L_p -CONVERGENCE OF HIGHER ORDER HERMITE OR HERMITE-FEJÉR INTERPOLATION POLYNOMIALS WITH EXPONENTIAL-TYPE WEIGHTS

HEE SUN JUNG¹ AND RYOZI SAKAI²

ABSTRACT. Let $\mathbb{R} = (-\infty, \infty)$, and let $Q \in C^1(\mathbb{R}) : \mathbb{R} \to \mathbb{R}^+ = [0, \infty)$ be an even function, which is an exponent. We consider the weight $w_o(x)$ $|x|^{p}e^{-Q(x)}, \rho \geqslant 0, x \in \mathbb{R}$, and then we can construct the orthonormal polynomials $p_n(w_\rho^2; x)$ of degree n for $w_\rho^2(x)$. In this paper we obtain L_p -convergence theorems of even order Hermite-Fejér interpolation polynomials at the zeros ${x_{k,n,\rho}}_{k=1}^n$ of $p_n(w_\rho^2; x)$.

MSC; 41A05, 41A10 Keywords; higher order Hermite-Fejér interpolation polynomials

1. INTRODUCTION

Let $\mathbb{R} = (-\infty, \infty)$, and let $Q \in C^1(\mathbb{R}) : \mathbb{R} \to \mathbb{R}^+ = [0, \infty)$ be an even function. Consider the weight $w(x) = \exp(-Q(x))$ and define for $\rho > -\frac{1}{2}$,

(1.1)
$$
w_{\rho}(x) := |x|^{\rho} w(x), \quad x \in \mathbb{R}.
$$

Suppose that $\int_0^\infty x^n w_\rho^2(x)dx < \infty$ for all $n = 0, 1, 2, \ldots$ Then, we can construct the orthonormal polynomials $p_{n,\rho}(x) = p_n(w_\rho^2; x)$ of degree n for $w_\rho^2(x)$, that is,

$$
\int_{-\infty}^{\infty} p_{n,\rho}(x) p_{m,\rho}(x) w_{\rho}^{2}(x) dx = \delta_{mn}(\text{Kronecker's delta}).
$$

Denote

$$
p_{n,\rho}(x) = \gamma_n x^n + \dots, \gamma_n = \gamma_{n,\rho} > 0,
$$

and the zeros of $p_{n,\rho}(x)$ by

$$
-\infty < x_{n,n,\rho} < x_{n-1,n,\rho} < \ldots < x_{2,n,\rho} < x_{1,n,\rho} < \infty.
$$

Let \mathcal{P}_n denote the class of polynomials with degree at most n. For $f \in C(\mathbb{R})$ we define the higher order Hermite-Fejer interpolation polynomial $L_n(\nu, f; x)$ based at the zeros $\{x_{k,n,\rho}\}_{k=1}^n$ as follows:

$$
L_n^{(i)}(\nu, f; x_{k,n,\rho}) = \delta_{0,i} f(x_{k,n,\rho}) \text{ for } k = 1, 2, \dots, n \text{ and } i = 0, 1, \dots, \nu - 1.
$$

 $L_n(1, f; x)$ is the Lagrange interpolation polynomial, $L_n(2, f; x)$ is the ordinary Hermite-Fejér interpolation polynomial, and $L_n(4, f; x)$ is the Krilov-Stayermann

Date: August 21, 2018.

polynomial. The fundamental polynomials $h_{k,n,\rho}(\nu; x) \in \mathcal{P}_{\nu^2-1}$ for the higher order Hermite-Fejér interpolation polynomial $L_n(\nu, f; x)$ are defined as follows:

i ,

(1.2)
\n
$$
h_{k,n,\rho}(\nu;x) = l_{k,n,\rho}^{\nu}(x) \sum_{i=0}^{\nu-1} e_i(\nu,k,n)(x - x_{k,n,\rho})
$$
\n
$$
l_{k,n,\rho}(x) = \frac{p_n(w_{\rho};x)}{(x - x_{k,n,\rho})p'_n(w_{\rho};x_{k,n,\rho})},
$$
\n
$$
h_{k,n,\rho}(\nu;x_{p,n,\rho}) = \delta_{k,p}, \quad h_{k,n,\rho}^{(i)}(\nu;x_{p,n,\rho}) = 0,
$$
\n
$$
k, p = 1, 2, \dots, n, i = 1, 2, \dots, \nu - 1.
$$

Using them, we can write $L_n(\nu, f; x)$ as follows:

$$
L_n(\nu, f; x) = \sum_{k=1}^n f(x_{k,n,\rho}) h_{k,n,\rho}(\nu; x).
$$

Furthermore, we extend the operator $L_n(\nu, f; x)$. Let l be a non-negative integer, and let $l \leq \nu - 1$. For $f \in C^l(\mathbb{R})$ we define the (l, ν) -order Hermite-Fejér interpolation polynomials $L_n(l, \nu, f; x) \in \mathcal{P}_{\nu n-1}$ as follows: For each $k = 1, 2, ..., n$,

$$
L_n(l, \nu, f; x_{k,n,\rho}) = f(x_{k,n,\rho}),
$$

\n
$$
L_n^{(j)}(l, \nu, f; x_{k,n,\rho}) = f^{(j)}(x_{k,n,\rho}), \quad j = 1, 2, ..., l,
$$

\n
$$
L_n^{(j)}(l, \nu, f; x_{k,n,\rho}) = 0, \quad j = l+1, l+2, ..., \nu-1.
$$

Especially, $L_n(0, \nu, f; x)$ is equal to $L_n(\nu, f; x)$, and for each $P \in \mathcal{P}_{\nu n-1}$ we see $L_n(\nu-1,\nu,P;x) = P(x)$. The fundamental polynomials $h_{s,k,n,\rho}(l,\nu;x) \in \mathcal{P}_{\nu n-1}, k =$ $1, 2, \ldots, n$, of $L_n(l, \nu, f; x)$ are defined by

(1.3)
$$
h_{s,k,n,\rho}(l,\nu;x) = l_{k,n,\rho}^{\nu}(x) \sum_{i=s}^{\nu-1} e_{s,i}(\nu,k,n)(x-x_{k,n,\rho})^i,
$$

$$
h_{s,k,n,\rho}^{(j)}(l,\nu;x_{p,n,\rho}) = \delta_{s,j}\delta_{k,p}, j,s = 0,1,\ldots,\nu-1, p = 1,2,\ldots,n.
$$

Then we have

$$
L_n(l, \nu, f; x) = \sum_{k=1}^n \sum_{s=0}^l f^{(s)}(x_{k,n,\rho}) h_{s,k,n,\rho}(l, \nu; x).
$$

For the ordinary Hermite and Hermite-Fejér interpolation polynomial $L_n(1, 2, f; x)$, $L_n(2, f; x)$ and the related approximation process, Lubinsky [15] gave some interesting convergence theorems.

In [7] we obtained uniform convergence theorems with respect to the interpolation polynomials $L_n(\nu, f; x)$ and $L_n(l, \nu, f; x)$ with even integer ν . In this paper we will give the L_p -convergence theorems of $L_n(\nu, f; x)$ and $L_n(l, \nu, f; x)$ with even order ν . If we consider the higher order Hermite-Fejer interpolation polynomial $L_n(\nu, f; x)$ on a finite interval, then we can see a remarkable difference between the cases of an odd number ν and of an even number ν , for example, as between the Lagrange interpolation polynomial $L_n(1, f; x)$ and the Hermite-Fejer interpolation polynomial $L_n(2, f; x)$ ([17]-[22]). We can also see a similar phenomenon in the cases of the infinite intervals ([7]-[14]). In this paper, we consider the even case in L_p -norm. We will discuss the odd case in L_p -norm elsewhere.

