## Abstract

The *crossing number* of a graph  $G$  is the minimum number of pairwise intersections of edges in a drawing of  $G$ . In this paper, we study the crossing numbers of  $K_m \times P_n$  and  $K_m \times C_n$ .

**Keywords:** *Crossing number; Drawing; Complete bipartite graphs; Kronecker product*

## 1 Introduction and preliminaries

Let  $G$  be a graph,  $V(G)$  the vertex set and  $E(G)$  the edge set. The crossing number of  $G$ , denoted by  $cr(G)$ , is the smallest number of pairwise crossings of edges among all drawings of  $G$  in the plane. We use  $D$  to denote a drawing of a graph  $G$  and  $\nu(D)$  the number of crossings in  $D$ . It is clear that  $cr(G) \leq \nu(D)$ .

Let  $E_1$  and  $E_2$  be two disjoint subsets of an edge set  $E$ . The number of the crossings formed by an edge in  $E_1$  and another edge in  $E_2$  is denoted by  $\nu_D(E_1, E_2)$  in a drawing  $D$ . The number of the crossings that involve a pair of edges in  $E_1$  is denoted by  $\nu_D(E_1)$ . Then  $\nu(D) = \nu_D(E)$ . By counting the numbers of crossings in  $E$ , we have

**Lemma 1.1.**  $\nu_D(E_1 \cup E_2) = \nu_D(E_1) + \nu_D(E_2) + \nu_D(E_1, E_2)$ .

The *Kronecker product*  $G \times H$  of graphs  $G$  and  $H$  has vertex set  $V(G \times H) = V(G) \times V(H)$  and edge set  $E(G \times H) = \{\{(a, x), (b, y)\} : \{a, b\} \in E(G) \text{ and } \{x, y\} \in E(H)\}$ .

(The product is also known as direct product, cardinal product, cross product and graph conjunction.)

Computing the crossing number of graphs is a complicated yet classical problem. And it is proved that the problem is NP-complete by Garey and Johnson [4].

In literature, the Cartesian product has been paid more attention[1, 8–10], while Kronecker product has fewer results on the crossing number[5].

In this paper, we study the crossing numbers of the Kronecker product  $K_m \times P_n$  and  $K_m \times C_n$ . In Section 2, we give an upper bound of  $cr(K_m \times P_n)$  for  $n \geq 4$  and  $m \geq 4$ . In Section 3, we give an upper bound of  $cr(K_m \times C_n)$  for  $n \geq 3$  and  $m \geq 4$ . In Section 4, we give lower bounds of  $cr(K_m \times P_n)$  and  $cr(K_m \times C_n)$ .

## 2 Upper bound of $cr(K_m \times P_n)$

Let

$$\begin{aligned} V(K_m \times P_n) &= \{(i, j) \mid 0 \leq i \leq m-1 \text{ and } 0 \leq j \leq n-1\}, \\ E(K_m \times P_n) &= \{((i_1, j), (i_2, j+1)) \mid 0 \leq i_1 \neq i_2 \leq m-1 \text{ and } 0 \leq j \leq n-2\}, \end{aligned}$$

where the first subscript is modulo  $m$ .

For  $0 \leq j \leq n-2$ , let

$$E^j = \{((i_1, j), (i_2, j+1)) \mid 0 \leq i_1 \neq i_2 \leq m-1\}.$$

Then

$$\bigcup_{j=0}^{n-2} E^j = E(K_m \times P_n), \quad E^{j_1} \cap E^{j_2} = \emptyset (0 \leq j_1 \neq j_2 \leq n-2).$$

In Figure 2.1, we exhibit drawings  $D_{m,4}$  of  $K_m \times P_4$  in a cylinder for  $m \leq 10$ . A cylinder can be ‘assembled’ from a polygon by identifying one pair of opposite sides of a rectangle[2].

