# Linear differential polynomials in zero-free meromorphic functions

J.K. Langley

October 9, 2018

In fondest memory of Günter Frank and Milne Anderson

#### Abstract

The paper determines all meromorphic functions  $f$  in  $\mathbb C$  such that  $f$  and  $F$  have finitely many zeros, where  $F = f^{(k)} + a_{k-1}f^{(k-1)} + \ldots + a_0f$  with  $k\geq 3$  and the  $a_j$  rational functions. MSC 2010: 30D35. Keywords: meromorphic function; zeros.

# 1 Introduction

Let the function f be meromorphic in an annulus  $\Omega(r_1) = \{z \in \mathbb{C} : r_1 < |z| < \infty\}$ , with  $r_1$  positive (not necessarily the same at each occurrence in this paper). Let  $k \geq 2$  and let  $a_0, \ldots, a_{k-1}$  be functions which are rational at infinity, that is, analytic on some  $\Omega(r_1)$  with at most a pole at  $\infty$ . Write  $D = d/dz$  and

<span id="page-0-0"></span>
$$
F = L[f], \quad L = D^{k} + a_{k-1}D^{k-1} + \ldots + a_{0}, \tag{1.1}
$$

in which  $L[y]$  denotes the operator L acting on the function y. The central objective of this paper is the classification of all those f for which f and F have no zeros in  $\Omega(r_1)$ . By a standard change of variables  $f=e^Pg, F=e^PG,$  with  $P$  a polynomial, it may be assumed that  $a_{k-1}(\infty)=0.$ 

This problem, part of which appeared as 1.42 in the collection [\[1\]](#page-44-0), has a long history going back to Hayman's conjecture in [\[10\]](#page-45-0), proved in [\[3,](#page-44-1) [18\]](#page-45-1), that if  $k \geq 2$  then the only meromorphic functions  $f$  in the plane for which  $f$  and  $f^{(k)}$  have no zeros are those of form  $f(z)=e^{az+b}$  or  $f(z)=(az+b)^{-n}$  with  $a,b\in\mathbb{C}$  and  $n\in\mathbb{N}=\{1,2,\ldots\}$ : more generally, if  $f$  and  $f^{(k)}$  have finitely many zeros then  $f=Re^P$ , with  $R$  a rational function and  $P$  a polynomial [\[5,](#page-44-2) [18\]](#page-45-1), so that  $f^{\prime}/f$  is rational. The problem for  $k=2$  and coefficients which are rational at infinity was fully solved in [\[18,](#page-45-1) [19\]](#page-45-2).

<span id="page-0-1"></span>**Theorem 1.1 ([\[18,](#page-45-1) [19\]](#page-45-2))** Let the function f be meromorphic in  $S \leq |z| < \infty$  for some  $S > 0$ and let the functions  $a_1$  and  $a_0$  be analytic there and rational at infinity. Assume that  $a_1(\infty) = 0$ and that  $f$  and  $F = f'' + a_1 f' + a_0 f$  have no zeros in  $S \le |z| < \infty$ . (a) If

$$
\deg_{\infty}(a_0) = \lim_{z \to \infty} \frac{\log |a_0(z)|}{\log |z|}
$$

is even then at least one of the following holds.

- (i) The function  $f'/f$  is rational at infinity.
- $(ii)$  The function  $f$  satisfies

<span id="page-1-4"></span>
$$
\frac{f'}{f} = -\frac{a_1}{2} + \frac{g'}{2g} + \frac{A}{g}, \quad g^2 = \frac{f}{F}, \quad g' = \left(2\frac{f'_1}{f_1} + a_1\right)g + B,\tag{1.2}
$$

where  $A, B \in \mathbb{C}$  and g is analytic in  $|z| \geq S$ , while  $f_1$  is a solution of the homogeneous equation

<span id="page-1-0"></span>
$$
w'' + a_1 w' + a_0 w = 0 \tag{1.3}
$$

which admits unrestricted analytic continuation without zeros in  $|z| \geq S$ . (iii) There exist solutions  $f_1$ ,  $f_2$  of [\(1.3\)](#page-1-0), such that

$$
f = Af_2 \left( 1 + B \left( \frac{f_2}{f_1} \right)^{1/N} \right)^{-N}, \quad A, B \in \mathbb{C}, \quad N \in \mathbb{N}.
$$
 (1.4)

Here both  $f_1$  and  $f_2$  admit unrestricted analytic continuation without zeros in  $|z| > R_1$  for some  $R_1>0$ , and  $(f_2/f_1)^{1/N}$  is analytic in  $\vert z \vert > R_1.$ 

(iv) There exist solutions  $f_1$ ,  $f_2$  of [\(1.3\)](#page-1-0), each admitting unrestricted analytic continuation without zeros in  $|z| > R_1$  for some  $R_1 > 0$ , a function  $M$  which is rational at infinity, and non-constant polynomials  $Q, Q_1$  such that

$$
\frac{f'}{f} = \frac{f'_2}{f_2} + \frac{Q(M)M'}{e^M + 1}, \quad \text{where} \quad Q(M)M' = \frac{f'_1}{f_1} - \frac{f'_2}{f_2} \quad \text{or} \quad Q_1(M)e^{-M} = \frac{f_1}{f_2}.
$$

(b) If  $\deg_{\infty}(a_0)$  is odd then f may be determined by applying part (a) to

$$
\phi(z) = f(z^2), \quad \Phi(z) = 4z^2 F(z^2) = \phi''(z) + (2za_1(z^2) - 1/z)\phi'(z) + 4z^2a_0(z^2)\phi(z).
$$

A refinement of this theorem for meromorphic functions in the plane may be found in [\[21,](#page-45-3) Theorem 1.3]. For  $k \geq 3$  and  $f, F$  zero-free in the whole plane, the case of constant coefficients was solved in full by Steinmetz in [\[23\]](#page-45-4), while polynomial coefficients were treated in [\[4\]](#page-44-3) for entire f, and for meromorphic f by Brüggemann in  $[2]$ .

<span id="page-1-3"></span>**Theorem 1.2 ([\[2,](#page-44-4) [4\]](#page-44-3))** Let the function f be meromorphic in the plane, such that f and  $F =$  $L[f]$  have no zeros, where  $k \geq 3$  and  $a_0, \ldots, a_{k-2}$  are polynomials, not all constant, with  $a_{k-1}\equiv 0.$  Then  $f=(H')^{-(k-1)/2}e^{H}$  or  $f=(H')^{-(k-1)/2}H^{-m}$  for some  $m\in \mathbb{N}$ , where  $H''/H'$ is a polynomial.

<span id="page-1-1"></span>The following theorem, which settles all cases, will be proved.

**Theorem 1.3** Let  $k \geq 3$  and let the function f be meromorphic in some annulus  $\Omega(r_1)$ , with  $f'/f$  not rational at infinity. Assume that  $f$  and  $F=L[f]$  have no zeros in  $\Omega(r_1)$ , where  $L$  is as in [\(1.1\)](#page-0-0) with the  $a_j$  analytic in  $\Omega(r_1)$  and rational at infinity, and with  $a_{k-1}(\infty) = 0$ . Then f satisfies at least one of the following.

(i) The logarithmic derivative  $f'/f$  has a representation

<span id="page-1-2"></span>
$$
\frac{f'}{f} = -\frac{a_{k-1}}{k} - \left(\frac{k-1}{2}\right)\frac{H''}{H'} + H' \quad \text{or} \quad \frac{f'}{f} = -\frac{a_{k-1}}{k} - \left(\frac{k-1}{2}\right)\frac{H''}{H'} - m\frac{H'}{H},\tag{1.5}
$$

where  $m \in \mathbb{N}$  and  $H_0 = H''/H'$  is rational at infinity, with  $H_0(\infty) \neq 0$ , while the equation  $L[y] = 0$  has linearly independent local solutions  $y_j$  satisfying

<span id="page-2-2"></span>
$$
\frac{y_j'}{y_j} = -\frac{a_{k-1}}{k} - \left(\frac{k-1}{2}\right)\frac{H''}{H'} + (j-1)\frac{H'}{H}, \quad j = 1, \dots, k,
$$
\n(1.6)

and  $f$  is given locally by either  $f=cy_1\exp(y_2/y_1)$  or  $f=cy_1^{m+1}y_2^{-m}$ , where  $c\in\mathbb{C}\setminus\{0\}.$ (ii) There exist a polynomial  $Q$  and functions  $\nu_1$ ,  $\nu_0$ , both rational at infinity, such that  $f'/f$  has a representation

<span id="page-2-0"></span>
$$
\frac{f'}{f} = \frac{Q(T)T'}{1 - e^{-T}} + \frac{y_1'}{y_1}, \quad T = \log\left(\frac{v}{u}\right),\tag{1.7}
$$

where  $y_1$  is a solution of  $L[y] = 0$ , while v and u are linearly independent solutions of

<span id="page-2-3"></span>
$$
y'' + \nu_1 y' + \nu_0 y = 0 \tag{1.8}
$$

which continue without zeros in some annulus  $\Omega(r_2)$ . Here  $Q(T)$  is rational at infinity, and  $u, v$ ,  $y_1'/y_1$  and  $a_0,\ldots,a_{k-2}$  all have representations in terms of  $Q(T)$ ,  $T$ ,  $a_{k-1}$  and their derivatives. Moreover, if  $T'$  is not rational at infinity then k is even and  $z^{-1/2}T'(z)$  is rational at infinity.

In both cases (i) and (ii) there exist  $r_3 > 0$  and functions  $\widetilde{a}_1$ ,  $\widetilde{a}_0$ , each rational at infinity, such that  $f'' + \widetilde{a}_1 f' + \widetilde{a}_0 f$  has no zeros in  $\Omega(r_3)$ .

The conclusions of Theorems [1.1](#page-0-1) and [1.3](#page-1-1) are closely related, and the last assertion of Theo-rem [1.3](#page-1-1) makes it clear that this is no coincidence. If Q is a constant d in [\(1.7\)](#page-2-0) then integration shows that  $f$  is a constant multiple of  ${y_1}\left( {v}/{u} - 1 \right)^d$ . Conclusion  $(1.5)$  may be compared with that of Theorem [1.2,](#page-1-3) and links closely to [\(1.2\)](#page-1-4) of Theorem [1.1](#page-0-1) and [\[21,](#page-45-3) Theorem 1.3(II)]. Ex-amples II and III in Section [2](#page-2-1) demonstrate that in  $(1.7)$  the multiplicities of poles of f may be unbounded, in sharp contrast to the situation in Theorem [1.2,](#page-1-3) where any poles of  $f$  must all have the same multiplicity  $m$ . Example III also shows that  $T^\prime$  need not be rational at infinity in [\(1.7\)](#page-2-0).

Some previous partial results for rational coefficients may be found in [\[13,](#page-45-5) [17\]](#page-45-6). Methods from [\[2,](#page-44-4) [3,](#page-44-1) [4,](#page-44-3) [23\]](#page-45-4) are essential to the proof of Theorem [1.3;](#page-1-1) these are supplemented by a result (Lemma [3.1\)](#page-4-0) on integer-valued analytic functions, facilitating the analytic continuation of several asymptotic representations. A decisive role is played by a criterion (Lemma [13.1\)](#page-31-0) for certain auxiliary functions to satisfy a second order differential equation, which simplifies the subsequent analysis considerably.

The author acknowledges extensive discussions and correspondence on this problem with the late Günter Frank; these took place over many years and have contributed substantially to the methodology of this paper. Indeed, the Wronskian-based method invented by Frank [\[3,](#page-44-1) [5\]](#page-44-2) underpins much of the successful work on these and related problems. Thanks are also due to the referees for their valuable comments.

## <span id="page-2-1"></span>2 Examples

Throughout the paper c will be used to denote non-zero constants, not always the same at each occurrence, and  $\mathbb{C}^*$  will denote  $\mathbb{C}\setminus\{0\}.$ 

#### 2.1 Example I

This example goes back to [\[4\]](#page-44-3), and may be compared with conclusion (i) of Theorem [1.3](#page-1-1) and that of Theorem [1.2.](#page-1-3) Let H be such that  $\delta = H''/H' \not\equiv 0$  is a polynomial, and write

$$
g = (H')^{-k}e^{H}, \quad h = (H')^{-k}H^{-m}, \quad D = \frac{d}{dz}, \quad m \in \mathbb{N}.
$$

Then it is easy to check (see the remark following [\(6.5\)](#page-13-0) below) that

$$
(D+\delta)\dots(D+k\delta)[g] = e^H, \quad (D+\delta)\dots(D+k\delta)[h] = cH^{-m-k}.
$$

Taking  $f$  to be  $e^Pg$  or  $e^Ph$  for a suitably chosen polynomial  $P$  gives polynomial coefficients  $a_j$ with  $a_{k-1} = 0$  such that f and  $F = L[f]$  have no zeros.

#### 2.2 Example II

Let  $P$  be a non-constant polynomial which takes positive integer values at all zeros of  $1-e^z$ , and write

<span id="page-3-0"></span>
$$
\frac{f'(z)}{f(z)} = \frac{P(z)}{1 - e^z}, \quad \frac{f''(z)}{f(z)} = \frac{Q_1(z)e^z + Q_0(z)}{(1 - e^z)^2}, \quad Q_1 = P - P', \quad Q_0 = P' + P^2.
$$
 (2.1)

Then f is meromorphic and zero-free in the plane, with a pole of multiplicity  $P(z)$  at a zero z of  $1-e^z$ . A standard calculation yields polynomials  $R_j$  such that

$$
\frac{f'''(z)}{f(z)} = \frac{R_2(z)e^{2z} + R_1(z)e^z + R_0(z)}{(1 - e^z)^3}.
$$

If  $F = f''' + b_2 f'' + b_1 f'$ , where the  $b_j$  are rational functions, then

$$
\frac{F(z)}{f(z)} = \frac{B_2(z)e^{2z} + B_1(z)e^z + B_0(z)}{(1 - e^z)^3},
$$
  
\n
$$
B_2 = R_2 - b_2Q_1 + b_1P,
$$
  
\n
$$
B_1 = R_1 + b_2(Q_1 - Q_0) - 2b_1P,
$$
  
\n
$$
B_0 = R_0 + b_2Q_0 + b_1P.
$$

Thus F may be made zero-free in some  $\Omega(r_1)$  by setting

<span id="page-3-1"></span>
$$
0 = R_1 + b_2(Q_1 - Q_0) - 2b_1P = R_0 + b_2Q_0 + b_1P,
$$
  
\n
$$
\frac{F(z)}{f(z)} = \frac{B_2(z)e^{2z}}{(1 - e^z)^3},
$$
\n(2.2)

these equations being solvable for  $b_1$  and  $b_2$ , since  $(Q_1 - Q_0)P + 2Q_0P = (Q_1 + Q_0)P \not\equiv 0$  by [\(2.1\)](#page-3-0). Similar calculations show that it is possible to achieve each of

<span id="page-3-2"></span>
$$
\frac{F(z)}{f(z)} = \frac{B_1(z)e^z}{(1 - e^z)^3} \quad ; \quad \frac{F(z)}{f(z)} = \frac{B_0(z)}{(1 - e^z)^3}.
$$
\n(2.3)

Finally, should it be the case that  $b_2(\infty) \neq 0$ , there exist a polynomial  $Q_2$  and rational functions  $a_j$ , with  $a_2(\infty)=0$ , such that writing  $h=e^{Q_2}f$  gives

$$
\frac{F(z)}{f(z)} = \frac{f''' + b_2 f'' + b_1 f'}{f} = \frac{h''' + a_2 h'' + a_1 h' + a_0 h}{h}.
$$

#### 2.3 Example III

This is adapted from [\[19\]](#page-45-2). Let  $Y(z) = z^{m/2}$ , where  $m \in \mathbb{N}$ , and set  $h = \cosh Y$ . Then  $h$  is entire with only simple zeros. Let  $P_1$  be an even polynomial which takes negative integer values at all odd integer multiples of  $\pi i/2$ , and set  $P = P_1(Y)$ . Then P is a polynomial and setting

$$
\frac{f'}{f} = P \cdot \frac{h'}{h} = \frac{PY'\sinh Y}{\cosh Y} = \frac{-2P_1(Y)Y'}{1 + e^{2Y}} + P_1(Y)Y'
$$

defines  $f$  as a meromorphic function in the plane, with no zeros. Next, set  $R=f^{\prime \prime }+b_{1}f^{\prime }+b_{0}f$ , where  $b_1=-P'/P-Y''/Y'$  and  $b_0=-(PY')^2$ . This gives, since  $h''=(Y''/Y')h'+(Y')^2h,$ 

$$
\frac{R}{f} = (P - P^2) \left( (Y')^2 - \left( \frac{h'}{h} \right)^2 \right) = \frac{(P - P^2)(Y')^2}{h^2},
$$

and so  $R$  is zero-free in some  $\Omega(r_1).$  Moreover,  $S=R(P-P^2)^{-1}(Y')^{-2}$  satisfies  $S/f=h^{-2}$ and  $S'/S = (P-2)h'/h$ . Hence the same construction, with  $P$  replaced by  $P-2$ , gives rational functions  $c_j,\,d_j$  and  $e_j$  such that

$$
\frac{S'' + c_1 S' + c_0 S}{S} = \frac{R'' + d_1 R' + d_0 R}{R} = \frac{f^{(4)} + e_3 f^{(3)} + \ldots + e_0 f}{R} = \frac{F}{R}
$$

is free of zeros in some  $\Omega(r_2)$ , as is F.

# <span id="page-4-0"></span>3 Preliminaries

**Lemma 3.1** Let the function g be analytic on the half-plane  $H^+$  given by  $\text{Re } z \geq 0$ , such that  $g(n)\in \mathbb{Z}$  for all  $n\in \mathbb{Z}\cap H^+$  and  $|g(z)|=o\left(2^{|z|}\right)$  as  $z\to \infty$  in  $H^+.$  Then  $g$  is a polynomial. Next, let  $h(z) = e^{2\pi i \alpha z} u(z)$ , where  $\alpha \in \mathbb{R}$  and u is analytic on  $H^+$ , with  $\log^+ |u(z)| = o(|z|)$ as  $z \to \infty$  in  $H^+$ , and assume that  $h(n) = 1$  for all large  $n \in \mathbb{N}$ . Then  $u(z) \equiv 1$  and  $\alpha \in \mathbb{Z}$ .

*Proof.* The first assertion is proved in [\[20\]](#page-45-7). To prove the second part let  $\delta_1 \in (0,\infty)$  be small: then there exist  $p \in \mathbb{Z}$  and  $q \in \mathbb{N}$  such that

$$
\alpha = s + t, \quad s = \frac{p}{q}, \quad |t| < \frac{\delta_1}{2\pi q}.
$$

Here  $t = 0$  if  $\alpha$  is rational, while if  $\alpha \notin \mathbb{Q}$  then suitable p and q exist by Dirichlet's approximation theorem [\[9,](#page-45-8) p.155]. Write

$$
z = qw, \quad F(w) = e^{2\pi i t qw} u(qw).
$$

If  $n \in \mathbb{N}$  is large then

$$
1 = h(qn) = e^{2\pi i \alpha qn} u(qn) = e^{2\pi i (pn + tqn)} u(qn) = F(n).
$$

<span id="page-4-1"></span>Thus F is a polynomial, by the first part, and so  $F(w) \equiv 1$ . Moreover,  $t = 0$ , because otherwise there exists  $\theta \in \{-\pi/4, \pi/4\}$  such that  $F(re^{i\theta}) \to 0$  as  $r \to +\infty$ , and so  $u \equiv 1$ . Finally,  $\alpha = p/q$  must be an integer, since  $1 = h(qn + 1) = \exp(2\pi i p/q)$  for large  $n \in \mathbb{N}$ .

**Lemma 3.2** Let  $d_1$ ,  $d_2$  and  $\lambda$  be positive constants and let g be a zero-free analytic function on the half-plane  $Re(w)>0$ , with  $\log^+|g(w)|\leq d_1+d_2 |w|^\lambda$  there. Then for  $0<\alpha<\pi/2$  there exists  $\mu = \mu_\alpha > 0$  such that  $\log^+ |1/g(w)| \leq \mu_\alpha |w|^{1+\lambda}$  as  $w \to \infty$  with  $|\arg w| \leq \alpha$ .

*Proof.* This is standard: set  $w = (1+z)/(1-z)$  and  $g(w) = G(z)$  for  $|z| < 1$ . With  $\rho = (1+r)/2$ this leads to

$$
\log M(r, 1/G) \le \left(\frac{\rho + r}{\rho - r}\right) T(\rho, 1/G) \le \left(\frac{\rho + r}{\rho - r}\right) (\log M(\rho, G) + O(1)) = O(1 - r)^{-1 - \lambda}
$$

<span id="page-5-2"></span>as  $r \to 1-$ . It remains only to observe that there exists  $c_1 = c_1(\alpha) > 0$  such that if  $|w|$  is large and  $|\arg w| \le \alpha < \pi/2$  then  $(1-|z|^2)^{-1} \le c_1|w|$ .

**Lemma 3.3** Suppose that p and q are (both formal or both locally analytic) solutions of the equations

<span id="page-5-1"></span>
$$
\frac{p'}{p} = d_0 \frac{q'}{q} + d_1, \quad q'' + \nu_1 q' + \nu_0 q = 0,\tag{3.1}
$$

where the  $d_j$  and  $\nu_j$  are rational at infinity, and let L be as in [\(1.1\)](#page-0-0). Then there exist coefficients  $b_j$ , each rational at infinity, such that  $p$  and  $q$  satisfy

<span id="page-5-0"></span>
$$
\frac{L[p]}{p} = \sum_{j=0}^{k} b_j \left(\frac{q'}{q}\right)^j, \quad b_k = d_0(d_0 - 1) \dots (d_0 - k + 1). \tag{3.2}
$$

Moreover, if  $d_0 \not\equiv 0, 1$  and  $e_1$  and  $e_0$  are rational at infinity, then there exist coefficients  $E_\mu$ , each rational at infinity and depending only on the  $d_j$ ,  $e_j$  and  $\nu_j$ , such that  $E_2\not\equiv 0$  and

$$
E_2 \frac{p''}{p} + E_1 \frac{p'}{p} + E_0 = \left(\frac{p'}{p}\right)^2 + e_1 \frac{p'}{p} + e_0.
$$
 (3.3)

Proof. Formula [\(3.2\)](#page-5-0) follows from [\(3.1\)](#page-5-1) and a simple induction argument, which deliver

$$
\left(\frac{q'}{q}\right)' = -\left(\frac{q'}{q}\right)^2 - \nu_1\left(\frac{q'}{q}\right) - \nu_0, \quad \frac{p^{(m)}}{p} = \sum_{j=0}^m b_{j,m} \left(\frac{q'}{q}\right)^j, \quad m \in \mathbb{N},
$$

with the  $b_{j,m}$  rational at infinity and  $b_{m,m} = d_0(d_0 - 1) \dots (d_0 - m + 1)$ .

To prove the second part, suppose that  $d_0\not\equiv 0,1$  and write  $P=p'/p$  and  $Q=q'/q$  so that  $Q = AP + B$ , with A, B rational at infinity and  $A \not\equiv 0, 1$ . This yields

$$
0 = A'P + AP' + B' + A^2P^2 + 2ABP + B^2 + \nu_1(AP + B) + \nu_0
$$
  
=  $(A^2 - A)P^2 + A(P' + P^2) + (A' + 2AB + \nu_1A)P + B' + B^2 + \nu_1B + \nu_0,$ 

and so

<span id="page-5-3"></span>
$$
(A - A2)(P2 + e1P + e0) = A(P' + P2) + (A' + 2AB + \nu1A + (A - A2)e1)P ++ B' + B2 + \nu1B + \nu0 + (A - A2)e0.
$$

 $\Box$ 

**Lemma 3.4** Suppose that u and v are linearly independent (both formal or both locally analytic) solutions of an equation

$$
y''' + B_2y'' + B_1y' + B_0y = 0,
$$

with the  $B_j$  rational at infinity, and assume that  $W = W(u, v) = uv' - u'v$  is such that  $W' + E_1 W = 0$ , where  $E_1$  is rational at infinity. Then u and v solve an equation

<span id="page-6-3"></span>
$$
y'' + E_1 y' + E_0 y = 0,\t\t(3.4)
$$

where  $E_0$  is also rational at infinity.

*Proof.* Since u and v are solutions of the equation  $W(u, v, y) = 0$ , it is enough to prove that  $W(u',v') = E_2 W(u,v)$  with  $E_2$  rational at infinity. But  $W'=uv''-u''v=-E_1 W$  leads to

$$
\begin{aligned}\n(-E_1' + E_1^2)W &= W'' = u'v'' - u''v' + uv''' - u'''v \\
&= W(u', v') + v(B_2u'' + B_1u' + B_0u) - u(B_2v'' + B_1v' + B_0v) \\
&= W(u', v') - B_2W' - B_1W = W(u', v') + (E_1B_2 - B_1)W.\n\end{aligned}
$$

 $\Box$ 

### <span id="page-6-1"></span>4 Asymptotics for linear differential equations

As in [\[2\]](#page-44-4) a fundamental role will be played by formal and asymptotic expansions for solutions of linear differential equations. For an equation  $L[y] = 0$ , with L as in [\(1.1\)](#page-0-0) and the  $a_j$  rational at infinity, classical results (see [\[24,](#page-45-9) Theorem 19.1] or [\[2,](#page-44-4) [16\]](#page-45-10))) show that there exist  $p \in \mathbb{N}$  and a fundamental set of  $k$  linearly independent formal solutions

<span id="page-6-0"></span>
$$
\widetilde{h}_j(z) = \exp(P_j(z^{1/p})) z^{\gamma_j} \sum_{\mu=0}^{n_j} U_{j,\mu}(z^{1/p}) (\log z)^{\mu}
$$
\n(4.1)

which satisfy the following:  $\gamma_j$  is a complex number;  $n_j$  is a non-negative integer; the *exponential part*  $P_j(z^{1/p})$  is a polynomial in  $z^{1/p}$ ; the  $U_{j,\mu}(z^{1/p})$  are formal series in descending integer powers of  $z^{1/p}.$  that is, in which at most finitely many positive powers occur; the lead series  $U_{j,n_j}$  is not the zero series. Formal solutions (not necessarily linearly independent) with these properties will be referred to henceforth as canonical formal solutions.

