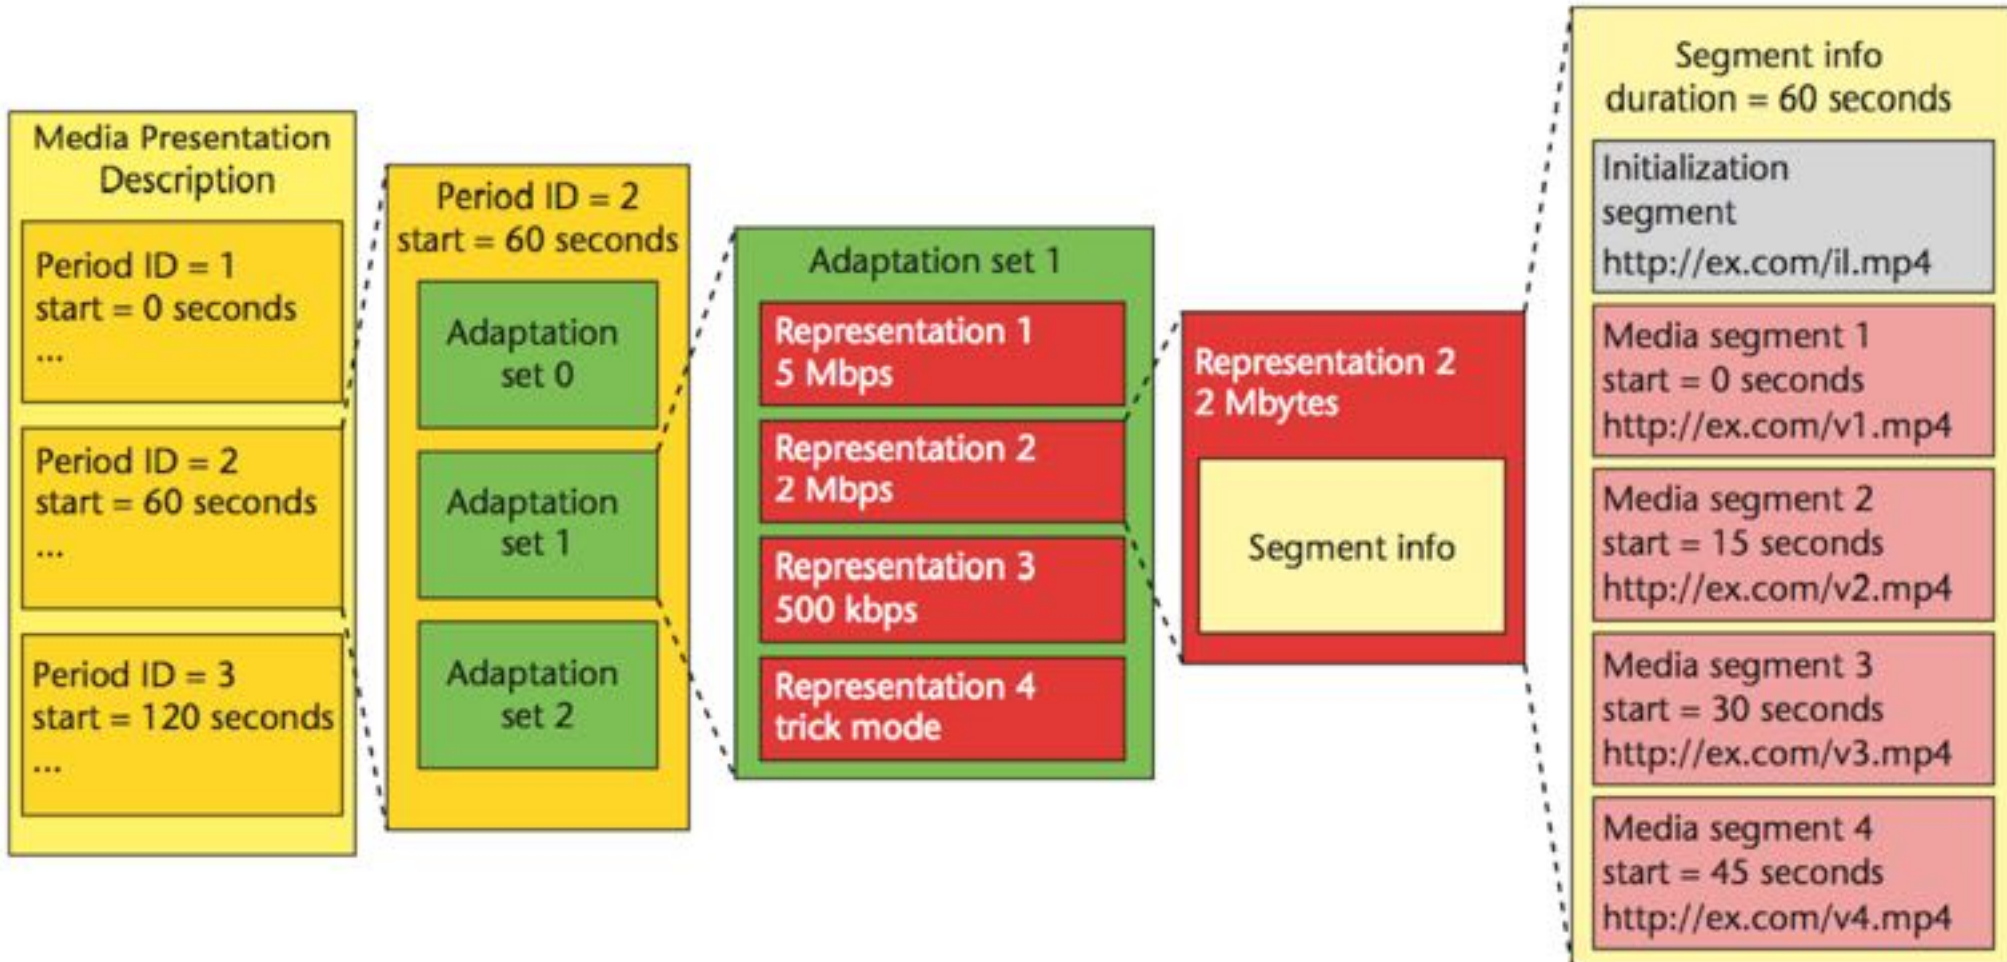

# MPEG-DASH Standard

- MPEG call and selection process for HTTP streaming standard (2009–2011)
- ISO/IEC standard (ISO 23009) April 2012

Sodagar

# Media Presentation Description in DASH

# Adaptive HTTP Streaming, Client-Side

- DASH access library:
  - Parsing of Media Presentation description (MPD)
  - Management of HTTP download of segments
  - Reference implementation *libdash* (<https://github.com/bitmovin/libdash/>)
- DASH streaming control:
  - Heuristics of switching between representations
  - "Quality of Experience" (QoE) optimization
  - Usually part of player component
  - Trend: Self-learning clients (machine learning)
- DASH player implementations:
  - Plugins for media players (e.g. DASH plugin for VLC player)
  - DASH player components for legacy browsers, e.g. based on Adobe Flash
  - JavaScript-based DASH players
    - » JavaScript code building on browser APIs

# Example: YouTube "Stats for Nerds"

Video ID: rCplocVemjo [x]  
Dimensions: 640 x 360 \* 2  
Resolution: 1280 x 720  
Volume: 100%  
Stream Host: r13---sn-h0j7sn7z  
Stream Type: https  
CPN: 3GB9oS3QR0SaSWEa  
Mime Type: video/webm; codecs="vp9"  
DASH: yes (247/251)  
Connection Speed: \_\_\_\_\_ 4108 Kbps  
Dropped Frames: 0/405