By counting the numbers of crossings in  $D_{m,n}$ , we have

**Lemma 2.1.** *For  $n \geq 4$ ,*

$$\nu(D_{m,n}) = \begin{cases} \frac{(n-1)m(m-1)(m-2)(m-3)}{6} - \frac{m(m-3)(m^2+6m-31)}{24} & \text{for odd } m \geq 5, \\ \frac{(n-1)m(m-1)(m-2)(m-3)}{6} - \frac{m(m-4)(m^2+10m-48)}{24} & \text{for even } m \geq 4. \end{cases}$$

Figure 2.1: Drawings  $D_{m,4}$  for  $m \leq 10$

*Proof.* Since  $\nu_{D_{m,n}}(E^{j_1}, E^{j_2}) = 0$  for  $0 \leq j_1 \neq j_2 \leq n - 2$ , by Lemma 1.1, we have

$$\nu(D_{m,n}) = \sum_{j=0}^{n-2} \nu_{D_{m,n}}(E^j) = 2\nu_{D_{m,n}}(E^0) + (n-3)\nu_{D_{m,n}}(E^1). \text{ For } m \geq 4,$$

$$\nu_{D_{m,n}}(E^1) = m \sum_{j=0}^{m-3} \sum_{i=0}^j i = \frac{m(m-1)(m-2)(m-3)}{6}.$$

For odd  $m \geq 5$ ,

$$\nu_{D_{m,n}}(E^0) = \nu_{D_{m,n}}(E^1) - m \sum_{j=2}^{\frac{m-1}{2}} (\sum_{i=2}^j i - 1) = \frac{m(m-1)(m-2)(m-3)}{6} - \frac{m(m-3)(m^2+6m-31)}{48}.$$

For even  $m \geq 4$ ,

$$\nu_{D_{m,n}}(E^0) = \nu_{D_{m,n}}(E^1) - m \sum_{j=3}^{\frac{m}{2}} (\sum_{i=3}^j i - 1) = \frac{m(m-1)(m-2)(m-3)}{6} - \frac{m(m-4)(m^2+10m-48)}{48}.$$

Hence,

$$\begin{aligned} \nu(D_{m,n}) &= 2\nu_{D_{m,n}}(E^0) + (n-3)\nu_{D_{m,n}}(E^1) \\ &= \begin{cases} \frac{(n-1)m(m-1)(m-2)(m-3)}{6} - \frac{m(m-3)(m^2+6m-31)}{24} & \text{for odd } m \geq 5, \\ \frac{(n-1)m(m-1)(m-2)(m-3)}{6} - \frac{m(m-4)(m^2+10m-48)}{24} & \text{for even } m \geq 4. \end{cases} \end{aligned}$$

□

It is easy to verify that  $cr(K_m \times P_n) = 0$  for  $m = 1, 2, 3$ . (See Figure 2.1). For  $m \geq 4$ , by Lemma 2.1 we have

**Theorem 2.1.** For  $n \geq 4$ ,

$$cr(K_m \times P_n) \leq \begin{cases} \frac{(n-1)m(m-1)(m-2)(m-3)}{6} - \frac{m(m-3)(m^2+6m-31)}{24} & \text{for odd } m \geq 5, \\ \frac{(n-1)m(m-1)(m-2)(m-3)}{6} - \frac{m(m-4)(m^2+10m-48)}{24} & \text{for even } m \geq 4. \end{cases}$$

We will discuss the crossing number of  $K_m \times P_n$  for  $n = 2, 3$  in another paper.

### 3 Upper bound of $cr(K_m \times C_n)$

It is easy to verify that  $cr(K_m \times C_n) = 0$  for  $m = 1, 2$ . (See Figure 3.1). For  $m = 3$ ,  $K_3 \times C_n \cong C_3 \times C_n$ . By [5],  $cr(K_3 \times C_3) = 3$ ,  $cr(K_3 \times C_n) \leq 6n - 18$  for  $3 < n < 9$  and  $cr(K_3 \times C_n) \leq 3n$  for  $n \geq 9$ . In this paper, we only consider the case for  $m \geq 4$ .