Here, we give the class of weights which is treated in this paper. We say that $f : \mathbb{R} \to \mathbb{R}^+$ is quasi-increasing if there exists $C > 0$ such that $f(x) \leq C f(y)$, $0 <$ $x < y$. In the following, we introduce the class of weights defined in [16].

Definition 1.1 (see [16]). Let $Q : \mathbb{R} \to \mathbb{R}^+$ be a continuous even function satisfying the following properties:

(a) $Q'(x)$ is continuous in $\mathbb R$ and $Q(0) = 0$.

- (b) $Q''(x)$ exists and is positive in $\mathbb{R} \setminus \{0\}.$
- (c) $\lim_{x\to\infty} Q(x) = \infty$.
- (d) The function

$$
T(x) := \frac{xQ'(x)}{Q(x)}, \quad x \neq 0
$$

is quasi-increasing in $(0, \infty)$, with

$$
T(x) \geqslant \Lambda > 1, \quad x \in \mathbb{R}^+ \setminus \{0\}.
$$

(e) There exists $C_1 > 0$ such that

$$
\frac{Q''(x)}{|Q'(x)|} \le C_1 \frac{|Q'(x)|}{Q(x)}, \quad a.e. \quad x \in \mathbb{R} \setminus \{0\}.
$$

Then we say that $w = \exp(-Q)$ is in the class $\mathcal{F}(C^2)$. Besides, if there exists a compact subinterval $J(⇒ 0)$ of $\mathbb R$ and $C_2 > 0$ such that

$$
\frac{Q''(x)}{|Q'(x)|} \geqslant C_2 \frac{|Q'(x)|}{Q(x)}, \quad a.e. \quad x \in \mathbb{R} \setminus J,
$$

then we say that $w = \exp(-Q)$ is in the class $\mathcal{F}(C^2+)$. If $T(x)$ is bounded, then w is called a Freud-type weight, and if $T(x)$ is unbounded, then w is Erdös-type weight.

Some typical examples in $\mathcal{F}(C^2+)$ are given as follows:

Example 1.2 (see [16]). (1) For $\alpha > 1$ and a non-negative integer ℓ , we put

$$
Q(x) = Q_{\ell,\alpha}(x) := \exp_{\ell}(|x|^{\alpha}) - \exp_{\ell}(0),
$$

where for $\ell \geqslant 1$,

$$
\exp_{\ell}(x) := \exp(\exp(\exp(\cdots \exp x) \dots)) \quad (\ell\text{-times})
$$

and $\exp_0(x) := x$.

(2) For $m \geq 0$, $\alpha \geq 0$ with $\alpha + m > 1$, we put

(1.4)
$$
Q(x) = Q_{\ell,\alpha,m}(x) := |x|^m \{ \exp_{\ell}(|x|^{\alpha}) - \alpha^* \exp_{\ell}(0) \},
$$

where for $\ell > 0$ we suppose $\alpha^* = 0$ if $\alpha = 0$; $\alpha^* = 1$ otherwise. For $\ell = 0$ we suppose $m > 1$ and $\alpha = 0$. Note that $Q_{\ell,0,m}$ is a Freud-type weight. (3) For $\alpha > 1$, we put

$$
Q(x) = Q_{\alpha}(x) := (1 + |x|)^{|x|^{\alpha}} - 1.
$$

To consider the higher order Hermite-Fejér interpolation polynomial we define a class of further strengthened weights for $\nu \geq 2$ than Definition [1.1](#page-1-0) as follows:

Definition 1.3 (cf.[7]). Let $w(x) = \exp(-Q(x)) \in \mathcal{F}(C^2+)$, and let $\nu \geq 2$ be an integer. Assume that $Q(x)$ is a v-times continuously differentiable function on $\mathbb R$ and satisfies the following:

(a) $Q^{(\nu+1)}(x)$ exists and $Q^{(i)}(x), 0 \le i \le \nu+1$, are positive for $x > 0$.

(b) There exist constants $C_i > 0$ such that

$$
\left|Q^{(i+1)}(x)\right| \leq C_i \left|Q^{(i)}(x)\right| \frac{|Q'(x)|}{Q(x)}, \quad x \in \mathbb{R} \setminus \{0\}, \quad i = 1, 2, \dots \nu.
$$

(c) There exist $0 \le \delta < 1$ and $c_1 > 0$ such that

(1.5)
$$
Q^{(\nu+1)}(x) \le C\left(\frac{1}{x}\right)^{\delta}, \quad x \in (0, c_1].
$$

Then we say that $w(x) = \exp(-Q(x))$ is in the class $\mathcal{F}_{\nu}(C^2+)$. (d) Suppose one of the following:

- (d-1) $Q'(x)/Q(x)$ is quasi-increasing on a certain positive interval $[c_2,\infty)$.
- (d-2) $Q^{(\nu+1)}(x)$ is non-decreasing on a certain positive interval $[c_2,\infty)$.
- (d-3) There exist constants $C > 0$ and $0 \le \delta < 1$ such that $Q^{(\nu+1)}(x) \le C(1/x)^{\delta}$ on $(0, \infty)$.

Then we write $w(x) = \exp(-Q(x)) \in \tilde{\mathcal{F}}_{\nu}(C^2+)$.

In this paper we treat the weight $w_{\rho}(x) = |x|^{\rho} \exp(-Q(x)), \ \rho \geq 0$ of type [\(1.1\)](#page-0-0). For $w_{\rho}(x) = |x|^{\rho} \exp(-Q(x)), w(x) = \exp(-Q(x)) \in \tilde{\mathcal{F}}_{\nu}(C^2)$, we write $w_{\rho} \in \tilde{\mathcal{F}}_{\nu,\rho}(C^2+)$.

In the following, we give specific examples of $w \in \tilde{\mathcal{F}}_{\nu}(C^2+)$.

Example 1.4 (cf.[6, Theorem 3.1]). Let ν be a positive integer, and let $Q_{\ell,\alpha,m}$ be defined in [\(1.4\)](#page-2-0).

(1) Let m and α be non-negative even integers with $m + \alpha > 1$. Then $w(x) =$ $\exp(-Q_{\ell,\alpha,m}) \in \mathcal{F}_{\nu}(C^2+)$, and one has the following.

(a) If $\ell > 0$, then we see that $Q'_{\ell,\alpha,m}(x)/Q_{\ell,\alpha,m}(x)$ is quasi-increasing on a certain positive interval (c_1, ∞) , and $Q_{\ell,0,m}(x)$ is non-decreasing on $(0, \infty)$.

(b) If $\ell = 0$, then we see that $Q_{0,0,m}(x), m \geq 2$, is non-decreasing on $(0,\infty)$. Hence $w(x) = \exp(-Q_{\ell,\alpha,m}) \in \tilde{\mathcal{F}}_{\nu}(C^2+)$.

(2) Let $m + \alpha - \nu > 0$. Then $w(x) = \exp(-Q_{\ell,\alpha,m}) \in \mathcal{F}_{\nu}(C^2+)$, and one has the following.

(c) If $\ell \geq 2$ and $\alpha > 0$, then there exists a constant $c_1 > 0$ such that $Q'_{\ell,\alpha,m}(x)/Q_{\ell,\alpha,m}(x)$ is quasi-increasing on (c_1, ∞) .

(d) Let $\ell = 1$. If $\alpha \geq 1$, then there exists a constant $c_2 > 0$ such that $Q'_{1,\alpha,m}(x)/Q_{1,\alpha,m}(x)$ is quasi-increasing on (c_2,∞) , and if $0<\alpha<1$, then $Q'_{1,\alpha,m}(x)/Q_{1,\alpha,m}(x)$ is quasi-decreasing on (c_2, ∞) .

