Calculus of archimedean Rankin–Selberg integrals with recurrence relations

Taku Ishii, and Tadashi Miyazaki June 9, 2020

Abstract

Let n and n' be positive integers such that $n-n' \in \{0,1\}$. Let F be either \mathbb{R} or \mathbb{C} . Let K_n and $K_{n'}$ be maximal compact subgroups of $\mathrm{GL}(n,F)$ and $\mathrm{GL}(n',F)$, respectively. We give the explicit descriptions of archimedean Rankin–Selberg integrals at the minimal K_n - and $K_{n'}$ -types for pairs of principal series representations of $\mathrm{GL}(n,F)$ and $\mathrm{GL}(n',F)$, using their recurrence relations. Our results for $F=\mathbb{C}$ can be applied to the arithmetic study of critical values of automorphic L-functions.

1 Introduction

The theory of automorphic L-functions via integral representations has its origin in the work of Hecke [7] for GL(2), and the works of Rankin [22], Selberg [23] for $GL(2) \times GL(2)$. As a direct outgrowth of their works, the theory of Rankin–Selberg integrals for $GL(n) \times GL(n')$ were developed by Jacquet, Piatetski-Shapiro, and Shalika [12]. Our interest here is the archimedean local theory of their Rankin–Selberg integrals.

Let F be either \mathbb{R} or \mathbb{C} . We fix a maximal compact subgroup K_n of $\mathrm{GL}(n,F)$. Let Π and Π' be irreducible generic Casselman–Wallach representations of $\mathrm{GL}(n,F)$ and $\mathrm{GL}(n',F)$, respectively. We denote by $L(s,\Pi\times\Pi')$ the archimedean L-factor for $\Pi\times\Pi'$. The theory of archimedean Rankin–Selberg integrals for $\Pi\times\Pi'$ was developed by Jacquet and Shalika. In [15], they showed that any archimedean Rankin–Selberg integral for $\Pi\times\Pi'$ is extended to $\mathbb C$ as a holomorphic multiple of $L(s,\Pi\times\Pi')$, is bounded at infinity in vertical strips, and satisfies the local functional equation. Furthermore, in [14], Jacquet refined the proofs of the above results, and showed further that $L(s,\Pi\times\Pi')$ can be expressed as a linear combination of archimedean Rankin–Selberg integrals for

 $\Pi \times \Pi'$ if $n-n' \in \{0,1\}$. Their results are sufficient for the proofs of important analytic properties of automorphic L-functions such as the analytic continuations, the functional equations and the converse theorems. However, in the studies of arithmetic properties of automorphic L-functions, the precise knowledges of archimedean Rankin–Selberg integrals at the special K_n - and $K_{n'}$ -types are required. For example, Sun's non-vanishing result [27] at the minimal K_n - and K_{n-1} -types is vital to the arithmetic study of critical values of automorphic L-functions for $GL(n) \times GL(n-1)$ by the cohomological method. The goal of this paper is to give explicit descriptions of archimedean Rankin–Selberg integrals at the minimal K_n - and $K_{n'}$ -types for pairs of principal series representations of GL(n, F) and GL(n', F) with $n - n' \in \{0, 1\}$. We generalize Stade's results [25], [26] (see [10] for a simplified proof) for the spherical case to general case.

Let us explain our main result for the $GL(n) \times GL(n-1)$ -case. Assume that Π and Π' are irreducible principal series representations of GL(n,F) and GL(n-1,F), respectively. Let ψ be the standard additive character of F. We regard GL(n-1,F) as a subgroup of GL(n,F) via the embedding

$$\iota_n \colon \mathrm{GL}(n-1,F) \ni g \mapsto \begin{pmatrix} g \\ 1 \end{pmatrix} \in \mathrm{GL}(n,F).$$

For $W \in \mathcal{W}(\Pi, \psi)$ and $W' \in \mathcal{W}(\Pi', \psi^{-1})$, we define the archimedean Rankin–Selberg integral Z(s, W, W') by

$$Z(s, W, W') = \int_{N_{n-1}\backslash GL(n-1, F)} W(\iota_n(g))W'(g)|\det g|_F^{s-1/2} dg \qquad (\text{Re}(s) \gg 0),$$

where $\mathcal{W}(\Pi, \psi)$, $\mathcal{W}(\Pi', \psi^{-1})$ are the Whittaker models of Π , Π' , respectively, N_{n-1} is the upper triangular unipotent subgroup of $\mathrm{GL}(n-1,F)$, and $|\cdot|_F$ is the usual norm on F. Let (τ_{\min}, V_{\min}) be the minimal K_n -type of Π , and we fix a K_n -embedding $\mathbf{W} \colon V_{\min} \to \mathcal{W}(\Pi, \psi)$. Let $(\tau'_{\min}, V'_{\min})$ be the minimal K_{n-1} -type of Π' , and we fix a K_{n-1} -embedding $\mathbf{W}' \colon V'_{\min} \to \mathcal{W}(\Pi', \psi^{-1})$. Here we give \mathbf{W} and \mathbf{W}' concretely by the Jacquet integrals. We note that

$$V_{\min} \otimes_{\mathbb{C}} V'_{\min} \ni v \otimes v' \mapsto Z(s, \mathbf{W}(v), \mathbf{W}'(v')) \in \mathbb{C}_{\text{triv}}$$

defines an element of $\operatorname{Hom}_{K_{n-1}}(V_{\min} \otimes_{\mathbb{C}} V'_{\min}, \mathbb{C}_{\operatorname{triv}})$, where $\mathbb{C}_{\operatorname{triv}} = \mathbb{C}$ is the trivial K_{n-1} -module. In the first main theorem (Theorem 2.5), we give the explicit description of this K_{n-1} -homomorphism. More precisely, under the assumption $\operatorname{Hom}_{K_{n-1}}(V_{\min} \otimes_{\mathbb{C}} V'_{\min}, \mathbb{C}_{\operatorname{triv}}) \neq \{0\}$, we show the equality

$$Z(s, \mathbf{W}(v), \mathbf{W}'(v')) = L(s, \Pi \times \Pi') \Psi(v \otimes v') \qquad (v \in V_{\min}, \ v' \in V'_{\min}) \quad (1.1)$$

with some nonzero $\Psi \in \operatorname{Hom}_{K_{n-1}}(V_{\min} \otimes_{\mathbb{C}} V'_{\min}, \mathbb{C}_{\operatorname{triv}})$ independent of s, and describe Ψ explicitly in terms of Gelfand–Tsetlin type bases of V_{\min} and V'_{\min} . In the second main theorem (Theorem 2.9), we give a similar description for the $\operatorname{GL}(n) \times \operatorname{GL}(n)$ -case. Since the statement of Theorem 2.9 is slightly complicated, we leave it to Section 2.

We introduce some applications of our results (Theorems 2.5 and 2.9) for $F = \mathbb{C}$. In the arithmetic study of critical values of automorphic L-functions for $GL(n) \times GL(n')$ with $n - n' \in \{0,1\}$ by the cohomological method, the archimedean Rankin–Selberg integrals at the minimal K_n - and $K_{n'}$ -types play important roles, and the hypothesis of the non-vanishing of them at critical points is called the non-vanishing hypothesis for $GL(n, F) \times GL(n', F)$. It is known that a local component at the complex place of irreducible regular algebraic cuspidal automorphic representation of GL(n) is a cohomological principal series representation (cf. [21, Proposition 2.14]). Hence, Theorem 2.5 gives another proof of the non-vanishing hypothesis for $GL(n,\mathbb{C}) \times GL(n-1,\mathbb{C})$ at all critical points, which were originally proved by Sun [27] and were used in Grobner-Harris [6] and Raghuram [21]. In [2], Dong and Xue proved the nonvanishing hypothesis for $\mathrm{GL}(n,\mathbb{C}) \times \mathrm{GL}(n,\mathbb{C})$ at the central critical point, and they indicate that it is hard to generalize their result to all critical points by the technique of the translation functor. Theorem 2.9 proves the non-vanishing hypothesis for $GL(n,\mathbb{C}) \times GL(n,\mathbb{C})$ at all critical points, and allows us to improve the archimedean part of Grenie's theorem [5, Theorem 2] into more explicit form (cf. Remark 2.12). We expect that our explicit results will be applied to deeper study of special values of automorphic L-functions.

There are some related results to be mentioned here. In the cases of $\operatorname{GL}(n) \times \operatorname{GL}(n-1)$ and $\operatorname{GL}(n) \times \operatorname{GL}(n)$, we expect that the archimedean Rankin–Selberg integrals for appropriate Whittaker functions are equal to the associated L-factors. This expectation was proved by Jacquet–Langlands [11] and Popa [20] for the $\operatorname{GL}(2) \times \operatorname{GL}(1)$ -case; by Jacquet [13], Zhang [31] and the second author [19] for the $\operatorname{GL}(2) \times \operatorname{GL}(2)$ -case; by Hirano and the authors [8] for the $\operatorname{GL}(3) \times \operatorname{GL}(2)$ -case. The results of this paper, that is, the formula (1.1) and the analogous formula for $\operatorname{GL}(n) \times \operatorname{GL}(n)$ in Theorem 2.9 can be regarded as additional evidences of this expectation for the higher rank cases.

Let us briefly explain the idea of the proofs of our main theorems. The key ingredients are two kinds of the Godement sections for a principal series representation Π of GL(n, F). One is defined by Jacquet [14] as an integral transform of the standard section for some principal series representation of GL(n-1,F), and gives a recursive integral representation of a Whittaker function for Π . The other seems to be new, and is defined as an integral transform of the standard section for the same representation Π of GL(n,F). It gives an integral representation of a Whittaker function for Π , which is related to the local theta correspondence in Watanabe [30, §2]. Using two kinds of the Godement sections, we construct the recurrence relations of the archimedean Rankin-Selberg integrals for pairs of principal series representations of GL(n, F) and GL(n', F)with $n-n' \in \{0,1\}$. Based on the representation theory of K_n , we write down these recurrence relations at the minimal K_{n-} and $K_{n'}$ -types, explicitly, and prove the main theorems by induction. Here we remark that the explicit recurrence relations for the spherical case coincide with those in [10], which follow from explicit formulas of the radial parts of spherical Whittaker functions in [9].

This paper consists of five sections together with an appendix. In Section 2, we introduce basic notation and state the main theorems. In Section 3, we

define two kinds of the Godement sections and give the recurrence relations of the archimedean Rankin–Selberg integrals. Section 4 is devoted to some preliminary results on the theory of finite dimensional representations of K_n and $GL(n, \mathbb{C})$. In Section 5, we prove the main theorems using the results in Sections 3 and 4. As an appendix, we generalize the explicit formulas of the radial parts of Whittaker functions in [9] using the Godement section.

2 Main results

In this section, we introduce basic notation and our main results. We describe each objects explicitly as possible, although not all of them are necessary to state our main theorems. The authors believe that they are of interest and useful for further studies.

2.1 Notation

We denote by \mathbb{Z} , \mathbb{Q} , \mathbb{R} and \mathbb{C} the ring of rational integers, the rational number field, the real number field and the complex number field, respectively. Let \mathbb{R}_+^{\times} be the multiplicative group of positive real numbers. Let \mathbb{N}_0 be the set of nonnegative integers. The real part, the imaginary part and the complex conjugate of a complex number z are denoted by $\operatorname{Re}(z)$, $\operatorname{Im}(z)$ and \overline{z} , respectively.

Throughout this paper, F denotes the archimedean local field, that is, F is either \mathbb{R} or \mathbb{C} . It is convenient to define the constant c_F by $c_{\mathbb{R}} = 1$ and $c_{\mathbb{C}} = 2$. We define additive characters $\psi_t \colon F \to \mathbb{C}^\times$ $(t \in F)$ and a norm $|\cdot|_F$ on F by

$$\psi_t(z) = \exp\left(\pi c_F \sqrt{-1}(tz + \overline{tz})\right) = \begin{cases} \exp(2\pi\sqrt{-1}tz) & \text{if } F = \mathbb{R}, \\ \exp(2\pi\sqrt{-1}(tz + \overline{tz})) & \text{if } F = \mathbb{C}, \end{cases}$$

and $|z|_F = |z|^{c_F}$ for $z \in F$, where $|\cdot|$ is the ordinary absolute value. When $t = \varepsilon \in \{\pm 1\}$, we call ψ_ε the standard character of F. We identify the additive group F with its dual group via the isomorphism $t \mapsto \psi_t$, and denote by $d_F z$ the self-dual additive Haar measure on F, that is, $d_{\mathbb{R}}z = dz$ is the ordinary Lebesgue measure on \mathbb{R} and $d_{\mathbb{C}}z = 2dx\,dy\,(z = x + \sqrt{-1}y)$ is twice the ordinary Lebesgue measure on $\mathbb{C} \simeq \mathbb{R}^2$. For $m \in \mathbb{Z}$, we define a meromorphic function $\Gamma_F(s;m)$ of s in \mathbb{C} by

$$\Gamma_F(s;m) = c_F(\pi c_F)^{-(sc_F + m)/2} \Gamma\left(\frac{sc_F + m}{2}\right) = \left\{ \begin{array}{ll} \Gamma_{\mathbb{R}}(s+m) & \text{if } F = \mathbb{R}, \\ \Gamma_{\mathbb{C}}(s+m/2) & \text{if } F = \mathbb{C}, \end{array} \right.$$

where $\Gamma_{\mathbb{R}}(s) = \pi^{-s/2}\Gamma(s/2)$, $\Gamma_{\mathbb{C}}(s) = 2(2\pi)^{-s}\Gamma(s)$ and $\Gamma(s)$ is the usual Gamma function.

Throughout this paper, n and n' are positive integers. The space of $n \times n'$ matrices over F is denoted by $M_{n,n'}(F)$. When n' = n, we denote $M_{n,n}(F)$

simply by $M_n(F)$. We denote by $d_F z$ the measure on $M_{n,n'}(F)$ defined by

$$d_F z = \prod_{i=1}^n \prod_{j=1}^{n'} d_F z_{i,j} \qquad (z = (z_{i,j}) \in \mathcal{M}_{n,n'}(F)).$$

Let $O_{n,n'}$ be the zero matrix in $M_{n,n'}(F)$. Let 1_n be the unit matrix in $M_n(F)$. Let $e_n = (O_{1,n-1}, 1) \in M_{1,n}(F)$. When n = 1, we understand $e_1 = 1$.