# HTML5 Media Source Extensions (MSE)

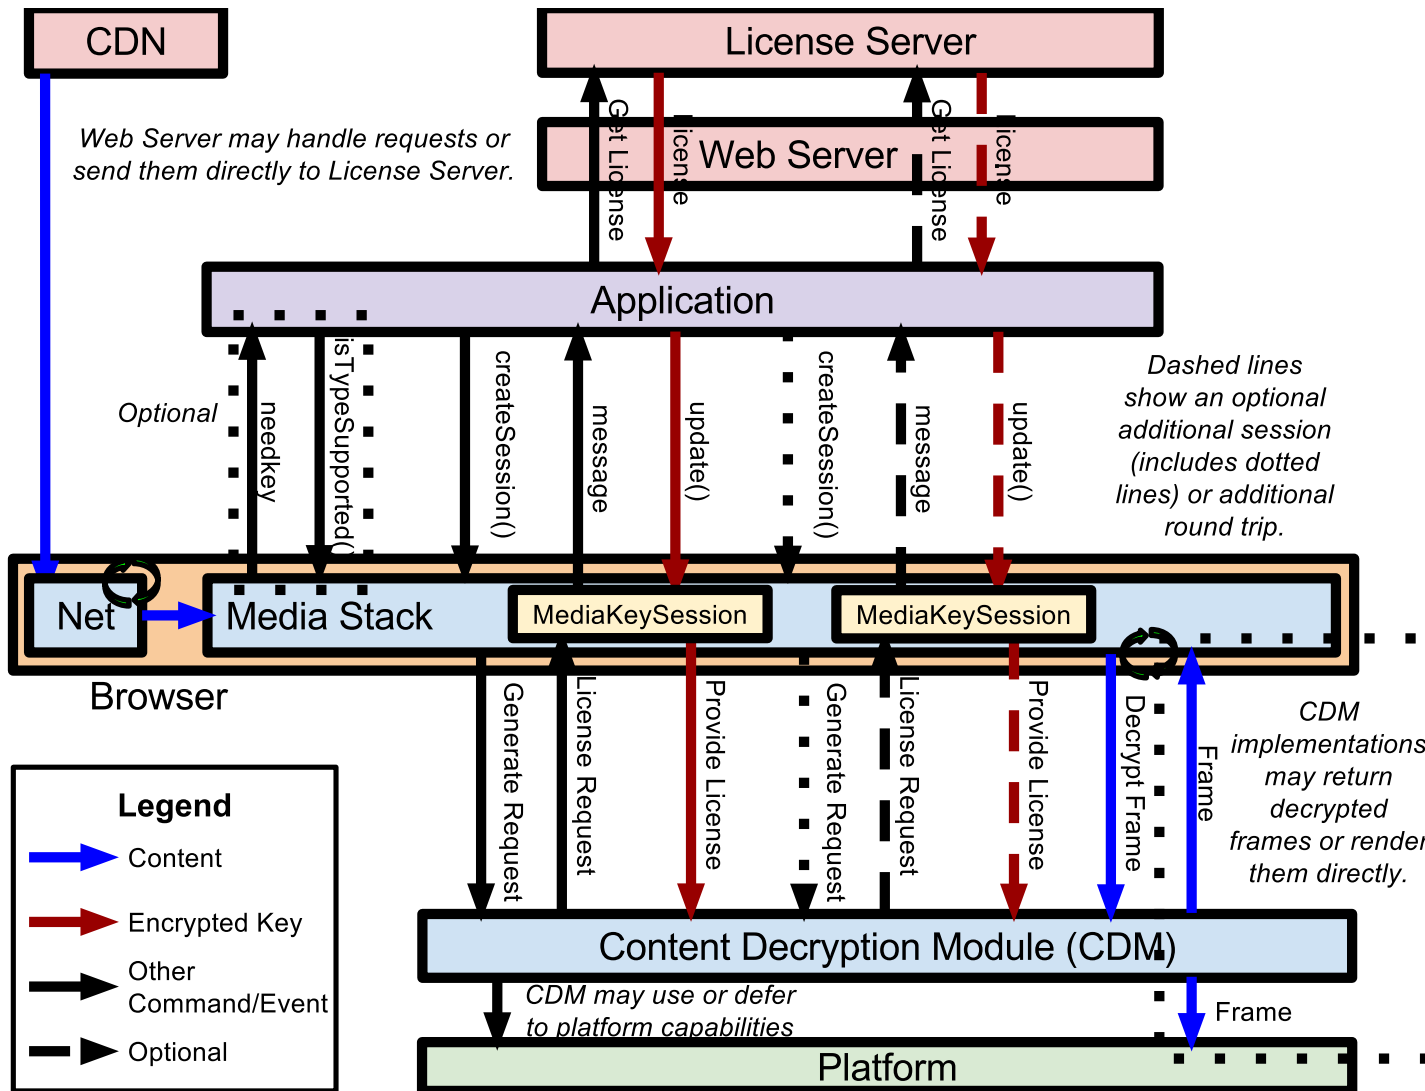

- W3C recommendation under development
  - <http://www.w3.org/TR/media-source/>
  - Candidate Recommendation 12 November 2015
- Goals:
  - JavaScript interface for HTML Media Elements to receive spliced and buffered media streams
  - Use cases:
    - » adaptive streaming
    - » ad-insertion
    - » time-shifting
    - » video editing

