EPIGRAPH OF OPERATOR FUNCTIONS

MOHSEN KIAN

ABSTRACT. It is known that a real function f is convex if and only if the set

 $E(f) = \{(x, y) \in \mathbb{R} \times \mathbb{R}; f(x) \leq y\},\$

the epigraph of f is a convex set in \mathbb{R}^2 . We state an extension of this result for operator convex functions and C^* -convex sets as well as operator log-convex functions and C^* -logconvex sets. Moreover, the C ∗ -convex hull of a Hermitian matrix has been represented in terms of its eigenvalues.

1. Introduction and preliminaries

Throughout the paper, assume that $\mathcal{B}(\mathcal{H})$ is the C^* -algebra of all bounded linear operators on a Hilbert space H. If $dim(\mathcal{H}) = n$, then we identify $\mathcal{B}(\mathcal{H})$ with \mathbb{M}_n , the algebra of all $n \times n$ matrices. We denote by \mathbb{H}_n the set of all Hermitian matrices in \mathbb{M}_n . An operator $X \in \mathcal{B}(\mathcal{H})$ is called positive (denoted by $X \geq 0$) if $\langle Xa, a \rangle \geq 0$ for every $a \in \mathcal{H}$. If in addition X is invertible, then it is called strictly positive(denoted by $X > 0$). We denote by $\mathcal{B}(\mathcal{H})^+$ the set of all strictly positive operators on \mathcal{H} .

For a real interval J, we mean by $sp(J)$ the set of all self-adjoint operators on H whose spectra are contained in J. A continuous function $f: J \to \mathbb{R}$ is said to be operator convex if $f\left(\frac{X+Y}{2}\right) \leq \frac{f(X)+f(Y)}{2}$ $\frac{f(f(Y))}{2}$ for all $X, Y \in sp(J)$. It is well known that $[6, 7]$ $[6, 7]$ f is operator convex if and only if the Jensen operator inequality

$$
f(C^*XC) \le C^*f(X)C\tag{1}
$$

holds for every isometry C and every $X \in sp(J)$. A continuous function $f : (0, \infty) \to$ $(0, \infty)$ is called operator log-convex $[1, 8]$ $[1, 8]$ if $f\left(\frac{X+Y}{2}\right) \leq f(X)\sharp f(Y)$ for all strictly positive operators X, Y, where the geometric mean \sharp is defined by $X\sharp Y = X^{\frac{1}{2}}\left(X^{-\frac{1}{2}}YX^{-\frac{1}{2}}\right)^{\frac{1}{2}}X^{\frac{1}{2}}$ for all strictly positive operators X and Y, see for example $[6]$. In the case where f is operator log-convex a sharper inequality than [\(1\)](#page-0-0) is valid as

$$
f\left(\sum_{i=1}^{n} C_{i}^{*} X_{i} C_{i}\right) \leq \left(\sum_{i=1}^{n} C_{i}^{*} f(X_{i})^{-1} C_{i}\right)^{-1}
$$
(2)

for all $X_1, \dots, X_n > 0$ and all $C_1, \dots, C_n \in \mathcal{B}(\mathcal{H})$ with $\sum_{i=1}^n C_i^* C_i = I$, see [\[8,](#page-7-2) Corollary 3.13].

²⁰¹⁰ *Mathematics Subject Classification.* Primary 46L89 ; Secondary 52A01, 46L08.

Key words and phrases. Epigraph, convex hull, C^* -convexity, operator convex, operator log-convex.

A set $\mathcal{K} \subseteq \mathcal{B}(\mathcal{H})$ is called C^* -convex if $X_1, \dots, X_n \in \mathcal{K}$ and $C_1, \dots, C_n \in \mathcal{B}(\mathcal{H})$ with $\sum_{i=1}^n C_i^* C_i = I$ implies that $\sum_{i=1}^n C_i^* X_i C_i \in \mathcal{K}$. This kind of convexity has been introduced by Loebl and Paulsen [\[9\]](#page-7-3) as a non-commutative generalization of linear convexity and has been studied by many authors, see e.g. $[5, 11, 12]$ $[5, 11, 12]$ $[5, 11, 12]$ $[5, 11, 12]$ and references therein. Typical examples of C^{*}-convex sets are $\{T \in \mathcal{B}(\mathcal{H}) : 0 \leq T \leq I\}$ and $\{T \in \mathcal{B}(\mathcal{H}); ||T|| \leq M\}$ for a fix scalar $M > 0$. It is evident that the C^{*}-convexity of a set K in $\mathcal{B}(\mathcal{H})$ implies its convexity in the usual sense. For if $X, Y \in \mathcal{K}$ and $\lambda \in [0,1]$, then with $C_1 = \sqrt{\lambda}I$ and $C_2 = \sqrt{1 - \lambda} I$ we have $C_1^* C_1 + C_2^* C_2 = I$ and