2.2 Groups and the invariant measures

Let G_n be the general linear group GL(n, F) of degree n over F. We fix a maximal compact subgroup K_n of G_n by

$$K_n = \begin{cases} \mathrm{O}(n) & \text{if } F = \mathbb{R}, \\ \mathrm{U}(n) & \text{if } F = \mathbb{C}, \end{cases}$$

where O(n) and U(n) are the orthogonal group and the unitary group of degree n, respectively. Let N_n and U_n be the groups of upper and lower triangular unipotent matrices in G_n , respectively, that is,

$$N_n = \{ x = (x_{i,j}) \in G_n \mid x_{i,j} = 0 \ (1 \le j < i \le n), \quad x_{k,k} = 1 \ (1 \le k \le n) \},$$

$$U_n = \{ u = (u_{i,j}) \in G_n \mid u_{i,j} = 0 \ (1 \le i < j \le n), \quad u_{k,k} = 1 \ (1 \le k \le n) \}.$$

We define subgroups M_n and A_n of G_n by

$$M_n = \{ m = \operatorname{diag}(m_1, m_2, \dots, m_n) \mid m_i \in G_1 = F^{\times} \quad (1 \le i \le n) \},$$

 $A_n = \{ a = \operatorname{diag}(a_1, a_2, \dots, a_n) \mid a_i \in \mathbb{R}_+^{\times} \quad (1 \le i \le n) \}.$

Let Z_n be the center of G_n . Then we have $Z_n = \{t1_n \mid t \in G_1 = F^*\}$. We denote by $C^{\infty}(G_n)$ the space of (\mathbb{C} -valued) smooth functions on G_n . We regard $C^{\infty}(G_n)$ as a G_n -module via the right translation

$$(R(g)f)(h) = f(hg) (g, h \in G_n, f \in C^{\infty}(G_n)).$$

Let dk, dx, du and da be the Haar measures on K_n , N_n , U_n and A_n , respectively. In this paper, we normalize these Haar measures by

$$\int_{K_n} dk = 1, \quad dx = \prod_{1 \le i \le j \le n} d_F x_{i,j}, \quad du = \prod_{1 \le j \le i \le n} d_F u_{i,j}, \quad da = \prod_{i=1}^n \frac{2c_F da_i}{a_i}$$

with $x = (x_{i,j}) \in N_n$, $u = (u_{i,j}) \in U_n$ and $a = \operatorname{diag}(a_1, a_2, \dots, a_n) \in A_n$. When n = 1, we understand $N_1 = U_1 = \{1\}$ and

$$\int_{N_1} f(x) \, dx = \int_{U_1} f(u) \, du = f(1)$$

for a function f on $\{1\}$. We normalize the Haar measure dg on G_n so that

$$\int_{G_n} f(g) \, dg = \int_{K_n} \int_{U_n} \int_{A_n} f(auk) \, da \, du \, dk = \int_{A_n} \int_{U_n} \int_{K_n} f(kua) \, dk \, du \, da$$

for any integrable function f on G_n . We normalize the right G_n -invariant measure dg on $N_n \backslash G_n$ so that

$$\int_{G_n} f(g) dg = \int_{N_n \backslash G_n} \left(\int_{N_n} f(xg) dx \right) dg \tag{2.1}$$

for any integrable function f on G_n . We normalize the right G_n -invariant measure dg on $Z_n N_n \backslash G_n$ so that

$$\int_{N_n \backslash G_n} f(g) \, dg = \int_{Z_n N_n \backslash G_n} \left(\int_{G_1} f(hg) \, dh \right) dg \tag{2.2}$$

for any integrable function f on $N_n \backslash G_n$.

2.3 Principal series representations of G_n

Following Jacquet [14], we will define principal series representations of G_n as representations induced from characters of the lower triangular Borel subgroup U_nM_n of G_n in this paper.

Let $d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n$ and $\nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n$. For $l \in \mathbb{Z}$ and $t \in F^{\times}$, we set $\chi_l(t) = (t/|t|)^l$. We define characters χ_d and η_{ν} of M_n by

$$\chi_d(m) = \prod_{i=1}^n \chi_{d_i}(m_i) = \prod_{i=1}^n \left(\frac{m_i}{|m_i|}\right)^{d_i}, \quad \eta_{\nu}(m) = \prod_{i=1}^n |m_i|_F^{\nu_i} = \prod_{i=1}^n |m_i|^{\nu_i c_F}$$

for $m = \operatorname{diag}(m_1, m_2, \cdots, m_n) \in M_n$. Let $\rho_n = (\rho_{n,1}, \rho_{n,2}, \cdots, \rho_{n,n}) \in \mathbb{Q}^n$ with

$$\rho_{n,i} = \frac{n+1}{2} - i \qquad (1 \le i \le n).$$

Let $I(d,\nu)$ be the subspace of $C^{\infty}(G_n)$ consisting of all functions f such that

$$f(umg) = \chi_d(m)\eta_{\nu-\rho_n}(m)f(g) \qquad (u \in U_n, \ m \in M_n, \ g \in G_n), \tag{2.3}$$

on which G_n acts by the right translation $\Pi_{d,\nu}=R$. We equip $I(d,\nu)$ with the usual Fréchet topology. We call $(\Pi_{d,\nu},I(d,\nu))$ a (smooth) principal series representation of G_n . We denote by $I(d,\nu)_{K_n}$ the subspace of $I(d,\nu)$ consisting of all K_n -finite vectors. When $F=\mathbb{R}$, we note that

$$\chi_{d+l} = \chi_d \qquad I(d+l,\nu) = I(d,\nu) \qquad (l \in 2\mathbb{Z}^n).$$
(2.4)

When $I(d,\nu)$ is irreducible, for any element σ of the symmetric group \mathfrak{S}_n of degree n, we have

$$I(d,\nu) \simeq I((d_{\sigma(1)}, d_{\sigma(2)}, \cdots, d_{\sigma(n)}), (\nu_{\sigma(1)}, \nu_{\sigma(2)}, \cdots, \nu_{\sigma(n)}))$$
 (2.5)

as representations of G_n (cf. [24, Corollary 2.8]).

Let I(d) be the space of smooth functions f on K_n satisfying

$$f(mk) = \chi_d(m)f(k) \qquad (m \in M_n \cap K_n, \ k \in K_n),$$

and we equip this space with the usual Fréchet topology. Because of the decomposition $G_n = U_n A_n K_n$ and (2.3), we can identify the space $I(d, \nu)$ with I(d) via the restriction map $I(d, \nu) \ni f \mapsto f|_{K_n} \in I(d)$ to K_n . The inverse map $I(d) \ni f \mapsto f_{\nu} \in I(d, \nu)$ of the restriction map is given by

$$f_{\nu}(uak) = \eta_{\nu - \rho_n}(a)f(k)$$
 $(u \in U_n, \ a \in A_n, \ k \in K_n).$ (2.6)

We regard I(d) as a G_n -module via this identification, and we denote the action of G_n on I(d) corresponding to $\Pi_{d,\nu}$ by Π_{ν} , that is,

$$(\Pi_{\nu}(q)f)(k) = f_{\nu}(kq) \qquad (q \in G_n, \ k \in K_n, \ f \in I(d)).$$

Here we note that $\Pi_{\nu}|_{K_n}$ is the right translation and does not depend on ν . We denote by $I(d)_{K_n}$ the subspace of I(d) consisting of all K_n -finite vectors. For $f \in I(d)$, we call a map $\mathbb{C}^n \ni \nu \mapsto f_{\nu} \in C^{\infty}(G_n)$ defined by (2.6) the standard section corresponding to f.

Remark 2.1. For the study of automorphic forms such as the Eisenstein series, it is convenient to realize principal series representations of G_n as representations $(\Pi_{B_n,d,\nu},I_{B_n}(d,\nu))$ induced from characters of the upper triangular Borel subgroup $B_n=N_nM_n$, that is, $I_{B_n}(d,\nu)$ is the subspace of $C^{\infty}(G_n)$ consisting of all functions f such that

$$f(xmg) = \chi_d(m)\eta_{\nu+\rho_n}(m)f(g) \qquad (x \in N_n, \ m \in M_n, \ g \in G_n),$$

and the action $\Pi_{B_n,d,\nu}$ of G_n is the right translation R. The results in this paper can be translated into this realization via the G_n -isomorphism

$$I_{B_n}(d,\nu) \ni f \mapsto f^{w_n} \in I((d_n,d_{n-1},\cdots,d_1),(\nu_n,\nu_{n-1},\cdots,\nu_1))$$

with $f^{w_n}(g) = f(w_n g)$ $(g \in G_n)$. Here w_n is the anti-diagonal matrix of size n with 1 at all anti-diagonal entries.

2.4 Whittaker functions

Let $\varepsilon \in \{\pm 1\}$, and let ψ_{ε} be the standard character of F defined in §2.1. Let $\psi_{\varepsilon,n}$ be a character of N_n defined by

$$\psi_{\varepsilon,n}(x) = \psi_{\varepsilon}(x_{1,2} + x_{2,3} + \dots + x_{n-1,n})$$
 $(x = (x_{i,j}) \in N_n).$

When n=1, we understand that $\psi_{\varepsilon,1}$ is the trivial character of $N_1=\{1\}$. Let $d\in\mathbb{Z}^n$ and $\nu=(\nu_1,\nu_2,\cdots,\nu_n)\in\mathbb{C}^n$. A ψ_{ε} -form on $I(d,\nu)$ is a continuous \mathbb{C} -linear form $\mathcal{T}\colon I(d,\nu)\to\mathbb{C}$ satisfying

$$\mathcal{T}(\Pi_{d,\nu}(x)f) = \psi_{\varepsilon,n}(x)\mathcal{T}(f)$$
 $(x \in N_n, f \in I(d,\nu)).$

Kostant [18] shows that the space of ψ_{ε} -forms on $I(d, \nu)$ is one dimensional. Let us recall the construction of nonzero ψ_{ε} -forms on principal series representations of G_n , which are called the Jacquet integrals. If ν satisfies

$$\operatorname{Re}(\nu_{i+1} - \nu_i) > 0$$
 $(1 \le i \le n - 1),$ (2.7)

we define the Jacquet integral $\mathcal{J}_{\varepsilon} \colon I(d,\nu) \to \mathbb{C}$ by the convergent integral

$$\mathcal{J}_{\varepsilon}(f) = \int_{N_n} f(x)\psi_{-\varepsilon,n}(x) dx \qquad (f \in I(d,\nu)).$$

When n=1, we understand $\mathcal{J}_{\varepsilon}(f)=f(1)$ $(f\in I(d,\nu))$. For $\nu\in\mathbb{C}$ satisfying (2.7), we set $\mathcal{J}_{\varepsilon}^{(d,\nu)}(f)=\mathcal{J}_{\varepsilon}(f_{\nu})$ $(f\in I(d))$, where f_{ν} is the standard section corresponding to f. By [29, Theorem 15.4.1], we know that $\mathcal{J}_{\varepsilon}^{(d,\nu)}(f)$ has the holomorphic continuation to whole $\nu\in\mathbb{C}^n$ for every $f\in I(d)$, and $\mathbb{C}^n\times I(d)\ni (\nu,f)\mapsto \mathcal{J}_{\varepsilon}^{(d,\nu)}(f)\in\mathbb{C}$ is continuous. Furthermore, this extends $\mathcal{J}_{\varepsilon}^{(d,\nu)}$ to all $\nu\in\mathbb{C}^n$ as a nonzero continuous \mathbb{C} -linear form on I(d) satisfying

$$\mathcal{J}_{\varepsilon}^{(d,\nu)}(\Pi_{\nu}(x)f) = \psi_{\varepsilon,n}(x)\mathcal{J}_{\varepsilon}^{(d,\nu)}(f) \qquad (x \in N_n, \ f \in I(d)).$$

We extend the Jacquet integral $\mathcal{J}_{\varepsilon} : I(d, \nu) \to \mathbb{C}$ to whole $\nu \in \mathbb{C}^n$ by

$$\mathcal{J}_{\varepsilon}(f) = \mathcal{J}_{\varepsilon}^{(d,\nu)}(f|_{K_n}) \qquad (f \in I(d,\nu))$$

which is a nonzero ψ_{ε} -form on $I(d, \nu)$. We set

$$W_{\varepsilon}(f)(g) = \mathcal{J}_{\varepsilon}(\Pi_{d,\nu}(g)f) \qquad (f \in I(d,\nu), \ g \in G_n). \tag{2.8}$$

For $f \in I(d, \nu)$, $W_{\varepsilon}(f)$ is called a Whittaker function for $(\Pi_{d,\nu}, \psi_{\varepsilon})$, and satisfies

$$W_{\varepsilon}(f)(xg) = \psi_{\varepsilon,n}(x)W_{\varepsilon}(f)(g) \qquad (x \in N_n, \ g \in G_n). \tag{2.9}$$

We note that $W_{\varepsilon}(f_{\nu})(g) = \mathcal{J}_{\varepsilon}^{(d,\nu)}(\Pi_{\nu}(g)f)$ is an entire function of ν for $g \in G_n$ and the standard section f_{ν} corresponding to $f \in I(d)_{K_n}$. Let

$$\mathcal{W}(\Pi_{d,\nu},\psi_{\varepsilon}) = \{ W_{\varepsilon}(f) \mid f \in I(d,\nu) \}.$$

When $\Pi_{d,\nu}$ is irreducible, this is a Whittaker model of $\Pi_{d,\nu}$.