Figure 3.1: Drawings  $D_{m,n}$  for  $(m,n) \in \{(1,3), (1,4), (2,3), (2,4)\}$

Let

$$\begin{aligned} V(K_m \times C_n) &= \{(i,j) \mid 0 \leq i \leq m-1, 0 \leq j \leq n-1\}, \\ E(K_m \times C_n) &= \{((i_1, j), (i_2, j+1)) \mid 0 \leq i_1 \neq i_2 \leq m-1, 0 \leq j \leq n-1\}, \end{aligned}$$

where the first subscript is modulo  $m$  and the second subscript is modulo  $n$ .

For  $0 \leq j \leq n-1$ , let

$$\begin{aligned} V^j &= \{(i,j) \mid 0 \leq i \leq m-1\}, \\ E^j &= \{((i_1, j), (i_2, j+1)) \mid 0 \leq i_1 \neq i_2 \leq m-1\}. \end{aligned}$$

Then

$$\bigcup_{j=0}^{n-1} E^j = E(K_m \times C_n), \quad E^{j_1} \cap E^{j_2} = \emptyset (0 \leq j_1 \neq j_2 \leq n-1).$$

In Figure 3.2, we exhibit drawings  $D_{m,n}$  of  $K_m \times C_n$  in a cylinder for  $(m,n) \in \{(4,6), (5,6), (4,7), (5,7), (6,7), (7,7)\}$ . In Figure 3.3 and 3.4, we exhibit drawings  $D_{m,3}$  for  $4 \leq m \leq 7$  and  $D_{m,5}$  for  $6 \leq m \leq 11$  respectively.

In drawings  $D_{m,n}$ , vertices  $(i_{0,0}, 0), (i_{1,0}, 1), \dots, (i_{n-1,0}, n-1)$  ( $(i_{0,m-1}, 0), (i_{1,m-1}, 1), \dots, (i_{n-1,m-1}, n-1)$ ) are placed equidistantly on the perimeter of the top (bottom) disk, vertices  $(i_{0,j}, 0), (i_{1,j}, 1), \dots, (i_{n-1,j}, n-1)$  are placed equidistantly on the cylinder from top

to down for  $j$  from 1 to  $m-2$ , edges of  $E^j$  are drawn on by shortest helical curves on the cylinder. For  $0 \leq j \leq n-1$ , let  $f^j = (f^j(0), f^j(1), \dots, f^j(m-1))$  be an arrangement of  $\{0, 1, \dots, m-1\}$  such that  $i_{j-1,t} = i_{j,f^j(t)}$  for all  $0 \leq t \leq m-1$ , where  $j$  is modulo  $m$ . In drawings  $D_{m,n}$ ,  $i_{0,t} = t$  for  $0 \leq t \leq m-1$ .

For  $m \geq 4$ , let

$$\begin{aligned} f_1(t) &= m-1-t, \quad 0 \leq t \leq m-1, \\ f_2(0) &= m-1, \\ f_2(t) &= m-1-t+(-1)^t, \quad 1 \leq t \leq m-2, \\ f_2(m-1) &= \frac{1-(-1)^m}{2}, \\ f_3(t) &= m-1-t-(-1)^t, \quad 0 \leq t \leq m-1, \end{aligned}$$

If  $m \geq 4$  and even  $n \geq 4$ ,  $f^j = f_1$  for  $0 \leq j \leq n-1$ .

If  $3 \leq \text{odd } m \leq \text{odd } n$ ,  $f^j = f_2$  for  $0 \leq j \leq m-1$ ,  $f^j = f_1$  for  $m \leq j \leq n-1$ .

If  $4 \leq \text{even } m \leq \text{odd } n-1$ ,  $f^j = f_{3-j \bmod 2}$  for  $0 \leq j \leq m-1$ ,  $f^j = f_1$  for  $m \leq j \leq n-1$ .