(e) Let $\ell = 1$, and $0 < \alpha < 1$, then $Q_{1,\alpha,m}^{(\nu+1)}(x)$ is non-decreasing on a certain positive interval on (c_2, ∞) . Hence $w(x) = \exp(-Q_{\ell,\alpha,m}) \in \tilde{\mathcal{F}}_{\nu}(C^2+)$.

Example 1.5 ([6, Theorem 3.5]). Let ν be a positive integer and $\alpha > \nu$. Then $w(x) = \exp(-Q_{\alpha}(x))$ belongs to $\mathcal{F}_{\nu}(C^2+)$. Moreover, there exists a positive constant $c_2 > 0$ such that $Q'_{\alpha}(x)/Q_{\alpha}(x)$ is quasi-increasing on (c_2, ∞) . Hence $w(x) = \exp(-Q_{\alpha}) \in \tilde{\mathcal{F}}_{\nu}(C^2+)$.

In Section 2, we report the L_p -convergence theorems. We write some lemmas to prove the theorems and then we prove them in Section 3.

In what follows we abbreviate several notations as $x_{k,n} := x_{k,n,\rho}, h_{kn}(x) :=$ $h_{k,n,\rho}(\nu,x),\ l_{kn}(x) := l_{k,n,\rho}(x),\ h_{skn}(x) := h_{s,k,n,\rho}(\nu,x)$ and $p_n(x) := p_{n,\rho}(x)$ if there is no confusion. For arbitrary nonzero real valued functions $f(x)$ and $g(x)$, we write $f(x) \sim g(x)$ if there exist constants $C_1, C_2 > 0$ independent of x such that $C_1g(x) \leq f(x) \leq C_2g(x)$ for all x. For arbitrary positive sequences $\{c_n\}_{n=1}^{\infty}$ and ${d_n}_{\equiv 1}^{\infty}$ we define $c_n \sim d_n$ similarly.

2. Theorems

We use the following notations.

(1) Mhaskar-Rakhmanov-Saff numbers a_x :

$$
x = \frac{2}{\pi} \int_0^1 \frac{a_x u Q'(a_x u)}{(1 - u^2)^{1/2}} du, \quad x > 0.
$$

(2)

(2.1)
$$
\varphi_u(x) = \begin{cases} \frac{|x|}{u} \frac{1 - \frac{|x|}{a_{2u}}}{\sqrt{1 - \frac{|x|}{a_u} + \delta_u}}, & |x| \le a_u; \\ \varphi_u(a_u), & a_u < |x|, \end{cases}
$$

where

$$
\delta_u = (uT(a_u))^{-2/3}, \quad u > 0.
$$

In the rest of this paper, we assume the following:

Assumption 2.1. Let the weight $w_{\rho} \in \tilde{\mathcal{F}}_{\nu,\rho}(C^2+)$, $\rho \geq 0$. (a) If $T(x)$ is bounded, then we suppose that for some $C > 0$

$$
Q(x) \geqslant C|x|^2
$$

,

and for δ in [\(1.5\)](#page-3-0),

$$
(2.2) \t\t\t a_n \le Cn^{1/(1+\nu-\delta)}.
$$

(b) There exist $0 \leq \gamma < 1$ and $C(\gamma) > 0$ such that

(2.3)
$$
T(a_n) \le C(\gamma)n^{\gamma},
$$

here, if $T(x)$ is bounded, that is, the weight w is a Freud weight, then we set $\gamma = 0$. We put

(2.4)
$$
\varepsilon_n := \begin{cases} \frac{a_n}{n}, & \frac{T(a_n)}{a_n} < 1; \\ \frac{1}{n^{1-\gamma}}, & \frac{T(a_n)}{a_n} \ge 1. \end{cases}
$$

Lemma 2.2 ([4, Theorem 1.4]). (1) Let $w = \exp(-Q) \in \mathcal{F}(C^2)$, and let $T(x)$ be unbounded. Then, for any $\eta > 0$ there exists $C(\eta) > 0$ such that for $t \geq 1$,

$$
(2.5) \t\t a_t \le C(\eta)t^{\eta}.
$$

(2) Let $\lambda := C_1$ be the constant in Definition [1.1](#page-1-0) (e), that is,

$$
\frac{Q''(x)}{Q'(x)} \le \lambda \frac{Q'(x)}{Q(x)}, \quad a.e. \quad x \in \mathbb{R} \setminus \{0\}.
$$

If $1 < \lambda$, and if η is defined in [\(2.5\)](#page-4-0), then there exists $C(\lambda, \eta)$ such that

$$
T(a_t) \le C(\lambda, \eta) t^{\frac{2(\eta + \lambda - 1)}{\lambda + 1}},
$$

and if $\lambda \leq 1 + \eta$, then there exists $C(\lambda, \eta)$ such that

(2.6)
$$
T(a_t) \le C(\lambda, \eta) t^{4\eta}, \quad t \ge 1.
$$

Remark 2.3. (1) If $T(x)$ is unbounded, then for any $L > 0$ we have $Q(x) \geq$ $C|x|^L([24, \text{Lemma } 3.2])$ and (2.2) holds $([4, \text{ Theorem } 1.4]).$

(2) [\(2.3\)](#page-4-2) holds for

$$
\gamma = \frac{2(\eta + \lambda - 1)}{\lambda + 1}, \quad 0 < \lambda < 3.
$$

(3) Let us denote the MRS-number a_n and the function $T(x)$ for $Q_{r,\alpha,m}$ by $a_{n,r,\alpha,m}$ and $T_{r,\alpha,m}$ respectively. Then $T_{r,\alpha,m}(a_{n,r,\alpha,m})$ satisfies [\(2.3\)](#page-4-2). In fact, we obtain from $[23,$ Proposition 4] and $[16,$ Example 2 and (1.34)],

$$
a_{n,r,\alpha,m} \sim (1 + \log_r^+ n)^{1/\alpha},
$$

where

$$
\log_r^+(x) = \begin{cases} \log(\log(\log(\dots \log x))) & \text{times}), \quad \text{if } x > \exp_r(0), \\ 0, & \text{otherwise} \end{cases}
$$

and for every $0 < \gamma < 1$,

$$
T_{r,\alpha,m}(a_{n,r,\alpha,m}) \sim (1 + \log_r^+ n)(1 + \log_{r-1}^+ n)(1 + \log_r^+ n) < n^\gamma
$$

by

$$
T_{r,\alpha,m}(a_{n,r,\alpha,m}) = m + T_{r,\alpha,0}(a_{n,r,\alpha,m}).
$$

(4) If the weight $w = \exp(-Q) \in \mathcal{F}(C^2+)$ satisfies

$$
\mu = \lim_{x \to \infty} \inf_{Q(x) \to Q'(x)} \frac{Q(x)Q''(x)}{(Q'(x))^2} = \lim_{x \to \infty} \frac{Q(x)Q''(x)}{(Q'(x))^2},
$$

then we say that the weight w is regular. For the regular weight w we have

$$
\mu = \lim_{x \to \infty} \frac{Q(x)Q''(x)}{(Q'(x))^2} = 1,
$$

therefore, we obtain [\(2.6\)](#page-4-3) for any fixed $\eta > 0$ (see [24, Corollary 5.5]). We note that all of examples in Example [1.4](#page-3-1) are regular. (5) [\(2.5\)](#page-4-0) means

$$
0 < C \le \frac{n}{a_n} \left(\frac{T(a_n)}{a_n}\right)^{\nu - 1}
$$

.

i .