A standard approach [\[24\]](#page-45-9) to obtaining these  $h_i(z)$  is to transform a solution h of  $L[y] = 0$ into a vector  $\mathbf{h}=(h,h',\dots,h^{(k-1)}),$  so that a fundamental solution set for  $L[y]=0$  corresponds to the first row of a matrix solution  $V(z)=U(z)z^G e^{Q(z)}$  of an equation  $Y'=A(z)Y$ , where  $Q(z)$  is a diagonal matrix, its entries polynomials in  $z^{1/p}.$  while  $G$  is a constant matrix, which may be assumed to be in Jordan form, and  $U(z)$  is a matrix with entries which are formal series in descending integer powers of  $z^{1/p}.$  Furthermore, for each  $\theta\in\mathbb{R}$  there exists  $\delta=\delta(\theta)>0$ such that  $L[y] = 0$  has a fundamental set of analytic solutions

<span id="page-6-2"></span>
$$
h_j(z) = \exp(P_j(z^{1/p}))z^{\gamma_j} \sum_{\mu=0}^{n_j} V_{j,\mu}(z^{1/p})(\log z)^{\mu}
$$
 (4.2)

on a sector  $S$  given by  $|z|>R_0>0$ ,  $|\arg z-\theta|<\delta$ , in which each  $V_{j,\mu}(z^{1/p})$  is analytic on  $S$ and satisfies  $V_{j,\mu}(z^{1/p})\sim U_{j,\mu}(z^{1/p})$  as  $z\to\infty$  on  $S$ , in the sense of asymptotic series (see [\[24,](#page-45-9) Theorem 19.1] or [\[22\]](#page-45-11)). Here  $W(z)\sim U(z)=\sum_{m=M}^\infty U_mz^{-m/p}$  as  $z\to\infty$  on  $S$  means that, for each  $n \geq M$ ,

$$
W(z) - \sum_{m=M}^{n} U_m z^{-m/p} = o(|z|^{-n/p}) \quad \text{as } z \to \infty \text{ in } S.
$$

It may be assumed that the exponential parts  $P_j (z^{1/p})$  have zero constant term, and this convention will be used throughout. Given any exponential part  $P_j(z^{1/p})$  arising for  $L[y]\,=\,$  $0$ , there is always a canonical formal solution with exponential part  $P_j (z^{1/p})$  which is free of logarithms, that is, has  $n_j = 0$ ; this holds because the matrix G may be chosen to be in Jordan form. The following lemma is well known [\[2,](#page-44-4) [16,](#page-45-10) [24\]](#page-45-9).

<span id="page-7-0"></span>**Lemma 4.1** Given k linearly independent canonical formal solutions of  $L[y] = 0$  with exponential parts  $q_1,\ldots,q_k$ , their formal Wronskian has exponential part  $\sum_{j=1}^k q_j$ , and the exponential parts of any fundamental set of canonical formal solutions of  $L[y]=0$  form a permutation of the  $q_j$ .

 $\Box$ 

For the special case of a second order equation, suppose that  $A^*$  is rational at infinity, with  $A^*(z)=(1+o(1))c_nz^n$  as  $z\to\infty$ , where  $c_n\in\mathbb{C}^*$  and  $n\geq-1.$  Then infinity is an irregular singular point for

<span id="page-7-1"></span>
$$
w'' + A^* w = 0,\t\t(4.3)
$$

and asymptotics are developed via Hille's method [\[14\]](#page-45-12) as follows. The *critical rays* are given by  $\arg z = \theta^*$ , where  $c_n e^{i(n+2)\theta^*}$  is real and positive. If  $0 < \beta < 2\pi/(n+2)$  then, in a sector given by  $|z| > r_1, \, |\arg z - \theta^*| < \beta$ , there exist linearly independent analytic solutions, for  $j=1,2,$ 

<span id="page-7-2"></span>
$$
\phi_j(z) = A^*(z)^{-1/4} (1 + o(1)) \exp((-1)^j iZ), \quad Z = \int^z A^*(t)^{1/2} dt = \frac{2c_n^{1/2} z^{(n+2)/2}}{n+2} + \dots (4.4)
$$

If  $n = -1$  then this sector should be understood as lying on the Riemann surface of  $\log z$ . To one side of the critical ray, one of these solutions is large and the other small, and these roles are reversed as the critical ray is crossed. Any linear combination  $D_1\phi_1+D_2\phi_2$  with  $D_1,D_2\in\mathbb{C}^*$ has a sequence of zeros tending to infinity near the critical ray. Moreover, the corresponding formal solutions, to which the  $\phi_j$  are asymptotic, may be calculated readily from  $A^*(z)$  and  $Z$ , with  $n_j = 0$  and  $p \in \{1, 2\}$  in [\(4.1\)](#page-6-0) (see [\[19\]](#page-45-2) for details).

<span id="page-7-3"></span>**Lemma 4.2** Suppose that  $F_1, \ldots, F_k$  are formal expressions, each of which is given by

$$
F_j(z) = U_j(z) z^{\gamma_j} r_j(z) \exp(q_j(z)),
$$

with  $\gamma_j \in \mathbb{C}$ ,  $r_j$  a rational function,  $q_j$  a polynomial and  $U_j(z) = 1 + O(1/z)$ , in which  $O(1/z)$ denotes a formal series in negative integer powers of z. Assume that none of the  $r_j$  vanishes identically, and that  $q_j - q_{j'}$  is non-constant for  $j \neq j'.$  Then the formal Wronskian  $W = \emptyset$  $W(F_1, \ldots, F_k)$  has an expansion

$$
W(z) = \left(1 + O\left(\frac{1}{z}\right)\right) \left(\prod_{j=1}^k \left[z^{\gamma_j} r_j(z) \exp(q_j(z))\right]\right) \left(\prod_{k \ge m > n \ge 1} \left[q'_m(z) - q'_n(z)\right]\right).
$$

*Proof.* This is standard, and is proved by induction on  $k$ , using

$$
W(F_1, ..., F_k) = F_1^k W\left(1, \frac{F_2}{F_1}, ..., \frac{F_k}{F_1}\right) = F_1^k W\left(\left(\frac{F_2}{F_1}\right)', ..., \left(\frac{F_k}{F_1}\right)'\right),
$$
  

$$
\left(\frac{F_j}{F_1}\right)'(z) = \left(1 + O\left(\frac{1}{z}\right)\right) z^{\gamma_j - \gamma_1} \left(\frac{r_j(z)}{r_1(z)}\right) (q'_j(z) - q'_1(z)) \exp(q_j(z) - q_1(z)).
$$

### <span id="page-8-3"></span>5 Beginning the proof of Theorem [1.3:](#page-1-1) Frank's method

Assume that f is as in the hypotheses of Theorem [1.3.](#page-1-1) Let  $f_1, \ldots, f_k$  be linearly independent locally analytic solutions of  $L[y] = 0$ . Frank's method [\[3,](#page-44-1) [4\]](#page-44-3) defines  $g, h, w_j$  and Y locally by

<span id="page-8-0"></span>
$$
g^{k} = \frac{f}{F}, \quad h = -\left(\frac{f'}{f}\right)g, \quad w_{j} = f'_{j}g + f_{j}h = fg\left(\frac{f_{j}}{f}\right)', \quad \frac{Y'}{Y} = -a_{k-1}.\tag{5.1}
$$

Note that  $g$  might not be meromorphic in  $\Omega(r_1)$ , but  $g'/g$  is, and has a simple pole with residue  $1$ at every pole of f; moreover, at a pole of f of multiplicity  $m_0$ , calculating the leading Laurent coefficient of  $F/f$  gives

<span id="page-8-2"></span>
$$
(g')^{-k} = (-1)^{k} m_0(m_0 + 1) \dots (m_0 + k - 1). \tag{5.2}
$$

Now write locally, using Abel's identity,  $W(f_1, \ldots, f_k) = cY$  and

$$
\frac{Y}{(fg)^k} = \frac{YF}{f^{k+1}} = \frac{cW(f_1,\ldots,f_k,f)}{f^{k+1}} = cW\left(\frac{f_1}{f},\ldots,\frac{f_k}{f},1\right) = cW\left(\left(\frac{f_1}{f}\right)',\ldots,\left(\frac{f_k}{f}\right)'\right),
$$

so that  $Y = cW(w_1, \ldots, w_k)$  by [\(5.1\)](#page-8-0). Hence the  $w_j$  are linearly independent (local) solutions of an equation  $M[y] = 0$ , where

$$
M = D^{k} + A_{k-1}D^{k-1} + A_{k-2}D^{k-2} + \ldots + A_{0}, \quad A_{k-1} = a_{k-1}, \quad D = \frac{d}{dz}.
$$
 (5.3)

Here a pivotal role is played by whether or not the differential operators  $L$  and  $M$  are the same, and Brüggemann's method in [\[2\]](#page-44-4) depends on reducing the problem to the case  $L = M$ . It will be proved in Proposition [6.1](#page-11-0) below that if  $L = M$  then all poles  $z$  of  $f$  with  $|z|$  sufficiently large have the same multiplicity. Thus Example II in Section [2](#page-2-1) demonstrates that  $L$  and  $M$  can indeed be different operators.

By Frank's method, the  $A_j$  are analytic in some annulus  $\Omega(r_1)$  and satisfy  $T(r, A_j)$  =  $S(r, f'/f)$ , where  $S(r, f'/f)$  denotes any term which is  $O(\log T(r, f'/f) + \log r)$  as  $r \to \infty$ , possibly outside a set of finite measure [\[11\]](#page-45-13): see [\[6,](#page-44-5) Section 2 and Lemmas A, B and 5] for details, including the Nevanlinna characteristic in  $\Omega(r_1).$  Denote by  $\Lambda$  the field generated by the  $a_j,A_j$ and their derivatives: then  $T(r, \lambda) = S(r, f'/f)$  for all  $\lambda \in \Lambda$ .

To simplify the subsequent calculations it is convenient to write

<span id="page-8-1"></span>
$$
-k\frac{X'}{X} = a_{k-1} = A_{k-1}, \quad p = \frac{f}{X}, \quad p_j = \frac{f_j}{X}, \quad q = -\left(\frac{p'}{p}\right)g, \quad t_j = p'_j g + p_j q = \frac{w_j}{X}.
$$
 (5.4)

It is then well known that there exist equations

<span id="page-9-0"></span>
$$
y^{(k)} + c_{k-2}y^{(k-2)} + \ldots + c_0y = 0,
$$
\n(5.5)

and

<span id="page-9-1"></span>
$$
y^{(k)} + C_{k-2}y^{(k-2)} + \ldots + C_0y = 0,
$$
\n(5.6)

in which the  $c_j$  and  $C_j$  all belong to  $\Lambda$ , and  $c_{k-2} = C_{k-2}$  if and only if  $a_{k-2} = A_{k-2}$ , such that  $L[Xy] = 0$  if and only if y solves [\(5.5\)](#page-9-0), and  $M[Xy] = 0$  if and only if y solves [\(5.6\)](#page-9-1). In particular, the  $p_i$  and  $t_i$  are linearly independent local solutions of [\(5.5\)](#page-9-0) and [\(5.6\)](#page-9-1) respectively. The following lemma [\[4\]](#page-44-3) is key to Frank's method: see also [\[6,](#page-44-5) Lemma C].

<span id="page-9-2"></span>**Lemma 5.1 ([\[4\]](#page-44-3))** Let G,  $\Phi$ ,  $p_1, \ldots, p_k$ ,  $c_0, \ldots, c_{k-2}$  and  $C_0, \ldots, C_{k-2}$  be analytic functions on a plane domain U, such that  $p_1, \ldots, p_k$  are linearly independent solutions of [\(5.5\)](#page-9-0). Then the functions  $p_1'G + p_1\Phi, \ldots, p_k'G + p_k\Phi$  are solutions in  $U$  of the equation  $(5.6)$  $(5.6)$  if and only if, with the notation  $C_k = 1$  and  $c_{k-1} = C_{k-1} = c_{-1} = C_{-1} = 0$  and

$$
M_{k,\mu}[w] = \sum_{m=\mu}^{k} \frac{m!}{\mu!(m-\mu)!} C_m w^{(m-\mu)} \quad (0 \le \mu \le k), \quad M_{k,-1}[w] = 0,
$$

the functions G and  $\Phi$  satisfy, for  $0 \leq \mu \leq k-1$ ,

<span id="page-9-3"></span>
$$
M_{k,\mu}[\Phi] - c_{\mu}\Phi = -M_{k,\mu-1}[G] + c_{\mu}M_{k,k-1}[G] + (c'_{\mu} + c_{\mu-1})G.
$$
\n(5.7)

Because the proof of Lemma [5.1](#page-9-2) is based on purely formal calculations, an analogous state-ment holds linking formal solutions of [\(5.5\)](#page-9-0), [\(5.6\)](#page-9-1) and [\(5.7\)](#page-9-3). Since the coefficient of  $\Phi$  in  $M_{k,\mu}[\Phi] - c_{\mu} \Phi$  is  $c_{0,\mu} = D_{\mu} = C_{\mu} - c_{\mu}$ , the equations [\(5.7\)](#page-9-3) may be written in the form

<span id="page-9-7"></span>
$$
T_{\mu}[G] = S_{\mu}[\Phi] = \sum_{j=0}^{k-\mu} c_{j,\mu} \Phi^{(j)}, \quad c_{0,\mu} = D_{\mu} = C_{\mu} - c_{\mu}, \quad 0 \le \mu \le k-1,
$$
 (5.8)

in which  $T_{\mu}$  and  $S_{\mu}$  are linear differential operators with coefficients in  $\Lambda$ . In particular these equations are satisfied by  $G = g$ ,  $\Phi = q$ . Taking  $\mu = k - 1$  in [\(5.7\)](#page-9-3) produces

<span id="page-9-4"></span>
$$
-\Phi' = -U[G] = \frac{(k-1)G''}{2} + \frac{D_{k-2}G}{k}.
$$
\n(5.9)

Now  $\mu = k - 2$  and [\(5.9\)](#page-9-4) give (as in [\[7,](#page-44-6) p.162] or [\[17,](#page-45-6) Lemma 8, pp.307-8])

<span id="page-9-6"></span>
$$
D_{k-2}\Phi = \frac{k(k^2 - 1)}{12}G''' + G'\left(-\frac{(k+1)D_{k-2}}{2} + 2C_{k-2}\right) + G\left(\frac{k-1}{2}D'_{k-2} + c'_{k-2} - D_{k-3}\right). \tag{5.10}
$$

Next, combining [\(5.9\)](#page-9-4) with [\(5.7\)](#page-9-3) for  $\mu = k - 3$  yields, with  $d_i$  denoting elements of  $\Lambda$ ,

<span id="page-9-5"></span>
$$
\frac{2D_{k-3}}{k-2}\Phi = \frac{k(k^2-1)}{12}G^{(4)} + G''\left(\frac{(k-1)D_{k-2}}{3} + 2C_{k-2}\right) + d_1G' + d_2G.
$$
 (5.11)

<span id="page-9-9"></span>Note that [\(5.11\)](#page-9-5) holds even if  $k = 3$ , in which case  $M_{k,k-4}[G] = 0$ . Differentiating [\(5.10\)](#page-9-6) and using [\(5.9\)](#page-9-4) and [\(5.11\)](#page-9-5) leads to

<span id="page-9-8"></span>
$$
D^*\Phi = \left(\frac{2D_{k-3}}{k-2} - D'_{k-2}\right)\Phi = \frac{(k+2)D_{k-2}}{3}G'' + d_3G' + d_4G.
$$
 (5.12)

**Lemma 5.2** There exists a non-trivial homogeneous linear differential equation  $N_1[y] = 0$ , of order at most 3 and with coefficients in  $\Lambda$ , with the property that if the pair  $\{G,\Phi\}$  solves the system [\(5.8\)](#page-9-7) then G solves  $N_1[y] = 0$ .

*Proof.* If  $D_{k-2} \equiv 0$  this is clear from [\(5.10\)](#page-9-6), so assume that  $D_{k-2} \not\equiv 0$ . If  $D^*$  vanishes identically in [\(5.12\)](#page-9-8) then a second order equation arises for  $G$ , while otherwise combining (5.12) with [\(5.10\)](#page-9-6)  $\Box$  yields a third order equation.

Consider now two cases.

Case 1. Assume that  $c_{0,\mu} = C_{\mu} - c_{\mu} \equiv 0$  for  $0 \le \mu \le k - 1$  in [\(5.8\)](#page-9-7). This is equivalent to the equations [\(5.5\)](#page-9-0) and [\(5.6\)](#page-9-1) being the same, and hence equivalent to the operators  $L$  and  $M$  being identical. In this case,  $t_j=p'_jg+p_jq$  is a solution of [\(5.5\)](#page-9-0) for  $1\leq j\leq k.$  Since  $p_1$  and  $p_2$  are linearly independent,  $p_1p_2^\prime - p_1^\prime p_2$  does not vanish identically and so [\(5.4\)](#page-8-1) yields

$$
H_1 = \frac{f'}{f} + \frac{a_{k-1}}{k} = \frac{p'}{p} = -\frac{q}{g} = \frac{p'_1 t_2 - p'_2 t_1}{p_1 t_2 - p_2 t_1}.
$$

For  $\theta \in \mathbb{R}$  and  $\kappa \in \mathbb{C}$  the number of distinct zeros of  $\kappa - H_1$  in  $r_1 + 1 \le |z| \le r$ ,  $|\arg z - \theta| \le \pi/4$ , is at most the number of zeros of  $p_1't_2 - p_2't_1 - \kappa(p_1t_2 - p_2t_1)$  there, which is bounded by a power of  $r$  as  $r\rightarrow\infty$ , by [\[6,](#page-44-5) Lemma 2] or standard sectorial methods. Hence  $f'/f$  has finite order of growth, by the second fundamental theorem, and every  $\lambda \in \Lambda$  is rational at infinity.

Case 2. Assume that the coefficient of  $\Phi$  in at least one of the  $S_{\mu}$  in [\(5.8\)](#page-9-7) is not identically zero, this being equivalent to  $L \neq M$ .

Let  $\nu$  be the largest integer with  $0 \le \nu \le k-1$  such that  $c_{0,\nu} \not\equiv 0$ . Then every pair  $\{G,\Phi\}$ satisfying the system [\(5.8\)](#page-9-7) (including  $\{g,q\}$ ) has

<span id="page-10-0"></span>
$$
\Phi = (c_{0,\nu})^{-1} \left( T_{\nu}[G] - \sum_{j=1}^{k-\nu} c_{j,\nu} \frac{d^{j-1}}{dz^{j-1}} (U[G]) \right) = T^*[G], \tag{5.13}
$$

by [\(5.9\)](#page-9-4). Observe that the operator  $T^*$  has order at least 1, and in particular is not the zero operator, since otherwise [\(5.4\)](#page-8-1) leads to  $(-p'/p)g=q=\eta_1 g$ , with  $\eta_1\in\Lambda$ , so that  $f'/f\in\Lambda$ , and hence  $f^{\prime}/f$  is rational at infinity, contrary to assumption. It follows from [\(5.8\)](#page-9-7), [\(5.9\)](#page-9-4) and [\(5.13\)](#page-10-0) that if  $\{G, \Phi\}$  solves [\(5.8\)](#page-9-7) then G solves the system

<span id="page-10-1"></span>
$$
U[G] = \frac{d}{dz}(T^*[G]), \quad S_{\mu}(T^*[G]) = T_{\mu}[G], \quad 0 \le \mu \le k - 2,
$$
\n(5.14)

as does, in particular, g. Conversely, if G solves the system  $(5.14)$  (in the analytic or formal sense), then [\(5.8\)](#page-9-7) is satisfied by setting  $\Phi\ =\ T^*[G].\;$  This system [\(5.14\)](#page-10-1) cannot be trivial, because otherwise [\(5.8\)](#page-9-7) holds with  $\Phi=T^*[G]$  and an arbitrary choice of  $G$ , which would then have to solve the equation  $N_1[y] = 0$  of Lemma [5.2.](#page-9-9) A standard reduction procedure [\[15,](#page-45-14) p.126] now generates a non-trivial homogeneous linear differential equation  $N[y] = 0$ , with coefficients in the field  $\Lambda$ , whose (analytic or formal) solution space coincides with that of the system [\(5.14\)](#page-10-1). Here every solution  $G$  of  $N[y]=0$  is such that the pair  $\{G, T^{*}[G]\}$  solves [\(5.8\)](#page-9-7), and so  $G$  solves  $N_1[y] = 0$ , from which it follows that N has order at most 3.

Suppose that N has order 1: then  $g'/g \in \Lambda$ , and so  $p'/p$  and  $f'/f$  belong to  $\Lambda$ , by [\(5.4\)](#page-8-1) and [\(5.13\)](#page-10-0), so that  $f^{\prime}/f$  is rational at infinity, contrary to assumption. Thus  $N$  has order at least 2, but at most 3, and the system [\(5.14\)](#page-10-1) has a solution G with  $G/g$  non-constant. By an argument from [\[4\]](#page-44-3) (see [\[6,](#page-44-5) Proof of Theorem 3, Case 1B] for details),  $p^{\prime}/p$  has a representation as a rational function in the  $p_j$  and their derivatives. The same sectorial argument as used in Case 1 shows that  $f^{\prime}/f$  has finite order of growth, as has  $g^{k}=f/F.$  and all members of the field  $\Lambda$  are rational at infinity.

Hence the fact that N has order at most 3 gives an operator  $V_2$ , having order at most 2 and coefficients which are rational at infinity, with the following property. Every solution  $G$  of [\(5.14\)](#page-10-1) has  $T^\ast[G]=V_2[G]$ , so that the pair  $\{G,V_2[G]\}$  solves [\(5.8\)](#page-9-7), and  $p_j'G+p_jV_2[G]$  solves [\(5.6\)](#page-9-1) for  $j=1,\ldots,k$ , by Lemma [5.1.](#page-9-2) Moreover,  $(5.13)$  gives  $q=T^*[g]=V_2[g]$ . With  $V=V_2+a_{k-1}/k$ , this implies using [\(5.4\)](#page-8-1) that each  $f_j'G+f_jV[G]$  solves  $M[y]=0$ , and  $-f'/f=h/g=V[g]/g.$ It now follows, using the Wiman-Valiron theory [\[12\]](#page-45-15) and estimates for logarithmic derivatives [\[8\]](#page-45-16) applied to g, that f has finite order. It also follows that f has an unbounded sequence of poles, since otherwise  $f^{\prime}/f$  is rational at infinity. The following key lemma has thus been proved.

<span id="page-11-2"></span>**Lemma 5.3** With the hypotheses of Theorem [1.3,](#page-1-1) the function  $f'/f$  has finite order, all elements of the field  $\Lambda$  are rational at infinity, and  $h=-(f'/f)g$  satisfies

<span id="page-11-1"></span>
$$
-h' = \left(\frac{k-1}{2}\right)g'' - \frac{a_{k-1}}{k}g' + \frac{D_{k-2} - a'_{k-1}}{k}g, \quad D_j = C_j - c_j.
$$
 (5.15)

Furthermore, if the operators L and M are not the same then the following additional conclusions hold. The function g solves a homogeneous linear differential equation  $N[y] = 0$ , of order 2 or 3, with coefficients which are rational at infinity. Moreover, f has finite order and an unbounded sequence of poles, and there exist functions  $\alpha, \beta, \gamma$ , all rational at infinity, such that

<span id="page-11-4"></span>
$$
h = -\left(\frac{f'}{f}\right)g = V[g], \quad V = \alpha D^2 + \beta D + \gamma. \tag{5.16}
$$

Finally, if G is a locally analytic solution of  $N[y] = 0$ , and K is a locally analytic solution of  $L[y] = 0$ , then  $K'G + KV[G]$  is a (possibly trivial) solution of  $M[y] = 0$ .

 $\Box$ 

Here [\(5.15\)](#page-11-1) follows from [\(5.4\)](#page-8-1) and [\(5.9\)](#page-9-4). The last assertion of Lemma [5.3](#page-11-2) also holds for formal solutions G and K of  $N[y] = 0$  and  $L[y] = 0$  respectively.

### 6 The first special case

<span id="page-11-0"></span>**Proposition 6.1** With the hypotheses of Theorem [1.3,](#page-1-1) suppose in addition that  $c_{k-2} = C_{k-2}$  in [\(5.5\)](#page-9-0) and [\(5.6\)](#page-9-1), which holds if and only if  $a_{k-2} = A_{k-2}$  in L and M, and certainly holds if the operators  $L$  and  $M$  are the same. Then  $f$  satisfies conclusion (i) of Theorem [1.3.](#page-1-1)

*Proof.* The approach here is essentially due to Frank and Hellerstein [\[4\]](#page-44-3). Since  $D_{k-2} = 0$  in  $(5.15)$ , integration gives a constant d such that

<span id="page-11-3"></span>
$$
\frac{f'}{f} = -\frac{h}{g} = \frac{(k-1)g'}{2g} + \frac{d}{g} - \frac{a_{k-1}}{k}.\tag{6.1}
$$

If  $d = 0$  then comparing residues shows that f has no poles in some  $\Omega(r_2)$  and  $F/f$ , which has finite order by Lemma [5.3,](#page-11-2) satisfies  $g^{-k} = F/f = R_1 e^{P_1}$  with  $R_1$  rational at infinity and  $P_1$  a polynomial, so that  $f'/f$  is rational at infinity, by  $(6.1)$ , contrary to assumption.