$$
\lambda X + (1 - \lambda)Y = C_1^* X C_1 + C_2^* Y C_2 \in \mathcal{K}.
$$

But the converse is not true in general. For example if $A \geq 0$, then

$$
[0, A] = \{ X \in \mathcal{B}(\mathcal{H}); \ 0 \le X \le A \}
$$

is convex but not C^* -convex [\[9\]](#page-7-3). The concept of C^* -convexity can be generalized to the sets which have a $\mathcal{B}(\mathcal{H})$ -module structure. Assume that M is a $\mathcal{B}(\mathcal{H})$ -module. We say that a subset K of M is C^{*}-convex whenever $X_1, \dots, X_n \in \mathcal{K}, C_1, \dots, C_n \in \mathcal{B}(\mathcal{H})$ and $\sum_{i=1}^{n} C_i^* C_i = I$ implies that $\sum_{i=1}^{n} C_i^* X_i C_i \in \mathcal{K}$. For example, let

$$
\mathcal{M} = \left\{ (X_1, \cdots, X_k); \ X_j \in \mathcal{B}(\mathcal{H}), \ j = 1, \cdots, k \right\}.
$$

Then M is a $\mathcal{B}(\mathcal{H})$ -module under

$$
\mathcal{M} \times \mathcal{B}(\mathcal{H}) \to \mathcal{M} \qquad ((X_1, \cdots, X_k), T) \mapsto (X_1 T, \cdots, X_k T)
$$

$$
\mathcal{B}(\mathcal{H}) \times \mathcal{M} \to \mathcal{M} \qquad (S, (X_1, \cdots, X_k)) \mapsto (SX_1, \cdots, SX_k).
$$

Now, $\mathcal{K} \subseteq \mathcal{M}$ is called C^* -convex if $X_i = (X_{i1}, \dots, X_{ik}) \in \mathcal{K}$, $C_i \in \mathcal{B}(\mathcal{H})$ $(i = 1, \dots, n)$ and $\sum_{i=1}^{n} C_i^* C_i = I$ implies that

$$
\sum_{i=1}^{n} C_{i}^{*} X_{i} C_{i} = \left(\sum_{i=1}^{n} C_{i}^{*} X_{i1} C_{i}, \cdots, \sum_{i=1}^{n} C_{i}^{*} X_{ik} C_{i} \right) \in \mathcal{K}.
$$

As an example, it is easy to see that $\mathcal{K} = \{(X_1, \dots, X_k) \in \mathcal{M}; 0 \leq X_j \leq I, j = 1, \dots, k\}$ is C^* -convex.

The epigraph of a real function f is defined to be the set

$$
E(f) = \{(x, y) \in \mathbb{R} \times \mathbb{R}; f(x) \le y\}.
$$

It is known that f is a convex function if and only if $E(f)$ is a convex set in \mathbb{R}^2 . The main purpose of this paper is to present this result for operator functions. In particular, we give the connection between operator convex functions and C^* -convex sets as well as operator log-convex functions and C^* -log-convex sets. It is also shown that the C^* -convex hull of a Hermitian matrix can be represented in terms of its eigenvalues.

2. Main Result

For a continuous real function $f: J \to \mathbb{R}$, we define the operator epigraph of f by

$$
OE(f) := \{(X, Y) \in sp(J) \times \mathcal{B}(\mathcal{H}); f(X) \le Y\}.
$$

The next result gives the connections between operator convex functions and C^* -convex sets.