For integer  $l$ , let  $\text{inv}(f_l)$  be the inversion number in  $f_l$ . By counting the number of crossings in  $D_{m,n}$ , we have

**Lemma 3.1.** If  $f^j = f_l$ , then  $\nu_{D_{m,n}}(E^j) = \binom{m}{2} \binom{m}{2} - (\sum_{t=0}^{m-1} ((m-1-t)f_l(t) + t(m-1-t)) - \text{inv}(f_l))$ .

By Lemma 3.1, we can get Lemmas 3.2-3.5:

**Lemma 3.2.** If  $f^j = f_1$ , then  $\nu_{D_{m,n}}(E^j) = \frac{m(m-1)(m-2)(3m-5)}{12}$ .

*Proof.*

$$\begin{aligned}\nu_{D_{m,n}}(E^j) &= \binom{m}{2} \binom{m}{2} - (\sum_{t=0}^{m-1} ((m-1-t)(m-1-t) - t(m-1-(m-1-t))) - \binom{m}{2}) \\ &= \frac{m(m-1)(m-2)(3m-5)}{12}.\end{aligned}$$

□

**Lemma 3.3.** If  $f^j = f_2$  and  $m$  is odd, then  $\nu_{D_{m,n}}(E^j) = \frac{m(m-1)(m-2)(3m-5)}{12} + \frac{m-1}{2}$ .

*Proof.*

$$\begin{aligned}\nu_{D_{m,n}}(E^j) &= \binom{m}{2} \binom{m}{2} - ((m-1)^2 + 2 \sum_{t=1}^{\frac{m-1}{2}} ((m-1-2t)(m-2t) + 2t(2t-1)) \\ &\quad - (m-1 + 2 \sum_{t=1}^{\frac{m-3}{2}} 2t)) \\ &= \frac{m(m-1)(m-2)(3m-5)}{12} + \frac{m-1}{2}.\end{aligned}$$

□

**Lemma 3.4.** If  $f^j = f_2$  and  $m$  is even, then  $\nu_{D_{m,n}}(E^j) = \frac{m(m-1)(m-2)(3m-5)}{12} + \frac{m-2}{2}$ .

*Proof.*

$$\begin{aligned}\nu_{D_{m,n}}(E^j) &= \binom{m}{2} \binom{m}{2} - (2(m-1)^2 + 2 \sum_{t=1}^{\frac{m-2}{2}} ((m-1-2t)(m-2t) + 2t(2t-1)) \\ &\quad - (m-1 + 2 \sum_{t=1}^{\frac{m-2}{2}} (2t-1))) \\ &= \frac{m(m-1)(m-2)(3m-5)}{12} + \frac{m-2}{2}.\end{aligned}$$

□

**Lemma 3.5.** If  $f^j = f_3$  and  $m$  is even, then  $\nu_{D_{m,n}}(E^j) = \frac{m(m-1)(m-2)(3m-5)}{12} + \frac{m}{2}$ .

*Proof.*

$$\begin{aligned}\nu_{D_{m,n}}(E^j) &= \binom{m}{2} \binom{m}{2} - (2 \sum_{t=1}^{\frac{m}{2}} ((m-2t)(m-(2t-1)) + (2t-1)(2t-2)) - 2 \sum_{t=1}^{\frac{m-2}{2}} (2t)) \\ &= \frac{m(m-1)(m-2)(3m-5)}{12} + \frac{m}{2}.\end{aligned}$$

□

By Lemma 1.1 and Lemmas 3.2-3.5, we have

**Lemma 3.6.** For  $m \geq 4$  and even  $n \geq 4$ ,  $\nu(D_{m,n}) = \frac{n \cdot m(m-1)(m-2)(3m-5)}{12}$ .

**Lemma 3.7.** For  $4 \leq m \leq$  odd  $n$ ,  $\nu(D_{m,n}) = \frac{n \cdot m(m-1)(m-2)(3m-5)}{12} + \frac{m(m-1)}{2}$ .