Assume henceforth that  $d \neq 0$  in [\(6.1\)](#page-11-3), which makes g meromorphic of finite order in  $\Omega(r_1)$ . Suppose that  $f$  has no poles in some  $\Omega(r_2).$  Then  $g$  has no zeros and poles there and  $g=R_2e^{P_2}$ in [\(6.1\)](#page-11-3), with  $R_2$  rational at infinity and  $P_2$  a polynomial. This gives, since  $f^{\prime}/f$  is not rational at infinity,

<span id="page-12-2"></span>
$$
\frac{f'}{f} = R + Se^P, \quad SP' \neq 0,
$$
\n(6.2)

where R and S are rational at infinity and P is a polynomial. It follows using [\[11,](#page-45-13) Lemma 3.5] that

<span id="page-12-1"></span>
$$
\frac{1}{g^k} = \frac{F}{f} = S^k e^{kP} + e^{(k-1)P} \left( kS^{k-1}R + a_{k-1}S^{k-1} + \frac{k(k-1)}{2}S^{k-2}(S' + P'S) \right) + \dots (6.3)
$$

Since  $F/f$  has neither zeros nor poles in  $\Omega(r_2)$ , the coefficient of  $e^{(k-1)P}$  must vanish identically, leading to the first equation of [\(1.5\)](#page-1-2), with  $H^{\prime}=Se^{P}$ , and to  $F/f= S^{k}e^{kP}=(H^{\prime})^{k}.$  Here  $H''/H'$  does not vanish at infinity, because  $P'$  does not.

Suppose next that f has an unbounded sequence of poles. At a pole z of f, with |z| large and with multiplicity  $m$ , equations [\(5.2\)](#page-8-2) and [\(6.1\)](#page-11-3) deliver

$$
\frac{1}{d^k} = \chi(m) = \frac{m(m+1)\dots(m+k-1)}{(m+(k-1)/2)^k},
$$

so that  $d^k$  must be real and greater than 1, by the arithmetic-geometric mean inequality. A further application of the same inequality to  $\chi'/\chi$  shows that all poles  $z$  of  $f$  with  $|z|$  sufficiently large have fixed multiplicity  $m.$  Set  $T_1\,=\,f'/f.$  Since  $g^k$  and  $T_1$  have finite order, standard estimates [\[8\]](#page-45-16) give  $M_1>0$  such that  $T_1^{(j)}$  $\int_1^{(j)}(z)/T_1(z) = O(|z|^{M_1})$  and  $g^{(j)}(z)/g(z) = O(|z|^{M_1})$ , for  $|z|$  outside a set  $F_0$  of finite measure and  $1\leq j\leq k.$  If  $|z|\not\in F_0$  and  $\log^+|T_1(z)|/\log|z|$  is sufficiently large this leads, using [\(6.1\)](#page-11-3) and [\[11,](#page-45-13) Lemma 3.5], to

$$
\frac{1}{g(z)^k} = \frac{F(z)}{f(z)} = T_1(z)^k + \ldots = (1 + o(1))T_1(z)^k = (1 + o(1))\frac{d^k}{g(z)^k},
$$

which is a contradiction since  $d^k>1.$  Thus  $\log^+ |f'(z)/f(z)| = O(\log |z|)$  for  $|z|$  outside a set of finite measure and applying the Wiman-Valiron theory [\[12\]](#page-45-15) to  $1/f$  shows that f has finite order. Furthermore, since f and g have finite order and all poles z of f with  $|z|$  sufficiently large have fixed multiplicity  $m$ , the function  $G_0 = f^{\prime}/f + mg^{\prime}/g$  is rational at infinity. Substituting  $f^{\prime}/f=-mg^{\prime}/g+G_{0}$  into [\(6.1\)](#page-11-3) produces a first order linear differential equation for  $g$  of form

$$
g' + \delta g = d_0,
$$

with  $d_0\in\mathbb{C}$  and  $\delta$  rational at infinity, and with  $\delta(\infty)\neq 0$ , because  $f/F = g^k$  has an essential singularity at infinity. This equation may be solved to give  $g=d_0H/H'$ , where  $H''/H'=\delta$  and  $H(z)\neq \infty$  and  $H'(z)\neq 0$  for large  $z$  in a sector containing an unbounded sequence of poles of f. It follows, using  $(6.1)$  again, that

<span id="page-12-0"></span>
$$
\frac{g'}{g} = \frac{H'}{H} - \frac{H''}{H'}, \quad \frac{f'}{f} = -\frac{a_{k-1}}{k} - \left(\frac{k-1}{2}\right)\frac{H''}{H'} + d_1\frac{H'}{H}, \quad d_1 \in \mathbb{C}.\tag{6.4}
$$

Now comparing residues shows that  $d_1 = -m$  in [\(6.4\)](#page-12-0), giving the second equation of [\(1.5\)](#page-1-2).

To determine the solutions of  $L[y] = 0$ , write

$$
\phi = (H')^{-k}e^{H}, \quad \psi = (H')^{-k}H^{-m}, \quad \delta = \frac{H''}{H'}, \quad M_k = (D + \delta) \dots (D + k\delta), \quad D = \frac{d}{dz}.
$$

Then it is easy to verify that

<span id="page-13-0"></span>
$$
\Phi = M_k[\phi] = e^H, \quad \Psi = M_k[\psi] = cH^{-m-k}, \quad M_k[(H')^{-k}P_{k-1}(H)] = 0, \quad (6.5)
$$

where  $P_{k-1}$  denotes any polynomial of degree at most  $k-1$ . In fact, the action of the differential operator  $M_k$  on  $\phi$ ,  $\psi$  and  $(H')^{-k}P_{k-1}(H)$  amounts to  $k$  times differentiating with respect to  $H$ the terms  $e^H$ ,  $H^{-m}$  and  $P_{k-1}(H).$  Define  $Z$  locally by

$$
\frac{Z'}{Z} = -\frac{a_{k-1}}{k} + \left(\frac{k+1}{2}\right)\frac{H''}{H'}.
$$

Then a standard change of variables gives  $L_k = D^k + \ldots + \widetilde{A}_1 D + \widetilde{A}_0$ , with coefficients which are readily computable and rational at infinity, such that  $L_k[Zy] = ZM_k[y]$ , and the last equation of [\(6.5\)](#page-13-0) shows that  $L_k[w] = 0$  has linearly independent solutions  $y_j$  given locally by [\(1.6\)](#page-2-2).

The next step is to show that  $L_k = L$ . When f has no poles in some  $\Omega(r_2)$ , combining the first equation of [\(1.5\)](#page-1-2) with [\(6.3\)](#page-12-1) and the remarks immediately following it yields

$$
Z\phi = cf
$$
,  $\frac{L[f]}{f} = \frac{F}{f} = S^k e^{kP} = (H')^k = \frac{\Phi}{\phi} = \frac{M_k[\phi]}{\phi} = \frac{ZM_k[\phi]}{cf} = \frac{L_k[cf]}{cf} = \frac{L_k[f]}{f}.$ 

Thus the operators L and  $L_k$  must agree: otherwise f satisfies a homogeneous linear differential equation with coefficients which are rational at infinity, and so has finite order, contradicting  $(6.2)$ . On the other hand, when f has an unbounded sequence of poles,  $(1.5)$  and  $(6.4)$  lead to

$$
Z\psi = cf, \quad \frac{L[f]}{f} = \frac{F}{f} = \frac{1}{g^k} = c\left(\frac{H'}{H}\right)^k = \frac{c\Psi}{\psi} = \frac{cM_k[\psi]}{\psi} = \frac{cZM_k[\psi]}{f} = \frac{cL_k[f]}{f}.
$$

Again the operators L and  $cL_k$  must agree, and  $c$  must be 1, because otherwise  $f$  cannot have an unbounded sequence of poles. Thus, in both cases, the  $y_j$  solve  $L[y] = 0$ . Next, using [\(1.5\)](#page-1-2) and [\(1.6\)](#page-2-2) shows, after multiplying  $y_2$  by a constant if necessary, that

$$
\frac{f'}{f} = \frac{y_1'}{y_1} + \left(\frac{y_2}{y_1}\right)'
$$
 or 
$$
\frac{f'}{f} = \frac{y_1'}{y_1} - m\left(\frac{y_2'}{y_2} - \frac{y_1'}{y_1}\right).
$$

This gives  $f = cy_1 \exp(y_2/y_1)$  or  $f = cy_1^{m+1}y_2^{-m}$  as asserted.

Finally, set  $\tilde{M}_2 = (D + (k-1)\delta)(D + k\delta)$ . There exists an operator  $\tilde{L}_2 = D^2 + \tilde{a}_1 D + \tilde{a}_0$ , with coefficients which are rational at infinity, such that  $\widetilde{L}_2[Zy] = Z \widetilde{M}_2[y]$  and

$$
\widetilde{L}_2[Z\phi] = Z\widetilde{M}_2[\phi] = Z(H')^{2-k}e^H, \quad \widetilde{L}_2[Z\psi] = Z\widetilde{M}_2[\psi] = cZ(H')^{2-k}H^{-m-2}.
$$

Since f equals  $cZ\phi$  or  $cZ\psi$ , there exists  $r_3 > 0$  such that  $\widetilde{L}_2[f]$  has no zeros in  $\Omega(r_3)$ , and Proposition [6.1](#page-11-0) is proved.

 $\Box$ 

# 7 Annihilators

The remainder of the proof of Theorem [1.3](#page-1-1) focuses on the case where the operators L and M differ. In this case Lemma [5.3](#page-11-2) ensures that if  $\phi$  is a non-trivial solution of  $L[y] = 0$ , and  $\psi$  is a non-trivial solution of  $N[y]=0$ , then  $\chi=\phi'\,\psi+\phi\,V[\psi]$  solves  $M[y]=0.$  Here  $\chi$  may vanish identically, in which case  $\psi$  will be said to annihilate  $\phi$ , and vice versa. This notion makes sense when  $\phi$  and  $\psi$  are both analytic solutions, and also when they are both formal solutions. The terminology in this section is as in Section [4,](#page-6-1) and the convention that exponential parts have zero constant term still applies. The following variant of an auxiliary result from [\[2\]](#page-44-4) is key to the proof of Theorem [1.3.](#page-1-1)

<span id="page-14-2"></span>**Lemma 7.1 ([\[2\]](#page-44-4))** Assume that  $L \neq M$  and take a canonical formal solution G of  $N[y] = 0$ which is free of logarithms and has exponential part  $\kappa$ . In addition, take a fundamental set of canonical formal solutions  $f_1,\ldots,f_k$  of  $L[y]=0$ , such that  $f_j$  has exponential part  $q_j$ , and a fundamental set of canonical formal solutions  $w_1, \ldots, w_k$  of  $M[y] = 0$ , where  $w_j$  has exponential part  $s_j$ . Then the following conclusions hold.

(i) Each  $W_j=f_j'G+f_jV[G]$  is either identically zero or a canonical formal solution of  $M[y]=0$ with exponential part  $q_i + \kappa$ .

(ii) There exists  $\lambda = \lambda(G) \in \{1, \ldots, k\}$  such that the collection  $s_1, \ldots, s_k$  consists of

<span id="page-14-1"></span>
$$
q_j + \kappa \quad (j \neq \lambda), \quad q_\lambda - (k-1)\kappa. \tag{7.1}
$$

(iii) If the  $W_j$  are linearly dependent, then  $G$  annihilates a canonical formal solution  $g_1$  of  $L[y]=0$ with exponential part  $q_{\lambda}$ , and every formal solution of  $L[y] = 0$  which is annihilated by G is a constant multiple of  $g_1$ .

(iv) If  $\kappa$  is not identically zero, then the  $W_j$  are linearly dependent.

Proof. Conclusion (i) follows immediately from Lemma [5.3.](#page-11-2) Next, Lemma [4.1](#page-7-0) and Abel's identity give, since  $a_{k-1}(\infty) = A_{k-1}(\infty) = 0$ ,

<span id="page-14-0"></span>
$$
\sum_{j=1}^{k} q_j = \sum_{j=1}^{k} s_j = 0.
$$
\n(7.2)

Suppose first that the  $W_j$  are linearly independent. Then (i), [\(7.2\)](#page-14-0) and Lemma [4.1](#page-7-0) yield

$$
0 = \sum_{j=1}^{k} s_j = \sum_{j=1}^{k} (q_j + \kappa) = k\kappa,
$$

which implies that  $\kappa = 0$  and that  $\{s_1, \ldots, s_k\} = \{q_1, \ldots, q_k\}$ , again by Lemma [4.1.](#page-7-0) This proves conclusion (iv), and that [\(7.1\)](#page-14-1) applies when the  $W_j$  are linearly independent.

Now suppose that the  $W_j$  are linearly dependent: then  $G$  annihilates a non-trivial solution  $g_1$  of  $L[y] = 0$ . It may be assumed that the exponential parts and formal series appearing in  $G$ and the  $f_j$  and  $w_j$  all involve integer powers of  $z^{1/p}.$  for some fixed  $p\in\mathbb{N}.$  Because  $G$  is free of logarithms, [\(5.16\)](#page-11-4) implies that  $V[G]/G$  is a formal series in descending powers of  $z^{1/p}$ , and therefore so is  $g_1^{\prime}/g_1$ . Thus  $g_1$  is a canonical formal solution of  $L[y]=0$ , and by Lemma [4.1](#page-7-0) it may be assumed that  $g_1 = f_1$ ; moreover, every formal solution  $g_2$  of  $L[y] = 0$  which is annihilated by G has  $W(g_1, g_2) = 0$ , so that  $g_2$  is a constant multiple of  $g_1$ . This proves (iii).

Now set  $U_j = f'_j G + f_j V[G]$ . Then  $U_1 \equiv 0$ , but  $U_2, \ldots, U_k$  are linearly independent, and  $M[y]=0$  has a fundamental set  $\{U^*, U_2, \ldots, U_k\}$  of canonical formal solutions, with exponential parts  $s^*,q_2+\kappa,\ldots,q_k+\kappa$  respectively. Using [\(7.2\)](#page-14-0) twice, as well as Lemma [4.1,](#page-7-0) shows that these exponential parts have sum  $0$  and  $s^* = q_1 - (k-1)\kappa$ , which leads to [\(7.1\)](#page-14-1).  $\hfill\Box$ 

<span id="page-15-1"></span>The following lemma, in which transcendentally fast means faster than any power of  $z$ , gives a sufficient condition for an analytic solution of  $N[y] = 0$  to annihilate a solution of  $L[y] = 0$ .

**Lemma 7.2** Suppose that  $L \neq M$ . Then  $g(z)$  cannot tend to 0 transcendentally fast as  $z \to \infty$ in a sector, and the equation  $N[y] = 0$  cannot have a fundamental set of canonical formal solutions with the same exponential part. Moreover, if  $G$  is a non-trivial analytic solution of  $N[y] = 0$  and  $G(z)$  tends to  $0$  transcendentally fast as  $z \to \infty$  in a sector  $S$ , then  $G$  annihilates a non-trivial analytic solution of  $L[y] = 0$ .

Proof. If  $g$  tends to zero transcendentally fast on a sector, then  $F/f = g^{-k}$  tends to infinity transcendentally fast there; since  $f$  has finite order by Lemma [5.3,](#page-11-2) this contradicts standard estimates [\[8\]](#page-45-16) for logarithmic derivatives  $f^{(j)}/f.$ 

Next, if  $N[y] = 0$  has a fundamental set of canonical formal solutions with the same exponential part  $\kappa$ , then  $\kappa$  is a polynomial in z, by Lemma [4.1](#page-7-0) and Abel's identity. Here  $\kappa$  cannot be the zero polynomial, because  $g^k$  is transcendental, and so there exists a sector on which every solution of  $N[y] = 0$ , including q, tends to zero transcendentally fast, which is a contradiction.

Assume now that G is a non-trivial analytic solution of  $N[y] = 0$  which tends to 0 transcendentally fast in a sector S, but annihilates no non-trivial solution of  $L[y] = 0$ . Then there exist  $k$  solutions  $f_j$  of  $L[y]=0$  such that the  $f_j^\prime G+f_jV[G]$  are linearly independent solutions of  $M[y] = 0$  on S. Because  $N[y] = 0$  has order at most 3 and at least two distinct exponential parts, the asymptotics in Section [4](#page-6-1) give rise to a subsector  $S^*$  of  $S$  on which  $G(z)\neq 0$  and  $G^{(j)}(z)/G(z)=O(|z|^q)$  as  $z\to\infty$ , for some  $q\in\mathbb{N}$  and all  $j\in\{1,\ldots,k\}.$  This is clear if one solution  $h_i$  as in [\(4.2\)](#page-6-2) dominates the others on a subsector, and so evidently holds unless there are two solutions  $h_j$  as in [\(4.2\)](#page-6-2), with the same exponential part, for which the powers  $\gamma_j$  differ by  $\delta\in i\mathbb{R}\setminus\{0\}$ ; but in this case, for any given  $A\in\mathbb{C}^*$ , a subsector may be chosen on which  $\log |z^\delta - A|$  is bounded. Define functions  $Y$ ,  $\phi$  and  $\Phi$  on  $S^*$  by

<span id="page-15-0"></span>
$$
\frac{Y'}{Y} = -a_{k-1} = -A_{k-1}, \quad -\frac{\phi'}{\phi} = \frac{V[G]}{G} = \alpha \frac{G''}{G} + \beta \frac{G'}{G} + \gamma, \quad \Phi = L[\phi]. \tag{7.3}
$$

It follows that

$$
cY = W(f'_1G + f_1V[G], \dots, f'_kG + f_kV[G])
$$
  
= 
$$
W(f'_1G - f_1(\phi'/\phi)G, \dots, f'_kG - f_k(\phi'/\phi)G) = (\phi G)^k W((f_1/\phi)', \dots, (f_k/\phi)')
$$
  
= 
$$
(\phi G)^k W(1, f_1/\phi, \dots, f_k/\phi) = \phi^{-1} G^k W(\phi, f_1, \dots, f_k).
$$

This delivers in turn

$$
\frac{\Phi}{\phi} = \frac{L[\phi]}{\phi} = \frac{cW(f_1,\ldots,f_k,\phi)}{Y\phi} = \frac{c}{G^k},
$$

so that  $\Phi(z)/\phi(z)$  tends to infinity transcendentally fast in the sector  $S^*$ . But [\(7.3\)](#page-15-0) implies that there exist  $q', q'' \in \mathbb{N}$  with  $\phi'(z)/\phi(z) = O(|z|^{q'})$  as  $z \to \infty$  in  $S^*$ , and hence  $\Phi(z)/\phi(z) =$  $O(|z|^{q''})$  as  $z \to \infty$  on a subsector of  $S^*$ , a contradiction.

## 8 The second special case

<span id="page-16-0"></span>**Proposition 8.1** With the hypotheses of Theorem [1.3,](#page-1-1) suppose in addition that  $L \neq M$  and that there exist  $E \in \mathbb{N}$  and a function R which is rational at infinity such that all poles z of  $\mathfrak{f}(z)=f\left(z^E\right)$  with  $|z|$  sufficiently large have multiplicity  $R(z).$  Then  $f$  satisfies at least one of conclusions (i) and (ii) of Theorem [1.3.](#page-1-1)

The proof of Proposition [8.1](#page-16-0) will occupy the remainder of this section. Observe first that  $f$  has finite order and an unbounded sequence of poles, by Lemma [5.3.](#page-11-2) Next, it may be assumed that  $E = 1$ . To see this, let  $\omega = \exp(2\pi i/E)$  and let  $z_0$  be large and a pole of f of multiplicity  $m_0$ . Let  $w_0^E\,=\,z_0$ . Then  $w_0$  is a pole of  $\mathfrak f$  of multiplicity  $m_0\,=\,R(w_0).$  This is true for all  $E$  choices of  $w_0$  and so  $R(z) = R(\omega z)$  for all large  $z$ , which gives  $R(z) = S\left(z^E\right)$  for some function S which is rational at infinity. Thus the multiplicity  $m_0$  of the pole of f at  $z_0$  satisfies  $m_0=R(w_0)=S(w_0^E)=S(z_0).$  Assume for the remainder of this section that  $E=1.$ 

<span id="page-16-2"></span>**Lemma 8.1** There exist functions  $d_0$ ,  $d_1$ , both rational at infinity, such that f and g satisfy

<span id="page-16-1"></span>
$$
\frac{f'}{f} = d_0 \frac{g'}{g} + d_1.
$$
\n(8.1)

Moreover,  $d_0$  either has  $d_0(\infty) = \infty$  or is constant and equal to a negative integer.

*Proof.* Let  $d_0 = -R$ . By the remark following [\(5.1\)](#page-8-0), there exists  $r_0 > 0$  such that  $f'/f - d_0g'/g$ has no poles in  $\Omega(r_0)$ , and so is rational at infinity since  $g^k$  and  $f$  have finite order. The last assertion follows from the fact that  $f$  has an unbounded sequence of poles.  $\Box$ 

<span id="page-16-4"></span>**Lemma 8.2** There exist functions  $\nu_1$ ,  $\nu_0$ , both rational at infinity, such that g satisfies [\(1.8\)](#page-2-3).

Proof. The equation [\(8.1\)](#page-16-1) yields, using [\(5.1\)](#page-8-0),

$$
-h = \left(\frac{f'}{f}\right)g = d_0g' + d_1g, \quad -h' = d_0g'' + (d'_0 + d_1)g' + d'_1g.
$$

Combining this with [\(5.15\)](#page-11-1) gives

<span id="page-16-3"></span>
$$
0 = \left(d_0 - \frac{k-1}{2}\right)g'' + \left(d'_0 + d_1 + \frac{a_{k-1}}{k}\right)g' + \left(d'_1 + \frac{a'_{k-1} + c_{k-2} - C_{k-2}}{k}\right)g\tag{8.2}
$$

and an equation [\(1.8\)](#page-2-3), as asserted, since  $d_0 - (k-1)/2 \not\equiv 0$  by Lemma [8.1.](#page-16-2)

 $\Box$ 

From [\(1.8\)](#page-2-3), [\(5.16\)](#page-11-4) and [\(8.1\)](#page-16-1) it follows that

$$
-d_0 g' - d_1 g = -\left(\frac{f'}{f}\right) g = h = V[g] = (\beta - \alpha \nu_1) g' + (\gamma - \alpha \nu_0) g
$$

and so, since  $g^{\bm{k}}$  has an unbounded sequence of zeros,

<span id="page-17-0"></span>
$$
-d_0 = \beta - \alpha \nu_1, \quad -d_1 = \gamma - \alpha \nu_0. \tag{8.3}
$$

<span id="page-17-2"></span>In the next lemma the convention that exponential parts have zero constant term is retained.

**Lemma 8.3** There exists an equation [\(4.3\)](#page-7-1), with  $A^*$  rational at infinity, such that  $yU^{-1/2}$  solves [\(4.3\)](#page-7-1) for every solution  $y$  of [\(1.8\)](#page-2-3), where  $U'/U = -\nu_1$ . The equation (1.8) has a pair of linearly independent canonical formal solutions with distinct exponential parts, and [\(4.3\)](#page-7-1) has an irregular singular point at infinity.

If  $\kappa$  is a non-zero exponential part for equation [\(1.8\)](#page-2-3), then there exists a locally analytic solution  $u_1$  of [\(1.8\)](#page-2-3), with exponential part  $\kappa$ , which continues without zeros in some  $\Omega(r_2)$  and annihilates a non-trivial locally analytic solution  $y_1$  of  $L[y] = 0$ , where  $y_1$  is given by

<span id="page-17-1"></span>
$$
\frac{y_1'}{y_1} = d_0 \frac{u_1'}{u_1} + d_1. \tag{8.4}
$$

Moreover, both  $zu_1'(z^2)/u_1(z^2)$  and  $zy_1'(z^2)/y_1(z^2)$  are rational at infinity.

*Proof.* The existence of the equation [\(4.3\)](#page-7-1) solved by  $yU^{-1/2}$  for every solution  $y$  of [\(1.8\)](#page-2-3) is a standard consequence of Abel's identity. Now the exponential parts  $\kappa_1, \kappa_2$  for [\(1.8\)](#page-2-3) are polynomials in  $z^{1/2}$ , by [\(4.4\)](#page-7-2), and their sum is a polynomial in  $z;$  thus  $\kappa_j(z)=Q_j(z)+z^{1/2}(-1)^jQ^*(z)$ with  $Q^*$  and the  $Q_j$  polynomials in  $z$ .

Suppose that  $\kappa_1 = \kappa_2 = \kappa_0$ . Then  $\kappa_0$  is a polynomial, and must be non-constant since g satisfies [\(1.8\)](#page-2-3) and  $f/F = g^k$  has an essential singularity at infinity. But this implies the existence of a sector on which every solution of  $(1.8)$ , including g, tends to zero transcendentally fast as  $z \to \infty$ , which contradicts Lemma [7.2.](#page-15-1) Thus  $\kappa_1 \neq \kappa_2$ , so that [\(4.3\)](#page-7-1) has an irregular singular point at infinity, and at least one canonical formal solution of [\(1.8\)](#page-2-3) has non-zero exponential part.