Let

$$
X_n(\nu, f; x) := \sum_{k=1}^n f(x_{k,n}) l_{kn}^{\nu}(x) \sum_{i=0}^{\nu-2} e_i(\nu, k, n) (x - x_{k,n})^i,
$$

\n
$$
Y_n(\nu, f; x) := \sum_{k=1}^n f(x_{k,n}) l_{kn}^{\nu}(x) e_{\nu-1}(\nu, k, n) (x - x_{k,n})^{\nu-1},
$$

\n
$$
Z_n(l, \nu, f; x) := \sum_{k=1}^n \sum_{s=1}^l f^{(s)}(x_{k,n}) l_{kn}^{\nu}(x) \sum_{i=s}^{\nu-1} e_{si}(\nu, k, n) (x - x_{k,n})
$$

Then we know

$$
L_n(\nu, f; x) = X_n(\nu, f; x) + Y_n(\nu, f; x),
$$

and

$$
L_n(l, \nu, f; x) = L_n(\nu, f; x) + Z_n(l, \nu, f; x).
$$

Let

(2.7)
$$
\Phi(x) := \frac{1}{(1 + Q(x))^{2/3}T(x)}.
$$

$$
\Phi(x) \sim \frac{Q(x)^{\frac{1}{3}}}{xQ'(x)}.
$$

Moreover, if we define

(2.8)
$$
\Phi_n(x) := \max\left\{\delta_n, 1 - \frac{|x|}{a_n}\right\}, \quad n = 1, 2, 3, \dots,
$$

then we have the following:

Lemma 2.4 ([7, Lemma 3.4]). For $x \in \mathbb{R}$ we have

$$
\Phi(x) \le C\Phi_n(x), n \ge 1.
$$

We have a chain of results as follows. In this section, we let $w_{\rho} \in \tilde{\mathcal{F}}_{\nu,\rho}(C^2+)$, $\rho \geq 0$, and we suppose Assumption [2.1.](#page-4-4) In addition, we let $\alpha > 0, \Delta > -1$, $1 < p < \infty$. Let C_f be a positive constant depending only on f, and let $C > 0$ be a constant.

Proposition 2.5. Let $\nu = 2, 3, 4, \dots$, and let

(2.9)
$$
\Delta \geqslant \frac{1}{p} - \min\left\{1, \alpha\right\}.
$$

For $f \in C(\mathbb{R})$ satisfying

(2.10)
$$
|f(x)|(1+|x|)^{\alpha} \left\{ \Phi^{-\frac{3}{4}}(x)w_{\rho}(x) \right\}^{\nu} \leq C_f, \quad x \in \mathbb{R},
$$

we have

$$
(2.11) \qquad \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_n(\nu, f; x) \right\|_{L_p(\mathbb{R})} \leq C C_f.
$$

Proposition 2.6. Let $\nu = 2, 4, 6, ...$ and assume that [\(2.9\)](#page-6-0) holds. For $f \in C(\mathbb{R})$ satisfying

$$
(2.12) \quad |f(x)|(1+|x|)^{\alpha} \left\{ \Phi^{-\frac{3}{4}}(x)w_{\rho}(x) \right\}^{\nu} \left(|Q'(x)| + \frac{1}{|x|} \right) \le C_f, \quad x \in \mathbb{R} \setminus \{0\}
$$

we have

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}Y_n(\nu,f;x)\right\|_{L_p(\mathbb{R})}\leq CC_f\varepsilon_n(a_n+\log n),
$$

where ε_n is defined by [\(2.4\)](#page-4-5).

Proposition 2.7. Let $\nu = 2, 3, 4, ...$ and assume that [\(2.9\)](#page-6-0) holds. For $f \in C^l(\mathbb{R})$, $0 \leq l \leq \nu - 1$ satisfying

$$
(2.13) \t |f^{(s)}(x)|(1+|x|)^{\alpha} \left\{ \Phi^{-\frac{3}{4}}(x)w_{\rho}(x) \right\}^{\nu} \le C_f, \quad x \in \mathbb{R}, \ s = 1, 2, ..., l,
$$

we have

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} Z_n(l, \nu, f; x) \right\|_{L_p(\mathbb{R})}
$$

$$
\leq C_f \frac{a_n^2 \log n}{n} \begin{cases} 1, & \Delta p < 1; \\ \frac{\log a_n}{a_n}, & \Delta p = 1; \\ \frac{1}{a_n}, & \Delta p > 1. \end{cases}
$$

Proposition 2.8. Let $\nu = 2, 3, 4, ...$ and assume that [\(2.9\)](#page-6-0) holds. Let $P \in \mathcal{P}_{\nu n-1}$ be fixed. Then, we have

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}\left(L_n(\nu,P;x)-P(x)\right)\right\|_{L_p(\mathbb{R})}\to 0 \quad as \quad n\to\infty.
$$

Proposition 2.9. Let $\nu = 2, 4, 6, ...$ and assume that [\(2.9\)](#page-6-0) holds. Let $P \in \mathcal{P}_{\nu n-1}$ be fixed. Then, we have

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}\left(X_n(\nu,P;x)-P(x)\right)\right\|_{L_p(\mathbb{R})}\to 0 \quad as \quad n\to\infty.
$$

Remark 2.10. Let $f \in C(\mathbb{R})$ satisfy that for given $0 < \eta < 1$ and $\alpha \geq 0$, (2.14)

$$
|f(x)|(1+|x|)^\alpha w^{\nu-\eta}(x)\left\{|Q'(x)|+\frac{1}{|x|}\right\} \le C_f, \quad x \in \mathbb{R} \quad \text{and} \quad \lim_{x \to 0} \frac{f(x)}{x} \le C_f,
$$

where C_f is a constant depending only on f. Then,

(1) [\(2.10\)](#page-6-1) and [\(2.12\)](#page-6-2) hold.

(2) Let $f \in C^l(\mathbb{R})$ for a certain $0 \leq l \leq \nu - 1$. Then [\(2.13\)](#page-6-3) holds.

(3) Let (2.14) be satisfied, then we see $f(0) = 0$.

Theorem 2.11. Let $\nu = 2, 4, 6, ...$ and assume that [\(2.9\)](#page-6-0) holds. For $f(x)$ satisfying (2.14) we have

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}\left(L_n(\nu,f;x)-f(x)\right)\right\|_{L_p(\mathbb{R})}\to 0 \quad as \quad n\to\infty.
$$

Theorem 2.12. Let $\nu = 2, 4, 6, ...$ and assume that [\(2.9\)](#page-6-0) holds. For $f(x)$ satisfying (2.14) and (2.13) , we have

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}\left(L_n(l,\nu,f;x)-f(x)\right)\right\|_{L_p(\mathbb{R})}\to 0 \quad as \quad n\to\infty.
$$

Remark 2.13. From the formulas (2.2) , (2.4) and (2.5) , we have

$$
\varepsilon_n(a_n + \log n) \to 0
$$
 as $n \to \infty$,

and

$$
\frac{a_n^2 \log n}{n} \begin{cases} 1, & \Delta p < 1; \\ \frac{\log a_n}{a_n}, & \Delta p = 1; \to 0 \quad \text{as} \quad n \to \infty. \\ \frac{1}{a_n}, & \Delta p > 1 \end{cases}
$$

3. Lemmas and Proof of Theorems

For the coefficients $e_{si}(\nu, k, n)(e_i(\nu, k, n)) := e_{0i}(\nu, k, n)$ in [\(1.2\)](#page-1-1) or [\(1.3\)](#page-1-2) we have the following estimates.

Lemma 3.1 ([3, Theorem 2.6]). Let $w(x) = \exp(-Q(x)) \in \mathcal{F}(C^2+)$. We have the following. For each $s = 0, 1, ..., \nu - 1$ and $i = s, s + 1, ..., \nu - 1$,

$$
e_0(\nu, k, n) = 1
$$
, $|e_{si}(\nu, k, n)| \le C \left\{ \frac{n}{(a_{2n}^2 - x_{k,n}^2)^{1/2}} \right\}^{i-s}$.