Now we consider the case of  $m > \text{odd } n \geq 3$ . Let  $r = \lfloor \frac{m}{n} \rfloor$ ,  $s = m \bmod n$ ,  $s_0 = \frac{n-1}{2}$  and  $s_1 = \frac{s}{2}$ . Let

$$\begin{aligned} f_4(d \cdot s_0) &= m - d \cdot s_0 - 2 + \frac{1-(-1)^{s_0}}{2}, \quad 0 \leq d \leq r-1, \\ f_4(t+d \cdot s_0) &= m - d \cdot s_0 - t - 1 - (-1)^{t+s_0}, \quad n \geq 5, \quad 0 \leq t \leq s_0-1, \quad 0 \leq d \leq r-1, \\ f_4(s_0 \cdot r) &= s_0 \cdot r + s + r - 2 + \frac{1-(-1)^{s_1}}{2}, \quad s \geq 2, \\ f_4(t) &= m - t - 1 - (-1)^{t+s_1+s_0 \cdot r}, \quad s \geq 4, \quad s_0 \cdot r + 1 \leq t \leq s_0 \cdot r + s_1 - 1, \\ f_4(s_0 \cdot r + s_1 + d) &= (d+1)s_0 - 1, \quad 0 \leq d \leq r-1, \\ f_4(t) &= m - t - 1 - (-1)^{t+s_1+r+s_0 \cdot r}, \quad \text{even } s \geq 4, \quad s_0 \cdot r + s_1 + r \leq t \leq s_0 \cdot r + s + r - 2, \\ f_4(s_0 \cdot r + s + r - 1) &= s_0 \cdot r + 1 - \frac{1-(-1)^{s_1}}{2}, \quad \text{even } s \geq 2, \\ f_4(s_0 \cdot r + r) &= s_0 \cdot r + r, \quad s = 1, \\ f_4(s_0 \cdot r + s_1 + r) &= s_0 \cdot r + s_1 - 1, \quad \text{odd } s \geq 3, \\ f_4(s_0 \cdot r + s_1 + r + 1) &= s_0 \cdot r + s_1 + r, \quad \text{odd } s \geq 3, \\ f_4(t) &= m - t - 1 - (-1)^{t+s_1+r+s_0 \cdot r}, \quad \text{odd } s \geq 7, \quad s_0 \cdot r + s_1 + r + 2 \leq t \leq s_0 \cdot r + s + r - 2, \\ f_4(s_0 \cdot r + s + r - 1) &= s_0 \cdot r + s_1 + \frac{1-(-1)^{s_1}}{2}, \quad \text{odd } s \geq 5, \\ f_4(m - (d+1)s_0) &= s_0 \cdot r + s_1 + d, \quad 0 \leq d \leq r-1, \\ f_4(t) &= m - t - 1 + (-1)^{t+r+s_0+s_0 \cdot d}, \quad n \geq 5, \quad m - d \cdot s_0 - s_0 + 1 \leq t \leq m - d \cdot s_0 - 2, \quad 0 \leq d \leq r-1, \\ f_4(m - d \cdot s_0 - 1) &= d \cdot s_0 + \frac{1-(-1)^{s_0}}{2}, \quad n \geq 5, \quad 0 \leq d \leq r-1. \end{aligned}$$

If  $s$  is even,  $f^j = f_{5-j} \bmod 2$  for  $0 \leq j \leq s-1$ ,  $f^j = f_6$  for  $s \leq j \leq n-1$ .

If  $s$  is odd,  $f^j = f_4$  for  $0 \leq j \leq s-1$ ,  $f^j = f_{8-j} \bmod 2$  for  $s \leq j \leq n-1$ .