Take a canonical formal solution  $u_1$  of [\(1.8\)](#page-2-3) with exponential part  $\kappa \neq 0$ . Then  $u_1$  is given by a formal expression as in [\(4.1\)](#page-6-0), but free of logarithms, and  $u_1^\prime/u_1$  is a formal series in descending powers of  $z^{1/2}.$  Since  $f$  has finite order and an unbounded sequence of poles, the function  $g^{\prime}/g$  is not rational at infinity. Thus  $g$  cannot solve a first order homogeneous linear differential equation with coefficients which are rational at infinity, and so the division algorithm for linear differential operators [\[15,](#page-45-14) p.126] shows that the operator N of Lemma [5.3](#page-11-2) must satisfy  $N = N_0 \circ (D^2 + \nu_1 D + \nu_0)$ , for some operator  $N_0$  of order 1 or 0. Hence every solution of [\(1.8\)](#page-2-3), including  $u_1$ , solves  $N[y] = 0$ . It follows from Lemma [7.1](#page-14-2) that  $u_1$  annihilates some canonical formal solution  $y_1$  of  $L[y] = 0$ . This gives, using [\(1.8\)](#page-2-3), [\(5.16\)](#page-11-4) and [\(8.3\)](#page-17-0),

$$
-y_1'u_1 = y_1V[u_1] = y_1((\beta - \alpha\nu_1)u_1' + (\gamma - \alpha\nu_0)u_1) = y_1(-d_0u_1' - d_1u_1),
$$

and hence [\(8.4\)](#page-17-1). Thus  $y_1^\prime/y_1$  is also a formal series in  $z^{1/2}$ , and the hypotheses of Lemma [3.3](#page-5-2) are satisfied with  $p = y_1$  and  $q = u_1$ . Hence [\(3.2\)](#page-5-0) holds with the  $b_j$  rational at infinity and

 $b_k\not\equiv 0$  by Lemma [8.1.](#page-16-2) But  $L[y_1]=0$ , and so  $u'_1/u_1$  is algebraic at infinity, that is,  $u'_1/u_1$  solves a polynomial equation with coefficients which are rational at infinity. In particular, the series for  $u_1^\prime/u_1$  converges for large  $z$  in some sector, as does that for  $y_1^\prime/y_1$ , by [\(8.4\)](#page-17-1), and  $u_1$  and  $y_1$  are analytic local solutions of  $(1.8)$  and  $L[y]=0$  respectively. Since the algebraic equation for  $u_1^\prime/u_1$ has only finitely many branches for its solutions, and each branch has no poles in some sector  $|z| > r_2$ ,  $|\arg z| < 4\pi$ , it follows that  $u_1$  continues without zeros in  $\Omega(r_2)$ . This means that, as  $z$  crosses a critical ray of [\(4.3\)](#page-7-1), the solution  $u_1U^{-1/2}$  of (4.3) must change from small to large or vice versa. Therefore continuing twice around a circle  $|z|=r_3>r_2$  brings  $u_1U^{-1/2}$  back to a constant multiple of itself, and the same is true for  $u_1$ . Thus  $z u_1'(z^2)/u_1(z^2)$  is rational at infinity, and so is  $zy'_1(z^2)/y_1(z^2)$  by [\(8.4\)](#page-17-1).

Choose a critical ray  $\arg z = \theta^*$  for the equation [\(4.3\)](#page-7-1) and a sector  $S^*$ , symmetric about the critical ray, and with internal angle slightly less than  $4\pi/(2+\deg_\infty A^*)$ , in which  $f$  has an unbounded sequence of poles, these being zeros of  $g$ . In the sector  $S^*$ , equation [\(4.3\)](#page-7-1) has two linearly independent zero-free analytic solutions, by [\(4.4\)](#page-7-2). Denote these by  $u^*=uU^{-1/2}$  and  $v^*=vU^{-1/2}$  say, where  $u$  and  $v$  solve  $(1.8).$  Here  $u$  and  $v$  have distinct exponential parts  $\kappa_u$ and  $\kappa_v$ , each a polynomial in  $z^{1/2}$ , and it may be assumed that  $\kappa_u$  is non-constant and

<span id="page-18-3"></span>
$$
\liminf_{z \to \infty, z \in S^*} \left| \frac{\kappa_v(z)}{\kappa_u(z)} \right| \le 1, \quad g = v - u,
$$
\n(8.5)

since  $u$  and  $v$  may be interchanged and multiplied by constants. Now Lemma [8.3](#page-17-2) shows that there exist locally analytic solutions  $u_1$  of [\(1.8\)](#page-2-3) and  $y_1$  of  $L[y] = 0$  respectively, such that  $u_1$  has exponential part  $\kappa_u$ , while [\(8.4\)](#page-17-1) holds and both  $z u_1'(z^2)/u_1(z^2)$  and  $z y_1'(z^2)/y_1(z^2)$  are rational at infinity. Thus  $u_1$  must be a constant multiple of u and so, by [\(8.1\)](#page-16-1),

<span id="page-18-0"></span>
$$
T_1 = \frac{y_1'}{y_1} = d_0 \frac{u'}{u} + d_1, \quad \frac{f'}{f} = d_0 \frac{g'}{g} + d_1 = d_0 \left(\frac{g'}{g} - \frac{u'}{u}\right) + \frac{y_1'}{y_1}.
$$
 (8.6)

Poles z of f occur where  $v(z)/u(z) = 1$ , and have multiplicity equal to  $-d_0(z)$ , by [\(8.6\)](#page-18-0). Furthermore, by [\(4.4\)](#page-7-2),  $\zeta = (1/2\pi i) \log(v^*/u^*) = (1/2\pi i) \log(v/u)$  maps  $S^*$  conformally onto a domain containing a right or left half-plane  $\pm \text{Re}\,\zeta > M_0 > 0$ . Since  $d_0$  takes integer values at all points in  $S^*$  where  $\zeta$  is integer-valued, applying Lemma [3.1](#page-4-0) shows that there exists a polynomial  $Q$  such that

<span id="page-18-1"></span>
$$
d_0 = Q(T), \quad T = 2\pi i \zeta = \log\left(\frac{v}{u}\right). \tag{8.7}
$$

The second equation of [\(8.6\)](#page-18-0) can now be written in the form

<span id="page-18-2"></span>
$$
\frac{f'}{f} = Q(T) \left( \frac{v' - u'}{v - u} - \frac{u'}{u} \right) + \frac{y'_1}{y_1} = Q(T) \frac{v'u - u'v}{(v - u)u} + \frac{y'_1}{y_1}
$$
\n
$$
= Q(T) \frac{v'/v - u'/u}{1 - u/v} + \frac{y'_1}{y_1} = \frac{Q(T)T'}{1 - e^{-T}} + \frac{y'_1}{y_1} = \frac{Q(T)T'}{1 - e^{-T}} + T_1,
$$
\n(8.8)

which gives [\(1.7\)](#page-2-0), and it suffices to consider two cases.

#### 8.1 Case I

Suppose first that Q is constant and one exponential part for [\(1.8\)](#page-2-3) is 0. Then  $d_0 = Q(T)$  is constant and  $v$  has exponential part  $0$  in  $S^*$ , because  $u$  does not.  ${\sf A}$  pole of  $f$  of multiplicity

 $m_0$  in  $S^*$  gives  $v/u = 1$  and  $g' = v' - u' = v' - (u'/u)v = T'v$ , as well as [\(5.2\)](#page-8-2). Since all poles of  $f$  in  $S^{\ast}$  with  $|z|$  sufficiently large have fixed multiplicity  $-d_{0}$ , it follows from Lemma [3.1](#page-4-0) and [\(5.2\)](#page-8-2) that  $(T'v)^{-k}$ , which also has exponential part  $0$  in  $S^*$ , must be constant, and so must  $v'-(u'/u)v$ . But then  $W(u,v)/u$  is constant, and so  $\nu_1=-u'/u$  in [\(1.8\)](#page-2-3). Because  $u$  solves [\(1.8\)](#page-2-3), it must be the case that  $\nu_0 = -(u'/u)' = \nu_1'$ . Now comparing [\(1.8\)](#page-2-3) and [\(8.2\)](#page-16-3) shows that, since  $d_0$  is constant,  $c_{k-2} - C_{k-2}$  must vanish, so that Proposition [6.1](#page-11-0) may be applied, and f satisfies conclusion (i) of Theorem [1.3.](#page-1-1)

#### 8.2 Case II

Assume now that either both exponential parts for  $(1.8)$  are non-zero, or  $Q$  is non-constant.

**Lemma 8.4** The solution  $v$  continues without zeros in some  $\Omega(r_2)$ , and  $zv'(z^2)/v(z^2)$  is rational at infinity.

*Proof.* Suppose first that both exponential parts for  $(1.8)$  are non-zero. Then Lemma [8.3](#page-17-2) gives a solution  $V_1$  of [\(1.8\)](#page-2-3), such that  $V_1$  and  $u$  are linearly independent and  $V_1$  continues without zeros in some  $\Omega(r_2)$ , with  $z V_1'(z^2)/V_1(z^2)$  rational at infinity. Since  $u$  and  $v$  are linearly independent and zero-free in  $S^*$ , the solution  $V_1$  must be a constant multiple of  $v.$ 

Now suppose that  $v$  has exponential part  $0$  in  $S^*$ : then  $Q$  is non-constant, and  $(8.7)$  implies that  $T = \log(v/u)$  is algebraic at infinity. Thus v continues without zeros in some  $\Omega(r_2)$ , because u does, and the same argument as applied to u in the proof of Lemma [8.3](#page-17-2) shows that  $zv'(z^2)/v(z^2)$  is rational at infinity as asserted.  $\square$ 

The functions  $u'/u$ ,  $v'/v$  and  $T' = v'/v - u'/u$  are all defined for large  $z \in S^*$  and given by convergent series in descending powers of  $z^{1/2}.$  Denote by  $\hat{\psi}$  the result of continuing a function element  $\psi$  once counter-clockwise around a circle  $|z|=r_3>r_2$ , starting in  $S^*.$  Since  $u$  and  $v$ both continue without zeros, there exists  $\zeta_0 \in \mathbb{C}$  such that

<span id="page-19-0"></span>(a) 
$$
\hat{u} = cu
$$
,  $\hat{v} = cv$ ,  $\hat{T} = T + \zeta_0$  or (b)  $\hat{u} = cv$ ,  $\hat{v} = cu$ ,  $\hat{T} = -T - \zeta_0$ . (8.9)

<span id="page-19-2"></span>**Lemma 8.5** There exist  $d_2 \in [0, 1/2]$  and functions  $E_0$ ,  $E_1$  and  $E_2 \neq 0$ , each rational at infinity, such that

<span id="page-19-1"></span>
$$
\frac{u'(z)}{u(z)} = (d_2 - 1)T'(z) + o(|T'(z)|), \quad \frac{v'(z)}{v(z)} = d_2T'(z) + o(|T'(z)|)
$$
(8.10)

as  $z \to \infty$  in  $S^*$ , while  $E_2 f'' + E_1 f' + E_0 f$  has no zeros in some  $\Omega(r_3)$ .

If subcase (a) applies in [\(8.9\)](#page-19-0), then  $T'$  is rational at infinity, with  $T'(\infty) \neq 0$ , while if subcase (b) applies then  $d_2=1/2$  and  $H_0(z)=z^{1/2}T'(z)$  is rational at infinity, with  $H_0(\infty)\neq 0.$ 

Proof. Suppose first that subcase (a) applies in [\(8.9\)](#page-19-0). Then  $u'/u$ ,  $v'/v$  and  $T'$  are all rational at infinity, and so is  $T_1$  in [\(8.6\)](#page-18-0). Thus applying Lemma [3.3](#page-5-2) to f and g gives, in view of [\(8.1\)](#page-16-1), [\(8.8\)](#page-18-2) and Lemma [8.2,](#page-16-4) functions  $E_0$ ,  $E_1$  and  $E_2$ , each rational at infinity, such that  $E_2 \not\equiv 0$  and

$$
E_2 \frac{f''}{f} + E_1 \frac{f'}{f} + E_0 = \left(\frac{f'}{f} - T_1\right)^2 = \left(\frac{Q(T)T'}{1 - e^{-T}}\right)^2.
$$

Hence  $E_2 f'' + E_1 f' + E_0 f$  has no zeros in some  $\Omega(r_3)$ .

To prove the existence of  $d_2$  in subcase (a), suppose first that  $\deg_\infty(u'/u) > \deg_\infty T'$ . Then, as  $z \to \infty$ , with arg z arbitrary,

$$
\frac{v'(z)}{v(z)} = \frac{u'(z)}{u(z)} + T'(z) = (1 + o(1))\frac{u'(z)}{u(z)}.
$$

Since u has non-zero exponential part, this gives a sector on which u and v both tend to zero transcendentally fast, and hence so does every solution of  $(1.8)$ , including g, contradicting Lemma [7.2.](#page-15-1) Thus there exists  $d_2 \in \mathbb{C}$  such that [\(8.10\)](#page-19-1) holds as  $z \to \infty$ , with  $\arg z$  arbitrary, and  $T'(\infty)\neq 0$ , since  $u$  has non-zero exponential part. If  $d_2\not\in\R$ , or if  $d_2\in\R\setminus[0,1]$ , then again there exists a sector on which  $u, v$  and  $g$  all tend to zero transcendentally fast, contradicting Lemma [7.2.](#page-15-1) Finally, [\(8.5\)](#page-18-3) gives  $d_2 \leq 1/2$ .

Assume now that subcase (b) holds in [\(8.9\)](#page-19-0). Because  $f$  has an unbounded sequence of poles in  $S^*$  and  $y_1$  continues without zeros,  $(8.8)$  leads to

<span id="page-20-0"></span>
$$
\widehat{T}' = -T', \quad \frac{f'}{f} = \frac{-Q(T)T'}{1 - e^{T + \zeta_0}} + \widehat{T}_1, \quad e^{\zeta_0} = 1, \quad Q(T)T' = \widehat{T}_1 - T_1 = T_2 - T_1. \tag{8.11}
$$

Furthermore,  $u'/u + v'/v = 2H_1$  and  $u'v'/uv$  are rational at infinity, and so are  $T_1 + T_2$  and  $T_1T_2$  by continuation of the first equation of [\(8.6\)](#page-18-0). On the other hand [\(8.11\)](#page-20-0) implies that  $T^{\prime}(z)=2z^{1/2}H_{2}(z)$ , with  $H_{2}$  rational at infinity. This yields

<span id="page-20-1"></span>
$$
\frac{u'(z)}{u(z)} = H_1(z) - z^{1/2} H_2(z), \quad \frac{v'(z)}{v(z)} = H_1(z) + z^{1/2} H_2(z).
$$
 (8.12)

Since u has non-zero exponential part, either  $\deg_{\infty} H_1 \geq 0$  or  $\deg_{\infty} H_2 \geq -1$ . Moreover,  $deg_{\infty} H_2 \geq deg_{\infty} H_1$  (and so  $deg_{\infty} H_2 \geq -1$ ) in [\(8.12\)](#page-20-1); otherwise there again exists a sector on which every solution of  $(1.8)$ , including g, tends to zero transcendentally fast, contradicting Lemma [7.2.](#page-15-1) Thus [\(8.10\)](#page-19-1) holds with  $d_2 = 1/2$ .

Applying Lemma [3.3](#page-5-2) to  $f$  and  $g$  now gives, in view of Lemma [8.2](#page-16-4) and [\(8.1\)](#page-16-1), [\(8.8\)](#page-18-2) and [\(8.11\)](#page-20-0), functions  $E_0$ ,  $E_1$  and  $E_2$ , each rational at infinity, such that  $E_2 \not\equiv 0$  and

$$
E_2 \frac{f''}{f} + E_1 \frac{f'}{f} + E_0 = \left(\frac{f'}{f} - T_1\right) \left(\frac{f'}{f} - T_2\right) = -\frac{\left(Q(T)T'\right)^2}{\left(1 - e^T\right)\left(1 - e^{-T}\right)},
$$

and so  $E_2 f'' + E_1 f' + E_0 f$  again has no zeros in some  $\Omega(r_3)$ .

Recall that  $\zeta(z) = T(z)/2\pi i$  maps a subdomain of  $S^*$  conformally onto a right or left halfplane. If  $z_1\in S^*$  and  $\zeta(z_1)\in \mathbb Z$  then  $e^{T(z_1)}=v(z_1)/u(z_1)=1$ , while  $f$  has a pole at  $z_1$  of multiplicity  $-d_0(z_1) = -Q(T(z_1))$ , by [\(8.8\)](#page-18-2), and [\(5.2\)](#page-8-2) gives

<span id="page-20-2"></span>
$$
(T'(z_1)v(z_1))^{-k} = (v'(z_1) - u'(z_1))^{-k} = g'(z_1)^{-k} = Q_0(T(z_1)),
$$
  
\n
$$
Q_0 = Q(Q-1) \dots (Q-k+1).
$$
\n(8.13)

Lemma [8.5](#page-19-2) makes it possible to write, on  $S^*$ ,

<span id="page-20-3"></span>
$$
T'(z)^{k}v(z)^{k}Q_{0}(T(z)) = e^{kd_{2}T(z)}u_{0}(z) = e^{2\pi ikd_{2}\zeta(z)}u_{0}(z),
$$
\n(8.14)

in which  $\log^+|u_0(z)|=o(|T(z)|)=o(|\zeta(z)|)$  as  $z\to\infty$  in  $S^*.$  Thus [\(8.13\)](#page-20-2), [\(8.14\)](#page-20-3) and Lemma [3.1](#page-4-0) together imply that  $kd_2 \in \mathbb{Z}$  and  $u_0 \equiv 1$ , so that v and u have representations, for some branch of  $Q_0(T)^{1/k}$ ,

<span id="page-21-0"></span>
$$
v = \frac{e^{d_2 T}}{Q_0(T)^{1/k}T'}, \quad u = v e^{-T} = \frac{e^{(d_2 - 1)T}}{Q_0(T)^{1/k}T'}, \quad d_2 \in [0, 1/2], \quad kd_2 \in \mathbb{Z},
$$
 (8.15)

and if  $T'$  is not rational at infinity then  $d_2=1/2$  and  $k$  is even. Now Abel's identity,  $(1.8)$ ,  $(8.2)$ , [\(8.6\)](#page-18-0), [\(8.7\)](#page-18-1) and [\(8.15\)](#page-21-0) lead to

$$
W_0 = W(u, v) = ce^{(2d_2 - 1)T} Q_0(T)^{-2/k} (T')^{-1},
$$
  
\n
$$
\nu_1 = \frac{d'_0 + d_1 + a_{k-1}/k}{d_0 - (k-1)/2} = -\frac{W'_0}{W_0} = (1 - 2d_2)T' + \frac{2Q'_0(T)T'}{kQ_0(T)} + \frac{T''}{T'},
$$
  
\n
$$
\frac{y'_1}{y_1} = Q(T) \left( (d_2 - 1)T' - \frac{Q'_0(T)T'}{kQ_0(T)} - \frac{T''}{T'} \right) +
$$
  
\n
$$
+ \left( Q(T) - \frac{k-1}{2} \right) \left( (1 - 2d_2)T' + \frac{2Q'_0(T)T'}{kQ_0(T)} + \frac{T''}{T'} \right) - Q'(T)T' - \frac{a_{k-1}}{k}.
$$

Hence  $T_3=y_1'/y_1+a_{k-1}/k$  is given by

<span id="page-21-3"></span>
$$
T_3 = \frac{1}{k} \sum_{j=0}^{k-2} \left( \frac{j-k+1}{Q(T)-j} \right) Q'(T)T' - \left( d_2(Q(T)-k+1) + \frac{k-1}{2} \right) T' - \left( \frac{k-1}{2} \right) \frac{T''}{T'}. \tag{8.16}
$$

Thus  $T_1 = y_1'/y_1$  belongs to the field  $\Lambda$  generated by  $d_0 = Q(T)$ ,  $T'$ ,  $a_{k-1}$  and their derivatives. Since  $L[y_1] = 0$ , a standard change of variables gives a linear differential operator  $\widetilde{L}$  with coefficients  $\widetilde{c}_j \in \Lambda$  such that

$$
L[y_1w] = y_1 \widetilde{L}[w], \quad \widetilde{L} = \sum_{j=1}^k \widetilde{c}_j D^j, \quad \widetilde{c}_k = 1, \quad D = \frac{d}{dz}.
$$

As  $T_1$  is known, the  $\widetilde{c}_j$  can be computed from the  $a_j$ , and vice versa. Using  $(8.5)$  and  $(8.8)$ , write

<span id="page-21-2"></span>
$$
f = y_1 \phi, \quad \frac{1}{(v-u)^k} = \frac{1}{g^k} = \frac{L[f]}{f} = \frac{\widetilde{L}[\phi]}{\phi} = \sum_{j=1}^k \widetilde{c}_j \frac{\phi^{(j)}}{\phi},
$$
  

$$
\frac{\phi'}{\phi} = \frac{S_1}{Y_1}, \quad S_1 = R_{1,0} = Q(T)T', \quad Y_1 = 1 - e^{-T}, \quad Y_1' = T'(1 - Y_1). \tag{8.17}
$$

There exist computable coefficients  $R_{j,\mu} \in \widetilde{\Lambda}$  such that, for  $j \in \mathbb{N}$ ,

<span id="page-21-1"></span>
$$
\frac{\phi^{(j)}}{\phi} = \frac{S_j}{Y_1^j}, \quad S_j = \sum_{\mu=0}^{j-1} R_{j,\mu} Y_1^{\mu}, \quad R_{j,0} = Q(T)(Q(T) - 1) \dots (Q(T) - j + 1)(T')^j. \tag{8.18}
$$

The relations [\(8.18\)](#page-21-1) hold by a straightforward induction argument, since the  $S_j$  satisfy

$$
S_{j+1} = Y_1 S'_j - jY'_1 S_j + S_1 S_j = Y_1 S'_j + jT'(Y_1 - 1)S_j + S_1 S_j, \quad R_{j+1,0} = (Q(T) - j)T'R_{j,0}.
$$

Using [\(8.15\)](#page-21-0), [\(8.17\)](#page-21-2) and [\(8.18\)](#page-21-1) now delivers

$$
Q_0(T)(T')^k(1 - Y_1)^{kd_2} = Q_0(T)(T')^k e^{-kd_2 T} = v^{-k} = \frac{Y_1^k}{(v - u)^k} = \sum_{j=1}^k \tilde{c}_j S_j Y_1^{k-j}
$$
  

$$
= \sum_{j=1}^k \sum_{\mu=0}^{j-1} \tilde{c}_j R_{j,\mu} Y_1^{k-j+\mu} = \sum_{\mu=0}^{k-1} \sum_{j=\mu+1}^k \tilde{c}_j R_{j,\mu} Y_1^{k-j+\mu}
$$
  

$$
= \sum_{\mu=0}^{k-1} \sum_{\nu=\mu}^{k-1} \tilde{c}_{k+\mu-\nu} R_{k+\mu-\nu,\mu} Y_1^{\nu} = \sum_{\nu=0}^{k-1} Y_1^{\nu} \sum_{\mu=0}^{\nu} \tilde{c}_{k+\mu-\nu} R_{k+\mu-\nu,\mu},
$$

in which  $\nu=k-j+\mu.$  Now  $e^{-T}=u/v$  grows transcendentally fast on a subsector of  $S^*,$ whereas each element of the field  $\Lambda$  has form  $\widetilde{v}(z) = v_1(z) + z^{1/2}v_2(z)$ , with  $v_1$  and  $v_2$  rational at infinity. Thus  $e^{-T}$  is transcendental over  $\Lambda$  and so is  $Y_1 = 1-e^{-T}$ . Since  $(8.7)$ ,  $(8.13)$ ,  $(8.18)$ and Lemma [8.1](#page-16-2) together imply that  $R_{j,0} \not\equiv 0$  for  $j = 1, ..., k$  and that  $\widetilde{c}_k R_{k,0} = Q_0(T) (T')^k$ , comparing the coefficients of  $Y_1^{\nu}$ , starting from  $\nu = 1$ , determines successively  $\widetilde{c}_{k-1}, \ldots, \widetilde{c}_1$  and hence  $\{a_0, \ldots, a_{k-2}\}.$   $\Box$ 

The proof of Proposition [8.1](#page-16-0) is complete, but it is worth remarking that [\(2.1\)](#page-3-0), [\(2.2\)](#page-3-1) and [\(2.3\)](#page-3-2) show that  $d_2 = 0$  and  $d_2 = 1/3$  are both possible when  $k = 3$ . Furthermore, Propositions [6.1](#page-11-0) and  $\,8.1$  each give a solution  $y_0$  of  $L[y]=0$  on  $S^\ast$ , of the form [\(4.2\)](#page-6-2), whose exponential part is a non-constant polynomial in  $z^{1/2}$ , and in  $z$  if  $k$  is odd. If  $d_2=0$  or  $d_2=1/2$  in [\(8.16\)](#page-21-3), or if f is given by [\(1.5\)](#page-1-2), then  $y_0 = y_1$ , by [\(8.7\)](#page-18-1), Lemma [8.5](#page-19-2) and the fact that  $H''/H'$  does not vanish at infinity in [\(1.5\)](#page-1-2). On the other hand, if  $0 < d_2 < 1/2$  then u and v both have non-constant exponential part, by Lemma [8.5](#page-19-2) and [\(8.15\)](#page-21-0), and Lemma [7.2](#page-15-1) gives a non-trivial solution  $y_2$  of  $L[y] = 0$  annihilated by  $v$ ; thus  $y_2'/y_2 - y_1'/y_1 = d_0(v'/v - u'/u) = Q(T)T'$ , by  $(8.3)$ ,  $(8.6)$  and  $(8.7)$ , and  $y_0 \in \{y_1,y_2\}$ . It follows that  $y_0'(z)/y_0(z) = (1+o(1))cz^{\lambda_0}$  and  $y_{0}^{\left( j\right) }$  $\zeta_0^{(j)}(z)/y_0^{(k)}(z)=(1+o(1))cz^{(j-k)\lambda_0}$  as  $z\to\infty$  in a subsector of  $S^*$ , for  $j=0,\ldots,k-1,$  where  $\lambda_0\geq -1/2$ , and  $\lambda_0\geq 0$  if  $k$  is odd. This implies that at least one  $a_j$  has  $a_j(z)\neq o(|z|^{(k-j)\lambda_0})$ as  $z \to \infty$ , which is sharp by [\[17,](#page-45-6) (1.8)].

### <span id="page-22-1"></span>9 A change of variables

In order to prove Theorem [1.3](#page-1-1) it now suffices, in view of Proposition [6.1,](#page-11-0) to show that the hypotheses of Proposition [8.1](#page-16-0) are satisfied when  $L \neq M$ . Since the value of E is immaterial in Proposition [8.1,](#page-16-0) a change of variables  $z \,\rightarrow\, z^n$  may now be employed to ensure that, in the terminology of Section [4,](#page-6-1) the integer  $p$  is 1, so that the exponential parts and associated asymptotic or formal series involve only integer powers. Indeed, let  $k \geq 3$  and  $n \geq 2$  be integers and let  $f$ ,  $F$  and  $f$  satisfy

<span id="page-22-0"></span>
$$
F(z) = L[f](z) = f^{(k)}(z) + a_{k-1}(z)f^{(k-1)}(z) + \ldots + a_0(z)f(z), \quad f(z) = f(z^n), \tag{9.1}
$$

where the  $a_j$  are rational at infinity with  $a_{k-1}(\infty) = 0$ . Take linearly independent locally analytic solutions  $f_1, \ldots, f_k$  of  $L[y] = 0$ .