Lemma 3.2 ([5, Theorem 4.4 and Lemma 3.7 (3.20)]). Let $w_{\rho} \in \tilde{\mathcal{F}}_{\nu,\rho}(C^2+)$. If $x_{kn} \neq 0$ and $|x_{k,n}| \leq a_n(1+\delta_n)$, then $e_0(\nu, k, n) = 1$ and for $i = 1, 2, ..., \nu - 1$,

$$
|e_i(\nu,k,n)| \leq C \left\{ \frac{T(a_n)}{a_n} + |Q'(x_{k,n})| + \frac{1}{x_{k,n}} \right\}^{\langle i \rangle} \left\{ \frac{n}{a_{2n} - |x_{k,n}|} + \frac{T(a_n)}{a_n} \right\}^{\langle -\langle i \rangle},
$$

where

$$
\langle i \rangle = \begin{cases} 1, & if i is odd, \\ 0, & if i is even. \end{cases}
$$

For $x_{kn} = 0$, we see $e_0(\nu, k, n) = 1$ and

$$
|e_i(\nu,k,n)| \le C\left(\frac{n}{a_n}\right)^i \quad i=1,2,\ldots,\nu-1.
$$

We have the following.

Lemma 3.3 ([1, Theorem 2.4]). Let $w_{\rho} \in \tilde{\mathcal{F}}_{\nu,\rho}(C^2+)$ ($\rho \geq 0$), $0 < p \leq \infty$, and $\beta \in \mathbb{R}$. Then given $r > 1$, there exist $C, n_0, \alpha > 0$ such that for $n \geq n_0$ and $P \in \mathcal{P}_n$,

$$
\left\|(Pw)(x)|x|^\beta\right\|_{L_p(a_{rn}\leq|x|)}\leq \exp(-Cn^\alpha)\left\|(Pw)(x)|x|^\beta\right\|_{L_p(L\frac{a_n}{n}\leq|x|\leq a_n(1-L\eta_n))}.
$$

Lemma 3.4. (1) Let $P \in \mathcal{P}_{\nu n-1}$. Then, we have

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} P(x) \right\|_{L_p(a_{2n} \leq |x|)}
$$

$$
\leq C e^{-C_1 n^{\eta}} \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} P(x) \right\|_{L_p(|x| \leq a_{2n})}.
$$

So, if

$$
\|(1+|x|)^{-\Delta} \left\{\Phi^{\frac{3}{4}}(x)w(x)(|x|+1)^{\rho}\right\}^{\nu} P(x)\Big\|_{L_p(\mathbb{R})} < \infty,
$$

then we have

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}P(x)\right\|_{L_p(a_{2n}\leq|x|)}\to 0 \quad as \quad n\to\infty.
$$

Proof. (1) Now, we denote the Mhaskar-Rakhmanov-Saff numbers for the exponents $Q(x)$ and $\nu Q(x)$ by $a_n(Q)$ and $a_n(\nu Q)$ respectively. Then, we have $a_n(Q)$ = $a_{\nu n}(\nu Q)$. From [\(2.7\)](#page-5-0) we note that $(1+|x|)^{\Delta} \Phi(x)^{-3\nu/4}$ is quasi-increasing. Then

applying Lemma [3.3](#page-8-0) with $w_{\nu\rho}^{\nu}(x) = \exp(-\nu Q(x))|x|^{\nu\rho}$, we have

$$
\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} P(x) \Big\|_{L_p(a_{2n}(Q) \leq |x|)}
$$
\n
$$
\leq C \left\| w^{\nu}(x) \left(|x| + \frac{a_n}{n} \right)^{\nu \rho} P(x) \right\|_{L_p(a_{2\nu n}(\nu Q) \leq |x|)}
$$
\n
$$
\leq C e^{-C(\nu n)^{\eta}} \left\| w^{\nu}(x) \left(|x| + \frac{a_n}{n} \right)^{\nu \rho} P(x) \right\|_{L_p(|x| \leq a_{2\nu n}(\nu Q))}
$$
\n
$$
\leq C \frac{e^{-C\nu^{\eta} n^{\eta}}}{(1 + a_{2n}(Q))^{-\Delta} \Phi(a_{2n}(Q))^{3\nu/4}}
$$
\n
$$
\times \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) (w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} P(x) \right\|_{L_p(|x| \leq a_{2n}(Q))}
$$
\n
$$
\leq C e^{-C_1 n^{\eta}} \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} P(x) \right\|_{L_p(|x| \leq a_{2n}(Q))}
$$
\n
$$
\to 0 \text{ as } n \to \infty,
$$

because that $(1 + a_{2n}(Q))^{\Delta} \Phi(a_{2n}(Q))^{-3\nu/4}$ has order n^s for some $s > 0$.

In the rest of this section we let $w_{\rho} \in \tilde{\mathcal{F}}_{\nu,\rho}(C^2+)$, $\rho \geqslant 0$, and we suppose Assumption [2.1.](#page-4-4) In addition, we let $\alpha > 0, \Delta > -1, 1 < p < \infty$, and C_f be a positive constant depending only on f .

To simplify the proofs of theorems we use the results of [7]. In what follows we use the following notation. Let $x_{0,n} := x_{1,n} + \varphi_n(x_{1,n})$, and $x_{n+1,n} = -x_{0,n}$. When $|x| \leq x_{0,n}$, we define

(3.1)
$$
x_{m,n} := x_{m(x),n}; \quad |x - x_{m,n}| = \min_{0 \le j \le n} |x - x_{j,n}|.
$$

If $|x - x_{j+1,n}| = |x - x_{j,n}|$, then we set $x_{m,n} := x_{j,n}$. If $x_{0,n} < x$, then we put $m = 0$. And if $x < x_{n+1,n}$, then we put $m = n+1$. Here, we note that there exists a constant $\delta > 0$ such that $|x - x_{m,n}| \leq \delta \varphi_n(x_{m,n}).$

Lemma 3.5 (cf.[7]). Let $m := m(x)$ be defined by [\(3.1\)](#page-9-0). (1) If (2.10) holds, then, we have (3.2)

$$
\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}|X_n(\nu,f;x)| \leq C_f \sum_{j=0}^n (1+|x_{j,n}|)^{-\alpha} \sum_{i=0}^{\nu-2} \left(\frac{1}{1+|m-j|}\right)^{\nu-i}.
$$

 (2) If (2.12) holds, then, we have (3.3)

$$
\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}|Y_n(\nu,f;x)|\leq C_f\varepsilon_n\sum_{j=0}^n(1+|x_{j,n}|)^{-\alpha}\left(\frac{1}{1+|m-j|}\right).
$$

(3) If (2.13) holds, then, we have

(3.4)
$$
\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}|Z_n(l,\nu,f;x)|
$$

$$
\leq C_f \frac{a_n}{n} \sum_{j=0}^n (1+|x_{j,n}|)^{-\alpha} \sum_{i=0}^{\nu-1} \left(\frac{1}{1+|m-j|}\right)^{\nu-i}.
$$

Proof. In [7, Propositions 3.7, 3.8 and 3.9] we got the similar estimations in $L_{\infty}(\mathbb{R})$ space. Now, in there we can exchange $f(x)$ with $f(x)(1+|x|)^\alpha$, and then we obtain the results in $L_p(\mathbb{R})$ by the similar methods as the proofs of [7, Propositions 3.7, 3.8 and 3.9] (see [7, p.16-p.23]).