Theorem 2.1. A continuous function $f : J \to \mathbb{R}$ is operator convex if and only if $OE(f)$ *is* C ∗ *-convex.*

Proof. Let f be operator convex. Let $(X_i, Y_i) \in \text{OE}(f)$ $(i = 1, \dots, n)$ and $C_i \in \mathcal{B}(\mathcal{H})$ with $\sum_{i=1}^{n} C_i^* C_i = I$. Therefore $f(X_i) \leq Y_i$ $(i = 1, \dots, n)$ and so we have by the Jensen operator inequality that

$$
f\left(\sum_{i=1}^{n} C_i^* X_i C_i\right) \le \sum_{i=1}^{n} C_i^* f(X_i) C_i \le \sum_{i=1}^{n} C_i^* Y_i C_i.
$$

In other words, $\sum_{i=1}^{n} C_i^*$ $i^*(X_i, Y_i)C_i \in \text{OE}(f)$ and so $\text{OE}(f)$ is C^* -convex.

Conversely, assume that $OE(f)$ is C^* -convex. For all $X_1, \dots, X_n \in B(H)$, we have from the definition of $OE(f)$ that $(X_i, f(X_i)) \in OE(f)$. If $C_i \in B(H)$ with $\sum_{i=1}^n C_i^* C_i = I$, then $\sum_{i=1}^n C_i^*$ $i^*(X_i, f(X_i))C_i \in \mathrm{OE}(f)$ by the C^{*}-convexity of OE(f). It follows that

$$
f\left(\sum_{i=1}^n C_i^* X_i C_i\right) \le \sum_{i=1}^n C_i^* f(X_i) C_i,
$$

which means that f is operator convex.

Let $\{f_{\alpha}; \alpha \in \Gamma\}$ be a family of operator convex functions and $M_{\alpha} \in \mathbb{R}$ for every $\alpha \in \Gamma$. By Theorem [2.1,](#page-2-0) the set $\{X \in \mathcal{B}(\mathcal{H})\; ; \; f_{\alpha}(X) \leq M_{\alpha}, \; \forall \alpha \in \Gamma\}$ is C^* -convex. For example, consider the family f_{α} where $f_{\alpha}(t) = t^{\alpha}$ and $\alpha \in [1,2]$. Then $\{X \in \mathcal{B}(\mathcal{H}); X^{\alpha} \leq M_{\alpha}, 1 \leq \alpha\}$ $\alpha \leq 2$ } is C^{*}-convex.

The Choi–Davis–Jensen inequality for an operator convex function $f: J \to \mathbb{R}$ asserts that $f(\Phi(X)) \leq \Phi(f(X))$ for every unital positive linear mapping Φ on $\mathcal{B}(\mathcal{H})$ and every $X \in sp(J)$, see [\[2,](#page-6-2) [3,](#page-6-3) [6\]](#page-7-0). Motivating by this result, we state a characterization for C^* convex sets in \mathbb{H}_n using positive linear mappings.

Theorem 2.2. *If* $K \subseteq \mathbb{H}_n$, then the followings are equivalent:

- (1) \mathcal{K} *is* C^* -convex;
- (2) $\sum_{i=1}^{m} \Phi_i(X_i) \in \mathcal{K}$ for every $X_i \in \mathcal{K}$, $(i = 1, \dots, m)$ and every unital family $\{\Phi_i; i = 1, \cdots, m\}$ *of positive linear mappings on* \mathbb{M}_n .

Proof. Assume that $K \subseteq \mathbb{H}_n$ is C^{*}-convex. First note that if $X \in \mathcal{K}$ and if λ is an eigenvalue of X, then $\lambda I \in \mathcal{K}$. Indeed, it follows from the spectral decomposition that there exists a unitary U such that U^*XU is a matrix such that λ is its k, k entry. Then $\lambda I = \sum_{i=1}^n E_{ki}^* U^* X U E_{ki} \in \mathcal{K}$, where $\{E_{ij}\}\$ is the system of unit matrices. Now let $X_i \in \mathcal{K}$,

 $(i = 1, \dots, m)$ and let $\{\Phi_i; i = 1, \dots, m\}$ be a unital family of positive linear mappings on \mathbb{M}_n . Assume that $X_i = \sum_{j=1}^n \lambda_{ij} P_{ij}$ be the spectral decomposition of X_i for $i = 1, \dots, m$ so that $\lambda_{ij}I \in \mathcal{K}$ for all i, j . Therefore

$$
\sum_{i=1}^{m} \Phi_i(X_i) = \sum_{i=1}^{m} \Phi_i\left(\sum_{j=1}^{n} \lambda_{ij} P_{ij}\right) = \sum_{i=1}^{m} \sum_{j=1}^{n} \lambda_{ij} \Phi_i(P_{ij}) = \sum_{i=1}^{m} \sum_{j=1}^{n} C_{ij}^* \lambda_{ij} C_{ij},
$$