**Lemma 9.1** For each integer  $m \geq 1$  there exist rational functions  $c_{p,m}(z)$ , depending only on  $m$  and  $n$ , such that

<span id="page-23-0"></span>
$$
f^{(m)}(z^n) = \sum_{p=1}^{m} c_{p,m}(z) \mathfrak{f}^{(p)}(z), \quad c_{m,m}(z) = (nz^{n-1})^{-m}.
$$
 (9.2)

 $\Box$ 

Moreover, if  $m \ge 2$  then  $c_{m-1,m}(z)/c_{m,m}(z) \to 0$  as  $z \to \infty$ .

*Proof.* Clearly  $f(z) = f(z^n)$  gives, as  $z \to \infty$ ,

$$
f'(z^n) = (nz^{n-1})^{-1} \mathbf{f}'(z), \quad f''(z^n) = (nz^{n-1})^{-2} \mathbf{f}''(z) + c_{1,2}(z) \mathbf{f}'(z), \quad c_{1,2}(z) = O(|z|^{1-2n}).
$$

Next, if the assertions of the lemma hold for some  $m \geq 2$  then, as  $z \to \infty$ ,

$$
nz^{n-1}f^{(m+1)}(z^n) = c_{m,m}(z)f^{(m+1)}(z) + f^{(m)}(z)(c'_{m,m}(z) + c_{m-1,m}(z)) + \dots
$$
  
=  $c_{m,m}(z)\left[f^{(m+1)}(z) + f^{(m)}(z)O(1/|z|) + \dots\right].$ 

Now [\(9.1\)](#page-22-0) and [\(9.2\)](#page-23-0) yield, as  $z \to \infty$ ,

$$
F(z^n) = (nz^{n-1})^{-k} \left[ \mathfrak{f}^{(k)}(z) + \mathfrak{f}^{(k-1)}(z)O(1/|z|) + \ldots \right] + O(|z|^{-n}) (nz^{n-1})^{1-k} \left[ \mathfrak{f}^{(k-1)}(z) + \ldots \right] + \ldots
$$
  
=  $(nz^{n-1})^{-k} \left[ \mathfrak{f}^{(k)}(z) + \mathfrak{f}^{(k-1)}(z)O(1/|z|) + \ldots \right].$ 

Hence there exist functions  $a_i(z)$ , all rational at infinity and with  $a_{k-1}(\infty) = 0$ , such that

$$
\mathfrak{f}^{(k)}(z)+\mathfrak{a}_{k-1}(z)\mathfrak{f}^{(k-1)}(z)+\ldots+\mathfrak{a}_0(z)\mathfrak{f}(z)=\mathfrak{F}(z)=(nz^{n-1})^kF(z^n).
$$

The new operator is  ${\mathfrak{L}}\,=\,D^k+\mathfrak{a}_{k-1}D^{k-1}+\ldots$ , and  $y(z^n)$  solves  ${\mathfrak{L}}[y]\,=\,0$  for every locally analytic or formal solution  $y$  of  $L[y] = 0$ , as does each  $\mathfrak{f}_j(z) = \mathfrak{f}_j(z^n)$ .

If  $f$  is as in the hypotheses of Theorem [1.3](#page-1-1) then running Frank's method as in Section [5](#page-8-3) for  $\frak f$  and  $\frak F$  gives rise to auxiliary functions  $\frak g$ ,  $\frak h=-(\frak f'/\frak f)\frak g$  and  $\frak w_j$ , which satisfy, using  $(5.1)$ ,

$$
\mathfrak{g}(z)^k = \frac{\mathfrak{f}(z)}{\mathfrak{F}(z)} = \frac{f(z^n)}{(nz^{n-1})^k F(z^n)} = \frac{g(z^n)^k}{(nz^{n-1})^k}, \quad \mathfrak{g}(z) = \frac{g(z^n)}{nz^{n-1}},
$$
  
\n
$$
\mathfrak{h}(z) = -\frac{\mathfrak{f}'(z)}{\mathfrak{f}(z)} \mathfrak{g}(z) = -nz^{n-1} \frac{f'(z^n)}{f(z^n)} \frac{g(z^n)}{nz^{n-1}} = h(z^n),
$$
  
\n
$$
\mathfrak{w}_j(z) = \mathfrak{f}'_j(z) \mathfrak{g}(z) + \mathfrak{f}_j(z) \mathfrak{h}(z) = f'_j(z^n) g(z^n) + f_j(z^n) h(z^n) = w_j(z^n).
$$

Thus the  $\mathfrak{w}_j$  solve the equation  $\mathfrak{M}[y] = y^{(k)} + \ldots = 0$  which is obtained from  $M[y] = 0$  in the same way as  $\mathfrak{L}[y]=0$  arose from  $L[y]=0.$  In  $\mathfrak{M}[y]$  the coefficient of  $y^{(k-1)}$  is  $\mathfrak{a}_{k-1}$ , since  $a_{k-1} = A_{k-1}$ . It is important to note that  $\mathfrak{L} = \mathfrak{M}$  if and only if  $L = M$ .

Therefore n may be chosen so that in the canonical formal solutions  $(4.1)$  for the equations  $\mathfrak{L}[y] = 0$  and  $\mathfrak{M}[y] = 0$  the integer  $p$  is 1. Moreover,  $\mathfrak{L}[y] = 0$  has linearly independent canonical formal solutions  $\mathfrak{h}_1, \mathfrak{h}_2$  whose formal Wronskian  $W(\mathfrak{h}_1, \mathfrak{h}_2)$  is free of logarithms. This is clear if there are solutions of  $\mathfrak{L}[y] = 0$  with distinct exponential parts. On the other hand if all exponential parts for  $\mathfrak{L}[y] = 0$  are the same then they are all 0, since  $\mathfrak{a}_{k-1}(\infty) = 0$ , and there exists a solution  $\mathfrak{h}_1(z)=z^{e_1}R_1(z)\not\equiv 0$ , with  $e_1\in \mathbb{C}$  and  $R_1$  rational at infinity. The standard reduction of order method then gives an equation which is solved by  $(y/\mathfrak{h}_1)' = W(\mathfrak{h}_1, y) \mathfrak{h}_1^{-2}$ , for every solution y of  $\mathfrak{L}[y] = 0$ , and which has a canonical formal solution free of logarithms.

When  $L \neq M$ , and hence  $\mathfrak{L} \neq \mathfrak{M}$ , Lemma [5.3](#page-11-2) applied to  $\mathfrak{L}$  and  $\mathfrak{M}$  gives an equation  $\mathfrak{N}[y] = 0$ , of order 2 or 3, which is solved by g, as well as a counterpart  $\mathfrak V$  for the operator V. Choosing  $\mathfrak{h}_1, \mathfrak{h}_2$  as in the previous paragraph and any canonical formal solution  $\mathfrak{G}$  of  $\mathfrak{N}[y] = 0$ then makes  $\frak h_j'\frak G+\frak h_j\frak V[\frak G]$  a solution of  $\frak M[y]=0.$  Solving for  $\frak G$  by Cramer's rule shows that in the canonical formal solutions [\(4.1\)](#page-6-0) for  $\mathfrak{N}[y] = 0$  it may also be assumed that  $p = 1$ .

# 10 The main step

<span id="page-24-0"></span>**Proposition 10.1** Assume that f and F are as in the hypotheses of Theorem [1.3,](#page-1-1) and that f has finite order and an unbounded sequence of poles. Then there exist  $E \in \mathbb{N}$  and a function R which is rational at infinity such that all poles  $z$  of  $\mathfrak{f}(z)=f\left(z^E\right)$  with  $|z|$  sufficiently large have multiplicity  $R(z)$ .

Once Proposition [10.1](#page-24-0) is proved, Theorem [1.3](#page-1-1) is established as follows. Under the hypotheses of Theorem [1.3,](#page-1-1) the first possibility is that  $L = M$  and f is determined by Proposition [6.1.](#page-11-0) If this is not the case then Lemma [5.3](#page-11-2) shows that  $f$  has finite order and an unbounded sequence of poles. In view of Proposition [10.1,](#page-24-0) Proposition [8.1](#page-16-0) may be applied, and  $f$  is thereby determined.  $\Box$ 

<span id="page-24-1"></span>Assume for the remainder of the paper that the assumptions of Proposition [10.1](#page-24-0) are satisfied.

#### **Lemma 10.1** The following additional assumptions may all be made.

 $(A)$  In Section [5,](#page-8-3) the operators L and M are not the same.

(B) In the canonical formal solutions [\(4.1\)](#page-6-0) for all of the equations  $L[y] = 0$ ,  $M[y] = 0$  and  $N[y] = 0$ , the integer p is 1.

 $(C)$  The function q solves no second order homogeneous linear differential equation with coefficients which are rational at infinity. Moreover, the operator  $N$  has order 3 and may be written in the form

<span id="page-24-2"></span>
$$
N = D3 + B2D2 + B1D + B0, \t\t(10.1)
$$

with the  $B_j$  rational at infinity, while  $\alpha \neq 0$  in [\(5.16\)](#page-11-4) and  $D_{k-2} = C_{k-2} - c_{k-2} \neq 0$  in Section [5.](#page-8-3)

Proof. Assumption (A) is legitimate because of Proposition [6.1,](#page-11-0) while (B) is justified by taking  $\mathfrak{f}(z)=f(z^{m_1})$  in place of  $f$ , for some  $m_1\in\mathbb{N}$ , as in Section [9.](#page-22-1) Next, the first three assumptions of (C) are valid since otherwise [\(5.16\)](#page-11-4) shows that f and g satisfy an equation [\(8.1\)](#page-16-1) with  $d_0$  and  $d_1$  rational at infinity, in which case the conclusion of Proposition [10.1](#page-24-0) follows from a comparison of residues. The last assumption of  $(C)$  is justified by Proposition [6.1.](#page-11-0)  $\Box$ 

<span id="page-24-3"></span>**Lemma 10.2** Assume that there exists a function  $a^*$  which is rational at infinity, with the property that  $-f'/f + dg'/g - a^*$  has no zeros in some  $\Omega(r_2)$ , where  $d \in \{0,\ldots,k-1\}$  is a constant. Then d satisfies  $d \neq (k - 1)/2$ .

Assume further that  $a^*(\infty) \neq 0$ . Then g is given by

<span id="page-25-6"></span>
$$
P'g = \beta_1 e^{\omega_1 P} + \beta_2 e^{\omega_2 P} + \beta_3 e^{\omega_3 P}, \quad \beta_j, \omega_j \in \mathbb{C}^*, \quad 1 = \omega_1 \neq \omega_2 \neq \omega_3 \neq 1,
$$
 (10.2)

in which  $P'$  is rational at infinity, with  $P'(\infty) \neq 0$ . If, in addition,  $d = 0$  or  $d = k - 1$  then f satisfies the conclusion of Proposition [10.1.](#page-24-0)

*Proof.* As in [\(5.4\)](#page-8-1), write  $p'/p = f'/f + a_{k-1}/k$  and  $q = -(p'/p)g$ . Then g and q solve the equations [\(5.7\)](#page-9-3) to [\(5.12\)](#page-9-8). Moreover,  $a = a^* - a_{k-1}/k$  is rational at infinity and  $-p'/p + dg'/g - a$ has no zeros in  $\Omega(r_2).$  Since poles of  $p'/p$  have negative residues and are simple zeros of  $g$ , while  $f^{\prime}/f$  and  $g^k$  have finite order, it is possible to write

<span id="page-25-0"></span>
$$
q + dg' - ag = g\left(-\frac{p'}{p} + \frac{dg'}{g} - a\right) = e^P,
$$
\n(10.3)

with  $P^\prime$  rational at infinity. Then  $(5.9)$  and  $(10.3)$  yield

<span id="page-25-1"></span>
$$
P'e^{P} = xg'' - ag' - \left(\frac{D_{k-2}}{k} + a'\right)g, \quad x = d - \frac{k-1}{2}, \tag{10.4}
$$

and by Lemma [10.1\(](#page-24-1)C) it may be assumed that  $P'\not\equiv 0.$  Differentiation of this equation leads to

<span id="page-25-5"></span>
$$
0 = x g''' + g'' \left( -x \left( \frac{P''}{P'} + P' \right) - a \right) + g' \left( a \left( \frac{P''}{P'} + P' \right) - \frac{D_{k-2}}{k} - 2a' \right) + g \left( \left( \frac{P''}{P'} + P' \right) \left( \frac{D_{k-2}}{k} + a' \right) - \frac{D'_{k-2}}{k} - a'' \right),
$$
\n(10.5)

and so  $x \neq 0$  and  $d \neq (k - 1)/2$ , as asserted, again by Lemma [10.1\(](#page-24-1)C).

Now assume that  $a^*(\infty) \neq 0$ , which implies that  $a(\infty) \neq 0$ . The following is an extension of a method from [\[7\]](#page-44-6). Since  $C_{k-2} = D_{k-2} + c_{k-2}$ , formula [\(5.10\)](#page-9-6) becomes, in view of [\(10.3\)](#page-25-0),

<span id="page-25-2"></span>
$$
D_{k-2}e^{P} = \frac{k(k^{2}-1)}{12}g''' + g'\left((x+1)D_{k-2} + 2c_{k-2}\right)
$$

$$
+g\left(\frac{k-1}{2}D'_{k-2} + c'_{k-2} - D_{k-3} - aD_{k-2}\right),
$$
(10.6)

and [\(5.12\)](#page-9-8) may be written as

$$
\left(\frac{2D_{k-3}}{k-2} - D'_{k-2}\right)e^{P} = \frac{(k+2)D_{k-2}}{3}g'' + d_5g' + d_6g,
$$

with  $d_5, d_6$  rational at infinity. Comparing the last equation with [\(10.4\)](#page-25-1) delivers

<span id="page-25-3"></span>
$$
x\left(\frac{2D_{k-3}}{k-2} - D'_{k-2}\right) = \frac{(k+2)D_{k-2}P'}{3},\tag{10.7}
$$

again using Lemma [10.1\(](#page-24-1)C). Combining [\(10.4\)](#page-25-1) with [\(10.6\)](#page-25-2) and [\(10.7\)](#page-25-3) leads to

<span id="page-25-4"></span>
$$
0 = \frac{k(k^2 - 1)}{12}g''' - g''\left(\frac{xD_{k-2}}{P'}\right) + g'\left((x+1)D_{k-2} + 2c_{k-2} + \frac{aD_{k-2}}{P'}\right)
$$
  
+ 
$$
g\left(\frac{D'_{k-2}}{2} + c'_{k-2} - \frac{(k^2 - 4)D_{k-2}P'}{6x} - aD_{k-2} + \frac{D_{k-2}}{P'}\left(\frac{D_{k-2}}{k} + a'\right)\right).
$$
 (10.8)

Lemma [10.1\(](#page-24-1)C) implies that [\(10.8\)](#page-25-4) must be [\(10.5\)](#page-25-5) multiplied by  $k(k^2-1)/12x$ . Comparing the coefficients of  $g''$  yields

<span id="page-26-0"></span>
$$
\frac{P''}{P'} + P' = -\frac{a}{x} + \frac{12xD_{k-2}}{k(k^2 - 1)P'}.
$$
\n(10.9)

Next, matching the coefficients of  $g'$  and using  $(10.9)$  results in

<span id="page-26-1"></span>
$$
c_{k-2} = -\frac{(12x^2 + 12x + k^2 - 1)D_{k-2}}{24x} - \frac{k(k^2 - 1)a'}{12x} - \frac{k(k^2 - 1)a^2}{24x^2}.
$$
 (10.10)

Examining the coefficients of g in [\(10.5\)](#page-25-5) and [\(10.8\)](#page-25-4) in the light of [\(10.9\)](#page-26-0) and [\(10.10\)](#page-26-1) leads to

$$
aD_{k-2}\left(\frac{k^2-1-12x^2}{12x^2}\right) = D'_{k-2}\left(\frac{12x^2+1-k^2}{24x}\right) + \frac{(k^2-4)D_{k-2}P'}{6x}.
$$

Because  $k\geq 3$  and  $D_{k-2}P'\not\equiv 0$ , this forces  $k^2-1-12x^2\not=0$  and

<span id="page-26-2"></span>
$$
a = -\frac{xD'_{k-2}}{2D_{k-2}} + \frac{2x(k^2 - 4)P'}{k^2 - 1 - 12x^2}.
$$
\n(10.11)

.

Therefore  $P'(\infty) \neq 0$ , since  $a(\infty) \neq 0$ , and using  $(10.11)$  to eliminate  $a$  from  $(10.9)$  delivers

$$
\frac{P''}{P'} + \frac{(3k^2 - 12x^2 - 9)P'}{k^2 - 1 - 12x^2} - \frac{D'_{k-2}}{2D_{k-2}} = \frac{12xD_{k-2}}{k(k^2 - 1)P'}
$$

Setting  $Z = 1/D_{k-2}$  yields in turn a linear differential equation of form

<span id="page-26-3"></span>
$$
\left(\frac{2P''}{P'} + \eta_1 P'\right) Z + Z' = \frac{24x}{k(k^2 - 1)P'}, \quad \eta_1 = \frac{6(k^2 - 4x^2 - 3)}{k^2 - 1 - 12x^2}.
$$
 (10.12)

If  $k^2 - 4x^2 - 3 = 0$ , then  $(k + 2x)(k - 2x) = 3$ ; because  $k, 2x \in \mathbb{Z}$ , this forces  $2k = \pm 4$ , a contradiction. Assume henceforth that  $k^2-4x^2-3\neq 0$ : then the integrating factor for [\(10.12\)](#page-26-3) is  $(P')^2 e^{\eta_1 P}$ , with  $\eta_1 \neq 0$ , and the general solution to  $(10.12)$  is

$$
Z = (P')^{-2} (\eta_2 + d_7 e^{-\eta_1 P}), \quad d_7 \in \mathbb{C}, \quad \eta_2 = \frac{24x}{k(k^2 - 1)\eta_1}.
$$

Since  $P'$  and  $Z$  are rational at infinity with  $P'(\infty) \neq 0$ , this yields  $Z = \eta_2(P')^{-2}$  and

<span id="page-26-4"></span>
$$
\frac{-D_{k-2}}{k} = \frac{-(P')^2}{k\eta_2} = \eta_3(P')^2, \quad \eta_3 = \frac{-(k^2-1)\eta_1}{24x} = \frac{(4x^2+3-k^2)(k^2-1)}{4x(k^2-1-12x^2)} \neq 0,\tag{10.13}
$$

as well as

<span id="page-26-5"></span>
$$
a = -x \left(\frac{P''}{P'} + \eta_4 P'\right), \quad \eta_4 = -\frac{2(k^2 - 4)}{k^2 - 1 - 12x^2} \neq 0,
$$
\n(10.14)

using [\(10.11\)](#page-26-2). Combining [\(10.4\)](#page-25-1), [\(10.13\)](#page-26-4) and [\(10.14\)](#page-26-5) shows that g solves the equation

<span id="page-26-6"></span>
$$
P'e^{P} = x\left(y' + \left(\frac{P''}{P'} + \eta_4 P'\right)y\right)' + \eta_3 (P')^2 y.
$$
 (10.15)

Now write  $\zeta = P(z)$  and  $Y_0(\zeta) = y(z)P'(z)$  so that

$$
y' + \left(\frac{P''}{P'} + \eta_4 P'\right)y = \frac{dY_0}{d\zeta} + \eta_4 Y_0, \quad \left(y' + \left(\frac{P''}{P'} + \eta_4 P'\right)y\right)' = P'\left(\frac{d^2Y_0}{d\zeta^2} + \eta_4 \frac{dY_0}{d\zeta}\right).
$$

Thus [\(10.15\)](#page-26-6) becomes

<span id="page-27-0"></span>
$$
e^{\zeta} = xY_0''(\zeta) + x\eta_4 Y_0'(\zeta) + \eta_3 Y_0(\zeta). \tag{10.16}
$$

The auxiliary equation for the complementary function of [\(10.16\)](#page-27-0) is then

<span id="page-27-1"></span>
$$
x\lambda^2 + x\eta_4\lambda + \eta_3 = 0, \quad x\eta_3\eta_4 \in \mathbb{C}^*.
$$
 (10.17)

Suppose that  $1$  is a double root of [\(10.17\)](#page-27-1). Then  $g$  has a representation  $g=(P^\prime)^{-1}e^PQ_2(P)$ , for some polynomial  $Q_2\not\equiv 0$  of degree at most two. Since  $P'(\infty)\neq 0$ , there cannot exist a sector on which  $g$  has an unbounded sequence of zeros, contradicting the assumption that  $f$  has an unbounded sequence of poles.

Now suppose that 1 is a simple root of  $(10.17)$ , or that  $(10.17)$  has a repeated root. Then the fact that  $\eta_3 \neq 0$  gives

$$
P'g = (\beta_1 + \beta_2 P)e^{\omega_1 P} + \beta_3 e^{\omega_3 P}, \quad \beta_j, \omega_j \in \mathbb{C}, \quad 0 \neq \omega_1 \neq \omega_3 \neq 0.
$$

Here  $\beta_2 \neq 0$  by Lemma [10.1\(](#page-24-1)C), since otherwise g satisfies a second order linear differential equation, and  $\beta_3 \neq 0$  by the assumption that f has an unbounded sequence of poles. Denote by  $\psi$ the result of analytically continuing a function element  $\psi$  once around a given circle  $|z| = r_3 > r_2$ . Then there exists  $\zeta_0 \in \mathbb{C}$  such that  $\widehat{P} = P + \zeta_0$  and

$$
(\beta_1 + \beta_2\zeta_0 + \beta_2P)e^{\omega_1P + \omega_1\zeta_0} + \beta_3e^{\omega_3P + \omega_3\zeta_0} = P'\hat{g} = P'\omega g = \omega\left((\beta_1 + \beta_2P)e^{\omega_1P} + \beta_3e^{\omega_3P}\right),
$$

where  $\omega^k=1.$  Because  $\beta_3P'(\infty)\neq 0$ , examining the coefficients of  $e^{\omega_3P}$  and  $e^{\omega_1P}$  leads to

$$
e^{\omega_3\zeta_0} = \omega
$$
,  $(\beta_1 + \beta_2\zeta_0 + \beta_2P)e^{\omega_1\zeta_0} = \omega(\beta_1 + \beta_2P)$ .

Differentiating the last relation then shows that  $e^{\omega_1 \zeta_0} = \omega$ , since  $\beta_2 \neq 0$ , and

$$
\omega\beta_1 = (\beta_1 + \beta_2\zeta_0)e^{\omega_1\zeta_0} = \omega(\beta_1 + \beta_2\zeta_0),
$$

so that  $\zeta_0 = 0$  and P is rational at infinity, which forces g to solve a second order equation, contradicting Lemma [10.1\(](#page-24-1)C). Thus [\(10.2\)](#page-25-6) holds, with the  $\omega_j\, \in\, \mathbb{C}^*$  pairwise distinct, since  $\eta_3 \neq 0$ , and  $\omega_1 = 1$ , and none of the  $\beta_j$  can vanish, again by Lemma [10.1\(](#page-24-1)C). The proof of [\(10.2\)](#page-25-6) is now complete.

Next, suppose that  $d = 0$  or  $d = k - 1$ , so that  $x = \pm (k - 1)/2$ . Now [\(10.13\)](#page-26-4) and [\(10.14\)](#page-26-5) imply that [\(10.16\)](#page-27-0) takes the form

$$
e^{\zeta} = xY_0''(\zeta) + x\left(\frac{k+2}{k-1}\right)Y_0'(\zeta) + x\left(\frac{k+1}{(k-1)^2}\right)Y_0(\zeta).
$$

The auxiliary equation for the complementary function has roots  $\lambda_j = 1-jk/(k-1)$ , for  $j = 1, 2$ , and  $(10.2)$  becomes, in view of Lemma  $10.1(C)$ ,

<span id="page-27-2"></span>
$$
g = \frac{e^P}{P'} \left( e_1 + e_2 e^{\eta P} + e_3 e^{2\eta P} \right), \quad \eta = -\frac{k}{k-1}, \quad e_j \in \mathbb{C}^*.
$$
 (10.18)

Thus [\(5.4\)](#page-8-1), [\(10.3\)](#page-25-0), [\(10.18\)](#page-27-2) and partial fractions deliver

<span id="page-28-0"></span>
$$
g = \frac{e_4 e^P}{P'} \left( e^{\eta P} - e_5 \right) \left( e^{\eta P} - e_6 \right),
$$
  

$$
\frac{f'}{f} + \frac{a_{k-1}}{k} + a = \frac{p'}{p} + a = e_7 P' \left( \frac{1}{e^{\eta P} - e_5} - \frac{1}{e^{\eta P} - e_6} \right) + \frac{dg'}{g}, \quad e_j \in \mathbb{C}. \tag{10.19}
$$

Again the  $e_j$  are all non-zero, and  $e_5 \neq e_6$  since g cannot have multiple zeros. If  $r_4$  is large and some continuation of  $e^{\eta P}$  takes the value  $e_5$  at some  $z_0\in\Omega(r_4)$  then  $z_0$  is a zero of  $g$ , and so is a pole of f of multiplicity  $m_1$  satisfying  $-m_1 = d + e_7/n e_5$ , so that [\(5.2\)](#page-8-2), [\(10.18\)](#page-27-2) and [\(10.19\)](#page-28-0) imply that at the point  $z_0$  the following equations are satisfied:

$$
e_5^{k-1} = e^{(k-1)\eta P} = e^{-kP};
$$
  
\n
$$
\frac{(-1)^k}{m_1(m_1+1)\dots(m_1+k-1)} = (g')^k = (e_4e^P\eta e_5(e_5-e_6))^k
$$
  
\n
$$
= e_4^k e_5^{1-k} \eta^k e_5^k (e_5-e_6)^k = e_4^k e_5 \eta^k (e_5-e_6)^k.
$$

Similarly, all zeros of continuations of  $e^{\eta P}-e_6$  to  $\Omega(r_4)$  are poles of  $f$  of multiplicity  $m_2$ , where  $-m_2 = d - e_7/\eta e_6$ , and

$$
\frac{m_2(m_2+1)\dots(m_2+k-1)}{m_1(m_1+1)\dots(m_1+k-1)} = (-1)^k \frac{e_5}{e_6} = (-1)^{k-1} \frac{m_2+d}{m_1+d}.
$$

But  $d = 0$  or  $d = k - 1$ , so that  $m_1 = m_2$  (and k is odd).