Lemma 3.6. (1) [7, Lemma 4.3] Uniformly for $n \geq 1$,

(3.5)
$$
\sup_{x \in \mathbb{R}} |p_{n,\rho}(x)w(x)| \left(|x| + \frac{a_n}{n} \right)^{\rho} \Phi^{\frac{1}{4}}(x) \leq C a_n^{-\frac{1}{2}}.
$$

(2) [2, Theorem 2.5(a)] Uniformly for $n \geq 1$,

(3.6)
$$
|p'_{n,\rho}w|(x_{j,n})\left(|x_{j,n}|+\frac{a_n}{n}\right)^{\rho} \sim \varphi_n(x_{j,n})^{-1}[a_n^2-x_{j,n}^2]^{-1/4}.
$$

Lemma 3.7. Let $w(x) = \exp(-Q(x)) \in \mathcal{F}(C^2+)$. For the zeros $x_{j,n} = x_{j,n,\rho}$, we have the following.

(1) [2, Theorem 2.2, (b)] For $n \ge 1$ and $1 \le j \le n - 1$,

$$
x_{j,n} - x_{j+1,n} \sim \varphi_n(x_{j,n}),
$$

and [2, Lemma A.1 (A.3)]

$$
\varphi_n(x_{j,n}) \sim \varphi_n(x_{j+1,n}).
$$

(2) [2, Theorem 2.2, (a)] For the minimum positive zero $x_{[n/2],n}$ ([n/2] is the largest integer $\leq n/2$, we have

$$
x_{[n/2],n} \sim a_n n^{-1},
$$

and for large enough n,

$$
1 - \frac{x_{1,n}}{a_n} \sim \delta_n.
$$

(3) [2, Lemma 4.7]

$$
b_n = \frac{\gamma_{n-1}}{\gamma_n} \sim a_n \sim x_{1,n}.
$$

Lemma 3.8. Let $w = \exp(-Q) \in \mathcal{F}(C^2+)$. Let $L > 0$ be fixed. Then we have the following.

(a) ([16, Lemma 3.5, (a)]) Uniformly for $t > 0$,

 $a_{Lt} \sim a_t$.

(b) ([16, Lemma 3.5, (b)]) Uniformly for $t > 0$,

$$
Q^{(j)}(a_{Lt}) \sim Q^{(j)}(a_t), \quad j = 0, 1.
$$

Moreover,

$$
T(a_{Lt}) \sim T(a_t).
$$

(c) ([16, Lemma 3.11 (3.52)]) Uniformly for $t > 0$,

$$
\left|1 - \frac{a_{Lt}}{a_t}\right| \sim \frac{1}{T(a_t)}.
$$

From Lemma [3.6](#page-10-0) it is sufficient that we estimate Proposition [2.5,](#page-6-4) [2.6](#page-6-5) or [2.7](#page-6-6) for only $|x| \leq a_{2n}$.

Proof of Proposition [2.5.](#page-6-4) First we set

$$
X_n(\nu, f; x) = \sum_{j=1}^n f(x_{j,n}) l_{jn}^{\nu}(x) \sum_{i=0}^{\nu-2} e_i(\nu, j, n) (x - x_{j,n})^i
$$

=
$$
\sum_{j \; ; |x_{j,n}| \geq \frac{a_n}{3}} + \sum_{j \; ; |x_{j,n}| < \frac{a_n}{3}} =: X_{1,n}(\nu, f; x) + X_{2,n}(\nu, f; x).
$$

Using (3.2) , we see

$$
\begin{aligned}\n& \left| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_{1,n}(\nu, f; x) \right| \\
&\leq C_f (1+|x|)^{-\Delta} \sum_{|x_{j,n}| \geq \frac{1}{3} a_n} (1+|x_{j,n}|)^{-\alpha} \sum_{i=0}^{\nu-2} \left(\frac{1}{1+|m-j|} \right)^{\nu-i} \\
&\leq C C_f a_n^{-\alpha} (1+|x|)^{-\Delta}.\n\end{aligned}
$$

Therefore, we have by [\(2.9\)](#page-6-0)

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_{1,n}(\nu, f; x) \right\|_{L_p(|x| \le a_{2n})}
$$

\n
$$
\le C_f a_n^{-\alpha} \left\| (1+|x|)^{-\Delta} \right\|_{L_p(|x| \le a_{2n})}
$$

\n
$$
\le C_f a_n^{-\alpha} \begin{cases} a_n^{\frac{1}{p}-\Delta}, & \Delta p < 1, \\ \log a_n, & \Delta p = 1, \\ 1, & \Delta p > 1 \end{cases} \le C_f.
$$

Now, we will estimate for $X_{2,n}(\nu, f, x)$. For $|x| < 1$, since we have from (3.2)

$$
\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}|X_{2,n}(\nu,f;x)|\leq C_f,
$$

we see

$$
(3.7) \qquad \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} |X_{2,n}(\nu, f; x)| \right\|_{L_p(|x| \le 1)} \le C_f.
$$

Let $|x| \geq 1$. We divide it into two sums as follows:

$$
\begin{array}{rcl} X_{2,n}(\nu,f;x) & =: & \displaystyle \sum_{\substack{j; \ |x_{j,n}| < \frac{a_n}{2}, \\ |x-x_{j,n}| \geqslant \frac{|x|}{2} \qquad \ \ |x-x_{j,n}| < \frac{|x|}{2} \qquad \ \ } \end{array} \hspace{-3mm} \sum_{\substack{j; \ |x_{j,n}| < \frac{a_n}{2}, \\ |x-x_{j,n}| < \frac{|x|}{2} \qquad \ \ } \end{array} \hspace{-3mm} \begin{array}{rcl} =: X_{2,n}^{[1]}(\nu,f;x) + X_{2,n}^{[2]}(\nu,f;x). \end{array}
$$

Using [\(2.10\)](#page-6-1), Lemma [3.7\(](#page-10-1)2), [\(3.5\)](#page-10-2) and [\(3.6\)](#page-10-3) with $\varphi_n(x_{j,n}) \sim a_n/n$, we see that

$$
(3.8) \qquad \left\{ \Phi^{\frac{3}{4}}(x)w(x)\left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} |f(x_{j,n})l_{jn}^{\nu}(x)|
$$

$$
\leq C_f (1 + |x_{j,n}|)^{-\alpha} \left| \frac{\left\{ \Phi^{\frac{3}{4}}(x_{j,n})\Phi^{\frac{3}{4}}(x)w(x)\left(|x| + \frac{a_n}{n} \right)^{\rho} \right\} p_n(x)}{p'_n(x_{j,n})w(x_{j,n})(\frac{a_n}{n} + |x_{j,n}|)^{\rho}} \right\}^{\nu}
$$

$$
\leq CC_f (1 + |x_{j,n}|)^{-\alpha} \left(\frac{a_n}{n} \right)^{\nu}
$$

and Lemma [3.1](#page-7-1)

$$
\sum_{i=0}^{\nu-2} e_i(\nu, j, n)(x - x_{j,n})^i \le C \sum_{i=0}^{\nu-2} \left(\frac{n}{a_n}\right)^i |x|^{i-\nu} \le C \left(\frac{n}{a_n}\right)^{\nu-2} |x|^{-2}.
$$

Then, we have

$$
\left| \left\{ \Phi^{\frac{3}{4}}(x)w(x)\left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_{2,n}^{[1]}(\nu, f; x) \right|
$$

\n
$$
\leq C_f \sum_{\substack{j \; ; \; |x_{j,n}| < \frac{a_n}{3}, \\ |x - x_{j,n}| \geq \frac{|x|}{2}}} (1 + |x_{j,n}|)^{-\alpha} \left(\frac{a_n}{n} \right)^2 |x|^{-2} \leq CC_f \frac{a_n^2}{n} \frac{1}{x^2}
$$