where $C_{ij} = \sqrt{\Phi_i(P_{ij})}$. Taking into account that

$$
\sum_{i=1}^{m} \sum_{j=1}^{n} C_{ij}^* C_{ij} = \sum_{i=1}^{m} \sum_{j=1}^{n} \Phi_i(P_{ij}) = \sum_{i=1}^{m} \Phi_i\left(\sum_{j=1}^{n} P_{ij}\right) = \sum_{i=1}^{n} \Phi_i(I) = I,
$$

we get by the C^{*}-convexity of K that $\sum_{i=1}^{m} \Phi_i(X_i) \in \mathcal{K}$.

Conversely, let $X_1, \dots, X_m \in \mathcal{K}$ and $C_i \in \mathbb{M}_n$ with $\sum_{i=1}^m C_i^* C_i = I$. Define positive linear mappings Φ_i on \mathbb{M}_n by $\Phi_i(X) = C_i^* X C_i$, $(i = 1, \dots, m)$. Then $\{\Phi_i; i = 1, \dots, m\}$ is a unital family and so

$$
\sum_{i=1}^{m} C_i^* X_i C_i = \sum_{i=1}^{m} \Phi_i(X_i) \in \mathcal{K},
$$

-convex.

i.e., K is C^*

The famous Choi–Davis–Jensen inequality which is a characterization of operator convex functions, can be derived from Theorem [2.1](#page-2-0) and Theorem [2.2.](#page-2-1)

Corollary 2.3. A continuous function $f: J \to \mathbb{R}$ is operator convex if and only if

$$
f\left(\sum_{i=1}^{m} \Phi_i(X_i)\right) \le \sum_{i=1}^{m} \Phi_i(f(X_i))
$$
\n(3)

for every $X_i \in sp(J)$ *and every unital family* $\{\Phi_i\}_{i=1}^m$ *of positive linear mappings on* \mathbb{M}_n *.*

Proof. Let $f: J \to \mathbb{R}$ be operator convex. Then $OE(f)$ is C^* -convex by Theorem [2.1.](#page-2-0) For every $X_i \in sp(J)$, we have $(X_i, f(X_i)) \in \text{OE}(f)$. Theorem [2.2](#page-2-1) then implies that $\sum_{i=1}^m \Phi_i(X_i, f(X_i)) \in \text{OE}(f)$ for every unital family $\{\Phi_i\}_{i=1}^m$ of positive linear mappings. Hence [\(3\)](#page-3-0) holds true. Conversely, assume that (3) is valid. Let $(X_i, Y_i) \in \text{OE}(f)$, $(i =$ $1, \dots, m$ so that $f(X_i) \leq Y_i$. If $\{\Phi_i\}_{i=1}^m$ is a unital family of positive linear mappings, then

$$
f\left(\sum_{i=1}^{m} \Phi_i(X_i)\right) \leq \sum_{i=1}^{m} \Phi_i(f(X_i)) \quad \text{(by (3))}
$$

$$
\leq \sum_{i=1}^{m} \Phi_i(Y_i) \quad \text{(by } f(X_i) \leq Y_i).
$$

This concludes that $\sum_{i=1}^{m} \Phi_i(X_i, Y_i) \in \text{OE}(f)$. Theorem [2.2](#page-2-1) now implies that $\text{OE}(f)$ is C^* -convex and so f is operator convex by Theorem [2.1.](#page-2-0)

Remark 2.4. Let $K \subseteq \mathcal{B}(\mathcal{H})^+$ be C^* -convex and $0 \in \mathcal{K}$. If $C \in \mathcal{B}(\mathcal{H})$ is a contraction, then $C^*XC \in \mathcal{K}$ for every $X \in \mathcal{K}$. To see this, put $D = (I - C^*C)^{\frac{1}{2}}$. Then $C^*C + D^*D = I$ and so $C^*XC = C^*XC + D^*0D \in \mathcal{K}$ for every $X \in \mathcal{K}$. It follows that if $\sum_{i=1}^n X_i \in \mathcal{K}$, then $X_i \in \mathcal{K}$ for $i = 1, \dots, n$. For if $X, Y \in \mathcal{K}$, put $C_1 = (X + Y)^{-\frac{1}{2}} X^{\frac{1}{2}}$ and $C_2 = (X + Y)^{-\frac{1}{2}} Y^{\frac{1}{2}}$ which are contractions and

$$
X = C_1^*(X + Y)C_1 \qquad Y = C_2^*(X + Y)C_2.
$$

Definition 2.5. We say that a set $\mathcal{K} \subseteq \mathcal{B}(\mathcal{H})$ is C^* -log-convex if $\left(\sum_{i=1}^n C_i^* X_i^{-1} C_i\right)^{-1} \in \mathcal{K}$ for all $X_i \in \mathcal{K}$ and $C_i \in \mathcal{B}(\mathcal{H})$ with $\sum_{i=1}^n C_i^* C_i = I$.