# HTML5 Encrypted Media Extensions (EME)

- W3C recommendation under development
  - <http://www.w3.org/TR/encrypted-media/>
  - Latest Editor's Draft 16 December 2015
- Highly controversial within HTML5 community!
- Main authors: Google, Microsoft, Netflix
- (JavaScript) API for HTML5 media elements to control playback of encrypted content
  - API to discover, select and interact with DRM systems

# HTML5 EME Stack Overview

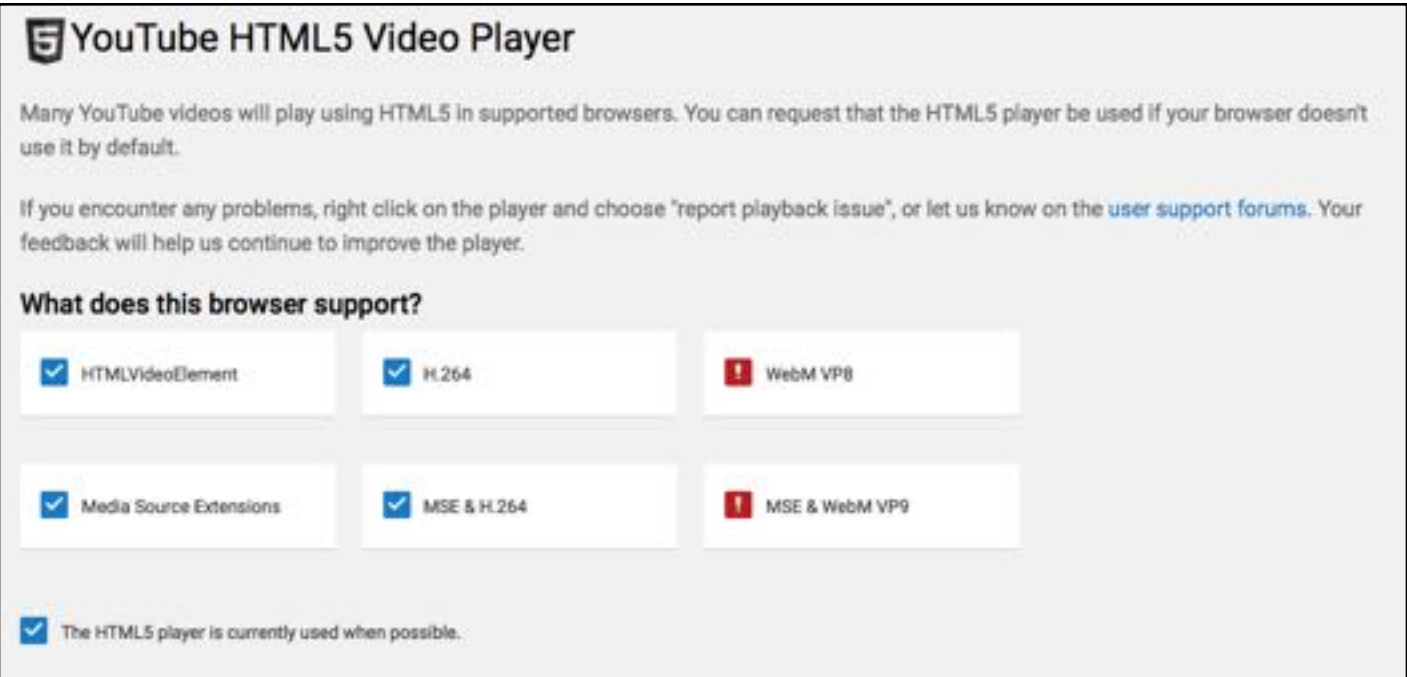

Source:  
W3C

# Example: YouTube HTML5 Video Player

Chrome 47

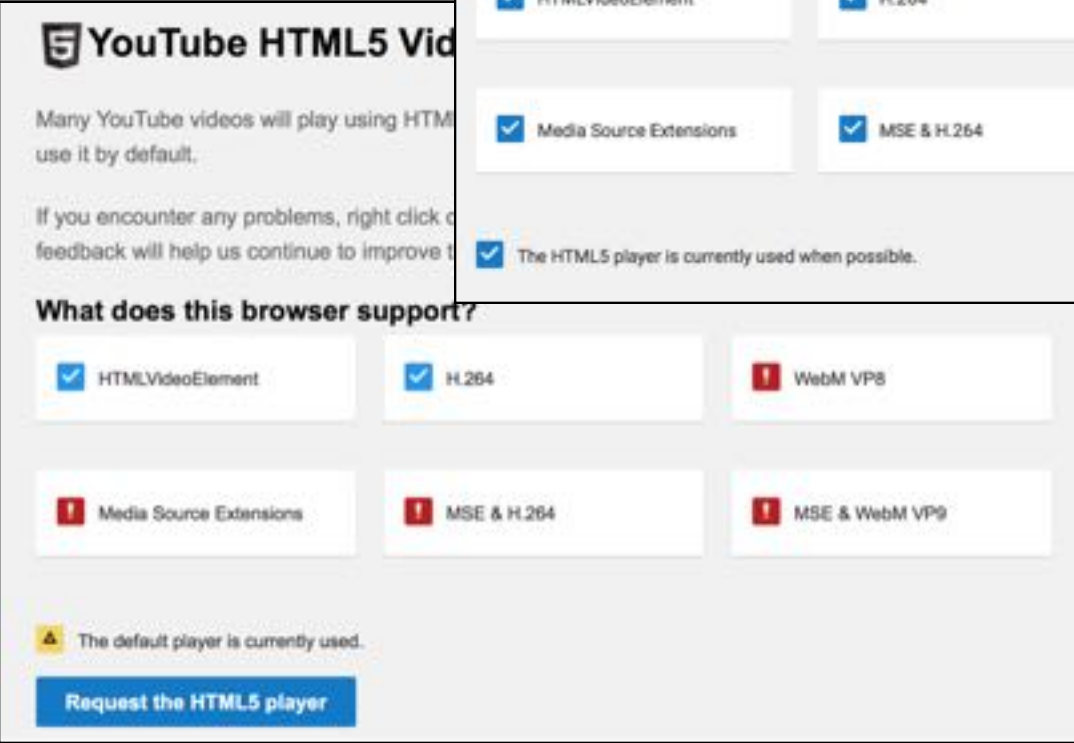

**YouTube HTML5 Video Player**

Many YouTube videos will play using HTML5 in supported browsers. You can request that the HTML5 player be used if your browser doesn't use it by default.

If you encounter any problems, right click on the player and choose "report playback issue", or let us know on the [user support forums](#). Your feedback will help us continue to improve the player.