Therefore, we have, using $\Delta > -1,$

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_{2,n}^{[1]}(\nu, f; x) \right\|_{L_p(1 \le |x| \le a_{2n})}
$$
\n
$$
(3.9) \le C_f \frac{a_n^2}{n} \left\| (1+|x|)^{-(\Delta+2)} \right\|_{L_p(1 \le |x| \le a_{2n})} \le C_C f \frac{a_n^2}{n} \le C_C f
$$

(note [\(2.2\)](#page-4-1) and [\(2.5\)](#page-4-0)). Since, for $|x - x_{j,n}| < \frac{|x|}{2}$ $\frac{x_1}{2}$, we see $|x_{j,n}| \sim |x|$, the inequality [\(3.2\)](#page-9-1) implies

$$
(3.10) \quad \left\{ \Phi^{\frac{3}{4}}(x)w(x)\left(|x| + \frac{a_n}{n}\right)^{\rho} \right\}^{\nu} X_{2,n}^{[2]}(\nu, f; x) \\ \leq \quad C C_f \sum_{\substack{j; \, |x_{j,n}| < \frac{a_n}{3}, \\ |x - x_{j,n}| < \frac{|x|}{2}}} (1 + |x_{j,n}|)^{-\alpha} \sum_{i=0}^{\nu-2} \left(\frac{1}{1 + |m - j|}\right)^{\nu-i} \leq C C_f (1 + |x|)^{-\alpha}.
$$

Therefore, we obtain by [\(2.9\)](#page-6-0)

$$
(3.11) \qquad \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_{2,n}^{[2]}(\nu, f; x) \right\|_{L_p(1 \le |x| \le a_{2n})}
$$

$$
\le C C_f \left\| (1+|x|)^{-(\alpha+\Delta)} \right\|_{L_p(|x| \le a_{2n})} \le C C_f a_n^{\frac{1}{p}-(\alpha+\Delta)} \le C C_f.
$$

Hence, from $(3.7), (3.8), (3.9), (3.11)$ $(3.7), (3.8), (3.9), (3.11)$ $(3.7), (3.8), (3.9), (3.11)$ $(3.7), (3.8), (3.9), (3.11)$ $(3.7), (3.8), (3.9), (3.11)$ $(3.7), (3.8), (3.9), (3.11)$ and Lemma [3.4](#page-8-1) we conclude (2.11)

$$
\mathcal{L}_{\mathcal{A}}
$$

Proof of Proposition [2.6.](#page-6-5) We repeat the methods of the proof of Proposition [2.5.](#page-6-4)

$$
Y_n(\nu, f; x) =: \sum_{j; |x_{j,n}| \geq \frac{a_n}{3}} + \sum_{j; |x_{j,n}| < \frac{a_n}{3}} =: Y_{1,n}(\nu, f; x) + Y_{2,n}(\nu, f; x).
$$

Then we have by [\(3.3\)](#page-9-2), [\(2.9\)](#page-6-0), [\(2.2\)](#page-4-1) and [\(2.5\)](#page-4-0)

$$
\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} Y_{1,n}(\nu, f; x) \Big\|_{L_p(|x| \le a_{2n})}
$$

\n
$$
\le C_f a_n^{-\alpha} \varepsilon_n \log n \|(1+|x|)^{-\Delta} \|_{L_p(|x| \le a_{2n})}
$$

\n
$$
\le C C_f a_n^{-\alpha} \varepsilon_n \log n \begin{cases} a_n^{\frac{1}{p}-\Delta}, & \Delta p < 1; \\ \log a_n, & \Delta p = 1; \\ 1, & \Delta p > 1 \end{cases}
$$

\n
$$
\le C C_f \varepsilon_n \log n \begin{cases} 1, & \Delta p < 1; \\ \frac{\log a_n}{a_n}, & \Delta p = 1; \\ \frac{1}{a_n}, & \Delta p > 1. \end{cases}
$$

.

Now, we estimate $Y_{2,n}(\nu, f; x)$. For $|x| \leq 1$ we obtain that from [\(3.3\)](#page-9-2),

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}Y_{2,n}(\nu,f;x)\right\|_{L_p(|x|\leq 1)} \leq CC_f\varepsilon_n\log n.
$$

Let $|x| \geq 1$ and

$$
Y_{2,n}(\nu,f;x) =: \sum_{\substack{j \; : \; |x_{j,n}| < \frac{a_n}{3}, \\ |x-x_{j,n}| \geqslant \frac{|x|}{2} > 0}} + \sum_{\substack{j \; : \; |x_{j,n}| < \frac{a_n}{3}, \\ |x-x_{j,n}| < \frac{|x|}{2}}} =: Y_{2,n}^{[1]} + Y_{2,n}^{[2]}.
$$

Then we have similarly to [\(3.10\)](#page-12-2) and [\(3.11\)](#page-12-1),

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} Y_{2,n}^{[2]}(\nu, f; x) \right\|_{L_p(1 \le |x| \le a_{2n})}
$$

$$
\le C C_f \varepsilon_n \log n \left\| (1+|x|)^{-(\alpha+\Delta)} \right\|_{L_p(|x| \le a_{2n})} \le C C_f a_n^{\frac{1}{p}-(\alpha+\Delta)} \varepsilon_n \log n \le C C_f \varepsilon_n \log n
$$

(see [\(2.9\)](#page-6-0)). Finally, we estimate $Y_{2,n}^{[1]}$. Let $|x_{j,n}| < \frac{a_n}{3}$ and $|x - x_{j,n}| \geqslant \frac{|x|}{2}$ $\frac{x_1}{2}$. Then, from Lemma [3.2,](#page-8-2) (2.12) , (3.5) and (3.6) , we have

$$
(3.12) \qquad \left\{ \Phi^{\frac{3}{4}}(x)w(x)\left(|x| + \frac{a_n}{n}\right)^{\rho}\right\}^{\nu} |f(x_{j,n})l_{jn}^{\nu}(x)| |x - x_{j,n}|^{\nu-1}e_{\nu-1}(\nu,k,n) \n\leq CC_f(1 + |x_{j,n}|)^{-\alpha} \left\{ |Q'(x_{j,n})| + \frac{1}{|x_{j,n}|} \right\}^{-1} \n\times \left| \frac{\left\{ \Phi^{\frac{3}{4}}(x_{j,n})\Phi^{\frac{3}{4}}(x)w(x)\left(|x| + \frac{a_n}{n}\right)^{\rho} \right\} p_n(x)}{p_n'(x_{j,n})w(x_{j,n})\left(\frac{a_n}{n} + |x_{j,n}|\right)^{\rho}} \right|^{ \nu} \frac{1}{|x - x_{j,n}|} \n\times \left\{ \frac{T(a_n)}{a_n} + |Q'(x_{k,n})| + \frac{1}{x_{k,n}} \right\} \left\{ \frac{n}{a_{2n} - |x_{k,n}|} \right\}^{\nu-2} \n\leq CC_f(1 + |x_{j,n}|)^{-\alpha} \left\{ |Q'(x_{j,n})| + \frac{1}{|x_{j,n}|} \right\}^{-1} \n\times \Phi^{\frac{3\nu}{4}}(x_{j,n})\varphi_n^{\nu}(x_{j,n})\left(1 - \frac{|x_{j,n}|}{a_n}\right)^{\frac{\nu}{4}} \frac{1}{|x - x_{j,n}|} \n\times \left\{ \frac{T(a_n)}{a_n} + |Q'(x_{k,n})| + \frac{1}{x_{k,n}} \right\} \left\{ \frac{n}{a_{2n} - |x_{k,n}|} \right\}^{\nu-2}.
$$

On the other hand, from [\(2.1\)](#page-4-6), [\(2.8\)](#page-6-8) and $|x_{j,n}| < a_n/3$, we easily see

$$
(3.13) \qquad \Phi_n^{\frac{3\nu}{4}}(x_{j,n})\varphi_n^{\nu}(x_{j,n})\left(1-\frac{|x_{j,n}|}{a_n}\right)^{\frac{\nu}{4}}\left(\frac{n}{a_{2n}-|x_{j,n}|}\right)^{\nu-2} \le C\left(\frac{a_n}{n}\right)^2.
$$