2.5 The Gelfand–Tsetlin type basis

In this subsection, we introduce a Gelfand–Tsetlin type basis of an irreducible holomorphic finite dimensional representation of $\mathrm{GL}(n,\mathbb{C})$. Let $\mathfrak{gl}(n,\mathbb{C})=\mathrm{M}_n(\mathbb{C})$ be the associated Lie algebra of $\mathrm{GL}(n,\mathbb{C})$. For $1\leq i< j\leq n$, we denote by $E_{i,j}$ the matrix unit in $\mathfrak{gl}(n,\mathbb{C})$ with 1 at the (i,j)-th entry and 0 at other entries. We define the set Λ_n of dominant weights by

$$\Lambda_n = \{ \lambda = (\lambda_1, \lambda_2, \cdots, \lambda_n) \in \mathbb{Z}^n \mid \lambda_1 \ge \lambda_2 \ge \cdots \ge \lambda_n \}.$$

Let $(\tau_{\lambda}, V_{\lambda})$ be an irreducible holomorphic finite dimensional representation of $\mathrm{GL}(n,\mathbb{C})$ with highest weight $\lambda=(\lambda_1,\lambda_2,\cdots,\lambda_n)\in\Lambda_n$, and we fix a $\mathrm{U}(n)$ invariant hermitian inner product $\langle \cdot, \cdot \rangle$ on V_{λ} . Then we have

$$\dim V_{\lambda} = \prod_{1 \le i \le j \le n} \frac{\lambda_i - \lambda_j + j - i}{j - i}$$

by Weyl's dimension formula [17, Theorem 4.48].

Let us recall the orthonormal basis on V_{λ} , which is constructed by Gelfand and Tsetlin [3] (see Zhelobenko [32] for a detailed proof). We call

$$M = (m_{i,j})_{1 \le i \le j \le n} = \begin{pmatrix} m_{1,n} & m_{2,n} & \cdots & m_{n,n} \\ m_{1,n-1} & \cdots & m_{n-1,n-1} \\ & \cdots & \cdots & \cdots \\ & m_{1,2} & m_{2,2} \\ & & m_{1,1} \end{pmatrix} \quad (m_{i,j} \in \mathbb{Z})$$

a integral triangular array of size n, and call $m_{i,j}$ the (i,j)-th entry of M. We denote by $G(\lambda)$ the set of integral triangular arrays $M = (m_{i,j})_{1 \le i \le j \le n}$ of size n such that

$$m_{i,n} = \lambda_i \quad (1 \le i \le n), \qquad m_{j,k} \ge m_{j,k-1} \ge m_{j+1,k} \quad (1 \le j < k \le n).$$

For $M=(m_{i,j})_{1\leq i\leq j\leq n}\in G(\lambda)$, we define $\gamma^M=(\gamma^M_1,\gamma^M_2,\cdots,\gamma^M_n)$ by

$$\gamma_j^M = \sum_{i=1}^j m_{i,j} - \sum_{i=1}^{j-1} m_{i,j-1} \qquad (1 \le j \le n).$$
 (2.10)

We call γ^M the weight of M. Gelfand and Tsetlin construct an orthonormal basis $\{\zeta_M\}_{M\in G(\lambda)}$ of V_λ with the following formulas of $\mathfrak{gl}(n,\mathbb{C})$ -actions:

$$\tau_{\lambda}(E_{k,k})\zeta_{M} = \gamma_{k}^{M}\zeta_{M},\tag{2.11}$$

$$\tau_{\lambda}(E_{j,j+1})\zeta_{M} = \sum_{\substack{1 \leq i \leq j \\ M+\Delta_{i,j} \in G(\lambda)}} \tilde{\mathbf{a}}_{i,j}^{+}(M)\zeta_{M+\Delta_{i,j}}, \qquad (2.12)$$

$$\tau_{\lambda}(E_{j+1,j})\zeta_{M} = \sum_{\substack{1 \leq i \leq j \\ 1 \leq i \leq j}} \tilde{\mathbf{a}}_{i,j}^{-}(M)\zeta_{M-\Delta_{i,j}} \qquad (2.13)$$

$$\tau_{\lambda}(E_{j+1,j})\zeta_{M} = \sum_{\substack{1 \le i \le j \\ M - \Delta_{i,j} \in G(\lambda)}} \tilde{\mathbf{a}}_{i,j}^{-}(M)\zeta_{M - \Delta_{i,j}}$$
(2.13)

for $1 \le k \le n, \ 1 \le j \le n-1$ and $M = (m_{i,j})_{1 \le i < j \le n} \in G(\lambda)$, where $\Delta_{i,j}$ is the integral triangular array of size n with 1 at the (i,j)-th entry and 0 at other entries, and

$$\tilde{\mathbf{a}}_{i,j}^{+}(M) = \left| \frac{\left(\prod_{h=1}^{j+1} (m_{h,j+1} - m_{i,j} - h + i) \right) \prod_{h=1}^{j-1} (m_{h,j-1} - m_{i,j} - h + i - 1)}{\prod_{1 \le h \le j, \ h \ne i} (m_{h,j} - m_{i,j} - h + i) (m_{h,j} - m_{i,j} - h + i - 1)} \right|^{\frac{1}{2}},$$

$$\tilde{\mathbf{a}}_{i,j}^{-}(M) = \left| \frac{\left(\prod_{h=1}^{j+1} (m_{h,j+1} - m_{i,j} - h + i + 1) \right) \prod_{h=1}^{j-1} (m_{h,j-1} - m_{i,j} - h + i)}{\prod_{1 \le h \le j, \ h \ne i} (m_{h,j} - m_{i,j} - h + i) (m_{h,j} - m_{i,j} - h + i + 1)} \right|^{\frac{1}{2}}.$$

We denote by $H(\lambda)$ a unique element of $G(\lambda)$ whose weight is λ , that is,

$$H(\lambda) = (h_{i,j})_{1 \le i \le j \le n} \in G(\lambda)$$
 with $h_{i,j} = \lambda_i$. (2.14)

Then $\zeta_{H(\lambda)}$ is a highest vector in V_{λ} , that is,

$$\tau_{\lambda}(E_{i,i})\zeta_{H(\lambda)} = \lambda_i \zeta_{H(\lambda)} \quad (1 \le i \le n), \quad \tau_{\lambda}(E_{j,k})\zeta_{H(\lambda)} = 0 \quad (1 \le j < k \le n).$$

There is a Q-rational structure of V_{λ} associated to the highest weight vector $\zeta_{H(\lambda)}$. It comes from the natural Q-rational structure of a tensor power of the standard representation of $\mathrm{GL}(n,\mathbb{C})$. We fix an embedding of V_{λ} into a tensor power of the standard representation of $GL(n,\mathbb{C})$ so that the image of $\zeta_{H(\lambda)}$ is \mathbb{Q} -rational, and give a \mathbb{Q} -rational structure of V_{λ} via this embedding.

Let us construct a Gelfand-Tsetlin type \mathbb{Q} -rational basis of V_{λ} . We set

$$\xi_M = \sqrt{\mathbf{r}(M)}\zeta_M \qquad (M = (m_{i,j})_{1 \le i < j \le n} \in \mathbf{G}(\lambda)) \qquad (2.15)$$

with the rational constant

$$r(M) = \prod_{1 \le i \le j \le k \le n} \frac{(m_{i,k} - m_{j,k-1} - i + j)!(m_{i,k-1} - m_{j+1,k} - i + j)!}{(m_{i,k-1} - m_{j,k-1} - i + j)!(m_{i,k} - m_{j+1,k} - i + j)!}. (2.16)$$

Then $\{\xi_M\}_{M\in \mathrm{G}(\lambda)}$ is an orthogonal basis of V_λ such that $\langle \xi_M,\xi_M\rangle = \mathrm{r}(M)$ $(M \in G(\lambda))$. For a integral triangular array $M = (m_{i,j})_{1 \le i \le j \le n}$, we define the dual triangular array $M^{\vee} = (m_{i,j}^{\vee})_{1 \leq i \leq j \leq n}$ of M by $m_{i,j}^{\vee} = -m_{j+1-i,j}$. The formulas corresponding to (2.11), (2.12) and (2.13) are given respectively by

$$\tau_{\lambda}(E_{k,k})\xi_{M} = \gamma_{k}^{M}\xi_{M},\tag{2.17}$$

$$\tau_{\lambda}(E_{j,j+1})\xi_{M} = \sum_{\substack{1 \le i \le j \\ M+\Delta_{i,i} \in G(\lambda)}} a_{i,j}(M)\xi_{M+\Delta_{i,j}}, \tag{2.18}$$

$$\tau_{\lambda}(E_{j,j+1})\xi_{M} = \sum_{\substack{1 \le i \le j \\ M + \Delta_{i,j} \in G(\lambda)}} a_{i,j}(M)\xi_{M+\Delta_{i,j}}, \qquad (2.18)$$

$$\tau_{\lambda}(E_{j+1,j})\xi_{M} = \sum_{\substack{1 \le i \le j \\ M + \Delta_{i,j}^{\vee} \in G(\lambda)}} a_{i,j}(M^{\vee})\xi_{M+\Delta_{i,j}^{\vee}} \qquad (2.19)$$

for $1 \le k \le n$, $1 \le j \le n-1$ and $M = (m_{i,j})_{1 \le i < j \le n} \in G(\lambda)$, where $a_{i,j}(M)$ is a rational number given by

$$a_{i,j}(M) = \frac{\prod_{h=1}^{i} (m_{h,j+1} - m_{i,j} - h + i)}{\prod_{h=1}^{i-1} (m_{h,j} - m_{i,j} - h + i)} \left(\prod_{h=2}^{i} \frac{m_{h-1,j-1} - m_{i,j} - h + i}{m_{h-1,j} - m_{i,j} - h + i} \right).$$

By these formulas and the equality $\xi_{H(\lambda)} = \zeta_{H(\lambda)}$, we know that $\{\xi_M\}_{M \in G(\lambda)}$ is a \mathbb{Q} -rational basis of V_{λ} .

Until the end of this subsection, we assume n > 1. Let

$$\Xi^+(\lambda) = \{ \mu = (\mu_1, \mu_2, \cdots, \mu_{n-1}) \in \Lambda_{n-1} \mid \lambda_i \ge \mu_i \ge \lambda_{i+1} \ (1 \le i \le n-1) \}.$$

We regard $GL_{n-1}(\mathbb{C})$ as a subgroup of $GL_n(\mathbb{C})$ via the embedding

$$\iota_n \colon \mathrm{GL}(n-1,\mathbb{C}) \ni g \mapsto \begin{pmatrix} g & O_{n-1,1} \\ O_{1,n-1} & 1 \end{pmatrix} \in \mathrm{GL}(n,\mathbb{C}).$$
(2.20)

We set $\widehat{M} = (m_{i,j})_{1 \leq i \leq j \leq n-1}$ for $M = (m_{i,j})_{1 \leq i \leq j \leq n} \in G(\lambda)$. By the construction of $\{\xi_M\}_{M \in G(\lambda)}$, we know that V_{λ} has the irreducible decomposition

$$V_{\lambda} = \bigoplus_{\mu \in \Xi^{+}(\lambda)} V_{\lambda,\mu}, \qquad V_{\lambda,\mu} = \bigoplus_{M \in G(\lambda;\mu)} \mathbb{C}\xi_{M} \simeq V_{\mu}, \qquad (2.21)$$

as a $GL(n-1,\mathbb{C})$ -module, where

$$G(\lambda; \mu) = \{ M \in G(\lambda) \mid \widehat{M} \in G(\mu) \}.$$

Let $\mu \in \Xi^+(\lambda)$. We define a \mathbb{C} -linear map $R^{\lambda}_{\mu} : V_{\lambda} \to V_{\mu}$ by

$$R^{\lambda}_{\mu}(\xi_M) = \begin{cases} \xi_{\widehat{M}} & \text{if } M \in G(\lambda; \mu), \\ 0 & \text{otherwise} \end{cases}$$
 $(M \in G(\lambda)).$ (2.22)

By the formulas (2.17), (2.18) and (2.19), we know that R^{λ}_{μ} is a surjective $GL(n-1,\mathbb{C})$ -homomorphism. For $M \in G(\mu)$, we denote by $M[\lambda]$ the element of $G(\lambda;\mu)$ characterized by $\widehat{M[\lambda]} = M$, that is,

$$M[\lambda] = \begin{pmatrix} \lambda \\ M \end{pmatrix} \in G(\lambda; \mu).$$
 (2.23)

Then we have $H(\mu)[\lambda] = {\lambda \choose H(\mu)}$, and $\xi_{H(\mu)[\lambda]}$ is the highest weight vector in the $\mathrm{GL}(n-1,\mathbb{C})$ -module $V_{\lambda,\mu}$. For later use, we prepare the following lemma.

Lemma 2.2. Retain the notation. A \mathbb{C} -linear map

$$V_{\mu} \ni \zeta_M \mapsto \zeta_{M[\lambda]} \in V_{\lambda,\mu}$$
 $(M \in G(\mu))$

is a $GL(n-1,\mathbb{C})$ -isomorphism which preserves the fixed inner products $\langle \cdot, \cdot \rangle$.

Proof. The assertion follows from (2.11), (2.12) and (2.13).

2.6 Complex conjugate representations

For a finite dimensional representation (τ, V_{τ}) of $GL(n, \mathbb{C})$, we define the complex conjugate representation $(\overline{\tau}, \overline{V_{\tau}})$ of τ as follows:

• Let $\overline{V_{\tau}}$ be a set with a fixed bijective map $V_{\tau} \ni v \mapsto \overline{v} \in \overline{V_{\tau}}$. We regard $\overline{V_{\tau}}$ as a \mathbb{C} -vector space via the following addition and scalar multiplication:

$$\overline{v_1} + \overline{v_2} = \overline{v_1 + v_2} \quad (v_1, v_2 \in V_\tau), \qquad c\overline{v} = \overline{\overline{c}v} \quad (c \in \mathbb{C}, \ v \in V_\tau),$$

where \overline{c} is the complex conjugate of c.

• The action $\overline{\tau}$ is defined by $\overline{\tau}(g)\overline{v} = \overline{\tau(g)v}$ $(g \in GL(n, \mathbb{C}), v \in V_{\tau}).$

By definition, the following assertions hold for finite dimensional representations (τ, V_{τ}) and $(\tau', V_{\tau'})$ of $GL(n, \mathbb{C})$:

- The complex conjugate representation $(\overline{\overline{\tau}}, \overline{\overline{V_{\tau}}})$ of $\overline{\tau}$ is naturally identified with (τ, V_{τ}) via the correspondence $\overline{\overline{v}} \leftrightarrow v \ (v \in V_{\tau})$.
- If $\langle \cdot, \cdot \rangle$ is a U(n)-invariant hermitian inner product on V_{τ} , then

$$V_{\tau} \otimes_{\mathbb{C}} \overline{V_{\tau}} \ni v_1 \otimes \overline{v_2} \mapsto \langle v_1, v_2 \rangle \in \mathbb{C}$$

is a non-degenerate \mathbb{C} -bilinear $\mathrm{U}(n)$ -invariant pairing.