# <span id="page-28-2"></span>11 The exponential parts for the equation  $N[y] = 0$

Let p and q be polynomials in z, and let  $\theta \in \mathbb{R}$ . Write  $p \prec q$  (respectively,  $p \preceq q$ ,  $p \simeq q$ ) to indicate that  $\text{Re } p(re^{i\theta}) < \text{Re } q(re^{i\theta})$  (respectively  $\text{Re } p(re^{i\theta}) \leq \text{Re } q(re^{i\theta})$ ,  $\text{Re } p(re^{i\theta}) =$  $\text{Re } q(re^{i\theta})$ ) as  $r \to +\infty$ . Since each  $P_{\theta}(r) = \text{Re } p(re^{i\theta})$  is a polynomial in r, every  $\theta \in \mathbb{R}$  has  $p \prec 0$  or  $p \simeq 0$  or  $0 \prec p$ , and if p is not constant then all but finitely many  $\theta \in [0, 2\pi]$  have either  $p \prec 0$  or  $0 \prec p$ .

Suppose that  $N[y] = 0$  has linearly independent canonical formal solutions with exponential parts  $\kappa_1, \kappa_2, \kappa_3$ . The  $\kappa_i$  are polynomials in z by Lemma [10.1,](#page-24-1) and it will be assumed as before that  $\kappa_j(0)=0$  for all  $j$ , from which it follows that if  $\kappa_j-\kappa_{j'}$  is constant then  $\kappa_j-\kappa_{j'}\equiv 0.$ 

<span id="page-28-1"></span>**Lemma 11.1** The  $\kappa_j$  are not all the same polynomial, and there does not exist  $\theta \in \mathbb{R}$  with  $\kappa_j \prec 0$  on  $\arg z = \theta$  for  $j = 1, 2, 3$ .

Proof. The first assertion is proved in Lemma [7.2,](#page-15-1) and the second holds because otherwise  $g^k = f/F$  tends to zero transcendentally fast on a sector, contradicting Lemma [7.2.](#page-15-1)  $\hfill\Box$ 

<span id="page-28-3"></span>Lemma [11.1](#page-28-1) does not exclude two of the  $\kappa_j$  being the same polynomial, possibly identically zero, and this case will be dealt with in Sections [15](#page-35-0) and [18.](#page-44-7) When there is no repetition among the  $\kappa_j$ , the next lemma shows that there are two subcases to handle.

**Lemma 11.2** Suppose that the  $\kappa_i$  are pairwise distinct. Then it is possible to label the  $\kappa_i$  and choose a ray  $\arg z = \theta \in \mathbb{R}$  such that

<span id="page-29-5"></span>
$$
(A) \quad \kappa_1 \prec \kappa_2 \prec 0 \prec \kappa_3 \quad \text{or} \quad (B) \quad \kappa_1 \prec \kappa_2 \prec 0, \quad \kappa_3 \equiv 0 \tag{11.1}
$$

or

<span id="page-29-6"></span>
$$
(C) \quad \kappa_1 \prec 0 \prec \kappa_3, \quad \kappa_2 \equiv 0. \tag{11.2}
$$

*Proof.* If one of the  $\kappa_j$  is identically zero label the other two as  $\kappa_a$  and  $\kappa_b$ , and choose  $\theta \in [0, 2\pi]$ such that  $\kappa_a \prec 0$  on  $\arg z = \theta$ . A small change to  $\theta$  delivers either  $\kappa_b \prec \kappa_a$ , which leads to (B), or  $\kappa_a \prec \kappa_b \prec 0$  or  $\kappa_a \prec 0 \prec \kappa_b$ , leading to (B) or (C).

Assume now that none of the  $\kappa_j$  is the zero polynomial. Let  $m^*$  be the largest of the degrees of the  $\kappa_i$  and, with no loss of generality, write

$$
\kappa_j(z) = \alpha_j z^{m^*} + \dots, \quad \alpha_1 \neq 0.
$$

If  $\alpha_2 = 0$  then it is easy to choose a ray  $\arg z = \theta$  on which  $\kappa_1 \prec \kappa_2 \prec 0$  and, by varying  $\theta$ slightly if necessary, either  $\kappa_3 \prec 0$  or  $0 \prec \kappa_3$ . Lemma [11.1](#page-28-1) then implies that (A) must hold.

Next, suppose that  $\alpha_j \neq 0$  for all j. If  $\alpha_2/\alpha_1$  is not a negative real number choose a ray on which  $\alpha_1 z^{m^*}$  and  $\alpha_2 z^{m^*}$  both have negative real part and  $\kappa_3 \not\simeq 0$ . Shifting  $\theta$  slightly gives either  $\kappa_1 \prec \kappa_2 \prec 0$  or  $\kappa_2 \prec \kappa_1 \prec 0$ , and Lemma [11.1](#page-28-1) forces (A) to hold, subject to re-labelling if necessary.

Thus the proof is complete, after re-labelling if necessary, unless both  $\alpha_2/\alpha_1$  and  $\alpha_3/\alpha_1$  are negative real numbers, in which case the argument of the previous paragraph applies with  $\kappa_2$  and  $\kappa_3$  in place of  $\kappa_1$  and  $\kappa_2$ .

# 12 A decomposition of the operators  $N$  and  $V$

By Lemma [10.1\(](#page-24-1)C), the equation  $N[y] = 0$  in Lemma [5.3,](#page-11-2) which is satisfied by g, has order 3, and so the asymptotics for its solutions may be complicated. However, the following lemma gives a condition under which two linearly independent solutions of  $N[y] = 0$  must together solve a second order equation, for which the asymptotics are then considerably simpler.

<span id="page-29-3"></span>**Lemma 12.1** With N and V as in Lemma [5.3,](#page-11-2) suppose that  $g_1$  and  $g_2$  are linearly independent (both formal or both locally analytic) solutions of  $N[y] = 0$  such that

<span id="page-29-0"></span>
$$
g_1 V[g_2] - g_2 V[g_1] = d(g_2 g_1' - g_1 g_2'),\tag{12.1}
$$

where d is rational at infinity. Then  $g_1$  and  $g_2$  solve an equation [\(3.4\)](#page-6-3) and

<span id="page-29-1"></span>
$$
W' + E_1 W = 0, \quad E_1 = \frac{\beta + d}{\alpha}, \quad W = W(g_1, g_2), \tag{12.2}
$$

<span id="page-29-4"></span>
$$
N = (D + \delta) \circ (D^2 + E_1 D + E_0), \tag{12.3}
$$

where  $E_1$ ,  $E_0$  and  $\delta$  are rational at infinity. If, in addition, d is constant then

<span id="page-29-2"></span>
$$
V = \alpha (D^2 + E_1 D + E_0) - dD - xE_1 - \frac{X'}{X}, \quad x = d - \frac{k-1}{2}, \quad \frac{X'}{X} = -\frac{a_{k-1}}{k}.
$$
 (12.4)

*Proof.* Differentiating  $W = W(g_1, g_2) = g_1g'_2 - g'_1g_2$  gives  $W' = g_1g''_2 - g''_1g_2$ . Thus equation  $(12.1)$  can be rewritten, using  $(5.16)$ , in the form  $(12.2)$ , with  $E_1$  rational at infinity. Applying Lemma [3.4](#page-5-3) shows that  $g_1$  and  $g_2$  solve an equation [\(3.4\)](#page-6-3), with  $E_0$  also rational at infinity. Because  $g_1$  and  $g_2$  are linearly independent solutions of  $N[y] = 0$  and [\(3.4\)](#page-6-3), the operator  $N$  factorises using [\(10.1\)](#page-24-2) and the division algorithm for linear differential operators [\[15,](#page-45-14) p.126] as

<span id="page-30-0"></span>
$$
N = D3 + B2D2 + B1D + B0
$$
  
= (D +  $\delta$ )  $\circ$  (D<sup>2</sup> + E<sub>1</sub>D + E<sub>0</sub>)  
= D<sup>3</sup> + (E<sub>1</sub> +  $\delta$ )D<sup>2</sup> + (E<sub>0</sub> + E'<sub>1</sub> +  $\delta$ E<sub>1</sub>)D + E'<sub>0</sub> +  $\delta$ E<sub>0</sub>, (12.5)

where  $\delta$  is again rational at infinity.

Now suppose that d is constant. [\(5.15\)](#page-11-1) and [\(5.16\)](#page-11-4) yield

$$
h' = \alpha g''' + (\beta + \alpha')g'' + (\beta' + \gamma)g' + \gamma'g = -\left(\frac{k-1}{2}\right)g'' + \frac{a_{k-1}}{k}g' + \frac{a_{k-1}'}{k}g' + \frac{a_{k-1}'}{k}g,
$$

where  $D_{k-2}$  is rational at infinity, so that

$$
0 = \alpha g''' + \left(\beta + \alpha' + \frac{k-1}{2}\right)g'' + \left(\beta' + \gamma - \frac{a_{k-1}}{k}\right)g' + \left(\gamma' + \frac{D_{k-2} - a'_{k-1}}{k}\right)g.
$$

Comparing coefficients with  $(12.5)$  leads, using Lemma  $10.1(C)$ , to

<span id="page-30-1"></span>
$$
E_1 + \delta = \frac{\beta + \alpha' + (k - 1)/2}{\alpha}, \quad E_0 + E_1' + \delta E_1 = \frac{\beta' + \gamma - a_{k-1}/k}{\alpha}.
$$
 (12.6)

Now [\(12.2\)](#page-29-1) and [\(12.6\)](#page-30-1) deliver, with  $x = d - (k - 1)/2$ ,

$$
\beta = \alpha E_1 - d, \quad \delta = \frac{\beta + \alpha' + (k - 1)/2}{\alpha} - E_1 = \frac{\alpha'}{\alpha} - \frac{x}{\alpha},
$$
  
\n
$$
\gamma = \alpha (E_0 + E_1' + \delta E_1) - \beta' + \frac{a_{k-1}}{k} = \alpha (E_0 + E_1' + \delta E_1) - \alpha' E_1 - \alpha E_1' + \frac{a_{k-1}}{k}
$$
  
\n
$$
= \alpha E_0 + E_1(\alpha' - x) - \alpha' E_1 + \frac{a_{k-1}}{k} = \alpha E_0 - x E_1 + \frac{a_{k-1}}{k},
$$

<span id="page-30-2"></span>and the representations given here for  $\beta$  and  $\gamma$  yield [\(12.4\)](#page-29-2).

**Lemma 12.2** Suppose that  $g_1$  and  $g_2$  are linearly independent (both formal or both locally analytic) solutions of  $N[y] = 0$ , such that [\(12.1\)](#page-29-0) holds, with  $d \in \{0, \ldots, k-1\}$  a constant. Then  $g_1$  and  $g_2$  solve an equation [\(3.4\)](#page-6-3), and formulas [\(12.2\)](#page-29-1) to [\(12.4\)](#page-29-2) hold, with  $E_1$ ,  $E_0$  and  $\delta$ rational at infinity, and d satisfies  $d \neq (k - 1)/2$ .

Suppose further that  $E_1(\infty) \neq 0$  in [\(3.4\)](#page-6-3). Then g is given by [\(10.2\)](#page-25-6). If, in addition,  $d = 0$ or  $d = k - 1$ , then f satisfies the conclusion of Proposition [10.1.](#page-24-0)

*Proof.* Lemma [12.1](#page-29-3) gives the equation [\(3.4\)](#page-6-3) solved by  $g_1$  and  $g_2$ , as well as formulas [\(12.2\)](#page-29-1) to  $(12.4)$ . Since  $N[g]=0$ , but  $g''+E_1g'+E_0g\not\equiv 0$ ,  $(5.16)$ ,  $(12.3)$  and  $(12.4)$  deliver

$$
g'' + E_1 g' + E_0 g = e^{\tau}, \quad \tau' = -\delta,
$$

and

$$
-\frac{f'}{f} = \frac{h}{g} = \frac{V[g]}{g} = \frac{\alpha e^{\tau}}{g} - \frac{dg'}{g} - xE_1 + \frac{a_{k-1}}{k} = \frac{\alpha e^{\tau}}{g} - \frac{dg'}{g} + a^*.
$$

Here the function  $a^* = -x E_1 + a_{k-1}/k$  is rational at infinity and  $-f^{\prime}/f + dg^{\prime}/g - a^*$  continues without zeros in some  $\Omega(r_2)$ . Hence Lemma [10.2](#page-24-3) and [\(12.4\)](#page-29-2) imply that  $d \neq (k-1)/2$  and  $x\neq 0.$  Finally, if  $E_1(\infty)\neq 0$  in [\(3.4\)](#page-6-3) then  $a^*(\infty)\neq 0$  and the remaining assertions of Lemma  $12.2$  follow from Lemma [10.2.](#page-24-3)  $\Box$ 

# <span id="page-31-3"></span>13 Analytic solutions decaying in the same sector

<span id="page-31-0"></span>This section determines conditions under which Lemma [12.2](#page-30-2) may be applied with analytic solutions of  $N[y] = 0$ .

**Lemma 13.1** Assume that there exist linearly independent analytic solutions  $g_1$ ,  $g_2$  of  $N[y] = 0$ , such that both tend to 0 transcendentally fast as  $z \to \infty$  in the same sector S. Then  $g_1$  and  $g_2$  satisfy the hypotheses of Lemma [12.2,](#page-30-2) for some constant  $d \in \{0,\ldots,k-1\}$ , and solve an equation [\(3.4\)](#page-6-3), with  $E_1$  and  $E_0$  rational at infinity and  $E_1(\infty) \neq 0$ . Moreover, formulas [\(12.2\)](#page-29-1) to [\(12.4\)](#page-29-2) hold, and d and g satisfy  $d \neq (k - 1)/2$  and [\(10.2\)](#page-25-6). Finally, if  $d = 0$  or  $d = k - 1$  then the conclusion of Proposition [10.1](#page-24-0) holds.

In the context of Section [11,](#page-28-2) Lemma [13.1](#page-31-0) applies if there is a repeated non-trivial exponential part among the  $\kappa_j$ , or if  $(11.1)$  holds for some ray  $\arg z = \theta.$ 

*Proof.* Choose  $z_0 \in S$  such that  $z_0$  is not a singular point for any of the operators  $L, M, N$ , and such that

<span id="page-31-1"></span>
$$
g_1(z_0)g_2(z_0) \neq 0, \quad W(g_1, g_2)(z_0) \neq 0.
$$
\n(13.1)

Let w lie close to  $z_0$ . Then  $g_w(z) = g_2(w)g_1(z) - g_1(w)g_2(z)$  tends to 0 transcendentally fast as  $z \to \infty$  in S and, by Lemma [7.2,](#page-15-1)  $g_w$  annihilates a solution  $f_w \not\equiv 0$  of  $L[y] = 0$ , with

<span id="page-31-2"></span>
$$
\frac{f_w'(z)}{f_w(z)} = -\frac{V[g_w](z)}{g_w(z)} = \frac{g_1(w)V[g_2](z) - g_2(w)V[g_1](z)}{g_2(w)g_1(z) - g_1(w)g_2(z)}.
$$
\n(13.2)

Let

$$
G_0(z) = \frac{g_1(z)V[g_2](z) - g_2(z)V[g_1](z)}{g_2(z)g_1'(z) - g_1(z)g_2'(z)}.
$$

The second condition of [\(13.1\)](#page-31-1) implies that w is a simple zero of  $g_w$ , and by [\(13.2\)](#page-31-2) the residue of  $f'_w/f_w$  at  $w$  is  $G_0(w)$ , which must belong to the set  $\{0,\ldots,k-1\}$ . Since this holds for all  $w$ near  $z_0$ , the function  $G_0$  is a constant  $d \in \{0, \ldots, k-1\}$ , and so  $g_1$  and  $g_2$  satisfy the hypotheses of Lemma [12.2,](#page-30-2) and hence solve an equation [\(3.4\)](#page-6-3). Cauchy's estimate for derivatives shows that  $W(g_1, g_2)$  tends to  $0$  transcendentally fast in a subsector of  $S$ , which gives  $E_1(\infty) \neq 0$  by Abel's identity. The remaining assertions hold by Lemma  $12.2$ .  $\Box$ 

### 14 Decaying solutions with different exponential parts

This section will deal with one case of the situation in Section [13,](#page-31-3) in which two linearly independent solutions of  $N[y] = 0$  decay in the same sector and have different exponential parts, corresponding to [\(11.1\)](#page-29-5) in Lemma [11.2.](#page-28-3) The case of a repeated non-trivial exponential part will be addressed in Section [15.](#page-35-0) The methods of this section are heavily influenced by [\[2\]](#page-44-4), but a decisive role will be played by Lemma [13.1](#page-31-0) and the second order equation [\(3.4\)](#page-6-3).

<span id="page-32-0"></span>**Proposition 14.1** Assume that there exists a ray  $\arg z = \theta$  on which the exponential parts  $\kappa_j$ for the equation  $N[y] = 0$  satisfy [\(11.1\)](#page-29-5). Then f satisfies the conclusions of Proposition [10.1.](#page-24-0)

To prove Proposition [14.1,](#page-32-0) note first that if  $\theta$  is varied slightly, then [\(11.1\)](#page-29-5) continues to hold. Take canonical formal solutions  $g_1, g_2$  of  $N[y] = 0$  with exponential parts  $\kappa_1, \kappa_2$ . By [\(11.1\)](#page-29-5) the exponential parts for  $N[y] = 0$  are pairwise distinct, and there exist linearly independent analytic solutions  $G_1, G_2$  of  $N[y] = 0$  which are asymptotic to  $g_1$  and  $g_2$  respectively on a sector centred on the ray  $\arg z = \theta$ , and so tend to 0 transcendentally fast there, by [\(11.1\)](#page-29-5). Thus the hypotheses of Lemma [13.1](#page-31-0) are satisfied, and therefore so are those of Lemma [12.2,](#page-30-2) for some  $d$  in  $\{0,\ldots,k-1\}$ , which gives rise to an equation  $(3.4)$  satisfied by the  $G_j.$  Computing series representations for  $0 = G_j'' + E_1 G_j' + E_0 G_j$  shows that the  $g_j$  also solve [\(3.4\)](#page-6-3). Thus the exponential parts  $\kappa_1$  and  $\kappa_2$  correspond to the equation [\(3.4\)](#page-6-3), while  $\kappa_3$  is from the third canonical formal solution of  $N[y] = 0$ . Furthermore, V satisfies [\(12.4\)](#page-29-2).

Next, let the operators  $L,\ M$  have canonical formal solutions with exponential parts  $q_j,\ s_j$ respectively, labelled so that

<span id="page-32-2"></span>
$$
q_1 \preceq q_2 \preceq \ldots \preceq q_k, \quad s_1 \preceq s_2 \preceq \ldots \preceq s_k,\tag{14.1}
$$

on  $\arg z = \theta$  (the last phrase will be omitted henceforth). The  $q_j$  and  $s_j$  are polynomials in z with zero constant term. It may be assumed that  $\theta$  is chosen so that if  $\widetilde{p}_1, \widetilde{p}_2 \in \{q_1, \ldots, q_k, s_1, \ldots, s_k\}$ and  $\widetilde{p}_1 - \widetilde{p}_2 \not\equiv 0$  then  $\widetilde{p}_1 \prec \widetilde{p}_2$  or  $\widetilde{p}_2 \prec \widetilde{p}_1$ .

<span id="page-32-4"></span>**Lemma 14.1** There exists  $\lambda \in \{1, ..., k\}$  such that the canonical formal solution  $g_1$  of [\(3.4\)](#page-6-3) with exponential part  $\kappa_1$  annihilates a canonical formal solution  $f_\lambda$  of  $L[y] = 0$  with exponential part  $q_{\lambda}$ , and the exponential parts for  $M[y] = 0$  are

<span id="page-32-1"></span>
$$
q_j + \kappa_1 \quad (j \neq \lambda), \quad q_\lambda - (k-1)\kappa_1. \tag{14.2}
$$

Moreover, this  $f_\lambda$  may be assumed to be  $g_1^d W^{-x}X$ , where  $W$ ,  $x$  and  $X$  are as in Lemma [12.1.](#page-29-3) Furthermore, there exists  $\mu \in \{1, \ldots, k\}$  such that the canonical formal solution  $g_2$  of [\(3.4\)](#page-6-3) with exponential part  $\kappa_2$  annihilates a canonical formal solution  $f_\mu\,=\,g_2^d W^{-x}X$  of  $L[y]\,=\,0$ , with exponential part  $q_{\mu}$ , while the exponential parts for  $M[y] = 0$  are

<span id="page-32-3"></span>
$$
q_j + \kappa_2 \quad (j \neq \mu), \quad q_\mu - (k-1)\kappa_2.
$$
 (14.3)

<span id="page-32-5"></span>*Proof.* Since the exponential parts for  $N[y] = 0$  are pairwise distinct,  $g_1$  and  $g_2$  both have non-zero exponential parts and are free of logarithms. Thus Lemma [7.1](#page-14-2) gives a canonical formal solution  $f_\lambda$  of  $L[y] = 0$ , with exponential part  $q_\lambda$ , such that  $g_1$  annihilates  $f_\lambda$  and the exponential parts for  $M[y] = 0$  are given by [\(14.2\)](#page-32-1). Moreover, since  $g_1$  is a solution of [\(3.4\)](#page-6-3), solving  $0=f'_\lambda g_1+f_\lambda V[g_1]$  in the light of [\(12.4\)](#page-29-2) shows that  $f_\lambda$  is a constant multiple of  $g_1^d W^{-x}X$ . The same argument works for  $g_2$  and  $f_\mu$ .

**Lemma 14.2** The integer  $\lambda$  is 1.

*Proof.* Suppose not: then an exponential part  $q_1 + \kappa_1$  occurs in the list [\(14.2\)](#page-32-1). But this term, in view of [\(11.1\)](#page-29-5) and [\(14.1\)](#page-32-2), cannot be realised as  $q_j + \kappa_2$  or  $q_\mu - (k-1)\kappa_2$ .

**Lemma 14.3** The  $q_i$  satisfy  $q_i + \kappa_1 \preceq q_1 - (k-1)\kappa_1$  for  $2 \leq j \leq k$ .

*Proof.* Suppose that this is not the case. Then the term  $q_k + \kappa_1$ , which does occur in the list [\(14.2\)](#page-32-1), must be maximal according to the ordering  $\preceq$ . But [\(11.1\)](#page-29-5) implies that

<span id="page-33-0"></span>
$$
q_k + \kappa_1 \prec q_k + \kappa_2 \prec q_k - (k-1)\kappa_2. \tag{14.4}
$$

This is a contradiction since the second or third term in  $(14.4)$  occurs in the list  $(14.3)$ .  $\Box$ 

Thus by  $(14.2)$  the  $s_j$  in  $(14.1)$  can now be written as

<span id="page-33-1"></span>
$$
s_1 = q_2 + \kappa_1, \quad \dots, \quad s_{k-1} = q_k + \kappa_1, \quad s_k = q_1 - (k-1)\kappa_1. \tag{14.5}
$$

<span id="page-33-2"></span>Note that each of these relations initially holds with  $\simeq$  in place of  $=$ , but may be assumed to be an identity, by the remark following [\(14.1\)](#page-32-2). The same property will subsequently be used on a number of occasions without explicit reference.

**Lemma 14.4** The exponential part  $s_{\mu}$  satisfies  $s_{\mu} = q_{\mu} - (k-1)\kappa_2$ .

*Proof.* Suppose first that  $q_{\mu} - (k-1)\kappa_2 \prec s_{\mu}$ . Then [\(11.1\)](#page-29-5) and [\(14.1\)](#page-32-2) give  $\mu > 1$  and

$$
q_1 + \kappa_2 \preceq \ldots \preceq q_{\mu-1} + \kappa_2 \prec q_{\mu} - (k-1)\kappa_2 \prec s_{\mu},
$$

in which all of the first  $\mu$  terms occur in the list [\(14.3\)](#page-32-3). Hence the second list in [\(14.1\)](#page-32-2) includes  $\mu$  terms  $\widetilde{s}$  all satisfying  $\widetilde{s} \prec s_{\mu}$ , which is a contradiction.

Now suppose that  $s_\mu \prec q_\mu - (k-1) \kappa_2$ . Then  $\mu < k$  and in the list [\(14.3\)](#page-32-3) there are at least  $\mu$  terms  $\tilde{s}$  all satisfying  $\tilde{s} \preceq s_{\mu} \prec q_{\mu} - (k-1)\kappa_2$ . Of these,  $\mu - 1$  are  $q_1 + \kappa_2, \ldots, q_{\mu-1} + \kappa_2$ (this list being void if  $\mu = 1$ ), and it must be the case that  $q_{\mu+1} + \kappa_2 \preceq s_{\mu} \prec q_{\mu} - (k-1)\kappa_2$ . But then [\(11.1\)](#page-29-5) and [\(14.5\)](#page-33-1) yield a contradiction via

$$
s_{\mu} = q_{\mu+1} + \kappa_1 \prec q_{\mu+1} + \kappa_2 \preceq s_{\mu}.
$$

Lemma [14.4](#page-33-2) implies that among the  $q_j + \kappa_2$   $(j \neq \mu)$  there are at least  $\mu - 1$  terms  $\widetilde{s}$  with  $\widetilde{s} \preceq q_\mu - (k-1)\kappa_2$ , and if  $\mu > 1$  these must include  $q_1 + \kappa_2, \ldots, q_{\mu-1} + \kappa_2$ ; similarly, there are at least  $k-\mu$  terms with  $q_{\mu}-(k-1)\kappa_2 \preceq \tilde{s}$ , and if  $\mu < k$  these must include  $q_{\mu+1}+\kappa_2,\ldots,q_k+\kappa_2$ . It follows that

<span id="page-33-3"></span>
$$
s_j = q_j + \kappa_2 \quad (j \neq \mu), \quad s_{\mu} = q_{\mu} - (k - 1)\kappa_2. \tag{14.6}
$$

<span id="page-33-4"></span>**Lemma 14.5** The integers d and  $\mu$  are related by  $d = \mu - 1$ .