**What does this browser support?**

- HTMLVideoElement
- H.264
- WebM VP8
- Media Source Extensions
- MSE & H.264
- MSE & WebM VP9
- The HTML5 player is currently used when possible.

**YouTube HTML5 Vid**

Many YouTube videos will play using HTML5 in supported browsers. You can request that the HTML5 player be used if your browser doesn't use it by default.

If you encounter any problems, right click on the player and choose "report playback issue", or let us know on the [user support forums](#). Your feedback will help us continue to improve the player.

**What does this browser support?**

- HTMLVideoElement
- H.264
- WebM VP8
- Media Source Extensions
- MSE & H.264
- MSE & WebM VP9
- The default player is currently used.

[Request the HTML5 player](#)

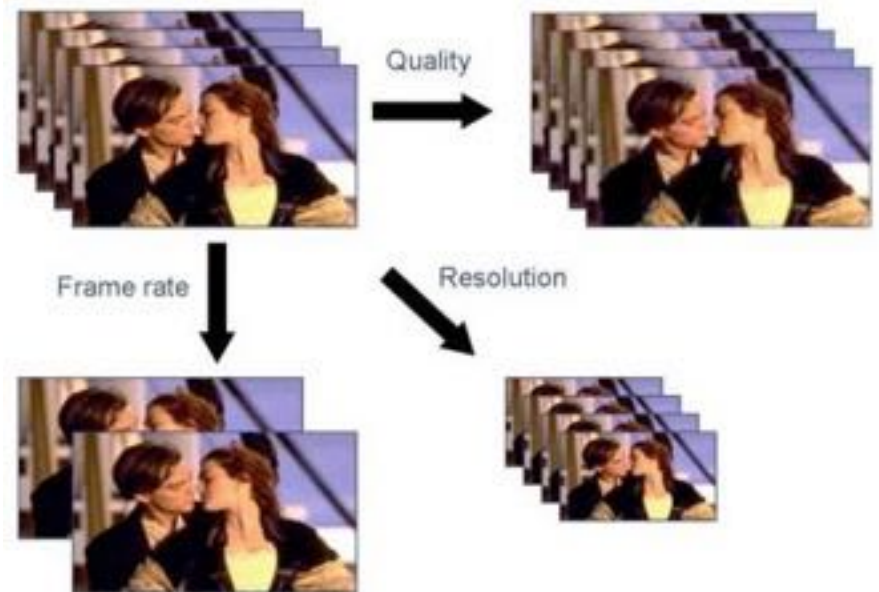

Safari 9  
(OS X 10.11 El Capitan)