• The complex conjugate representation $(\overline{\tau \otimes \tau'}, \overline{V_{\tau} \otimes_{\mathbb{C}} V_{\tau'}})$ of $\tau \otimes \tau'$ is naturally identified with $(\overline{\tau} \otimes \overline{\tau'}, \overline{V_{\tau}} \otimes_{\mathbb{C}} \overline{V_{\tau'}})$ via the correspondence

$$\overline{v_1 \otimes v_2} \leftrightarrow \overline{v_1} \otimes \overline{v_2} \qquad (v_1 \in V_{\tau}, \ v_2 \in V_{\tau'}).$$

• For any subgroup S of $GL(n,\mathbb{C})$, there is a bijective \mathbb{C} -antilinear map

$$\operatorname{Hom}_S(V_{\tau}, V_{\tau'}) \ni \Psi \mapsto \overline{\Psi} \in \operatorname{Hom}_S(\overline{V_{\tau}}, \overline{V_{\tau'}})$$

defined by
$$\overline{\Psi}(\overline{v}) = \overline{\Psi(v)} \in \overline{V_{\tau'}} \ (v \in V_{\tau}).$$

Let $\lambda = (\lambda_1, \lambda_2, \cdots, \lambda_n) \in \Lambda_n$. We consider the complex conjugate representation $(\overline{\tau_{\lambda}}, \overline{V_{\lambda}})$ of τ_{λ} . We denote by $\mathfrak{u}(n)$ the associated Lie algebra of $\mathrm{U}(n)$. The complexification $\mathfrak{u}(n)_{\mathbb{C}} = \mathfrak{u}(n) \otimes_{\mathbb{R}} \mathbb{C}$ of $\mathfrak{u}(n)$ is isomorphic to $\mathfrak{gl}(n, \mathbb{C})$ via the correspondence $E_{i,j}^{\mathfrak{u}(n)} \leftrightarrow E_{i,j}$ $(1 \leq i,j \leq n)$ with

$$E_{i,j}^{\mathfrak{u}(n)} = \frac{1}{2} \{ (E_{i,j} - E_{j,i}) \otimes 1 - \sqrt{-1} (E_{i,j} + E_{j,i}) \otimes \sqrt{-1} \} \in \mathfrak{u}(n)_{\mathbb{C}}.$$

For $1 \leq i, j \leq n$ and $v \in V_{\lambda}$, we have

$$\tau_{\lambda}(E_{i,j}^{\mathfrak{u}(n)})v = \tau_{\lambda}(E_{i,j})v, \qquad \overline{\tau_{\lambda}}(E_{i,j}^{\mathfrak{u}(n)})\overline{v} = -\overline{\tau_{\lambda}(E_{j,i})v}.$$
 (2.24)

By the pairing $V_{\lambda} \otimes_{\mathbb{C}} \overline{V_{\lambda}} \ni v_1 \otimes \overline{v_2} \mapsto \langle v_1, v_2 \rangle \in \mathbb{C}$, we can identified $(\overline{\tau_{\lambda}}, \overline{V_{\lambda}})$ with the contragredient representation $(\tau_{\lambda}^{\vee}, V_{\lambda}^{\vee})$ of τ_{λ} as a U(n)-module. Let $\lambda^{\vee} = (-\lambda_n, -\lambda_{n-1}, \cdots, -\lambda_1) \in \Lambda_n$. Since $V_{\lambda}^{\vee} \simeq V_{\lambda^{\vee}}$ as $\mathrm{GL}(n, \mathbb{C})$ -modules, we have $\overline{V_{\lambda}} \simeq V_{\lambda^{\vee}}$ as U(n)-modules. In fact, by (2.17), (2.18), (2.19) and (2.24), we can confirm that the \mathbb{C} -linear map

$$\overline{V_{\lambda}}\ni\overline{\xi_{M}}\mapsto(-1)^{\sum_{1\leq i\leq j\leq n}m_{i,j}}\,\xi_{M^{\vee}}\in V_{\lambda^{\vee}} \hspace{0.5cm}(M=(m_{i,j})_{1\leq i\leq j\leq n}\in\mathcal{G}(\lambda))$$

is a $\mathrm{U}(n)$ -isomorphism. Via this isomorphism, we derive the \mathbb{Q} -rational structure of $\overline{V_{\lambda}}$ from that of $V_{\lambda^{\vee}}$. Then $\{\overline{\xi_M}\}_{M\in\mathrm{G}(\lambda)}$ is a \mathbb{Q} -rational basis of $\overline{V_{\lambda}}$.

Remark 2.3. We note that $\{E_{i,j} - E_{j,i}\}_{1 \leq i < j \leq n}$ forms a basis of the associated Lie algebra $\mathfrak{o}(n)$ of O(n). By (2.18), (2.19) and (2.24), we know that

$$\overline{V_{\lambda}} \ni \overline{\xi_M} \mapsto \xi_M \in V_{\lambda} \qquad (M \in \mathcal{G}(\lambda))$$

defines a \mathbb{Q} -rational O(n)-isomorphism.

2.7 The minimal K_n - and $K_{n'}$ -types

We define a subset $\Lambda_{n,F}$ of Λ_n by $\Lambda_{n,\mathbb{R}} = \Lambda_n \cap \{0,1\}^n$ and $\Lambda_{n,\mathbb{C}} = \Lambda_n$. In §4.2, we study the O(n)-module structure of V_{λ} for $\lambda \in \Lambda_{n,\mathbb{R}}$, and prove the following lemma.

Lemma 2.4. Let $\lambda \in \Lambda_{n,F}$. Then V_{λ} is an irreducible K_n -module. Moreover, for any $\lambda' \in \Lambda_{n,F}$ such that $\lambda' \neq \lambda$, we have $V_{\lambda} \not\simeq V_{\lambda'}$ as K_n -modules.

Let $(\Pi_{d,\nu}, I(d,\nu))$ be a principal series representations of G_n with

$$d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n, \qquad \nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n$$

such that $d \in \Lambda_{n,F}$. By the formula (2.17) and the Frobenius reciprocity law [17, Theorem 1.14], we know that $\tau_d|_{K_n}$ is the minimal K_n -type of $\Pi_{d,\nu}$, and $\operatorname{Hom}_{K_n}(V_d,I(d,\nu))$ is 1 dimensional. Let $\operatorname{f}_{d,\nu}\colon V_d \to I(d,\nu)$ be the K_n -homomorphism normalized by $\operatorname{f}_{d,\nu}(\xi_{H(d)})(1_n)=1$, that is,

$$f_{d,\nu}(v)(uak) = \eta_{\nu-\rho_n}(a)\langle \tau_d(k)v, \xi_{H(d)}\rangle$$
 (2.25)

for $u \in U_n$, $a \in A_n$, $k \in K_n$ and $v \in V_d$. Here $H(\lambda)$ $(\lambda \in \Lambda_n)$ are defined by (2.14). For $v \in V_d$, we note that $f_{d,\nu}(v)$ is the standard section corresponding to $f_d(v) \in I(d)$ defined by $f_d(v)(k) = \langle \tau_d(k)v, \xi_{H(d)} \rangle$ $(k \in K_n)$.

Let $(\Pi_{d',\nu'}, I(d',\nu'))$ be a principal series representations of $G_{n'}$ with

$$d' = (d'_1, d'_2, \dots, d'_{n'}) \in \mathbb{Z}^{n'}, \qquad \nu' = (\nu'_1, \nu'_2, \dots, \nu'_{n'}) \in \mathbb{C}^{n'}$$

such that $-d' \in \Lambda_{n',F}$. By the formula (2.17) and the Frobenius reciprocity law [17, Theorem 1.14], we know that $\overline{\tau_{-d'}}|_{K_{n'}}$ is the minimal $K_{n'}$ -type of $\Pi_{d',\nu'}$ and $\operatorname{Hom}_{K_{n'}}(\overline{V_{-d'}},I(d',\nu'))$ is 1 dimensional. Let $\overline{\mathbf{f}}_{d',\nu'}\colon \overline{V_{-d'}}\to I(d',\nu')$ be the $K_{n'}$ -homomorphism normalized by $\overline{\mathbf{f}}_{d',\nu'}(\overline{\xi_{H(-d')}})(1_{n'})=1$, that is,

$$\bar{\mathbf{f}}_{d',\nu'}(\overline{v})(uak) = \eta_{\nu'-\rho_{n'}}(a)\overline{\langle \tau_{-d'}(k)v, \xi_{H(-d')}\rangle}$$
 (2.26)

for $u \in U_{n'}$, $a \in A_{n'}$, $k \in K_{n'}$ and $v \in V_{-d'}$. For $v \in V_{-d'}$, we note that $\bar{\mathbf{f}}_{d',\nu'}(\overline{v})$ is the standard section corresponding to $\bar{\mathbf{f}}_{d'}(\overline{v}) \in I(d')$ defined by $\bar{\mathbf{f}}_{d'}(\overline{v})(k) = \overline{\langle \tau_{-d'}(k)v, \xi_{H(-d')} \rangle}$ $(k \in K_{n'})$.

We define the archimedean L-factor for $\Pi_{d,\nu} \times \Pi_{d',\nu'}$ by

$$L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'}) = \prod_{i=1}^{n} \prod_{j=1}^{n'} \Gamma_F(s + \nu_i + \nu_j; |d_i + d'_j|),$$

where the functions $\Gamma_F(s;m)$ $(m \in \mathbb{Z})$ are defined in §2.1. Moreover, we set

$$\Gamma_F(\nu; d) = \prod_{1 \le i < j \le n} \Gamma_F(\nu_j - \nu_i + 1; |d_i - d_j|),$$

$$\Gamma_F(\nu'; d') = \prod_{1 \le i < j \le n'} \Gamma_F(\nu'_j - \nu'_i + 1; |d'_i - d'_j|).$$

Here $1/\Gamma_F(\nu;d)$ and $1/\Gamma_F(\nu';d')$ are both nonzero if $\Pi_{d,\nu}$ and $\Pi_{d',\nu'}$ are irreducible. This fact follows from Corollary 5.4 in §5.1.

2.8 Archimedean Rankin–Selberg integrals for $G_n \times G_{n-1}$

In this subsection, we assume n > 1. Let $(\Pi_{d,\nu}, I(d,\nu))$ and $(\Pi_{d',\nu'}, I(d',\nu'))$ be principal series representations of G_n and G_{n-1} , respectively, with parameters

$$d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n, \qquad \nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n,$$

$$d' = (d'_1, d'_2, \dots, d'_{n-1}) \in \mathbb{Z}^{n-1}, \quad \nu' = (\nu'_1, \nu'_2, \dots, \nu'_{n-1}) \in \mathbb{C}^{n-1}.$$

We assume $d \in \Lambda_{n,F}$ and $-d' \in \Lambda_{n-1,F}$. If $\Pi_{d,\nu}$ and $\Pi_{d',\nu'}$ are irreducible, these are not serious assumptions because of (2.4) and (2.5). We take $f_{d,\nu}$, $\bar{f}_{d',\nu'}$, $\Gamma_F(\nu;d)$, $\Gamma_F(\nu';d')$ and $L(s,\Pi_{d,\nu} \times \Pi_{d',\nu'})$ as in §2.7 with n' = n - 1.

Let $\varepsilon \in \{\pm 1\}$, $W \in \mathcal{W}(\Pi_{d,\nu}, \psi_{\varepsilon})$ and $W' \in \mathcal{W}(\Pi_{d',\nu'}, \psi_{-\varepsilon})$. Let $s \in \mathbb{C}$ such that Re(s) is sufficiently large. We define the archimedean Rankin–Selberg integral Z(s, W, W') for $\Pi_{d,\nu} \times \Pi_{d',\nu'}$ by

$$Z(s, W, W') = \int_{N_{n-1}\backslash G_{n-1}} W(\iota_n(g))W'(g)|\det g|_F^{s-1/2} dg, \qquad (2.27)$$

where ι_n is defined by (2.20). Here we note

$$Z(s, R(\iota_n(k))W, R(k)W') = Z(s, W, W') \qquad (k \in K_{n-1}). \tag{2.28}$$

By (2.28), we know that

$$v_1 \otimes \overline{v_2} \mapsto Z(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})))$$
 (2.29)

defines an element of $\operatorname{Hom}_{K_{n-1}}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}}, \mathbb{C}_{\operatorname{triv}})$. Here W_{ε} is defined by (2.8), and $\mathbb{C}_{\operatorname{triv}} = \mathbb{C}$ is the trivial K_{n-1} -module. The following theorem is the first main result of this paper, which gives the explicit expression of the K_{n-1} -homomorphism (2.29).

Theorem 2.5. Retain the notation. For $v_1 \in V_d$ and $v_2 \in V_{-d'}$, we have

$$\begin{split} &Z(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(v_1)), \mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{v_2}))) \\ &= \frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}}{(\dim V_{-d'})\mathbf{\Gamma}_F(\nu;d)\mathbf{\Gamma}_F(\nu';d')} L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'}) \langle \mathbf{R}_{-d'}^d(v_1), v_2 \rangle \end{split}$$

if $-d' \in \Xi^+(d)$, and $Z(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2}))) = 0$ otherwise. Here $R^d_{-d'}$ is given explicitly by (2.22). In particular, we have

$$Z(s, W_{\varepsilon}(f_{d,\nu}(\xi_{H(-d')[d]})), W_{-\varepsilon}(\bar{f}_{d',\nu'}(\overline{\xi_{H(-d')}})))$$

$$= \frac{(-\varepsilon\sqrt{-1})\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}{(\dim V_{-d'})\Gamma_F(\nu;d)\Gamma_F(\nu';d')}L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'})$$
(2.30)

if $-d' \in \Xi^+(d)$. Here H(-d') and H(-d')[d] are defined by (2.14) and (2.23).