*Proof.* By Lemmas [14.1](#page-32-4) and [14.2](#page-32-5) the canonical formal solutions  $f_{\lambda}$  and  $f_{\mu}$  of  $L[y] = 0$  annihilated by  $g_1$  and  $g_2$  have exponential parts  $q_1$  and  $q_\mu$  respectively. The quotient  $f_\mu/f_\lambda=(g_2/g_1)^d$  has exponential part  $d(\kappa_2 - \kappa_1)$ , which implies that  $d(\kappa_2 - \kappa_1) = q_\mu - q_1$ . If  $\mu = 1$  this gives  $d = 0$ since  $\kappa_1 \neq \kappa_2$ . For  $\mu > 1$ , [\(14.5\)](#page-33-1) and [\(14.6\)](#page-33-3) yield

$$
s_1 = q_2 + \kappa_1, \ldots, s_{\mu-1} = q_{\mu} + \kappa_1, s_1 = q_1 + \kappa_2, \ldots, s_{\mu-1} = q_{\mu-1} + \kappa_2,
$$

and so

$$
\kappa_2 - \kappa_1 = q_2 - q_1 = \ldots = q_{\mu} - q_{\mu-1}, \quad d(\kappa_2 - \kappa_1) = q_{\mu} - q_1 = (\mu - 1)(\kappa_2 - \kappa_1).
$$

<span id="page-34-0"></span>By [\(11.1\)](#page-29-5) there exists a canonical formal solution  $g_3$  of  $N[y] = 0$  which is free of logarithms and has exponential part  $\kappa_3$ .

**Lemma 14.6** The exponential part  $\kappa_3$  is not the zero polynomial, and case (A) applies in [\(11.1\)](#page-29-5).

*Proof.* Suppose that  $\kappa_3 \equiv 0$ . Then Lemma [7.1](#page-14-2) and [\(14.6\)](#page-33-3) give at least one j with  $q_j = s_j = 1$  $q_j + \kappa_2 \prec q_j$ , a contradiction.

By Lemmas [7.1](#page-14-2) and [14.6,](#page-34-0) there exists  $\nu$  such that  $g_3$  annihilates a canonical formal solution of  $L[y] = 0$  with exponential part  $q_{\nu}$ , and the exponential parts for  $M[y] = 0$  are

<span id="page-34-1"></span>
$$
q_j + \kappa_3 \quad (j \neq \nu), \quad q_{\nu} - (k-1)\kappa_3.
$$
 (14.7)

<span id="page-34-2"></span>**Lemma 14.7** Assume that  $2 \leq \mu \leq k-1$ . Then  $\nu = k$  and  $s_1 = q_k - (k-1)\kappa_3$ .

*Proof.* Suppose first that  $\nu < k$ . Then the list [\(14.7\)](#page-34-1) includes  $q_k + \kappa_3$ , which must be maximal with respect to the ordering  $\preceq$ , since  $0 \prec \kappa_3$ . But  $\mu \neq k$  by assumption, which gives

$$
q_k + \kappa_3 = s_k = q_k + \kappa_2
$$

using [\(14.6\)](#page-33-3), and this contradicts [\(11.1\)](#page-29-5). Thus  $\nu = k$  in [\(14.7\)](#page-34-1).

<span id="page-34-6"></span>Now suppose that  $s_1 \neq q_k - (k-1)\kappa_3$ . Then  $s_1 \prec q_k - (k-1)\kappa_3$  and so  $s_1 = q_1 + \kappa_3$ , whereas [\(14.6\)](#page-33-3) gives  $s_1 = q_1 + \kappa_2$  since  $\mu \neq 1$ , again contradicting [\(11.1\)](#page-29-5).

**Lemma 14.8** If  $k \geq 4$  then  $\mu = 1$  or  $\mu = k$ .

*Proof.* Suppose instead that  $2 \leq \mu \leq k-1$ . Then, by Lemma [14.7,](#page-34-2) the list [\(14.7\)](#page-34-1) consists of

<span id="page-34-3"></span>
$$
s_1 = q_k - (k-1)\kappa_3
$$
,  $s_2 = q_1 + \kappa_3$ , ...,  $s_k = q_{k-1} + \kappa_3$ . (14.8)

Using [\(14.5\)](#page-33-1), [\(14.6\)](#page-33-3) and [\(14.8\)](#page-34-3) gives

<span id="page-34-4"></span>
$$
s_{\mu+1} = q_{\mu} + \kappa_3 = q_{\mu+1} + \kappa_2, \quad q_{\mu} - q_{\mu+1} = \kappa_2 - \kappa_3,\tag{14.9}
$$

and

<span id="page-34-5"></span>
$$
s_{\mu} = q_{\mu+1} + \kappa_1 = q_{\mu} - (k-1)\kappa_2, \qquad q_{\mu} - q_{\mu+1} = \kappa_1 + (k-1)\kappa_2. \tag{14.10}
$$

Define  $\tau$  as follows: if  $2 \leq \mu \leq k-2$  take  $\tau = k-1$ , and if  $\mu = k-1$  choose  $\tau = 1$ . In either case  $\mu \neq \tau, \tau + 1$ , since  $k \geq 4$  by assumption. Thus [\(14.5\)](#page-33-1), [\(14.6\)](#page-33-3) and [\(14.8\)](#page-34-3) deliver

<span id="page-35-1"></span>
$$
s_{\tau+1} = q_{\tau+1} + \kappa_2 = q_{\tau} + \kappa_3, \quad q_{\tau+1} - q_{\tau} = \kappa_3 - \kappa_2,\tag{14.11}
$$

in addition to

<span id="page-35-2"></span>
$$
s_{\tau} = q_{\tau} + \kappa_2 = q_{\tau+1} + \kappa_1, \quad q_{\tau+1} - q_{\tau} = \kappa_2 - \kappa_1. \tag{14.12}
$$

Combining [\(14.9\)](#page-34-4), [\(14.10\)](#page-34-5), [\(14.11\)](#page-35-1) and [\(14.12\)](#page-35-2) yields

$$
\kappa_2 - \kappa_1 = \kappa_3 - \kappa_2 = -\kappa_1 - (k-1)\kappa_2,
$$

contradicting the fact that  $\kappa_2 \prec 0$ .

Thus d must be 0 or  $k - 1$ : this follows from Lemmas [14.5](#page-33-4) and [14.8](#page-34-6) when  $k \geq 4$ , while if  $k = 3$  then Lemma [13.1](#page-31-0) forces  $d \neq (k - 1)/2 = 1$ . Hence the conclusion of Proposition [10.1](#page-24-0) holds by Lemma [13.1](#page-31-0) and the proof of Proposition [14.1](#page-32-0) is complete.

 $\Box$ 

#### <span id="page-35-0"></span>15 The case of a repeated non-trivial exponential part

Suppose that  $\kappa$  is a repeated non-trivial exponential part for the equation  $N[y] = 0$ . Then it is possible to choose a ray  $\arg z = \theta \in \mathbb{R}$  on which  $\kappa \prec 0$ , and linearly independent analytic solutions  $g_1, g_2$  of  $N[y] = 0$ , each with exponential part  $\kappa$  near  $\arg z = \theta$ . It then follows from Lemma [13.1](#page-31-0) that  $g$  is given by [\(10.2\)](#page-25-6), which yields

$$
0 = N[g] = \beta_1 H_1 e^{\omega_1 P} + \beta_2 H_2 e^{\omega_2 P} + \beta_3 H_3 e^{\omega_3 P}, \quad \beta_j, \omega_j \in \mathbb{C}^*,
$$

in which the  $\omega_j$  are pairwise distinct, while  $P'$  and the  $H_j$  are rational at infinity and  $H_je^{\omega_j P}=$  $N [e^{\omega_j P}/P']$ . This forces each  $H_j$  to vanish identically, so that the equation  $N[y]=0$  has three pairwise distinct exponential parts for its solutions, which is a contradiction.  $\Box$ 

### 16 Two lemmas concerning trivial exponential parts

If at least one of the three exponential parts arising from the equation  $N[y] = 0$  is trivial (that is, the zero polynomial), then it is not necessarily the case that  $N[y] = 0$  will have two linearly independent solutions decaying in the same sector, so that a second order equation [\(3.4\)](#page-6-3) may not be available. The approach to this case will combine Lemma [3.1](#page-4-0) with some ideas from [\[2\]](#page-44-4).

<span id="page-35-5"></span>**Lemma 16.1** Assume that two exponential parts  $\kappa_1, \kappa_2$  arising from the equation  $N[y] = 0$  are such that  $\kappa_2$  is the zero polynomial, while

<span id="page-35-3"></span>
$$
\kappa_1 \prec 0 \quad \text{or} \quad 0 \prec \kappa_1 \tag{16.1}
$$

on a ray  $\arg z = \theta$ . Let the operators L, M have canonical formal solutions with exponential parts as in  $(14.1)$ . Then the exponential parts for M are as in  $(14.2)$ , while

<span id="page-35-4"></span>
$$
s_j = q_j \text{ for each } j \tag{16.2}
$$

and the following additional conclusions hold.

If  $\kappa_1 \prec 0$  in [\(16.1\)](#page-35-3) then  $\lambda = 1$  and

<span id="page-36-0"></span>
$$
q_1 = s_1 = q_2 + \kappa_1, \quad \dots, \quad q_{k-1} = s_{k-1} = q_k + \kappa_1, \quad q_k = s_k = q_1 - (k-1)\kappa_1. \tag{16.3}
$$

If  $0 \prec \kappa_1$  in [\(16.1\)](#page-35-3) then  $\lambda = k$  and

<span id="page-36-1"></span>
$$
q_1 = s_1 = q_k - (k-1)\kappa_1, \quad q_2 = s_2 = q_1 + \kappa_1, \dots, \quad q_k = s_k = q_{k-1} + \kappa_1. \tag{16.4}
$$

*Proof.* First observe that  $N[y] = 0$  has two canonical formal solutions which are free of logarithms and have exponential parts 0 and  $\kappa_1$  respectively. Thus [\(14.2\)](#page-32-1) and [\(16.2\)](#page-35-4) hold by Lemma [7.1.](#page-14-2) Assume that  $\kappa_1 \prec 0$  in [\(16.1\)](#page-35-3). If  $\lambda \neq 1$  then an exponential part  $q_1 + \kappa_1$  occurs in the list [\(14.2\)](#page-32-1), but this term, in view of [\(16.1\)](#page-35-3), cannot be realised as  $q_j$  for any  $j$ , contradicting [\(16.2\)](#page-35-4). Now suppose that  $s_k \neq q_1 - (k-1)\kappa_1$ ; then  $s_k = q_k + \kappa_1$ , again contradicting [\(16.2\)](#page-35-4).

Now assume that  $0 \prec \kappa_1$  in [\(16.1\)](#page-35-3). Then  $\lambda$  must be k, since otherwise an exponential part  $q_k + \kappa_1$  occurs in [\(14.2\)](#page-32-1), contradicting [\(16.2\)](#page-35-4). Moreover,  $q_1 = s_1 = q_k - (k-1)\kappa_1$ , because the contrary case forces  $s_1 = q_1 + \kappa_1$ , which again contradicts [\(16.2\)](#page-35-4).

<span id="page-36-2"></span>**Lemma 16.2** If there exists a ray  $\arg z = \theta$  on which the three exponential parts arising from the equation  $N[y] = 0$  satisfy [\(11.2\)](#page-29-6), then  $\kappa_3 = -\kappa_1$ .

*Proof.* Assuming the existence of such a ray, let the operators  $L$ ,  $M$  have exponential parts as in [\(14.1\)](#page-32-2). Now [\(16.3\)](#page-36-0) and [\(16.4\)](#page-36-1) yield

$$
q_1 = s_1 = q_k - (k-1)\kappa_3
$$
,  $q_k = s_k = q_1 - (k-1)\kappa_1$ ,  $\kappa_3 = -\kappa_1$ .

### 17 The case where [\(11.2\)](#page-29-6) holds

This section will deal with the case where there exists a ray for which conclusion [\(11.2\)](#page-29-6) arises in Lemma [11.2.](#page-28-3) In this situation Lemma [16.2](#page-36-2) makes it possible to assume that the exponential parts for  $N[y] = 0$  are P, 0 and  $-P$ , where P is a polynomial in z of positive degree  $\rho$ . Hence  $N[y] = 0$  has canonical formal solutions which are free of logarithms and satisfy

<span id="page-36-3"></span>
$$
u_1(z) = z^{\eta_1} e^{P(z)} (1 + \ldots), \quad u_2(z) = z^{\eta_2} (1 + \ldots), \quad u_3(z) = z^{\eta_3} e^{-P(z)} (1 + \ldots). \tag{17.1}
$$

Since  $N[g]=0$ , the order of growth of  $g^k=f/F$  is  $\rho\left(g^k\right)=\rho.$  Choose a ray  $\arg z=\theta_0$  on which  ${\rm Re}\,P(z)=O(|z|^{\rho-1})$  as  $|z|\to\infty$ , such that  $f$  has a sequence of poles (and so  $g$  has a sequence of simple zeros) tending to  $\infty$  in the sector  $|\arg z - \theta_0| \le \pi/2\rho$ . Take a sector  $\Sigma$  given by  $|\arg z - \theta_0| \le \pi/\rho - \delta_1$ , where  $\delta_1$  is small and positive, and write

<span id="page-36-4"></span>
$$
g = U_1 + U_2 + U_3, \quad U_j = b_j \phi_j, \quad b_j \in \mathbb{C}, \quad \phi_j \sim u_j,
$$
 (17.2)

in which the  $\phi_j$  are analytic solutions on  $\Sigma$ , and the last relation holds in the sense of asymptotic series, as in Section [4.](#page-6-1) Here the fact that the asymptotics for  $N[y] = 0$  may be extended to hold

in  $\Sigma$  follows from the work of Jurkat [\[16\]](#page-45-10): in the present case, where the exponential parts are  $P$ , 0 and  $-P$ , it is relatively simple to establish, using the Phragmén-Lindelöf principle. Since  $g$ has infinitely many zeros in  $\Sigma$ , at least two of the  $b_j$ , and so at least one of  $b_1$  and  $b_3$ , must be non-zero. By replacing P by  $-P$ , it may be assumed that  $b_1 \neq 0$ .

Now take a ray  $\arg z = \theta$  lying in  $\Sigma$ , on which  $P \prec 0 \prec -P$ , and apply Lemma [16.1](#page-35-5) with  $\kappa_1 = P$ . It follows from [\(16.2\)](#page-35-4) and [\(16.3\)](#page-36-0) that

<span id="page-37-1"></span>
$$
q_2 = q_1 - P
$$
,  $q_3 = q_2 - P = q_1 - 2P$ , ...,  $q_k = q_{k-1} - P = q_1 - (k-1)P$ ,  $s_j = q_j$ , (17.3)

and so, by [\(7.2\)](#page-14-0),

<span id="page-37-0"></span>
$$
0 = q_1 + \ldots + q_k = kq_1 - \left(\frac{k(k-1)}{2}\right)P, \quad q_1 = \left(\frac{k-1}{2}\right)P, \quad q_k = -\left(\frac{k-1}{2}\right)P. \quad (17.4)
$$

Hence the equations  $L[y] = 0$ ,  $M[y] = 0$  have canonical formal solutions

<span id="page-37-2"></span>
$$
f_j(z) = z^{\lambda_j} e^{q_j(z)} (1 + \ldots), \quad w_j(z) = z^{\mu_j} e^{q_j(z)} (1 + \ldots), \tag{17.5}
$$

respectively, in which the  $q_j$  are pairwise distinct. Since  $a_{k-1} = A_{k-1}$ , Lemma [4.2](#page-7-3) implies that

<span id="page-37-4"></span>
$$
\lambda_1 + \ldots + \lambda_k = \mu_1 + \ldots + \mu_k. \tag{17.6}
$$

Write  $v_j=V[u_j].$  By Lemmas [7.1](#page-14-2) and [16.1,](#page-35-5)  $u_1, \ u_3$  annihilate  $f_1, \ f_k$  respectively, and [\(17.4\)](#page-37-0) gives

<span id="page-37-3"></span>
$$
\frac{v_1(z)}{u_1(z)} = -\frac{f_1'(z)}{f_1(z)} = \hat{c}_1 z^{\rho - 1} + \dots, \quad \frac{v_3(z)}{u_3(z)} = -\frac{f_k'(z)}{f_k(z)} = \hat{c}_3 z^{\rho - 1} + \dots,
$$
 (17.7)

where  $\widehat{c}_1$ ,  $\widehat{c}_3$  are non-zero constants. It follows from [\(5.16\)](#page-11-4) and [\(17.1\)](#page-36-3) that  $v_2/u_2$  is given by a (possibly vanishing) formal series in descending integer powers of  $z$  of the form

<span id="page-37-5"></span>
$$
\frac{v_2(z)}{u_2(z)} = \alpha(z)\frac{u_2''(z)}{u_2(z)} + \beta(z)\frac{u_2'(z)}{u_2(z)} + \gamma(z) = c_N z^N + \dots
$$
\n(17.8)

**Lemma 17.1** The integer  $k$  is at least 4.

*Proof.* Suppose that  $k = 3$ ; then [\(17.3\)](#page-37-1) and [\(17.4\)](#page-37-0) lead to

$$
q_1 = P
$$
,  $q_2 = 0$ ,  $q_3 = -P$ .

Now write, using [\(17.1\)](#page-36-3), [\(17.5\)](#page-37-2) and [\(17.7\)](#page-37-3),

$$
f_3'(z)u_1(z) + f_3(z)v_1(z) = f_3(z)u_1(z)\left(\frac{f_3'(z)}{f_3(z)} - \frac{f_1'(z)}{f_1(z)}\right) = z^{\lambda_3 + \eta_1}(1 + \ldots)\left(\frac{f_3'(z)}{f_3(z)} - \frac{f_1'(z)}{f_1(z)}\right)
$$

and

$$
f'_1(z)u_3(z)+f_1(z)v_3(z)=f_1(z)u_3(z)\left(\frac{f'_1(z)}{f_1(z)}-\frac{f'_3(z)}{f_3(z)}\right)=z^{\lambda_1+\eta_3}(1+\ldots)\left(\frac{f'_1(z)}{f_1(z)}-\frac{f'_3(z)}{f_3(z)}\right).
$$

Each of these is a formal solution of  $M[y] = 0$ , with zero exponential part, and so a constant multiple of  $w_2$ . But this implies that  $\lambda_1 + \eta_3 = \lambda_3 + \eta_1$  and  $f'_3u_1 + f_3v_1 = -(f'_1u_3 + f_1v_3)$ , so that  $f_1u_3 = f_3u_1$ , which leads in turn to

$$
\frac{V[u_3]}{u_3} - \frac{V[u_1]}{u_1} = \frac{f_1'}{f_1} - \frac{f_3'}{f_3} = \frac{u_1'}{u_1} - \frac{u_3'}{u_3}, \quad u_1 V[u_3] - u_3 V[u_1] = u_3 u_1' - u_1 u_3'.
$$

<span id="page-38-3"></span>Hence [\(12.1\)](#page-29-0) holds, with  $g_1 = u_1$ ,  $g_2 = u_3$  and  $d = 1$ . Thus the hypotheses of Lemma [12.2](#page-30-2) are satisfied, so that  $d \neq (k - 1)/2 = 1$ , a contradiction.

**Lemma 17.2** One of the following two conclusions holds, in which  $\rho = \deg P > 0$ : (A)  $\eta_2 = -N \le -\rho$  and  $\eta_1 + \eta_3 = -2(\rho - 1)$ ;  $(B)$   $\eta_1 + \eta_3 - 2\eta_2 = 0$  and f has order of growth  $\rho$ .

*Proof.* [\(17.3\)](#page-37-1) and [\(17.7\)](#page-37-3) show that, for  $j = 2, \ldots, k$ , the term

$$
f'_j u_1 + f_j v_1 = f_j u_1 \left( \frac{f'_j}{f_j} - \frac{f'_1}{f_1} \right)
$$

is a canonical formal solution of  $M[y] = 0$  with exponential part  $q_i + P = q_{i-1}$ , and so is a constant multiple of  $w_{j-1}$ . This delivers, using [\(17.3\)](#page-37-1), [\(17.5\)](#page-37-2) and [\(17.6\)](#page-37-4),

<span id="page-38-0"></span>
$$
\mu_1 = \lambda_2 + \eta_1 + \rho - 1
$$
, ...,  $\mu_{k-1} = \lambda_k + \eta_1 + \rho - 1$ ,  $\mu_k = \lambda_1 - (k-1)(\eta_1 + \rho - 1)$ . (17.9)

In the same way, for  $j = 1, \ldots, k - 1$ , the term  $f_j'u_3 + f_jv_3$  has exponential part  $q_j - P = q_{j+1}$ , and so is a constant multiple of  $w_{j+1}$ , which yields

<span id="page-38-1"></span>
$$
\mu_2 = \lambda_1 + \eta_3 + \rho - 1
$$
, ...,  $\mu_k = \lambda_{k-1} + \eta_3 + \rho - 1$ ,  $\mu_1 = \lambda_k - (k-1)(\eta_3 + \rho - 1)$ . (17.10)

Suppose first that  $N \ge \rho$  and  $c_N \ne 0$  in [\(17.8\)](#page-37-5). In this case [\(17.3\)](#page-37-1) and [\(17.5\)](#page-37-2) show that  $u_2$  cannot annihilate any of the  $f_j$ , and that each  $f_j'u_2+f_jv_2$  is a canonical formal solution of  $M[y]=0$  with exponential part  $q_j$ , and so a constant multiple of  $w_j.$  This implies in view of [\(17.6\)](#page-37-4) that

 $\mu_i = \lambda_i + \eta_2 + N \quad (i = 1, \dots, k), \quad \eta_2 = -N.$ 

Moreover, [\(17.9\)](#page-38-0) and [\(17.10\)](#page-38-1) now lead to

$$
\lambda_k = \mu_k = \lambda_1 - (k-1)(\eta_1 + \rho - 1), \quad \lambda_1 = \mu_1 = \lambda_k - (k-1)(\eta_3 + \rho - 1), \quad \eta_1 + \rho - 1 = -(\eta_3 + \rho - 1),
$$

so that  $\eta_1 + \eta_3 = -2(\rho - 1)$  and conclusion (A) holds.

Now suppose that  $N \leq \rho-1$  in [\(17.8\)](#page-37-5): this case will lead to conclusion (B), and encompasses the possibility that  $v_2/u_2$  vanishes identically. The first step is to show that the order of growth of  $f$  is  $\rho.$  Since  $g^k$  has order  $\rho$  it follows from [\(5.1\)](#page-8-0) that the order of  $f$  is at least  $\rho.$  It suffices to show that in [\(5.16\)](#page-11-4) the coefficients (which are rational at infinity) satisfy

<span id="page-38-2"></span>
$$
\alpha(z) = O(|z|^{1-\rho}), \quad \beta(z) = O(1), \quad \gamma(z) = O(|z|^{\rho-1}) \quad \text{as } z \to \infty,
$$
 (17.11)

because if this can be established then  $\rho(f) \leq \rho$  follows from [\(5.16\)](#page-11-4), the Wiman-Valiron theory [\[12\]](#page-45-15) applied to  $1/f$ , and standard estimates [\[8\]](#page-45-16) for logarithmic derivatives of  $g^k$  and  $g$ .

To prove  $(17.11)$  use  $(17.1)$ ,  $(17.7)$  and  $(17.8)$  to write

$$
\alpha(z)P'(z)^2(1+O(z^{-1})) + \beta(z)P'(z)(1+O(z^{-1})) + \gamma(z) = \frac{v_1(z)}{u_1(z)} = O(z^{\rho-1}),
$$
  
\n
$$
\alpha(z)P'(z)^2(1+O(z^{-1})) - \beta(z)P'(z)(1+O(z^{-1})) + \gamma(z) = \frac{v_3(z)}{u_3(z)} = O(z^{\rho-1}),
$$
  
\n
$$
\alpha(z)O(z^{-2}) + \beta(z)O(z^{-1}) + \gamma(z) = \frac{v_2(z)}{u_2(z)} = O(z^N) = O(z^{\rho-1}).
$$

Here  $O(z^{\omega})$  denotes any formal series in descending integer powers of  $z$  with leading power at most  $\omega \in \mathbb{Z}$ . Eliminating  $\gamma$  via the last equation yields

$$
\alpha(z)P'(z)^2(1+O(z^{-1})) + \beta(z)P'(z)(1+O(z^{-1})) = O(z^{\rho-1}),
$$
  
\n
$$
\alpha(z)P'(z)^2(1+O(z^{-1})) - \beta(z)P'(z)(1+O(z^{-1})) = O(z^{\rho-1}),
$$

and now [\(17.11\)](#page-38-2) follows from Cramer's rule.