## 4 Lower bounds of $cr(K_m \times P_n)$ and $cr(K_m \times C_n)$

We shall introduce the lower bound method proposed by Leighton [7]. Let  $G_1 = (V_1, E_1)$  and  $G_2 = (V_2, E_2)$  be graphs. An embedding of  $G_1$  in  $G_2$  is a couple of mapping  $(\varphi, \kappa)$  satisfying

$$\varphi : V_1 \rightarrow V_2 \text{ is an injection}$$

$$\kappa : E_1 \rightarrow \{\text{set of all paths in } G_2\},$$

such that if  $uv \in E_1$  then  $\kappa(uv)$  is a path between  $\varphi(u)$  and  $\varphi(v)$ . For any  $e \in E_2$  define

$$cg_e(\varphi, \kappa) = |\{f \in E_1 : e \in \kappa(f)\}|$$

and

$$cg(\varphi, \kappa) = \max_{e \in E_2} \{cg_e(\varphi, \kappa)\}.$$

The value  $cg(\varphi, \kappa)$  is called congestion.

**Lemma 4.1.** [7] Let  $(\varphi, \kappa)$  be an embedding of  $G_1$  in  $G_2$  with congestion  $cg(\varphi, \kappa)$ . Let  $\Delta(G_2)$  denote the maximal degree of  $G_2$ . Then

$$cr(G_2) \geq \frac{cr(G_1)}{cg^2(\varphi, \kappa)} - \frac{|V_2|}{2} \Delta^2(G_2).$$

Let  $K_{m,n}^x$  be the complete bipartite multigraph of  $m+n$  vertices, in which every two vertices are joined by  $x$  parallel edges.

According to De Klerk [3] and Kainen [6], the following lemmas hold.

**Lemma 4.2.** [3]  $cr(K_{m,n}) \geq 0.8594 \lfloor \frac{m}{2} \rfloor \lfloor \frac{m-1}{2} \rfloor \lfloor \frac{n}{2} \rfloor \lfloor \frac{n-1}{2} \rfloor$ .

**Lemma 4.3.** [6]  $cr(K_{m,n}^x) = x^2 cr(K_{m,n})$ .

Now we are in a position to show the lower bound of  $cr(K_{m,m} - mK_2)$  and  $cr(K_{m,2m} - mK_{1,2})$ .

**Theorem 4.1.**  $cr(K_{m,m} - mK_2) \geq \frac{0.8594}{(1+\frac{3}{m-1})^2} \lfloor \frac{m}{2} \rfloor^2 \lfloor \frac{m-1}{2} \rfloor^2 - m(m-1)^2$ .

*Proof.* By Lemmas 4.1-4.3, we only need to construct an embedding  $(\varphi, \kappa)$  of  $K_{m,m}^{(m-1)(m-2)}$  into  $K_{m,m} - mK_2$  with congestion  $cg(\varphi, \kappa) = (m-2)(m+2)$ .

Let  $\alpha_i^k \beta_i^k$  be the  $k$ -th  $(m-1, 2)$ -arrangement, where  $\alpha_i^k, \beta_i^k \in \{0, 1, 2, \dots, m-1\} - \{i\}$  and  $\alpha_i^k \neq \beta_i^k$ . Let

$$\begin{aligned} V(K_{m,m}^{(m-1)(m-2)}) &= \{u_i, v_i \mid 0 \leq i \leq m-1\}, \\ E(K_{m,m}^{(m-1)(m-2)}) &= \{(u_i, v_j)^k \mid 0 \leq i, j \leq m-1, 1 \leq k \leq (m-1)(m-2)\}, \\ V(K_{m,m} - mK_2) &= \{a_i, b_i \mid 0 \leq i \leq m-1\}, \\ E(K_{m,m} - mK_2) &= \{(a_i, b_j) \mid 0 \leq i \neq j \leq m-1\}. \end{aligned}$$