Remark 2.6. Retain the notation. The space $\operatorname{Hom}_{K_{n-1}}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}}, \mathbb{C}_{\operatorname{triv}})$ is 1 dimensional if $-d' \in \Xi^+(d)$, and is equal to $\{0\}$ otherwise. This fact follows from Lemma 4.2 in $\S4.2$.

Remark 2.7. We set $F = \mathbb{C}$. By [21, Proposition 2.14 and Theorem 2.21], we note that the compatible pairs of cohomological representations of G_n and G_{n-1} in Sun [27, §6] can be regarded as pairs of some irreducible principal series representations $\Pi_{d,\nu}$ and $\Pi_{d',\nu'}$ with $d \in \Lambda_{n,\mathbb{C}}$ and $-d' \in \Xi^+(d)$. Hence, Theorem 2.5 gives another proof of the non-vanishing hypothesis for $G_n \times G_{n-1}$, which were originally proved by Sun [27, Theorem C].

Corollary 2.8. Retain the notation, and assume $-d' \in \Xi^+(d)$. Then

$$\sum_{M \in G(-d')} r(M)^{-1} \, \xi_{M[d]} \otimes \overline{\xi_M}$$

is a unique \mathbb{Q} -rational K_{n-1} -invariant vector in $V_d \otimes_{\mathbb{C}} \overline{V_{-d'}}$ up to scalar multiple, and its image under the K_{n-1} -homomorphism (2.29) is

$$\frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d_i')}}{\Gamma_F(\nu;d)\Gamma_F(\nu';d')}L(s,\Pi_{d,\nu}\times\Pi_{d',\nu'}).$$

Here r(M) and M[d] are defined by (2.16) and (2.23), respectively.

This corollary follows from Theorem 2.5 with Lemma 4.2, and is similar to Corollary 2.11 which gives the explicit description of the archimedean part of Grenié's theorem [5, Theorem 2].

2.9 Schwartz functions

Let $S(M_{n,n'}(F))$ be the space of Schwartz functions on $M_{n,n'}(F)$. We define $\mathbf{e}_{(n,n')} \in S(M_{n,n'}(F))$ by

$$\mathbf{e}_{(n,n')}(z) = \exp(-\pi \mathbf{c}_F \operatorname{Tr}({}^t \overline{z} z)) = \begin{cases} \exp(-\pi \operatorname{Tr}({}^t z z)) & \text{if } F = \mathbb{R}, \\ \exp(-2\pi \operatorname{Tr}({}^t \overline{z} z)) & \text{if } F = \mathbb{C} \end{cases}$$
(2.31)

for $z \in M_{n,n'}(F)$. We denote $\mathbf{e}_{(n,n)}$ simply by $\mathbf{e}_{(n)}$. Let $\mathcal{S}_0(M_{n,n'}(F))$ be the subspace of $\mathcal{S}(M_{n,n'}(F))$ consisting of all functions ϕ of the form

$$\phi(z) = p(z, \overline{z})\mathbf{e}_{(n,n')}(z) \qquad (z \in \mathbf{M}_{n,n'}(F)),$$

where p is a polynomial function. We call elements of $S_0(M_{n,n'}(F))$ standard Schwartz functions on $M_{n,n'}(F)$.

Let $C(M_{n,n'}(F))$ be the space of continuous functions on $M_{n,n'}(F)$. We define actions of G_n and $G_{n'}$ on $C(M_{n,n'}(F))$ by

$$(L(g)f)(z) = f(g^{-1}z),$$
 $(R(h)f)(z) = f(zh)$

for $g \in G_n$, $h \in G_{n'}$, $f \in C(M_{n,n'}(F))$ and $z \in M_{n,n'}(F)$. Since $\mathbf{e}_{(n,n')}$ is $K_n \times K_{n'}$ -invariant, we note that $S_0(M_{n,n'}(F))$ is closed under the action $L \boxtimes R$ of $K_n \times K_{n'}$, and all elements of $S_0(M_{n,n'}(F))$ are $K_n \times K_{n'}$ -finite.

Let $l \in \mathbb{N}_0$, and we consider the representation $(\tau_{(l,\mathbf{0}_{n-1})},V_{(l,\mathbf{0}_{n-1})})$. Here we put $\mathbf{0}_{n-1}=(0,0,\cdots,0)\in\Lambda_{n-1}$ if n>1, and erase $\mathbf{0}_{n-1}$ if n=1. We set

$$\ell(\gamma) = \gamma_1 + \gamma_2 + \dots + \gamma_n \qquad (\gamma = (\gamma_1, \gamma_2, \dots, \gamma_n) \in \mathbb{Z}^n). \tag{2.32}$$

For $\gamma = (\gamma_1, \gamma_2, \dots, \gamma_n) \in \mathbb{N}_0^n$ such that $\ell(\gamma) = l$, we denote by $Q(\gamma)$ a unique element of $G((l, \mathbf{0}_{n-1}))$ whose weight is γ , that is,

$$Q(\gamma) = (q_{i,j})_{1 \le i \le j \le n} \quad \text{with} \quad q_{i,j} = \begin{cases} \sum_{k=1}^{j} \gamma_k & \text{if } i = 1, \\ 0 & \text{otherwise.} \end{cases}$$
 (2.33)

Then we have $G((l, \mathbf{0}_{n-1})) = \{Q(\gamma) \mid \gamma \in \mathbb{N}_0^n, \ \ell(\gamma) = l\}$. We define \mathbb{C} -linear maps $\varphi_{1,n}^{(l)} \colon V_{(l,\mathbf{0}_{n-1})} \to \mathcal{S}_0(M_{1,n}(F))$ and $\overline{\varphi}_{1,n}^{(l)} \colon \overline{V_{(l,\mathbf{0}_{n-1})}} \to \mathcal{S}_0(M_{1,n}(F))$ by

$$\varphi_{1,n}^{(l)}(\xi_{Q(\gamma)})(z) = z_1^{\gamma_1} z_2^{\gamma_2} \cdots z_n^{\gamma_n} \mathbf{e}_{(1,n)}(z), \tag{2.34}$$

$$\overline{\varphi}_{1,n}^{(l)}(\overline{\xi_{Q(\gamma)}})(z) = \overline{z_1^{\gamma_1} z_2^{\gamma_2} \cdots z_n^{\gamma_n}} \mathbf{e}_{(1,n)}(z)$$
 (2.35)

for $z=(z_1,z_2,\cdots,z_n)\in \mathrm{M}_{1,n}(F)$ and $\gamma=(\gamma_1,\gamma_2,\cdots,\gamma_n)\in \mathbb{N}_0^n$ such that $\ell(\gamma)=l$. In §4.4, we show that $\varphi_{1,n}^{(l)}$ and $\overline{\varphi}_{1,n}^{(l)}$ are K_n -homomorphisms, where $\mathcal{S}_0(\mathrm{M}_{1,n}(F))$ is regarded as a K_n -module via the action R.

2.10 Injector

Let $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_n) \in \Lambda_n$ and $l \in \mathbb{N}_0$. In this subsection, we specify each irreducible components of the tensor product $V_{\lambda} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}$. Let

$$\Xi^{\circ}(\lambda) = \{ \lambda' = (\lambda'_1, \lambda'_2, \cdots, \lambda'_n) \in \Lambda_n \mid \lambda'_1 \ge \lambda_1 \ge \lambda'_2 \ge \lambda_2 \ge \cdots \ge \lambda'_n \ge \lambda_n \},$$

and $\Xi^{\circ}(\lambda;l) = \{\lambda' \in \Xi^{\circ}(\lambda) \mid \ell(\lambda' - \lambda) = l\}$. Then Pieri's rule [4, Corollary 9.2.4] asserts that $V_{\lambda} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}$ has the irreducible decomposition

$$V_{\lambda} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})} \simeq \bigoplus_{\lambda' \in \Xi^{\circ}(\lambda;l)} V_{\lambda'}$$
 (2.36)

as $GL(n, \mathbb{C})$ -modules.

For $\lambda' = (\lambda'_1, \lambda'_2, \cdots, \lambda'_n) \in \Xi^{\circ}(\lambda)$, we set

$$S^{\circ}(\lambda',\lambda) = \frac{\prod_{1 \le i \le j \le n} (\lambda'_i - \lambda_j - i + j)!}{\prod_{1 \le i \le j \le n} (\lambda_i - \lambda'_{i+1} - i + j)!}.$$
 (2.37)

When n > 1, for $\mu = (\mu_1, \mu_2, \cdots, \mu_{n-1}) \in \Xi^+(\lambda)$, we set

$$S^{+}(\lambda,\mu) = \prod_{1 \le i \le j \le n} \frac{(\lambda_i - \mu_j - i + j)!}{(\mu_i - \lambda_{j+1} - i + j)!}.$$
 (2.38)

Let $\lambda' = (\lambda'_1, \lambda'_2, \cdots, \lambda'_n) \in \Xi^{\circ}(\lambda; l)$. Based on the result of Jucys [16], we will construct a \mathbb{Q} -rational $\mathrm{GL}(n, \mathbb{C})$ -homomorphism $\mathrm{I}^{\lambda, l}_{\lambda'} \colon V_{\lambda'} \to V_{\lambda} \otimes_{\mathbb{C}} V_{(l, \mathbf{0}_{n-1})}$ in §4.1. The explicit expression of $\mathrm{I}^{\lambda, l}_{\lambda'}$ is given by

$$I_{\lambda'}^{\lambda,l}(\xi_{M'}) = \sum_{M \in G(\lambda)} \sum_{P \in G((l,\mathbf{0}_{n-1}))} c_{M'}^{M,P} \xi_M \otimes \xi_P \qquad (M' \in G(\lambda')), \qquad (2.39)$$

where $c_{M'}^{M,P}$ $(M' \in G(\lambda'), M \in G(\lambda), P \in G((l, \mathbf{0}_{n-1})))$ are rational numbers determined by the following conditions, recursively:

- When n=1, we have $c_{\lambda_1+l}^{\lambda_1,l}=1$ for $\lambda_1,l\in\mathbb{Z}$.
- When n > 1, for $\mu' \in \Xi^+(\lambda')$, $M' \in G(\lambda'; \mu')$, $\mu \in \Xi^+(\lambda)$, $M \in G(\lambda; \mu)$, $0 \le q \le l$ and $P \in G((l, \mathbf{0}_{n-1}); (q, \mathbf{0}_{n-2}))$, we have

$$\mathbf{c}_{M'}^{M,P} = \mathbf{c}_{\widehat{M'}}^{\widehat{M},\widehat{P}} \mathbf{S}^{\circ}(\lambda',\lambda') \mathbf{S}^{\circ}(\mu,\mu) \frac{l!}{q!} \frac{\prod_{1 \leq i \leq j < n} (\lambda_{i} - \lambda_{j+1} - i + j)!}{\prod_{1 \leq i \leq j \leq n} (\lambda'_{i} - \lambda_{j} - i + j)!}$$

$$\times \left(\prod_{1 \leq i \leq j < n} \frac{(\mu'_{i} - \mu_{j} - i + j)!(\mu'_{i} - \lambda'_{j+1} - i + j)!}{(\mu'_{i} - \mu'_{j} - i + j)!(\mu_{i} - \lambda_{j+1} - i + j)!} \right)$$

$$\times \sum_{\substack{\alpha \in \Xi^{+}(\lambda) \cap \Xi^{+}(\lambda') \\ \mu' \in \Xi^{\circ}(\alpha), \ \alpha \in \Xi^{\circ}(\mu)}} \frac{(-1)^{\ell(\alpha - \mu)} \mathbf{S}^{\circ}(\alpha, \alpha)}{\mathbf{S}^{\circ}(\mu', \alpha) \mathbf{S}^{\circ}(\alpha, \mu)} \frac{\mathbf{S}^{+}(\lambda', \alpha)}{\mathbf{S}^{+}(\lambda, \alpha)}$$

if $\mu' \in \Xi^{\circ}(\mu; q)$, and $c_{M'}^{M,P} = 0$ otherwise.

We define a U(n)-invariant hermitian inner product on $V_{\lambda} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}$ by

$$\langle v_1 \otimes v_1', v_2 \otimes v_2' \rangle = \langle v_1, v_2 \rangle \langle v_1', v_2' \rangle \qquad (v_1, v_2 \in V_\lambda, v_1', v_2' \in V_{(l, \mathbf{0}_{n-1})}).$$

Then we have

$$\langle I_{\lambda'}^{\lambda,l}(\xi_{H(\lambda')}), \xi_{H(\lambda)} \otimes \xi_{Q(\lambda'-\lambda)} \rangle = C^{\circ}(\lambda'; \lambda),$$
 (2.40)

$$\langle I_{\lambda'}^{\lambda,l}(v), I_{\lambda'}^{\lambda,l}(v') \rangle = b(\lambda' - \lambda)C^{\circ}(\lambda'; \lambda)\langle v, v' \rangle \qquad (v, v' \in V_{\lambda'}), \qquad (2.41)$$

where

$$C^{\circ}(\lambda';\lambda) = \prod_{1 \le i \le j \le n} \frac{(\lambda'_i - \lambda'_j - i + j)!(\lambda_i - \lambda_j - i + j - 1)!}{(\lambda'_i - \lambda_j - i + j)!(\lambda_i - \lambda'_j - i + j - 1)!},$$
(2.42)

$$b(\gamma) = \frac{(\gamma_1 + \gamma_2 + \dots + \gamma_n)!}{\gamma_1! \gamma_2! \dots \gamma_n!} \qquad (\gamma = (\gamma_1, \gamma_2, \dots, \gamma_n) \in \mathbb{N}_0^n).$$
 (2.43)

2.11 Archimedean Rankin–Selberg integrals for $G_n \times G_n$

Let $(\Pi_{d,\nu}, I(d,\nu))$ and $(\Pi_{d',\nu'}, I(d',\nu'))$ be principal series representations of G_n with parameters

$$d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n, \qquad \nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n, d' = (d'_1, d'_2, \dots, d'_n) \in \mathbb{Z}^n, \qquad \nu' = (\nu'_1, \nu'_2, \dots, \nu'_n) \in \mathbb{C}^n.$$

We assume $d \in \Lambda_{n,F}$ and $-d' \in \Lambda_{n,F}$. If $\Pi_{d,\nu}$ and $\Pi_{d',\nu'}$ are irreducible, these are not serious assumptions because of (2.4) and (2.5). We take $f_{d,\nu}$, $\overline{f}_{d',\nu'}$, $\Gamma_F(\nu;d)$, $\Gamma_F(\nu';d')$ and $L(s,\Pi_{d,\nu} \times \Pi_{d',\nu'})$ as in §2.7 with n' = n.