If M is a positive scalar, then $\{X \in \mathcal{B}(\mathcal{H})\colon 0 < X \leq M\}$ is an obvious example for C^* -log-convex sets. Moreover, if $K \subseteq \mathcal{B}(\mathcal{H})$ is C^* -log-convex, then $K^{-1} = \{X^{-1}; X \in \mathcal{K}\}\$ is convex in the usual sense. For if $X, Y \in \mathcal{K}^{-1}$ and $\lambda \in [0, 1]$, with $C_1 = \sqrt{\lambda} I$ and $C_2 = \sqrt{1 - \lambda}I$ we have $C_1^*C_1 + C_2^*C_2 = I$ and so $(C_1^*XC_1 + C_2^*YC_2)^{-1} \in \mathcal{K}$. This follows that $\lambda X + (1 - \lambda)Y = C_1^* X C_1 + C_2^* Y C_2 \in \mathcal{K}^{-1}$. More generally, a set $\mathcal{K} \subseteq \mathcal{B}(\mathcal{H})$ is a C^* -log-convex set if and only if $\mathcal{K} \subseteq \text{Inv}(\mathcal{B}(\mathcal{H}))$ and \mathcal{K}^{-1} is a C^* -convex set, where we mean by Inv $(\mathcal{B}(\mathcal{H}))$ the set of invertible elements in $\mathcal{B}(\mathcal{H})$.

Proposition 2.6. *If* $\mathcal L$ *and* $\mathcal K$ *are* C^* -*log-convex sets, then so is*

$$
\left(\mathcal{K}^{-1}+\mathcal{L}^{-1}\right)^{-1} = \left\{ \left(X^{-1}+Y^{-1}\right)^{-1}; \ \ X \in \mathcal{K}, \ Y \in \mathcal{L} \right\}.
$$

Proof. Assume that $C_i \in \mathcal{B}(\mathcal{H})$ with $\sum_{i=1}^n C_i^* C_i = I$. If $Z_1, \dots, Z_n \in (\mathcal{K}^{-1} + \mathcal{L}^{-1})^{-1}$, then $Z_i = (X_i^{-1} + Y_i^{-1})^{-1}$ for some $X_i \in \mathcal{K}$ and $Y_i \in \mathcal{L}$, $(i = 1, \dots, n)$. It follows from the C^* -log-convexity of K and \mathcal{L} that $\left(\sum_{i=1}^n C_i^* X_i^{-1} C_i\right)^{-1} \in \mathcal{K}$ and $\left(\sum_{i=1}^n C_i^* Y_i^{-1} C_i\right)^{-1} \in \mathcal{L}$. Therefore,

$$
\left(\sum_{i=1}^{n} C_{i}^{*} Z_{i}^{-1} C_{i}\right)^{-1} = \left(\sum_{i=1}^{n} C_{i}^{*} \left(X_{i}^{-1} + Y_{i}^{-1}\right) C_{i}\right)^{-1}
$$
\n
$$
= \left(\sum_{i=1}^{n} C_{i}^{*} X_{i}^{-1} C_{i} + \sum_{i=1}^{n} C_{i}^{*} Y_{i}^{-1} C_{i}\right)^{-1} \in \left(\mathcal{K}^{-1} + \mathcal{L}^{-1}\right)^{-1},
$$

which implies that $(\mathcal{K}^{-1} + \mathcal{L}^{-1})^{-1}$ is C^* -log-convex.

Proposition 2.7. Let $K \subseteq \mathcal{B}(\mathcal{H})$ be inverse closed in the sense that $K^{-1} \subseteq K$. If K is C^* -log-convex, then it is C^* -convex.