Let  $\varphi(u_i) = a_i$ ,  $\varphi(v_i) = b_i$ ,  $\kappa((u_i, v_i)^k) = P_{a_i b_{\alpha_i^k} a_{\beta_i^k} b_i}$  for  $0 \leq i \leq m-1$ , and  $\kappa((u_i, v_j)^k) = (a_i, b_j)$  for  $0 \leq i \neq j \leq m-1$ . Then  $cge_e(\varphi, \kappa) = (m-2)(m+2)$  for every  $e \in E(K_{m,m}^{(m-1)(m-2)})$ . This completes the proof of Theorem 4.1.  $\square$

**Theorem 4.2.**  $cr(K_{m,2m} - mK_{1,2}) \geq \frac{0.8594}{(1+\frac{3}{m-1})^2} m(m-1) \lfloor \frac{m}{2} \rfloor \lfloor \frac{m-1}{2} \rfloor - 6m(m-1)^2$ .

*Proof.* By Lemmas 4.1-4.3, we only need to construct an embedding  $(\varphi, \kappa)$  of  $K_{m,2m}^{(m-1)(m-2)}$  into  $K_{m,2m} - mK_{1,2}$  with congestion  $cg(\varphi, \kappa) = (m-2)(m+2)$ .

Let  $\alpha_i^k \beta_i^k$  be the  $k$ -th  $(m-1, 2)$ -arrangement, where  $\alpha_i^k, \beta_i^k \in \{0, 1, 2, \dots, m-1\} - \{i\}$  and  $\alpha_i^k \neq \beta_i^k$ . Let

$$\begin{aligned} V(K_{m,2m}^{(m-1)(m-2)}) &= \{u_i, v_i, w_i \mid 0 \leq i \leq m-1\}, \\ E(K_{m,2m}^{(m-1)(m-2)}) &= \{(u_i, v_j)^k, (u_i, w_j)^k \mid 0 \leq i, j \leq m-1, 1 \leq k \leq (m-1)(m-2)\}, \\ V(K_{m,2m} - mK_{1,2}) &= \{a_i, b_i, c_i \mid 0 \leq i \leq m-1\}, \\ E(K_{m,2m} - mK_{1,2}) &= \{(a_i, b_j), (a_i, c_j) \mid 0 \leq i \neq j \leq m-1\}. \end{aligned}$$

Let  $\varphi(u_i) = a_i$ ,  $\varphi(v_i) = b_i$ ,  $\varphi(w_i) = c_i$ ,  $\kappa((u_i, v_i)^k) = P_{a_i b_{\alpha_i^k} a_{\beta_i^k} b_i}$ ,  $\kappa((u_i, w_i)^k) = P_{a_i c_{\alpha_i^k} a_{\beta_i^k} c_i}$  for  $0 \leq i \leq m-1$ , and  $\kappa((u_i, v_j)^k) = (a_i, b_j)$ ,  $\kappa((u_i, w_j)^k) = (a_i, c_j)$  for  $0 \leq i \neq j \leq m-1$ . Then  $cg_e(\varphi, \kappa) = (m-2)(m+2)$  for every  $e \in E(K_{m,2m}^{(m-1)(m-2)})$ . This completes the proof of Theorem 4.2.  $\square$

Let  $D_P$  ( $D_C$ ) be an arbitrary drawing of  $K_m \times P_n$  ( $K_m \times C_n$ ). By Lemma 1.1, we have  $\nu(D_P) \geq \sum_{j=0}^{n-2} \nu_{D_P}(E_j)$  ( $\nu(D_C) \geq \sum_{j=0}^{n-1} \nu_{D_C}(E_j)$ ). Since  $(K_m \times P_n)[E^j] \cong (K_m \times C_n)[E^j] \cong K_{m,m} - mK_2$  and  $(K_m \times P_n)[E^j \cup E^{j+1}] \cong (K_m \times C_n)[E^j \cup E^{j+1}] \cong K_{m,2m} - mK_{1,2}$ , where  $G[X]$  denotes the subgraph of  $G$  induced by  $X \subseteq E(G)$ , by Theorems 4.1 and 4.2, we have