Next, since  $N \leq \rho-1$ , [\(17.3\)](#page-37-1) and [\(17.8\)](#page-37-5) give pairwise distinct  $d_j \in \mathbb{C}$  with

$$
\frac{f'_j(z)}{f_j(z)} + \frac{v_2(z)}{u_2(z)} = \hat{d}_j z^{\rho - 1} + \dots
$$

If  $d_j\neq 0$  then  $f_j'u_2+f_jv_2$  is again a canonical formal solution of  $M[y]=0$  with exponential part  $q_j$ , and so a constant multiple of  $w_j.$  Since  $k\geq 4,$  this implies in view of [\(17.5\)](#page-37-2) that

<span id="page-39-0"></span>
$$
\mu_j = \lambda_j + \eta_2 + \rho - 1 \tag{17.12}
$$

for  $j = 1$  and  $j = 2$ , or for  $j = k - 1$  and  $j = k$ . If [\(17.12\)](#page-39-0) holds for  $j = 1$  and  $j = 2$  then [\(17.9\)](#page-38-0), [\(17.10\)](#page-38-1) and [\(17.12\)](#page-39-0) give

$$
\mu_1 = \lambda_1 + \eta_2 + \rho - 1 = \lambda_2 + \eta_1 + \rho - 1, \quad \mu_2 = \lambda_2 + \eta_2 + \rho - 1 = \lambda_1 + \eta_3 + \rho - 1,
$$

from which it follows that

$$
\eta_1 - \eta_2 = \lambda_1 - \lambda_2 = \eta_2 - \eta_3, \quad \eta_1 + \eta_3 - 2\eta_2 = 0.
$$

Similarly, if [\(17.12\)](#page-39-0) holds for  $j = k - 1$  and  $j = k$ , then [\(17.9\)](#page-38-0), [\(17.10\)](#page-38-1) and (17.12) give

$$
\mu_k = \lambda_k + \eta_2 + \rho - 1 = \lambda_{k-1} + \eta_3 + \rho - 1, \quad \mu_{k-1} = \lambda_{k-1} + \eta_2 + \rho - 1 = \lambda_k + \eta_1 + \rho - 1,
$$

which delivers

$$
\eta_1 - \eta_2 = \lambda_{k-1} - \lambda_k = \eta_2 - \eta_3, \quad \eta_1 + \eta_3 - 2\eta_2 = 0.
$$

**Lemma 17.3** If  $b_3 = 0$  in [\(17.2\)](#page-36-4) then f satisfies the conclusion of Proposition [10.1.](#page-24-0)

 $\Box$ 

*Proof.* Using [\(5.16\)](#page-11-4) write, on  $\Sigma$ .

<span id="page-40-2"></span>
$$
g = U_1 + U_2, \quad -\frac{f'}{f} = \frac{V[g]}{g} = \frac{V[U_1] + V[U_2]}{U_1 + U_2} = \frac{V[U_1]/U_2 + V[U_2]/U_2}{e^{\Phi} + 1}, \quad e^{\Phi} = \frac{U_1}{U_2}.
$$
 (17.13)

A zero of  $g$  arises wherever  $U_1/U_2 = e^\Phi = -1$ , and the multiplicity of the pole of  $f$  at such a point is

<span id="page-40-0"></span>
$$
m_0 = \frac{V[U_1]/U_1 - V[U_2]/U_2}{\Phi'}.
$$
\n(17.14)

By [\(17.1\)](#page-36-3) and [\(17.2\)](#page-36-4), the function  $\zeta = (1/\pi i)\Phi = (1/\pi i) \log U_1/U_2$  maps the sector  $\Sigma$  univalently onto a region containing a half-plane  $\pm \text{Re}\,\zeta > M_1 \in \mathbb{R}$ , and [\(17.14\)](#page-40-0) holds wherever  $\zeta$  is an odd integer. Thus [\(17.1\)](#page-36-3), [\(17.2\)](#page-36-4), [\(17.7\)](#page-37-3) and Lemma [3.1](#page-4-0) give a polynomial  $Q^*$  such that

<span id="page-40-1"></span>
$$
\frac{V[U_1]}{U_1} - \frac{V[U_2]}{U_2} = Q^*(\Phi)\Phi', \quad U_2 V[U_1] - U_1 V[U_2] = Q^*(\Phi)(U_2 U_1' - U_1 U_2'). \tag{17.15}
$$

Suppose first that  $Q^*(\Phi)$  is rational at infinity in [\(17.15\)](#page-40-1). Then it follows from Lemma [12.1](#page-29-3) that  $U_1$  and  $U_2$  solve a second order equation [\(3.4\)](#page-6-3) with  $E_1$  and  $E_0$  rational at infinity, and so does g, by  $(17.13)$ , contradicting Lemma [10.1\(](#page-24-1)C).

It may therefore be assumed henceforth that  $Q^*$  is non-constant. Then [\(17.14\)](#page-40-0) and [\(17.15\)](#page-40-1) show that the multiplicity  $m_0(z)$  of a pole  $z\in\Sigma$  of  $f$  tends to  $\infty$  as  $z\to\infty$ , faster than  $|z|^{\rho_1}$ for some  $\rho_1 > 0$ . Since the zeros of  $g = U_1 + U_2$  in  $\Sigma$  have of exponent of convergence  $\rho$ , this is incompatible with Case B of Lemma [17.2.](#page-38-3) Hence Case A of Lemma [17.2](#page-38-3) must hold, and so  $(\eta_1 - \eta_2) - (\eta_2 - \eta_3) = \eta_1 + \eta_3 - 2\eta_2$  is a positive integer.

Furthermore, the left-hand side of [\(17.15\)](#page-40-1) has a meromorphic continuation along any path in  $\Omega(r_1)$ , as has  $\Phi'$ , but if a continuation of  $U_1/U_2$  has a zero or pole at some  $z_0$  then  $\Phi(z) =$  $\log U_1(z)/U_2(z)$  behaves like  $m_1 \log(z - z_0)$  as  $z \to z_0$ , for some  $m_1 \in \mathbb{Z} \setminus \{0\}$ . Therefore [\(17.15\)](#page-40-1) implies that  $e^{\Phi} = U_1/U_2$  continues without poles or zeros in  $\Omega(r_1)$ , and so any zeros of continuations of  $U_1$  and  $U_2$  are shared.

Take any sector  $\Sigma^*$  given by  $|\arg z - \theta^*| \leq \pi/\rho - \delta_1$ , where  $\text{Re } P(re^{i\theta^*}) = O(r^{\rho-1})$  as  $r\rightarrow\infty$ , let  $\bar{U}_1,\bar{U}_2$  be continuations of  $U_1,U_2$  to  $\Sigma^*$ , and write

<span id="page-40-3"></span>
$$
\widetilde{U}_1 = d_1 \psi_1 + d_2 \psi_2 + d_3 \psi_3, \quad \widetilde{U}_2 = e_1 \psi_1 + e_2 \psi_2 + e_3 \psi_3, \quad d_j, e_j \in \mathbb{C}, \tag{17.16}
$$

on  $\Sigma^*$ , in which the  $\psi_j$  are analytic solutions of  $N[y]=0$  which satisfy, as  $z\to\infty$  on  $\Sigma^*$ ,

<span id="page-40-4"></span>
$$
\psi_1(z) = z^{\eta_1} e^{P(z)} (1 + o(1)), \quad \psi_2(z) = z^{\eta_2} (1 + o(1)), \quad \psi_3(z) = z^{\eta_3} e^{-P(z)} (1 + o(1)). \quad (17.17)
$$

Suppose that  $U_1$  and  $U_2$  have a sequence  $\zeta_\mu\to\infty$  of common zeros in  $\Sigma^*.$  The matrix with rows  $(d_1, d_2, d_3)$  and  $(e_1, e_2, e_3)$  has rank 2, since  $U_1$  and  $U_2$  are linearly independent, and so Cramer's rule gives  $e_4, e_5 \in \mathbb{C}$  and a permutation  $(j, j', j'')$  of  $(1, 2, 3)$  such that

$$
\psi_{j'}(\zeta_\mu) = e_4 \psi_j(\zeta_\mu), \quad \psi_{j''}(\zeta_\mu) = e_5 \psi_j(\zeta_\mu) \quad \text{as } \mu \to \infty.
$$

Here  $e_4e_5\neq 0$ , as  $\psi_j(\zeta_\mu)\neq 0$  for large  $\mu$ . But this gives a contradiction, since the fact that  $(\eta_1 - \eta_2) - (\eta_2 - \eta_3)$  is positive implies that  $\psi_2(\zeta_\mu)/\psi_3(\zeta_\mu) = o(|\psi_1(\zeta_\mu)/\psi_2(\zeta_\mu)|)$  as  $\mu \to \infty$ .

It follows that  $U_1$  and  $U_2$  continue without zeros in some annulus  $\Omega(r^*)$ . Lemma [3.2](#page-4-1) shows that there exists  $\rho_2$   $>$   $\,0$  such that any continuation of  $U_2$  to any sector in  $\Omega(r^*)$  satisfies

 $\log|U_2(z)| = O\left(|z|^{\rho_2}\right)$  as  $z\to\infty$  there. Take a sector  $\Sigma^{**}$  given by  $\theta_1<\arg z<\theta_2$ , where these  $\theta_j$  are such that no  $\theta\in[\theta_1,\theta_2]$  has  ${\rm Re}\,P(re^{i\theta})=O(r^{\rho-1})$  as  $r\to\infty.$  For any continuation of  $U_2$  to  $\Sigma^{**}$  there exist  $P^*\in\{-P,0,P\}$  and a matching  $\eta^*\in\{\eta_1,\eta_2,\eta_3\}$  such that  $U_2(z)\sim$  $cz^{\eta^*}\exp(P^*(z))$  as  $z\to\infty$  in  $\Sigma^{**}$ . Since  $U_2(z)\sim cz^{\eta_2}$  as  $z\to\infty$  in  $\Sigma$ , repeated application of the Phragmén-Lindelöf principle to the continuations of  $U_2(z)z^{-\eta_2}$  or its reciprocal shows that  $P^*=0$ , and so  $\eta^*=\eta_2$ . Examining  $(17.16)$  in the light of  $(17.17)$ , first on a subsector of  $\Sigma^*$ on which  $e^P$  is large and subsequently on a subsector where  $e^{-P}$  is large, forces  $0=e_1=e_3.$ Choosing  $\Sigma^* = \Sigma$  gives  $e_0 \in \mathbb{C}$  such that  $z^{e_0}U_2(z)$  is analytic and zero-free of finite order of growth in some annulus  $\Omega(r^{**})$ . This, coupled with almost identical reasoning applied to  $U_1$ , shows that  $U_1'/U_1$ ,  $U_2'/U_2$  and  $\Phi'$  are rational at infinity, as is  $Q^*(\Phi)$  by  $(17.15)$ , and this case has already been dealt with.  $\square$ 

Assume henceforth that  $b_1b_3\neq 0$  in [\(17.2\)](#page-36-4), and write this formula for g as

<span id="page-41-0"></span>
$$
g = Ae^{-P}((e^{P} - B)^{2} - C^{2}), \quad U_{1} = Ae^{P}, \quad U_{2} = -2AB, \quad U_{3} = A(B^{2} - C^{2})e^{-P}. \quad (17.18)
$$

By [\(17.1\)](#page-36-3), this initially formal expression for g results in, as  $z \to \infty$  in  $\Sigma$ ,

<span id="page-41-1"></span>
$$
A(z) = b_1 z^{\eta_1} \chi_1(z), \quad B(z) = -\frac{b_2}{2b_1} z^{\eta_2 - \eta_1} \chi_2(z),
$$
  

$$
B(z)^2 - C(z)^2 = \frac{b_3}{b_1} z^{\eta_3 - \eta_1} \chi_3(z), \quad \chi_j(z) = 1 + o(1).
$$
 (17.19)

Here the  $\chi_j$  have asymptotic series on  $\Sigma$  in descending integer powers of  $z$  and, by Lemma [17.2,](#page-38-3)  $\eta_3-\eta_1-2(\eta_2-\eta_1)=\eta_1+\eta_3-2\eta_2$  is a non-negative even integer. Evidently  $A,B$  and  $E=C^2$ are analytic on  $\Sigma$ , and E does not vanish identically, since zeros of g are simple. Furthermore, it is clear from [\(17.18\)](#page-41-0) that, at a zero of g in  $\Sigma$ ,

<span id="page-41-2"></span>
$$
(eP - B)2 = E = C2, g' = Ae-P(2(eP - B)(P'eP - B') - E').
$$
 (17.20)

<span id="page-41-5"></span>**Lemma 17.4** Let  $d = \pm 1$ . Then there exist  $r_2 > 0$  and  $\sigma_d, \tau_d \in \mathbb{C}^*$ , as well as  $\gamma_d, \zeta_d \in \mathbb{C}$ , such that  $B + dC$  is analytic on  $\Sigma \cap \Omega(r_2)$  and

<span id="page-41-3"></span>
$$
C(z)^{2} = \sigma_{d} z^{\gamma_{d}} \psi_{1}(z), \quad \psi_{1}(z) = 1 + o(1), \tag{17.21}
$$

and

<span id="page-41-4"></span>
$$
B(z) + dC(z) = \tau_d z^{\zeta_d} \psi_2(z), \quad \psi_2(z) = 1 + o(1), \tag{17.22}
$$

as  $z \to \infty$  in  $\Sigma$ , in which the  $\psi_j(z)$  have asymptotic series on  $\Sigma$  in descending integer powers of  $z^{1/2}.$  Furthermore, if conclusion (A) of Lemma [17.2](#page-38-3) holds, then  $\gamma_d=\eta_3-\eta_1.$ 

*Proof.* Note first that  $B+dC$  does not vanish identically, since  $B^2-C^2$  does not. All conclusions of the lemma clearly follow from [\(17.19\)](#page-41-1) if  $b_2 = 0$  or  $\eta_3 - \eta_1 - 2(\eta_2 - \eta_1) > 0$ , and in particular if conclusion (A) of Lemma [17.2](#page-38-3) holds.

Assume therefore that  $b_2\neq 0$  and  $\eta_3-\eta_1 = 2(\eta_2-\eta_1)$ . Then [\(17.19\)](#page-41-1) implies that  $\widetilde{C}(z) = 0$  $C(z)^2 z^{2(\eta_1-\eta_2)}$  has an asymptotic series on  $\Sigma$  in descending non-positive integer powers of  $z.$  If this asymptotic series for  $C(z)$  vanishes identically then, by making  $\Sigma$  slightly narrower if necessary, it may be assumed that  $E(z)=C(z)^2$  and  $E'(z)$  both tend to zero in  $\Sigma$  transcendentally fast, that is, faster than any negative power of z, but f still has infinitely many poles there. This implies using [\(5.2\)](#page-8-2) and [\(17.20\)](#page-41-2) that if  $M_1$  is a positive integer and z is a pole of f of multiplicity  $m_0(z)$  in  $\Sigma$ , with  $|z|$  large, then

$$
g(z) = 0
$$
,  $e^{P(z)} = B(z) + O(|z|^{-2M_1})$ ,  $g'(z) = O(|z|^{-M_1})$ ,  $|z|^{M_1} = O(m_0(z))$ ,

which is a contradiction since f has finite order. Hence there must exist an integer  $m_1 \leq 0$  such that [\(17.21\)](#page-41-3) holds with  $\gamma_d = 2(\eta_2-\eta_1)+m_1$ , in which  $\psi_1(z)$  has an asymptotic series in descending integer powers of z. It is now clear from [\(17.19\)](#page-41-1) and [\(17.21\)](#page-41-3) that  $B(z) = (B(z) + dC(z))z^{\eta_1-\eta_2}$ has an asymptotic series on  $\Sigma$  in descending integer powers of  $z^{1/2};$  thus  $(17.22)$  holds unless this series for  $\tilde{B}(z)$  vanishes identically, in which case  $B(z) + dC(z)$  tends to zero transcendentally fast on  $\Sigma$ , and so does  $B(z)^2 - C(z)^2$ , by the second equation of [\(17.19\)](#page-41-1), which forces  $b_3=0$ in  $(17.19)$ , contrary to assumption.  $\Box$ 

**Lemma 17.5** For  $d = \pm 1$  there exists a polynomial  $Q_d \not\equiv 0$  such that

<span id="page-42-0"></span>
$$
\[2dCA\left(P' - \frac{B' + dC'}{B + dC}\right)\]^{-k} = Q_d(P - \log(B + dC)).\tag{17.23}
$$

*Proof.* The function  $g$  has a zero in  $\Sigma$  wherever  $e^P = B + dC$ , and at such a zero [\(17.20\)](#page-41-2) gives

<span id="page-42-1"></span>
$$
g' = Ae^{-P}(2dC(P'e^{P} - B') - 2CC') = 2dCAe^{-P}(P'e^{P} - B' - dC')
$$
  
= 
$$
2dCA\left(P' - \frac{B' + dC'}{B + dC}\right).
$$
 (17.24)

Here [\(17.22\)](#page-41-4) shows that  $\zeta = (1/2\pi i)(P(z) - \log(B(z) + dC(z)))$  maps a subdomain of  $\Sigma$ univalently onto a half-plane  $\pm {\rm Re}\,\zeta>M_1\in\mathbb{R}$ . Because [\(5.2\)](#page-8-2) implies that  $(g')^{-k}$  is integervalued at each zero of g, and so at points where  $\zeta$  is integer-valued, it follows from [\(17.19\)](#page-41-1),  $(17.21)$  and Lemma [3.1](#page-4-0) that a polynomial  $Q_d$  exists as asserted.  $\hfill \Box$ 

#### <span id="page-42-2"></span>**Lemma 17.6** For  $d = \pm 1$  the polynomial  $Q_d$  in [\(17.23\)](#page-42-0) is constant.

*Proof.* Assume that  $Q_d$  is non-constant. Then it follows from [\(5.2\)](#page-8-2), [\(17.22\)](#page-41-4), [\(17.23\)](#page-42-0) and [\(17.24\)](#page-42-1) that the multiplicity  $m_0(z)$  of the pole of f at  $z \in \Sigma$  tends to  $\infty$  faster than some positive power of  $|z|$  and, since the exponent of convergence of the zeros of  $e^P-(B+dC)$  in  $\Sigma$  is  $\rho$ , this implies that  $N(r, f)$  has order greater than  $\rho$ , which is incompatible with conclusion (B) of Lemma [17.2.](#page-38-3)

Hence conclusion (A) of Lemma [17.2](#page-38-3) must hold. In view of [\(17.19\)](#page-41-1) and Lemma [17.4,](#page-41-5) it follows that  $\eta_1 + \eta_3 = -2(\rho - 1)$  and  $\gamma_d = \eta_3 - \eta_1$ , and that

$$
C(z)A(z) \sim cz^{\gamma_d/2 + \eta_1} = cz^{(\eta_1 + \eta_3)/2} = cz^{1-\rho}
$$

<span id="page-42-3"></span>as  $z \to \infty$  in  $\Sigma$ . But then the left-hand side of [\(17.23\)](#page-42-0) is bounded as  $z \to \infty$  in  $\Sigma$ , which is a  $\Box$  contradiction.  $\Box$ 

**Lemma 17.7** There exist a large positive  $r_3$  and an analytic function K such that

<span id="page-43-0"></span>
$$
K' = \frac{1}{U_1}, \quad U_1 = Ae^P, \quad U_2 = -2AB = e_3U_1K, \quad U_3 = A(B^2 - C^2)e^{-P} = e_4U_1K^2, \tag{17.25}
$$

on  $\Sigma \cap \Omega(r_3)$ , where  $e_3, e_4 \in \mathbb{C}$  and  $e_4 \neq 0$ .

*Proof.* Suppose first that  $B \neq 0$ . Then [\(17.23\)](#page-42-0) holds for  $d = 1$  and  $d = -1$ , with  $Q_1$  and  $Q_{-1}$ both constant by Lemma [17.6.](#page-42-2) Hence, by [\(17.22\)](#page-41-4) and [\(17.23\)](#page-42-0),

$$
CA\left(P' - \frac{B' + C'}{B + C}\right), \quad CA\left(P' - \frac{B' - C'}{B - C}\right)
$$

are both constant, and so identically equal. Thus  $(B+C)/(B-C)$  must be constant and so must  $B/C.$  Now [\(17.18\)](#page-41-0), [\(17.21\)](#page-41-3), [\(17.23\)](#page-42-0) and Lemma [17.6](#page-42-2) yield, with  $c\in\mathbb{C}^*$  as before,

<span id="page-43-1"></span>
$$
CA\left(P' - \frac{C'}{C}\right) = c, \quad C' - P'C = \frac{c}{A}, \quad Ce^{-P} = c \int \frac{1}{Ae^P} = c \int \frac{1}{U_1} = cK, \quad (17.26)
$$

from which [\(17.25\)](#page-43-0) follows, using [\(17.18\)](#page-41-0) again. On the other hand, if  $B \equiv 0$  then the first equation of [\(17.26\)](#page-43-1) still holds, by Lemma [17.6,](#page-42-2) and the formula for  $U_2$  in [\(17.25\)](#page-43-0) is trivially satisfied with  $e_3 = 0$ .

<span id="page-43-3"></span>**Lemma 17.8** The function K of Lemma [17.7](#page-42-3) continues meromorphically along any path in the annulus  $\Omega(r_3)$ , its continuations locally univalent. Moreover, all zeros of any continuation of  $U_1$ into  $\Omega(r_3)$  are simple poles of K.

*Proof.* Since  $e_4 \neq 0$  in [\(17.25\)](#page-43-0), writing

<span id="page-43-2"></span>
$$
\Phi = K^2 = \frac{U_3}{e_4 U_1}, \quad \frac{1}{U_1^2} = (K')^2 = \frac{(\Phi')^2}{4\Phi},\tag{17.27}
$$

shows that  $\Phi$  continues meromorphically along any path in  $\Omega(r_3)$ . Any zero of any continuation of  $U_1$  is either simple or double, since  $U_1$  solves  $N[y] = 0$ , and must be a pole of  $\Phi$ , by [\(17.27\)](#page-43-2). Comparing multiplicities in [\(17.27\)](#page-43-2) excludes simple zeros of  $U_1$ , and double zeros of  $U_1$  have to be triple poles of  $\Phi'$  and so double poles of  $\Phi_+$  Furthermore, any zeros of any continuation of  $\Phi$  must be double, again by [\(17.27\)](#page-43-2). Thus  $K=\Phi^{1/2}$  continues meromorphically along paths in  $\Omega(r_3)$ , and is locally univalent since  $K'(z) = 1/U_1(z) \neq 0$ .

Again because  $e_4 \neq 0$  in [\(17.25\)](#page-43-0), there exists a polynomial  $Q_2$  of degree 2 such that [\(17.2\)](#page-36-4) and continuation of  $g$  into  $\Omega(r_3)$  give  $g=Q_2(K)/K'$ , whether or not  $U_2\equiv 0$ , where  $K$  is as in Lemma [17.8.](#page-43-3) Hence  $g=0$  forces  $K=a$ , where  $Q_2(a)=0$ , and so  $g'=Q_2'(a)=\pm b$  for some  $b\in\mathbb{C}^*$ , by elementary properties of quadratics. It now follows using  $(5.2)$  that all poles of  $f$  in  $\Omega(r_3)$  have the same multiplicity, and f satisfies the conclusion of Proposition [10.1.](#page-24-0)  $\Box$ 

# <span id="page-44-7"></span>18 The case of a repeated trivial exponential part

There remains only one case to deal with, in which the equation  $N[y] = 0$  has two linearly independent formal solutions  $g_1$ ,  $g_2$  with trivial exponential part. The third exponential part  $\kappa$  must be non-zero, by Lemma [11.1.](#page-28-1) Take a ray  $\arg z = \theta_0$  on which  $\kappa \prec 0$ , and label the exponential parts arising from L and M to be consistent with [\(14.1\)](#page-32-2) on  $\arg z = \theta_0$ . It then follows from Lemma [16.1](#page-35-5) that the exponential parts  $q_j$  for the equation  $L[y]\,=\,0$  are pairwise distinct, and the same is true for  $M[y] = 0$ , and so the formal solutions of these equations are free of logarithms. This implies that any formal solution G of  $N[y] = 0$  is also free of logarithms; to see this, take a fundamental set of canonical formal solutions  $f_j$  of  $L[y] = 0$ , write  $f_j'G + f_jV[G] = w_j$ , where the  $w_j$  are formal solutions of  $M[y] = 0$ , and solve for  $G$ .

Therefore  $N[y] = 0$  has linearly independent canonical formal solutions  $g_1, g_2$  each having the form  $g_j(z) = z^{m_j}(1 + \ldots)$ , with  $m_j \in \mathbb{C}$ . There exists a third canonical formal solution  $g_3$ , which has exponential part  $\kappa$  and, by Lemma [7.1,](#page-14-2) annihilates some canonical formal solution  $h_\mu$ of  $L[y]=0$ , with exponential part  $q_\mu$  say. Consider the terms  $R_j=V[g_j]/g_j$ , for  $j=1,2$ ; these are formal series in descending integer powers of  $z$ . Hence

$$
S_j = h'_\mu g_j + h_\mu V[g_j] = h_\mu g_j \left( h'_\mu / h_\mu + R_j \right)
$$

is a formal solution of  $M[y] = 0$ , for  $j = 1, 2$ , and either is identically zero or has exponential part  $q_{\mu}$ . Since the exponential parts for M are all different,  $S_{1}$  and  $S_{2}$  must be linearly dependent, and some non-trivial linear combination  $g_4$  of  $g_1$  and  $g_2$  must annihilate  $h_\mu$ , as does  $g_3$ . Therefore  $g_3V[g_4] = g_4V[g_3]$  and Lemma [12.2,](#page-30-2) with  $d=0$ , gives an equation [\(3.4\)](#page-6-3) solved by  $g_3$  and  $g_4$ . Furthermore,  $g_4$  must be a canonical formal solution of  $N[y] = 0$ ; this is obvious unless  $g_4 = d_1 g_1 - d_2 g_2$  with  $d_1, d_2 \in \mathbb{C}^*$ , in which case

$$
d_1S_1 = d_2S_2, \quad d_1g_1 \left( h'_{\mu}/h_{\mu} + R_1 \right) = d_2g_2 \left( h'_{\mu}/h_{\mu} + R_2 \right).
$$

Thus  $W(g_3, g_4)$  has non-zero exponential part, so that  $E_1(\infty) \neq 0$  in [\(3.4\)](#page-6-3), and the conclusion of Proposition [10.1](#page-24-0) follows from Lemma [12.2.](#page-30-2)  $\Box$