Proof. Assume that K is a C^* -log-convex set with $K^{-1} \subseteq K$. Let $C_i \in \mathcal{B}(\mathcal{H})$ and $\sum_{i=1}^{n} C_i^* C_i = I$. If $X_i \in \mathcal{K}$, then $X_i^{-1} \in \mathcal{K}$ and we have from the C^* -log-convexity of \mathcal{K} that $(\sum_{i=1}^n C_i^* X_i C_i)^{-1} \in \mathcal{K}$. It follows that $\sum_{i=1}^n C_i^* X_i C_i \in \mathcal{K}$ and so \mathcal{K} is C^* -convex. \square

The convex hull of a set K in a vector space X is defined to be the smallest convex set in $\mathcal X$ containing $\mathcal K$. It is known that the convex hull of $\mathcal X$ is the set

$$
CH(\mathcal{K}) = \left\{ \sum_{i=1}^{m} t_i a_i; \ a_i \in \mathcal{K}, \ m \in \mathbb{N}, \ \sum_{i=1}^{m} t_i = 1 \right\}.
$$
 (4)

The C^{*}-convex hull [\[9\]](#page-7-3) of a set $\mathcal{K} \subseteq \mathcal{B}(\mathcal{H})$ is the smallest C^{*}-convex set in $\mathcal{B}(\mathcal{H})$ which contains K . This is the generalization of convex hull in the non-commutative setting. It is known [\[9,](#page-7-3) Corollary 20] that given $T \in \mathcal{B}(\mathcal{H})$, the C^* -convex hull of $\{T\}$ is the set

$$
C^*-\mathrm{CH}(T)=\left\{\sum_i C_i^*TC_i; \ \sum_i C_i^*C_i=I\right\}.
$$

Moreover, we define the C^{*}-log-convex hull of a set $\mathcal{K} \subseteq \mathcal{B}(\mathcal{H})$ to be the smallest C^{*}-logconvex set in $\mathcal{B}(\mathcal{H})$ which contains K. It is easy to see that if $T \in \mathcal{B}(\mathcal{H})$ and $T > 0$, then the C^* -log-convex hull of $\{T\}$ turns out to be

$$
C^*-\mathrm{LCH}(T)=\left\{\left(\sum_i C_i^*T^{-1}C_i\right)^{-1};\ \sum_i C_i^*C_i=I\right\}.
$$

When $T \in \mathbb{H}_n$, we can present the C^* -convex hull of $\{T\}$ in terms of its eigenvalues.

Theorem 2.8. *If* $\lambda_1, \dots, \lambda_n$ *are eigenvalues of* $T \in \mathbb{H}_n$ *, then*

$$
C^*-\text{CH}(T) = \left\{ \sum_{i=1}^n \lambda_i E_i; \quad E_i \ge 0, \ i = 1, \cdots, n, \ \sum_{i=1}^n E_i = I \right\}.
$$

Proof. Let $T = \sum_{i=1}^{n} \lambda_i P_i$ be the spectral decomposition of T. Put

$$
\Omega = \left\{ \sum_{i=1}^{n} \lambda_i E_i; \ E_i \geq 0, \ i = 1, \dots, n, \ \sum_{i=1}^{n} E_i = I \right\}.
$$

If $X \in C^*$ – CH(T), then $X = \sum_i C_i^* T C_i$ for some $C_i \in M_n$ with $\sum_i C_i^* C_i = I$. Therefore,

$$
X = \sum_i C_i^* T C_i = \sum_i C_i^* \left(\sum_{j=1}^n \lambda_j P_j \right) C_i = \sum_{j=1}^n \lambda_j \sum_i C_i^* P_j C_i.
$$

Putting $E_j = \sum_i C_i^* P_j C_i$, we have $E_j \geq 0$, $(j = 1, ..., n)$ and

$$
\sum_{j=1}^{n} E_j = \sum_{j=1}^{n} \sum_{i} C_i^* P_j C_i = \sum_{i} C_i^* \left(\sum_{j=1}^{n} P_j \right) C_i = \sum_{i} C_i^* C_i = I.
$$

Hence, $X = \sum_{j=1}^{n} \lambda_j E_j$ and $\sum_{j=1}^{n} E_j = I$, i.e., $X \in \Omega$.