Moreover, since $|Q'(x_{j,n})| + \frac{1}{|x_{j,n}|} \geqslant C > 0$ for some constant C, we see (3.14)

$$
\left\{ \frac{T(a_n)}{a_n} + |Q'(x_{j,n})| + \frac{1}{|x_{j,n}|} \right\} \left\{ |Q'(x_{j,n})| + \frac{1}{|x_{j,n}|} \right\}^{-1} \le C \max \left\{ 1, \frac{T(a_n)}{a_n} \right\}
$$

and since $|x - x_{j,n}| \geqslant \frac{|x|}{2}$ $\frac{x_1}{2}$, we have

(3.15)
$$
\frac{1}{|x - x_{j,n}|} \le \frac{2}{|x|}.
$$

Thus, using [\(3.12\)](#page-13-0), [\(3.13\)](#page-13-1), [\(3.14\)](#page-13-2) and [\(3.15\)](#page-13-3), we can estimate for $Y_{2,n}^{[1]}(\nu, f; x)$ as follows:

$$
\begin{aligned}\n&\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}Y_{2,n}^{[1]}(\nu,f;x) \\
&\leq C C_f \max\left\{1,\frac{T(a_n)}{a_n}\right\}\frac{1}{|x|}\left(\frac{a_n}{n}\right)^2 \sum_{\substack{j;\ |x_{j,n}| < \frac{a_n}{3},\\ |x-x_{j,n}| \geq \frac{|x|}{2}}} (1+|x_{j,n}|)^{-\alpha} \\
&\leq C C_f \max\left\{1,\frac{T(a_n)}{a_n}\right\}\frac{1}{|x|}\frac{a_n^2}{n} \leq C C_f a_n \varepsilon_n \frac{1}{|x|}.\n\end{aligned}
$$

Therefore we have by [\(2.9\)](#page-6-0)

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} Y_{2,n}^{[1]}(\nu, f; x) \right\|_{L_p(1 \le |x| \le a_{2n})}
$$

\n
$$
\le C C_f a_n \varepsilon_n \left\| (1+|x|)^{-(\Delta+1)} \right\|_{L_p(1 \le |x| \le a_{2n})} \le C C_f a_n \varepsilon_n a_n^{\frac{1}{p}-(\Delta+1)} \le C C_f a_n \varepsilon_n.
$$

Proof of Proposition [2.7.](#page-6-6) Using (3.4) , we have from (2.2) and (2.5)

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} Z_n(l, \nu, f; x) \right\|_{L_p(\mathbb{R})}
$$
\n
$$
\leq C C_f \frac{a_n \log n}{n} \left\| (1+|x|)^{-\Delta} \right\|_{L_p(|x| \leq a_{2n})}
$$
\n
$$
\leq C C_f \frac{a_n \log n}{n} \begin{cases} a_n^{\frac{1}{p}-\Delta}, & \Delta p < 1; \\ \log a_n, & \Delta p = 1; \leq C C_f \frac{a_n^2 \log n}{n} \begin{cases} 1, & \Delta p < 1; \\ \frac{\log a_n}{a_n}, & \Delta p = 1; \\ \frac{1}{a_n}, & \Delta p > 1. \end{cases}
$$

Proof of Proposition [2.8.](#page-7-2) Since we see for a fixed polynomial $P \in \mathcal{P}_{\nu n-1}$

$$
L_n(\nu, P) - P = L_n(\nu, P) - L_n(\nu - 1, \nu, P) = Z_n(\nu - 1, \nu, P),
$$

we can obtain from Proposition [2.7,](#page-6-6)

$$
\left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} \left\{ L_n(\nu, P) - P \right\} \right\|_{L_p(\mathbb{R})}
$$

$$
\leq C C_f \frac{a_n^2 \log n}{n} \begin{cases} 1, & \Delta p < 1; \\ \frac{\log a_n}{a_n}, & \Delta p = 1; \to 0 \quad \text{as} \quad n \to \infty \\ \frac{1}{a_n}, & \Delta p > 1. \end{cases}
$$

(note Remark [2.13\)](#page-7-3). \Box

Proof of Proposition [2.9.](#page-7-4) Since we see for a fixed polynomial $P \in \mathcal{P}_{\nu n-1}$

$$
X_n(\nu, P) - P = L_n(\nu, P) - P + Y_n(\nu, P)
$$

and $\varepsilon_n(a_n + \log n) \to 0$ as $n \to 0$, we have the result from Proposition [2.6](#page-6-5) and Proposition [2.8.](#page-7-2) \Box

 \Box

Proof of Theorem [2.11.](#page-7-5) Let $\varepsilon > 0$ be taken arbitrarily. Then there exists a polynomial P such that

$$
(3.16)\qquad \left\|(f(x)-P(x))(1+|x|)^{\alpha}\left\{\Phi^{-\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu-\frac{\eta}{2}}\right\|_{L_{\infty}(\mathbb{R})} < \varepsilon.
$$

In fact, by (2.14) we see

$$
\lim_{|x| \to \infty} |f(x)w^{\nu - \eta}(x)| = 0,
$$

hence as $[7, (4.55)]$ we obtain (3.16) . Then we also have

(3.17)
$$
\left\| (f(x) - P(x)) (1+|x|)^{\alpha} \left\{ \Phi^{-\frac{3}{4}}(x) w_{\rho}(x) \right\}^{\nu} \right\|_{L_{\infty}(\mathbb{R})} < C \varepsilon,
$$

and from

$$
\left\|(1+|x|)^{\Delta-\alpha}\left\{\Phi^{-\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu/2}\right\|_{L_\infty(\mathbb{R})}<\infty,
$$

with (3.16) , we have

$$
(3.18)\qquad \left\| (f(x) - P(x))(1+|x|)^{\Delta} \left\{ \Phi^{-\frac{3}{4}}(x)w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} \right\|_{L_{\infty}(\mathbb{R})} < C\varepsilon.
$$

Now, we see

$$
|L_n(\nu, f) - f| \le |X_n(\nu, f - P)| + |X_n(\nu, P) - P| + |P - f| + |Y_n(\nu, f)|.
$$

From Proposition 2.5 with $C_{f-P} = C\varepsilon$ and (3.17), we know

$$
(3.19) \qquad \left\| (1+|x|)^{-\Delta} \left\{ \Phi^{\frac{3}{4}}(x) w(x) \left(|x| + \frac{a_n}{n} \right)^{\rho} \right\}^{\nu} X_n(\nu, f - P) \right\|_{L_p(\mathbb{R})} \leq C \varepsilon.
$$

Then, using [\(3.18\)](#page-15-2), [\(3.19\)](#page-15-3), Proposition [2.9](#page-7-4) and Proposition [2.6,](#page-6-5) we conclude

$$
\left\|(1+|x|)^{-\Delta}\left\{\Phi^{\frac{3}{4}}(x)w(x)\left(|x|+\frac{a_n}{n}\right)^{\rho}\right\}^{\nu}\left(L_n(\nu,f)-f\right)\right\|_{L_p(\mathbb{R})}\leq C\varepsilon.
$$

Hence, we have the result. $\hfill \square$

Proof of Theorem [2.12.](#page-7-6) If we split $|L_n(l, \nu, f) - f|$ as follows:

$$
|L_n(l, \nu, f) - f| \le |L_n(\nu, f) - f| + |Z_n(l, \nu, f)|,
$$

then the result is proved from Theorem [2.11](#page-7-5) and Proposition [2.7.](#page-6-6) \Box