Safari 7 (OS X 10.9 Mavericks)

# MPEG-4 Scalable Video Coding (SVC)

- SVC: Splitting of raw video data into multiple streams
  - MPEG/ITU-Standard 2007 (H.264/AVC Extension)
  - subsets of the data, self-contained
  - subsets can be combined to achieve better quality
  - dimensions: temporal resolution (frame rate), spatial resolution, SNR (loss)
- DASH is compatible with SVC
- Strategical question for player:
  - Download additional quality information for current segment, or
  - Download future segment (in lower quality)?
- See: Andelin et al., Quality selection for Dynamic Adaptive Streaming over HTTP with Scalable Video Coding, 3rd Multimedia Systems Conference, 2012

[www.imec.be](http://www.imec.be)

# MPEG-4 Multiple View Coding (MVC)

- SVC: Multiple camera images in a multiplexed video stream
  - MPEG/ITU-Standard 2008 (H.264/AVC Extension)
- Main application area: Stereoscopic (3D) video
  - Generalizable to multiple camera positions
- DASH is compatible with MVC
  - Server announces availability in MPD
  - Client adapts requests to the current needs

# 10 Multimedia Content Management and Distribution

10.1 Media Production Chains

10.2 Streaming Technology – Push Model

10.3 Streaming Technology – Pull Model

10.4 Scalability of Multimedia Distribution

Literature:

David Austerberry: The Technology of Video & Audio Streaming,  
Focal Press 2002

Gregory C. Demetriades: Streaming Media, Wiley 2003

Xueyan Tang et al.: Web Content Delivery, Springer 2005

# Bandwidth Economy

- Fully heterogeneous individual requests:
  - Required bandwidth = stream bandwidth x number requests
- Homogeneity of requests helps saving bandwidth:
  - Same content for many clients, but different playback times:
    - » Broadcast with caching
  - Same content at same time for many clients
    - » Multicast (splitting streams)
- Pre-planning saves bandwidth
  - (Individual) transmission of pre-booked content in non-real time (“download and play”)

# Unicast, Broadcast, Multicast, Anycast

Unicast:  
One specific  
receiver

Broadcast:  
Many receivers,  
all on the network

Multicast:  
Many receivers,  
all of a specific  
group

Anycast:  
One receiver,  
"nearest" of a  
specific group

Geocast:  
Many receivers,  
all of a geographic  
region

Pictures: Wikipedia

# Traditional Solution: IP Multicast

- Multicast relatively easy to integrate in routers
- IP versions 4 and 6 provide special multicast addresses

- Reliable multicast: e.g. “Mbone” overlay network, 1992
- Multicast still rarely used in today’s Internet
- Problems: Charging and access control

# Content Delivery Networks (CDN)

- Serve content closer to to the user
  - “edge serving”
- Main components of CDN:
  - Smart routing
  - Edge caching of content
  - Proxy serving
  - Splitting of live webcasts
- Examples:
  - Akamai
    - » Runs 160,000+ servers in 95 countries
  - Limelight Networks
    - Own physical network
  - Amazon CloudFront

See also [www.cdnplanet.com/cdns/](http://www.cdnplanet.com/cdns/)

# Key Problems in CDNs

- Replica placement:
  - Where to place copies of web sites or other content
  - Problem is in general NP-hard (Karlsson, Karamolis, 2004)
  - Replica placement algorithms (RPA) achieve a suboptimal solution within reasonable time frame
  - Global information is difficult or costly to get - RPA uses local information mostly
  - CDN providers typically try to observe global network performance to some extent
- Request routing:
  - Mechanism and policy of redirecting client requests to a suitable server containing the requested content
  - Redirection algorithm: Decides what node to direct a client request to
  - Redirection mechanism: Way of redirecting the request (client, network)