Let $\varepsilon \in \{\pm 1\}$, $W \in \mathcal{W}(\Pi_{d,\nu}, \psi_{\varepsilon})$, $W' \in \mathcal{W}(\Pi_{d',\nu'}, \psi_{-\varepsilon})$ and $\phi \in \mathcal{S}(M_{1,n}(F))$. Let $s \in \mathbb{C}$ such that Re(s) is sufficiently large. We define the archimedean Rankin–Selberg integral $Z(s, W, W', \phi)$ for $\Pi_{d,\nu} \times \Pi_{d',\nu'}$ by

$$Z(s, W, W', \phi) = \int_{N_n \backslash G_n} W(g)W'(g)\phi(e_n g)|\det g|_F^s dg, \qquad (2.44)$$

where we put $e_n = (O_{1,n-1}, 1) \in M_{1,n}(F)$ as in §2.1. Here we note

$$Z(s, W, W', \phi) = Z(s, W', W, \phi),$$
 (2.45)

$$Z(s, R(k)W, R(k)W', R(k)\phi) = Z(s, W, W', \phi)$$
 $(k \in K_n).$ (2.46)

Let l be a integer determined by

$$\left\{ \begin{array}{ll} l \in \{0,1\} \text{ and } l \equiv -\ell(d+d') \bmod 2 & \text{ if } F = \mathbb{R} \text{ and } \ell(d+d') \leq 0, \\ l \in \{0,-1\} \text{ and } l \equiv -\ell(d+d') \bmod 2 & \text{ if } F = \mathbb{R} \text{ and } \ell(d+d') \geq 0, \\ l = -\ell(d+d') & \text{ if } F = \mathbb{C}, \end{array} \right.$$

where $\ell(\gamma)$ ($\gamma \in \mathbb{Z}^n$) are defined by (2.32). By (2.46), we know that

$$v_1 \otimes \overline{v_2} \otimes v_3 \mapsto Z(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})), \varphi_{1,n}^{(l)}(v_3))$$
 (2.47)

defines an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}, \mathbb{C}_{\operatorname{triv}})$ if $l \geq 0$, and

$$v_1 \otimes \overline{v_2} \otimes \overline{v_3} \mapsto Z(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})), \overline{\varphi}_{1,n}^{(-l)}(\overline{v_3}))$$
 (2.48)

defines an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} \overline{V_{(-l,\mathbf{0}_{n-1})}}, \mathbb{C}_{\operatorname{triv}})$ if $l \leq 0$. Here W_{ε} , $\varphi_{1,n}^{(l)}$, $\overline{\varphi}_{1,n}^{(-l)}$ are defined by (2.8), (2.34), (2.35), respectively, and $\mathbb{C}_{\operatorname{triv}} = \mathbb{C}$ is the trivial K_n -module. The following theorem is the second main result of this paper, which gives the explicit expressions of the K_n -homomorphisms (2.47) and (2.48).

Theorem 2.9. Retain the notation.

(1) Assume $l \geq 0$. For $v_1 \in V_d$, $v_2 \in V_{-d'}$ and $v_3 \in V_{(l,\mathbf{0}_{n-1})}$, we have

$$\begin{split} &Z\big(s, \mathcal{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(v_1)), \mathcal{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{v_2})), \varphi_{1,n}^{(l)}(v_3)\big)\\ &= \frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}}{(\dim V_{-d'})\Gamma_F(\nu;d)\Gamma_F(\nu';d')} L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'}) \, \langle v_1 \otimes v_3, \, \mathcal{I}_{-d'}^{d,l}(v_2) \rangle. \end{split}$$

if $-d' \in \Xi^{\circ}(d)$, and $Z(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})), \varphi_{1,n}^{(l)}(v_3)) = 0$ otherwise. Here $I_{-d'}^{d,l}$ is given explicitly by (2.39). In particular, if $-d' \in \Xi^{\circ}(d)$, we have

$$Z(s, W_{\varepsilon}(f_{d,\nu}(\xi_{H(d)})), W_{-\varepsilon}(\bar{f}_{d',\nu'}(\overline{\xi_{H(-d')}})), \varphi_{1,n}^{(l)}(\xi_{Q(-d-d')}))$$

$$= \frac{(-\varepsilon\sqrt{-1})\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)C^{\circ}(-d';d)}{(\dim V_{-d'})\Gamma_F(\nu;d)\Gamma_F(\nu';d')}L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'}).$$
(2.49)

(2) Assume $l \leq 0$. For $v_1 \in V_d$, $v_2 \in V_{-d'}$ and $v_3 \in V_{(-l,0,-1)}$, we have

$$\begin{split} &Z(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(v_{1})), \mathbf{W}_{-\varepsilon}(\overline{\mathbf{f}}_{d',\nu'}(\overline{v_{2}})), \overline{\varphi}_{1,n}^{(-l)}(\overline{v_{3}})) \\ &= \frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_{i}+d'_{i})}}{(\dim V_{d})\mathbf{\Gamma}_{F}(\nu;d)\mathbf{\Gamma}_{F}(\nu';d')} L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'}) \left\langle \mathbf{I}_{d}^{-d',-l}(v_{1}), v_{2} \otimes v_{3} \right\rangle \end{split}$$

if $d \in \Xi^{\circ}(-d')$, and $Z(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})), \overline{\varphi}_{1,n}^{(-l)}(\overline{v_3})) = 0$ otherwise. Here $I_d^{-d',-l}$ is given explicitly by (2.39). In particular, if $d \in \Xi^{\circ}(-d')$, we have

$$Z(s, W_{\varepsilon}(f_{d,\nu}(\xi_{H(d)})), W_{-\varepsilon}(\bar{f}_{d',\nu'}(\overline{\xi_{H(-d')}})), \overline{\varphi}_{1,n}^{(-l)}(\overline{\xi_{Q(d+d')}}))$$

$$= \frac{(-\varepsilon\sqrt{-1})\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)C^{\circ}(d;-d')}{(\dim V_d)\Gamma_F(\nu;d)\Gamma_F(\nu';d')}L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'}).$$
(2.50)

Remark 2.10. Retain the notation. Under the assumption $l \geq 0$, the space

$$\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}, \mathbb{C}_{\operatorname{triv}})$$

is 1 dimensional if $-d' \in \Xi^{\circ}(d)$, and is equal to $\{0\}$ otherwise. Under the assumption $l \leq 0$, the space

$$\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} \overline{V_{(-l,\mathbf{0}_{n-1})}}, \mathbb{C}_{\operatorname{triv}})$$

is 1 dimensional if $d \in \Xi^{\circ}(-d')$, and is equal to $\{0\}$ otherwise. These facts follow from Lemma 4.3 in $\S4.2$.

Let P_n be a maximal parabolic subgroup of G_n defined by

$$P_n = \{ p = (p_{i,j}) \in G_n \mid p_{n,j} = 0 \ (1 \le i \le n - 1) \},$$

which contains the upper triangular Borel subgroup $B_n = N_n M_n$. We put $\chi_l(t) = (t/|t|)^l \ (t \in F^{\times})$ as in §2.3, and set $\nu'' = -\sum_{i=1}^n (\nu_i + \nu_i')$. We define a subspace $I_{P_n}(l, \nu'', s)$ of $C^{\infty}(G_n)$ consisting of all functions f such that

$$f(pg) = \chi_l(p_{n,n})|p_{n,n}|_F^{\nu''-ns}|\det p|_F^s f(g) \qquad (p = (p_{i,j}) \in P_n, \ g \in G_n),$$

on which G_n acts by the right translation $\Pi_{P_n,l,\nu'',s}=R$. The representation $(\Pi_{P_n,l,\nu'',s},I_{P_n}(l,\nu'',s))$ is called a degenerate principal series representation of G_n . Similar to the proof of [5, Proposition 7], we can specify the minimal K_n -type of $\Pi_{P_n,l,\nu'',s}$, which occur in $\Pi_{P_n,l,\nu'',s}|_{K_n}$ with multiplicity 1. If $l\geq 0$,

we know that $\tau_{(l,\mathbf{0}_{n-1})}|_{K_n}$ is the minimal K_n -type of $\Pi_{P_n,l,\nu'',s}$, and there is a K_n -homomorphism $f_{P_n,l,\nu'',s}\colon V_{(l,\mathbf{0}_{n-1})}\to I_{P_n}(l,\nu'',s)$ characterized by

$$\mathbf{f}_{P_n,l,\nu'',s}(\xi_{Q(\gamma)})(g) = \frac{|\det g|_F^s \prod_{i=1}^n g_{n,i}^{\gamma_i}}{(\sum_{i=1}^n |g_{n,i}|^2)^{(n\mathbf{s}\mathbf{c}_F - \nu''\mathbf{c}_F + l)/2}}$$

for $g=(g_{i,j})\in G_n$ and $\gamma=(\gamma_1,\gamma_2,\cdots,\gamma_n)\in\mathbb{N}_0^n$ such that $\ell(\gamma)=l$. If $l\leq 0$, we know that $\overline{\tau_{(-l,\mathbf{0}_{n-1})}}|_{K_n}$ is the minimal K_n -type of $\Pi_{P_n,l,\nu'',s}$, and there is a K_n -homomorphism $\overline{\mathrm{f}}_{P_n,l,\nu'',s}\colon \overline{V_{(-l,\mathbf{0}_{n-1})}}\to I_{P_n}(l,\nu'',s)$ characterized by

$$\bar{\mathbf{f}}_{P_n,l,\nu'',s}(\overline{\xi_{Q(\gamma)}})(g) = \frac{|\det g|_F^s \prod_{i=1}^n \overline{g_{n,i}}^{\gamma_i}}{(\sum_{i=1}^n |g_{n,i}|^2)^{(n\mathbf{sc}_F - \nu''\mathbf{c}_F - l)/2}}$$

for $g = (g_{i,j}) \in G_n$ and $\gamma = (\gamma_1, \gamma_2, \dots, \gamma_n) \in \mathbb{N}_0^n$ such that $\ell(\gamma) = -l$. For $f \in I_{P_n}(l, \nu'', s)$, we define an integral

$$Z_{P_n}(W, W', f) = \int_{Z_n N_n \backslash G_n} W(g)W'(g)f(g) dg.$$
 (2.51)

This integral is equivalent to (2.44) via the correspondence

$$Z(s, W, W', \phi) = Z_{P_n}(W, W', g_{P_n, l, \nu'', s}(\phi))$$
(2.52)

with $g_{P_n,l,\nu'',s}(\phi) \in I_{P_n}(l,\nu'',s)$ defined by

$$g_{P_n,l,\nu'',s}(\phi)(g) = |\det g|_F^s \int_{G_1} \chi_{-l}(h)\phi(he_ng)|h|_F^{ns-\nu''} dh$$
 $(g \in G_n).$

For $g \in G_n$ and $\gamma = (\gamma_1, \gamma_2, \dots, \gamma_n) \in \mathbb{N}_0^n$ such that $\ell(\gamma) = |l|$, we have

$$g_{P_n,l,\nu,s}(\varphi_{1,n}^{(l)}(\xi_{Q(\gamma)}))(g) = \Gamma_F(ns-\nu;l)f_{P_n,l,\nu,s}(\xi_{Q(\gamma)})(g)$$
 if $l \ge 0$,

$$g_{P_n,l,\nu,s}(\overline{\varphi}_{1,n}^{(-l)}(\overline{\xi_{Q(\gamma)}}))(g) = \Gamma_F(ns-\nu;-l)\overline{f}_{P_n,l,\nu,s}(\overline{\xi_{Q(\gamma)}})(g) \quad \text{if } l \le 0$$

using

$$\int_0^\infty \exp(-\pi c_F r t^2) t^{sc_F + m} \frac{2c_F dt}{t} = \frac{\Gamma_F(s; m)}{r^{(sc_F + m)/2}}$$

$$(r \in \mathbb{R}_+^\times, \ m \in \mathbb{Z}, \ \text{Re}(sc_F + m) > 0).$$
(2.53)

Hence, Theorem 2.9 gives the explicit descriptions of the integral (2.51) at the minimal $K_n \times K_n \times K_n$ -type of $\Pi_{d,\nu} \boxtimes \Pi_{d',\nu'} \boxtimes \Pi_{P_n,l,\nu'',s}$. We note that

$$v_1 \otimes \overline{v_2} \otimes v_3 \mapsto Z_{P_n}(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})), f_{P_n,l,\nu'',s}(v_3))$$
 (2.54)

defines an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}, \mathbb{C}_{\operatorname{triv}})$ if $l \geq 0$, and

$$v_1 \otimes \overline{v_2} \otimes \overline{v_3} \mapsto Z_{P_n}(s, W_{\varepsilon}(f_{d,\nu}(v_1)), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{v_2})), \overline{f}_{P_n,l,\nu'',s}(\overline{v_3}))$$
 (2.55)

defines an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} \overline{V_{(-l,\mathbf{0}_{n-1})}}, \mathbb{C}_{\operatorname{triv}})$ if $l \leq 0$. By Theorem 2.9 with Lemma 4.3, we obtain the following corollary.

Corollary 2.11. Retain the notation.

(1) Assume $-d' \in \Xi^{\circ}(d)$. Then

$$\sum_{M \in \mathrm{G}(d)} \sum_{M' \in \mathrm{G}(-d')} \sum_{P \in \mathrm{G}((l,\mathbf{0}_{n-1}))} \frac{\mathrm{c}_{M'}^{M,P}}{\mathrm{r}(M')} \, \xi_M \otimes \overline{\xi_{M'}} \otimes \xi_P,$$

is a unique \mathbb{Q} -rational K_n -invariant vector in $V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}$ up to scalar multiple, and its image under the K_n -homomorphism (2.54) is

$$\frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d_i')}\mathrm{b}(-d-d')\mathrm{C}^{\circ}(-d';d)}{\Gamma_F(\nu;d)\Gamma_F(\nu';d')}\frac{L(s,\Pi_{d,\nu}\times\Pi_{d',\nu'})}{\Gamma_F(ns-\nu'';l)}.$$

Here b(-d-d') and $C^{\circ}(-d';d)$ are the nonzero rational constants, which are given by (2.43) and (2.42), respectively.