For the converse, note that the C^* -CH(T) is C^* -convex and contains all eigenvalues of T. Now if $X = \sum_{j=1}^n \lambda_j E_j$ in which $\sum_{j=1}^n E_j = I$ and $E_j \ge 0$, $(j = 1, \dots, n)$, then

$$
X = \sum_{j=1}^{n} \lambda_j E_j = \sum_{j=1}^{n} \sqrt{E_j} \lambda_j \sqrt{E_j} \in C^* - \text{CH}(T),
$$

by C^* -convexity of C $*-\text{CH}(T)$.

Let $f: J \to \mathbb{R}$ be a continuous function. If $T \in \mathbb{H}_n$ has the spectral decomposition $T = \sum_{i=1}^{n} \lambda_i P_i$ in which the eigenvalues $\lambda_1, \dots, \lambda_n$ are contained in J, then the well

known functional calculus yields that $f(T) = \sum_{i=1}^{n} f(\lambda_i) P_i$. By use of Theorem [2.8,](#page-5-0) the C^* -convex hull of $f(T)$ turns to be

$$
C^*-\mathrm{CH}(f(T))=\left\{\sum_{i=1}^n f(\lambda_i)E_i; \quad E_i\geq 0, \ i=1,\cdots,n, \ \sum_{i=1}^n E_i=I\right\}.
$$

The next result reveals the reason of naming C^* -log-convex sets. First note that, the notion of C^* -log-convexity can be extended to subsets of an algebra with a $\mathcal{B}(\mathcal{H})$ -module structure. For example, a set $\mathcal{K} \subseteq \mathcal{B}(\mathcal{H}) \times \mathcal{B}(\mathcal{H})$ is called C^* -log-convex if $(X_i, Y_i) \in \mathcal{K}$, $C_i \in \mathcal{B}(\mathcal{H})$ and $\sum_{i=1}^n C_i^* C_i = I$ implies that

$$
\left(\sum_{i=1}^n C_i^*(X_i, Y_i)^{-1} C_i\right)^{-1} = \left(\left(\sum_{i=1}^n C_i^* X_i^{-1} C_i\right)^{-1}, \left(\sum_{i=1}^n C_i^* Y_i^{-1} C_i\right)^{-1}\right) \in \mathcal{K}.
$$

Theorem 2.9. *A continuous function* $f : (0, \infty) \to (0, \infty)$ *is operator log-convex if and only if the set* $K = \{(X, Y) \in \mathcal{B}(\mathcal{H})^+ \times \mathcal{B}(\mathcal{H})^+; f(X^{-1}) \leq Y\}$ *is a* C^* -log-convex set.

Proof. Let f be operator log-convex, $C_i \in \mathcal{B}(\mathcal{H})$ and $\sum_{i=1}^n C_i^* C_i = I$. If $(X_i, Y_i) \in \mathcal{K}$, then $f(X_i^{-1}) \leq Y_i$. It follows from [\(2\)](#page-0-1) that

$$
f\left(\sum_{i=1}^n C_i^* X_i^{-1} C_i\right) \le \left(\sum_{i=1}^n C_i^* f\left(X_i^{-1}\right)^{-1} C_i\right)^{-1} \le \left(\sum_{i=1}^n C_i^* Y_i^{-1} C_i\right)^{-1}.
$$

Hence $\left(\left(\sum_{i=1}^n C_i^* X_i^{-1} C_i\right)^{-1}, \left(\sum_{i=1}^n C_i^* Y_i^{-1} C_i\right)^{-1}\right) \in \mathcal{K}$ and so \mathcal{K} is C^* -log-convex.

Conversely, assume that K is C^* -log-convex, $C_i \in \mathcal{B}(\mathcal{H})$ and $\sum_{i=1}^n C_i^* C_i = I$. If $X_i \in$ $\mathcal{B}(\mathcal{H})^+$ $(i = 1, \dots, n)$, then $(X_i^{-1}, f(X_i)) \in \mathcal{K}$. Therefore

$$
\left(\left(\sum_{i=1}^n C_i^* X_i C_i\right)^{-1}, \left(\sum_{i=1}^n C_i^* f(X_i)^{-1} C_i\right)^{-1}\right) \in \mathcal{K}
$$

by the C^* -log-convexity of K . It follows that

$$
f\left(\sum_{i=1}^{n} C_{i}^{*} X_{i} C_{i}\right) \leq \left(\sum_{i=1}^{n} C_{i}^{*} f(X_{i})^{-1} C_{i}\right)^{-1}
$$

and so f is operator log-convex by [\(2\)](#page-0-1).