# Example: Visualizing Akamai

## Visualizing Akamai

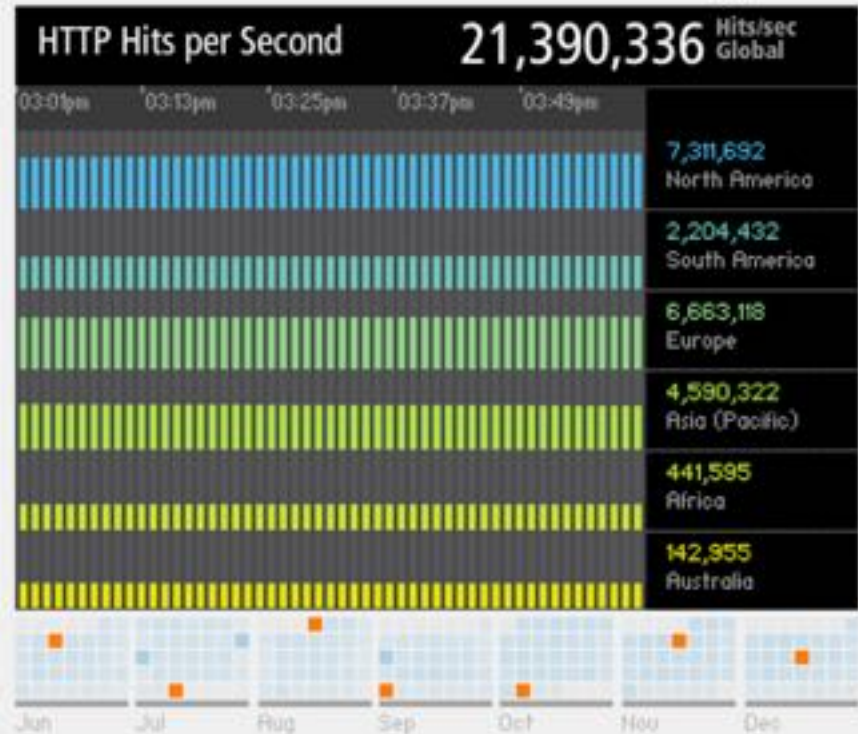

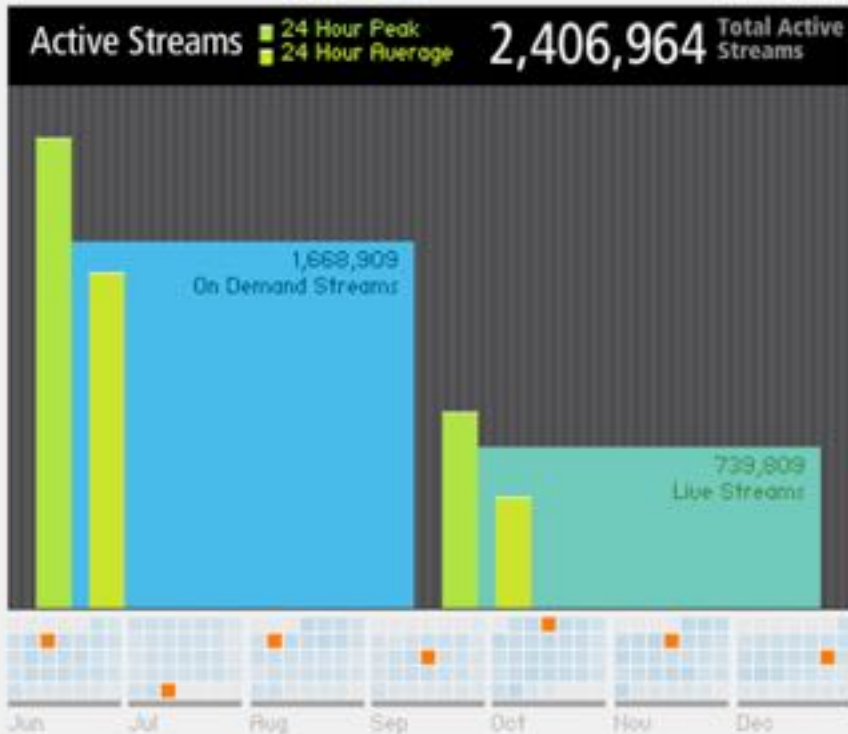

<http://www.akamai.com/html/technology/real-time-web-metrics.html>

Akamai handles 20% of the world's total Web traffic, providing a unique view into what's happening on the Web - what events are generating traffic, how much, from where, and why. Bookmark this page to get a feel for the world's online behavior at any given moment - how much rich media is on the move, the sheer volume of data in play, the number and concentration of worldwide visitors, and average connection speeds worldwide.