(2) Assume $d \in \Xi^{\circ}(-d')$. Then

$$\sum_{M \in \mathrm{G}(d)} \sum_{M' \in \mathrm{G}(-d')} \sum_{P \in \mathrm{G}((-l,\mathbf{0}_{n-1}))} \frac{\mathrm{c}_{M}^{M',P}}{\mathrm{r}(M)} \, \xi_{M} \otimes \overline{\xi_{M'}} \otimes \overline{\xi_{P}},$$

is a unique \mathbb{Q} -rational K_n -invariant vector in $V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} \overline{V_{(-l,\mathbf{0}_{n-1})}}$ up to scalar multiple, and its image under the K_n -homomorphism (2.55) is

$$\frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d_i')}\mathrm{b}(d+d')\mathrm{C}^{\circ}(d;-d')}{\Gamma_F(\nu;d)\Gamma_F(\nu';d')}\frac{L(s,\Pi_{d,\nu}\times\Pi_{d',\nu'})}{\Gamma_F(ns-\nu'';-l)}$$

Here b(d + d') and $C^{\circ}(d; -d')$ are the nonzero rational constants, which are given by (2.43) and (2.42), respectively.

Remark 2.12. We set $F = \mathbb{C}$. By [2, Proposition 3.3], we note that the compatible pairs of cohomological representations of G_n in Grenié [5] can be regarded as pairs of some irreducible principal series representations $\Pi_{d,\nu}$ and $\Pi_{d',\nu'}$ with $d,-d' \in \Lambda_{n,F}$ such that either $-d' \in \Xi^{\circ}(d)$ or $d \in \Xi^{\circ}(-d')$ holds. Hence, Theorem 2.9 gives a proof of Grenié's conjecture [5, Conjecture 1] at all critical points (Dong and Xue [2] proved this conjecture only at the central critical point by another method). Corollary 2.11 gives the explicit descriptions of the archimedean part of Grenié's theorem [5, Theorem 2].

Remark 2.13. Although we use the orthonormal basis $\{\zeta_M\}_{M \in G(\lambda)}$ rather than $\{\xi_M\}_{M \in G(\lambda)}$ in the proofs, we state the main theorems in terms of the \mathbb{Q} -rational basis $\{\xi_M\}_{M \in G(\lambda)}$ because of the applications in the above remark.

3 Recurrence relations

3.1 The Godement section $(G_{n-1} \to G_n)$

Let us recall the Godement section, which is defined by Jacquet in [14, §7.1]. Assume n > 1. Let $d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n$ and $\nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n$.

We set $\hat{d} = (d_1, d_2, \dots, d_{n-1}) \in \mathbb{Z}^{n-1}$ and $\hat{\nu} = (\nu_1, \nu_2, \dots, \nu_{n-1}) \in \mathbb{C}^{n-1}$. Let $f \in I(\widehat{d})_{K_{n-1}}$, and we denote by $f_{\widehat{\nu}}$ the standard section corresponding to f. Let $\phi \in \mathcal{S}_0(\mathcal{M}_{n-1,n}(F))$. When $\operatorname{Re}(\nu_n - \nu_i) > -1$ $(1 \le i \le n-1)$, we define the Godement section $g_{d_n,\nu_n}^+(f_{\widehat{\nu}},\phi)$ by the convergent integral

$$g_{d_{n},\nu_{n}}^{+}(f_{\widehat{\nu}},\phi)(g) = \chi_{d_{n}}(\det g)|\det g|_{F}^{\nu_{n}+(n-1)/2}$$

$$\times \int_{G_{n-1}} \phi((h,O_{n-1,1})g)f_{\widehat{\nu}}(h^{-1})\chi_{d_{n}}(\det h)|\det h|_{F}^{\nu_{n}+n/2}dh$$

for $g \in G_n$. Here we set $\chi_l(t) = (t/|t|)^l$ $(l \in \mathbb{Z}, t \in F^{\times})$ as in §2.3. Jacquet shows that $g_{d_n,\nu_n}^+(f_{\widehat{\nu}},\phi)(g)$ extends to a meromorphic function of ν_n in \mathbb{C} , which is a holomorphic multiple of

$$\prod_{1 \le i \le n-1} \Gamma_F(\nu_n - \nu_i + 1; |d_n - d_i|).$$

Moreover, $g_{d_n,\nu_n}^+(f_{\widehat{\nu}},\phi)$ is an element of $I(d,\nu)_{K_n}$ if it is defined. For later use, we prepare the following lemma.

Lemma 3.1. Retain the notation. Then we have

$$\Pi_{d,\nu}(k) g_{d_n,\nu_n}^+(f_{\widehat{\nu}},\phi) = (\det k)^{d_n} g_{d_n,\nu_n}^+(f_{\widehat{\nu}}, R(k)\phi) \qquad (k \in K_n),$$

$$(\det k')^{-d_n} g_{d_n,\nu_n}^+(\Pi_{\widehat{d},\widehat{\nu}}(k')f_{\widehat{\nu}}, L(k')\phi) = g_{d_n,\nu_n}^+(f_{\widehat{\nu}},\phi) \qquad (k' \in K_{n-1}).$$
(3.2)

$$(\det k')^{-d_n} g_{d_n, \nu_n}^+ (\Pi_{\widehat{d}_{\widehat{\nu}}}(k') f_{\widehat{\nu}}, L(k') \phi) = g_{d_n, \nu_n}^+(f_{\widehat{\nu}}, \phi) \quad (k' \in K_{n-1}).$$
 (3.2)

Proof. When $Re(\nu_n - \nu_i) > -1$ $(1 \le i \le n-1)$, the equalities (3.1) and (3.2) follow immediately from the definition. Hence, by the uniqueness of the analytic continuations, we obtain the assertion.

Let $\varepsilon \in \{\pm 1\}$. In [14, §7.2], Jacquet gives convenient integral representations of Whittaker functions. If ν satisfies (2.7), then for $g \in G_n$, we have

$$W_{\varepsilon}(g_{d_{n},\nu_{n}}^{+}(f_{\widehat{\nu}},\phi))(g) = \chi_{d_{n}}(\det g)|\det g|_{F}^{\nu_{n}+(n-1)/2}$$

$$\times \int_{G_{n-1}} \left(\int_{M_{n-1,1}(F)} \phi\left((h,hz)g\right) \psi_{-\varepsilon}(e_{n-1}z) dz \right)$$

$$\times W_{\varepsilon}(f_{\widehat{\nu}})(h^{-1})\chi_{d_{n}}(\det h)|\det h|_{F}^{\nu_{n}+n/2} dh,$$
(3.3)

where $e_{n-1} = (O_{1,n-2}, 1) \in M_{1,n-1}(F)$. The right hand side of (3.3) converges absolutely for all $\nu \in \mathbb{C}^n$, and defines an entire function of ν . Thus the equality holds for all ν . In the appendix of this paper, we show that the integral representation (3.3) can be regarded as a generalization of the recursive formula [9, Theorem 14] of spherical Whittaker functions.

The Godement section $(G_n \to G_n)$ 3.2

In this subsection, we define a new kind of the Godement section. Let $d \in \mathbb{Z}^n$ and $\nu \in \mathbb{C}^n$. Let $f \in I(d)_{K_n}$ and $\phi \in \mathcal{S}_0(M_n(F))$. We denote by f_{ν} the standard section corresponding to f. For $s \in \mathbb{C}$, $l \in \mathbb{Z}$ and $g \in G_n$, we set

$$g_{l,s}^{\circ}(f_{\nu},\phi)(g) = \int_{G_n} f_{\nu}(gh)\phi(h)\chi_l(\det h)|\det h|_F^{s+(n-1)/2} dh.$$
 (3.4)

Proposition 3.2. Let $d \in \mathbb{Z}^n$, $l \in \mathbb{Z}$ and $\varepsilon \in \{\pm 1\}$. Let Ω be an open, relatively compact subset of \mathbb{C}^n . Then there is a constant c_0 such that, for any $f \in I(d)_{K_n}$ and $\phi \in \mathcal{S}_0(M_n(F))$, the following assertions (i) and (ii) hold:

- (i) The integral (3.4) converges absolutely and uniformly on any compact subset of $\{(s, \nu, g) \in \mathbb{C} \times \Omega \times G_n \mid \operatorname{Re}(s) > c_0\}$.
- (ii) Let $\nu \in \Omega$ and $s \in \mathbb{C}$ such that $\operatorname{Re}(s) > c_0$. Then $g_{l,s}^{\circ}(f_{\nu}, \phi)$ is an element of $I(d, \nu)_{K_n}$ satisfying

$$\Pi_{d,\nu}(k)g_{l,s}^{\circ}(f_{\nu},\phi) = (\det k)^{-l}g_{l,s}^{\circ}(f_{\nu},L(k)\phi) \qquad (k \in K_n),$$
(3.5)

$$(\det k')^l g_{l,s}^{\circ} (\Pi_{d,\nu}(k') f_{\nu}, R(k') \phi) = g_{l,s}^{\circ} (f_{\nu}, \phi) \qquad (k' \in K_n).$$
 (3.6)

Moreover, for $g \in G_n$, we have

$$W_{\varepsilon}(g_{l,s}^{\circ}(f_{\nu},\phi))(g) = \int_{G_{\mathcal{P}}} W_{\varepsilon}(f_{\nu})(gh)\phi(h)\chi_{l}(\det h)|\det h|_{F}^{s+(n-1)/2} dh.$$
 (3.7)

Here f_{ν} is the standard section corresponding to f.

Proof. For $g \in G_n$, we set $||g|| = \text{Tr}(g^t \overline{g}) + \text{Tr}((g^{-1})^t (\overline{g^{-1}}))$ and denote by

$$g = u(g)a(g)k(g)$$
 $(u(g) \in U_n, a(g) \in A_n, k(g) \in K_n)$

the decomposition of g according to $G_n = U_n A_n K_n$. It is easy to see that

$$\|\mathbf{a}(g)\| \le \|g\| = \|kgk'\|, \quad \|gh\| \le \|g\| \|h\|, \quad \mathbf{a}(gh) = \mathbf{a}(g)\mathbf{a}(\mathbf{k}(g)h)$$
 (3.8)

for $g, h \in G_n$ and $k, k' \in K_n$. Since $G_n \ni g \mapsto \eta_{\nu - \rho_n}(\mathbf{a}(g)) \in \mathbb{C}$ is an element of $I(\mathbf{0}_n, \nu)$, we have

$$\int_{N} |\eta_{\nu-\rho_n}(\mathbf{a}(x))| \, dx < \infty \qquad (\nu \in \mathbb{C}^n \text{ satisfying } (2.7)). \tag{3.9}$$

by the absolute convergence of the Jacquet integral [29, Theorem 15.4.1].

We take d, l, ε and Ω as in the statement. Replacing Ω with its superset if necessary, we may assume that Ω contains an element ν satisfying (2.7). By (3.8) and [14, Proposition 3.2], there are a constant c_1 and a continuous seminorm \mathcal{Q} on I(d) such that, for any $\nu \in \Omega$, $g \in G_n$ and $f \in I(d)$, the following inequalities hold:

$$|\eta_{\nu-\rho_n}(\mathbf{a}(g))| \le ||g||^{c_1}, \qquad |\mathbf{W}_{\varepsilon}(f_{\nu})(g)| \le ||g||^{c_1} \mathcal{Q}(f).$$
 (3.10)

By [14, Lemma 3.3 (ii)], there is a positive constant c_0 such that, for any $t > c_0$ and $\phi \in \mathcal{S}(M_n(F))$, the integral

$$\int_{G_n} ||h||^{c_1} \phi(h) |\det h|_F^{t+(n-1)/2} dh \tag{3.11}$$

converges absolutely.

Let $f \in I(d)_{K_n}$ and $\phi \in \mathcal{S}_0(M_n(F))$. By (3.8), (3.10) and the definition of $I(d,\nu)$, for $\nu \in \Omega$, $x \in N_n$ and $g,h \in G_n$, we have an estimate

$$|f_{\nu}(xgh)| \le |\eta_{\nu-\rho_n}(\mathbf{a}(x))| \|g\|^{c_1} \|h\|^{c_1} \sup_{k \in K_n} |f(k)|.$$
 (3.12)

By the absolute convergence of (3.11) and the estimate (3.12) with $x = 1_n$, we obtain the assertion (i).

Let $\nu \in \Omega$ and $s \in \mathbb{C}$ such that $\text{Re}(s) > c_0$. By definition, we have the equalities (3.5), (3.6) and

$$g_{l,s}^{\circ}(f_{\nu},\phi)(umg) = \chi_d(m)\eta_{\nu-\rho_n}(m)g_{l,s}^{\circ}(f_{\nu},\phi)(g)$$
 (3.13)

for $u \in U_n$, $m \in M_n$ and $g \in G_n$. Since $\Pi_{d,\nu}$ is admissible and $g_{l,s}^{\circ}(f_{\nu},\phi)$ is a continuous K_n -finite function on G_n satisfying (3.13), we know that $g_{l,s}^{\circ}(f_{\nu},\phi)$ is smooth and an element of $I(d,\nu)_{K_n}$ by [17, Propositions 8.4 and 8.5].

Let $g \in G_n$. If $\nu \in \Omega$ satisfies (2.7), we obtain the equality (3.7) as follows:

$$W_{\varepsilon}(g_{l,s}^{\circ}(f_{\nu},\phi))(g) = \int_{N_{n}} g_{l,s}^{\circ}(f_{\nu},\phi)(xg)\psi_{-\varepsilon,n}(x) dx$$

$$= \int_{N_{n}} \left(\int_{G_{n}} f(xgh)\phi(h)\chi_{l}(\det h) |\det h|_{F}^{s+(n-1)/2} dh \right) \psi_{-\varepsilon,n}(x) dx$$

$$= \int_{G_{n}} \left(\int_{N_{n}} f(xgh)\psi_{-\varepsilon,n}(x) dx \right) \phi(h)\chi_{l}(\det h) |\det h|_{F}^{s+(n-1)/2} dh$$

$$= \int_{G_{n}} W_{\varepsilon}(f_{\nu})(gh)\phi(h)\chi_{l}(\det h) |\det h|_{F}^{s+(n-1)/2} dh.$$

Here the third equality is justified by Fubini's theorem, since the double integral converges absolutely by (3.9), (3.12) and the absolute convergence of (3.11).