Visualizing Akamai

- [Return to Visualizing the Internet](#)
- [Methodology and Data Collection](#)

2013!

# Case Study:

# NETFLIX

- Netflix
  - North America market leader for online movies
  - 23 mio subscribers
  - HD video, up to 3.6 Mbps
  - Single largest source of Internet traffic in US (29.7% peak downstream)
- Network architecture
  - netflix.com hosted on own data centers (only registration, payment)
  - Main servers (e.g. movies.netflix.com) hosted by Amazon cloud services
  - Three CDNs used in parallel: Akamai, Limelight, Level-3
- Player based on Silverlight using DASH, transiting to HTML5
- Dynamic CDN selection strategy influences performance, see:
  - Adhiukari et al.: Unreeling Netflix: Understanding and Improving Multi-CDN Movie Delivery, IEEE INFOCOM 2012

# Case Study: YouTube Sources

- T. Hossfeld, R. Schatz, E. Biersack, and L. Plissonneau. Internet Video Delivery in YouTube: From Traffic Measurements to Quality of Experience. In Data Traffic Monitoring and Analysis, LNCS 7754, pages 266--303. Springer Verlag, Berlin Heidelberg, Germany, 2013.
- <http://www.e-biersack.eu/BPublished/YoutubeIncs.pdf>
- [http://peering.google.com/about/delivery\\_ecosystem.html](http://peering.google.com/about/delivery_ecosystem.html)

# Case Study: YouTube, Delivery Ecosystem

- Google's network infrastructure has four distinct elements:
  - Data centers
  - Backbone
  - Edge Points of Presence (POPs), 70+ POPs in 33 countries
  - Google's edge caching infrastructure (Google Global Cache GGC)

Google Edge POPs

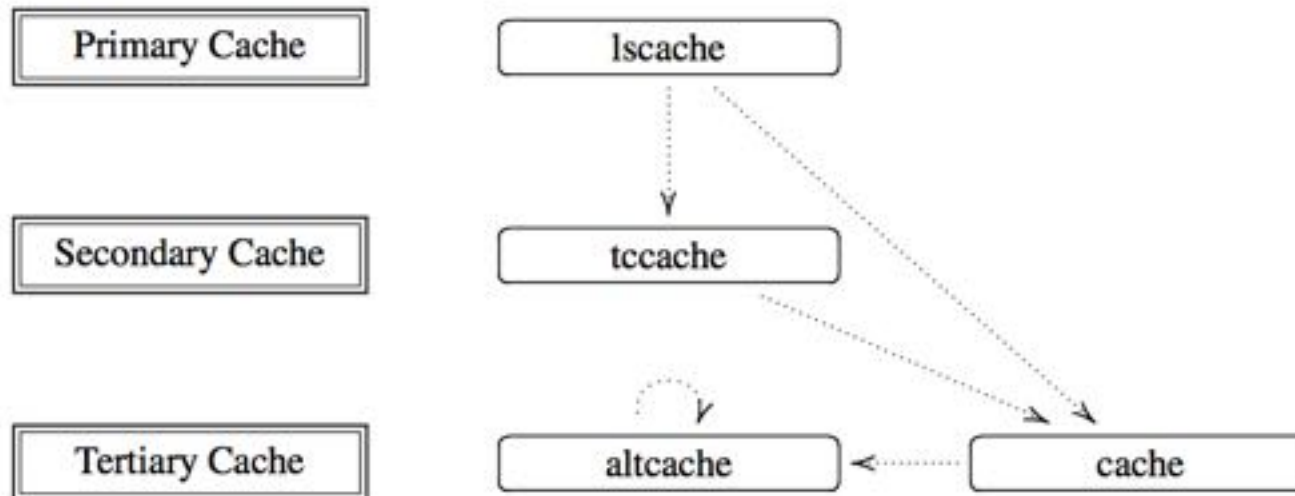

Google Data Centers

- Europe
- Hamina, Finland
- St Ghislain, Belgium
- Dublin, Ireland
- Eemshaven, Netherlands

# Case Study: YouTube, Caching

- Original content hosted within Google Data Centers
  - Replicated to multiple data centers for redundancy and efficiency
- Multi-tiered caching platform
  - Google servers within infrastructure of network operators and ISPs

**Fig. 2.** Organization of the YouTube Caches; dashed lines indicate possible redirections

# Google Data Centers