In order to complete the proof, it suffices to show that the both sides of (3.7) are holomorphic functions of (s, ν) on a domain

$$\{(s,\nu) \in \mathbb{C} \times \Omega \mid \operatorname{Re}(s) > c_0\}.$$
 (3.14)

By (3.8), (3.10) and the absolute convergence of (3.11), the integral in the right hand side of (3.7) converges absolutely and uniformly on any compact subset of the domain (3.14), and defines a holomorphic function on the domain (3.14).

Let $S_{\phi,l}$ be a subspace of $S_0(\mathbf{M}_n(F))$ spanned by $L(k)\phi$ $(k \in K_n)$, and we regard $S_{\phi,l}$ as a K_n -module via the action $\det^{-l} \otimes L$. Let $I_{\phi,l}$ be a subspace of $I(d)_{K_n}$ spanned by $\{T(\phi') \mid \phi' \in S_{\phi,l}, T \in \operatorname{Hom}_{K_n}(S_{\phi,l}, I(d)_{K_n})\}$. Then we have $g_{l,s}^{\circ}(f_{\nu},\phi)|_{K_n} \in I_{\phi,l}$ by (3.5). Since ϕ is K_n -finite and $\Pi_{d,\nu}$ is admissible, the space $I_{\phi,l}$ is finite dimensional. Let $\{f_{\phi,l}\}_{l=1}^m$ be an orthonormal basis of $I_{\phi,l}$ with respect to the L^2 -inner product

$$\langle f_1, f_2 \rangle_{L^2} = \int_{K_-} f_1(k) \overline{f_2(k)} \, dk \qquad (f_1, f_2 \in I(d)).$$

Since $g_{l,s}^{\circ}(f_{\nu},\phi)|_{K_n} = \sum_{i=1}^m \langle g_{l,s}^{\circ}(f_{\nu},\phi)|_{K_n}, f_{\phi,i} \rangle_{L^2} f_{\phi,i}$, we have

$$W_{\varepsilon}(g_{l,s}^{\circ}(f_{\nu},\phi))(g) = \sum_{i=1}^{m} \langle g_{l,s}^{\circ}(f_{\nu},\phi)|_{K_{n}}, f_{\phi,i} \rangle_{L^{2}} W_{\varepsilon}(f_{\phi,i,\nu})(g),$$

where $f_{\phi,i,\nu}$ is the standard section corresponding to $f_{\phi,i}$. By this expression and the statement (i), we know that the right hand side of (3.7) is holomorphic on the domain (3.14).

Remark 3.3. The equality (3.7) with l = 0 can be regarded as the local theta correspondence for a principal series representation $\Pi_{d,\nu}$ in [30, §2].

3.3 Recurrence relations with the Godement sections

Let $\varepsilon \in \{\pm 1\}$. For $\phi \in \mathcal{S}(M_{n,1}(F))$, we define $\mathcal{F}_{\varepsilon}(\phi) \in \mathcal{S}(M_{1,n}(F))$ by

$$\mathcal{F}_{\varepsilon}(\phi)(t) = \int_{\mathcal{M}_{n,1}(F)} \phi(z)\psi_{-\varepsilon}(tz) d_F z \qquad (t \in \mathcal{M}_{1,n}(F)). \tag{3.15}$$

Let

$$d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n, \qquad \nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n,$$

$$d' = (d'_1, d'_2, \dots, d'_{n'}) \in \mathbb{Z}^{n'}, \qquad \nu' = (\nu'_1, \nu'_2, \dots, \nu'_{n'}) \in \mathbb{C}^{n'}.$$

If n > 1, we set $\widehat{d} = (d_1, d_2, \dots, d_{n-1})$ and $\widehat{\nu} = (\nu_1, \nu_2, \dots, \nu_{n-1})$. If n' > 1, we set $\widehat{d'} = (d'_1, d'_2, \dots, d'_{n'-1})$ and $\widehat{\nu'} = (\nu'_1, \nu'_2, \dots, \nu'_{n'-1})$.

Proposition 3.4 $(G_n \times G_n \to G_n \times G_{n-1})$. Retain the notation, and assume n' = n > 1. Let $f \in I(d)_{K_n}$ and $f' \in I(\widehat{d'})_{K_{n-1}}$. We denote by f_{ν} and $f'_{\widehat{\nu'}}$ the standard sections corresponding to f and f', respectively. Let $\phi_1 \in \mathcal{S}_0(M_{n-1,n}(F))$ and $\phi_2 \in \mathcal{S}_0(M_{1,n}(F))$. For $s \in \mathbb{C}$ such that $\operatorname{Re}(s)$ is sufficiently large, we have

$$Z(s, \mathbf{W}_{\varepsilon}(f_{\nu}), \mathbf{W}_{-\varepsilon}(\mathbf{g}_{d'_{n}, \nu'_{n}}^{+}(f'_{\widehat{\nu'}}, \phi_{1})), \phi_{2})$$

$$= Z(s, \mathbf{W}_{\varepsilon}(\mathbf{g}_{d'_{n}, s + \nu'_{n}}^{\circ}(f_{\nu}, \phi_{0})), \mathbf{W}_{-\varepsilon}(f'_{\widehat{\nu'}})).$$

where $\phi_0 \in \mathcal{S}_0(M_n(F))$ is defined by

$$\phi_0(z) = \phi_1((1_{n-1}, O_{n-1,1})z)\phi_2(e_n z) \qquad (z \in \mathcal{M}_n(F)).$$

Proof. Using (3.3), Jacquet shows the following equality [14, (8.1)]:

$$\begin{split} &Z\big(s,\,\mathbf{W}_{\varepsilon}(f_{\nu}),\,\mathbf{W}_{-\varepsilon}\big(\mathbf{g}_{d'_{n},\nu'_{n}}^{+}(f'_{\nu'},\phi_{1})\big),\,\phi_{2}\big)\\ &=\int_{N_{n-1}\backslash G_{n-1}}\left(\int_{G_{n}}\mathbf{W}_{\varepsilon}(f_{\nu})(\iota_{n}(h)g)\phi_{0}(g)\chi_{d'_{n}}(\det g)|\det g|_{F}^{s+\nu'_{n}+(n-1)/2}\,dg\right)\\ &\times\mathbf{W}_{-\varepsilon}(f'_{\nu'})(h)|\det h|_{F}^{s-1/2}dh. \end{split}$$

Hence, we obtain the assertion by Proposition 3.2.

П

Proposition 3.5 $(G_n \times G_{n-1} \to G_{n-1} \times G_{n-1})$. Retain the notation, and assume n' = n - 1. Let $f \in I(\widehat{d})_{K_{n-1}}$ and $f' \in I(d')_{K_{n-1}}$. We denote by $f_{\widehat{\nu}}$ and $f'_{\nu'}$ the standard sections corresponding to f and f', respectively. Let $\phi_1 \in \mathcal{S}_0(M_{n-1}(F))$ and $\phi_2 \in \mathcal{S}_0(M_{n-1,1}(F))$. For $s \in \mathbb{C}$ such that $\operatorname{Re}(s)$ is sufficiently large, we have

$$Z(s, W_{\varepsilon}(g_{d_{n},\nu_{n}}^{+}(f_{\widehat{\nu}}, \phi_{0})), W_{-\varepsilon}(f_{\nu'}'))$$

$$= Z(s, W_{\varepsilon}(f_{\widehat{\nu}}), W_{-\varepsilon}(g_{d_{n},s+\nu_{n}}^{\circ}(f_{\nu'}', \phi_{1})), \mathcal{F}_{\varepsilon}(\phi_{2})),$$

where $\phi_0 \in \mathcal{S}_0(M_{n-1,n}(F))$ is defined by

$$\phi_0(z) = \phi_1(z^t(1_{n-1}, O_{n-1,1}))\phi_2(z^t e_n) \qquad (z \in M_{n-1,n}(F)).$$

Proof. Using (3.3), Jacquet shows the following equality [14, (8.3)]:

$$Z(s, W_{\varepsilon}(g_{d_{n},\nu_{n}}^{+}(f_{\widehat{\nu}},\phi_{0})), W_{-\varepsilon}(f_{\nu'}^{\prime}))$$

$$= \int_{N_{n-1}\backslash G_{n-1}} \left(\int_{G_{n-1}} W_{-\varepsilon}(f_{\nu'}^{\prime})(gh)\phi_{1}(h)\chi_{d_{n}}(\det h)|\det h|_{F}^{s+\nu_{n}+(n-2)/2}dh \right)$$

$$\times W_{\varepsilon}(f_{\widehat{\nu}})(g)\mathcal{F}_{\varepsilon}(\phi_{2})(e_{n-1}g)|\det g|_{F}^{s}dg.$$

Hence, we obtain the assertion by Proposition 3.2.

4 Finite dimensional representations

4.1 The Clebsch–Gordan coefficients

Let $\lambda = (\lambda_1, \lambda_2, \cdots, \lambda_n) \in \Lambda_n$, $l \in \mathbb{N}_0$ and $\lambda' = (\lambda'_1, \lambda'_2, \cdots, \lambda'_n) \in \Xi^{\circ}(\lambda; l)$. By Pieri's rule (2.36), we can take a $\mathrm{GL}(n, \mathbb{C})$ -homomorphism $\tilde{\mathrm{I}}_{\lambda'}^{\lambda, l} \colon V_{\lambda'} \to V_{\lambda} \otimes_{\mathbb{C}} V_{(l, \mathbf{0}_{n-1})}$ satisfying

$$\left\langle \tilde{\mathbf{I}}_{\lambda'}^{\lambda,l}(v), \; \tilde{\mathbf{I}}_{\lambda'}^{\lambda,l}(v') \right\rangle = \left\langle v, v' \right\rangle \quad (v, v' \in V_{\lambda'}).$$
 (4.1)

Such $\tilde{I}_{\lambda'}^{\lambda,l}$ is unique up to multiplication by scalars in U(1). We set

$$\tilde{\mathbf{I}}_{\lambda'}^{\lambda,l}(\zeta_{M'}) = \sum_{M \in \mathcal{G}(\lambda)} \sum_{P \in \mathcal{G}((l,\mathbf{0}_{n-1}))} \mathcal{C}_{M'}^{M,P} \zeta_M \otimes \zeta_P \qquad (M' \in \mathcal{G}(\lambda')).$$

Then we call $C_{M'}^{M,P}$ $(M \in G(\lambda), P \in G((l, \mathbf{0}_{n-1})), M' \in G(\lambda'))$ the Clebsch-Gordan coefficients. When n = 1, we may normalize $C_{\lambda_1 + l}^{\lambda_1, l} = 1$, since

$$\Xi^{\circ}(\lambda_1; l) = \{\lambda_1 + l\}, \quad G(\lambda_1) = \{\lambda_1\}, \quad G(l) = \{l\}, \quad G(\lambda_1 + l) = \{\lambda_1 + l\}.$$

We consider the case n > 1. Let $\mu \in \Xi^+(\lambda)$ and $0 \le q \le l$. By Lemma 2.2, there are some constants

$$\begin{pmatrix} \lambda, & l & \lambda' \\ \mu, & q & \mu' \end{pmatrix} \qquad (\mu' \in \Xi^+(\lambda') \cap \Xi^{\circ}(\mu; q)) \tag{4.2}$$

such that, for any $M' \in G(\lambda'; \mu')$, $M \in G(\lambda; \mu)$, $P \in G((l, \mathbf{0}_{n-1}); (q, \mathbf{0}_{n-2}))$ and $\mu' \in \Xi^+(\lambda')$, the following equality hold:

$$\mathbf{C}_{M'}^{M,P} = \begin{cases} \begin{pmatrix} \lambda, & l \mid \lambda' \\ \mu, & q \mid \mu' \end{pmatrix} \mathbf{C}_{\widehat{M'}}^{\widehat{M},\widehat{P}} & \text{if } \mu' \in \Xi^{\circ}(\mu;q), \\ 0 & \text{otherwise.} \end{cases}$$
(4.3)

The constants (4.2) are called the isoscalar factors. In [16] (see also [1] and [28, Chapter 18]), Jucys gives the following expressions of them under some normalization of $\tilde{\mathbf{I}}_{\lambda^{l}}^{\lambda,l}$:

$$\begin{pmatrix} \lambda, & l & \lambda' \\ \mu, & q & \mu' \end{pmatrix} = \sqrt{\frac{(l-q)! \, S^{\circ}(\lambda', \lambda') S^{+}(\lambda, \mu) S^{\circ}(\mu', \mu) S^{\circ}(\mu, \mu)}{S^{\circ}(\lambda', \lambda) S^{+}(\lambda', \mu')}} \times \sum_{\substack{\alpha \in \Xi^{+}(\lambda) \cap \Xi^{+}(\lambda') \\ \mu' \in \Xi^{\circ}(\alpha), \ \alpha \in \Xi^{\circ}(\mu)}} \frac{(-1)^{\ell(\alpha-\mu)} S^{\circ}(\alpha, \alpha)}{S^{\circ}(\mu', \alpha) S^{\circ}(\alpha, \mu)} \frac{S^{+}(\lambda', \alpha)}{S^{+}(\lambda, \alpha)}$$

$$(4.4)$$

for $\mu' \in \Xi^+(\lambda') \cap \Xi^{\circ}(\mu;q)$, where the symbols $S^{\circ}(\lambda',\lambda)$ and $S^+(\lambda,\mu)$ are defined by (2.37) and (2.38), respectively. Hereafter, we assume that $\tilde{I}_{\lambda'}^{\lambda,l}$ is normalized so that (4.4) holds. Then we have

$$C_{M'}^{M,Q((\mathbf{0}_{n-1},l))} = \sqrt{\frac{l! S^{\circ}(\lambda',\lambda') S^{+}(\lambda',\mu)}{S^{\circ}(\lambda',\lambda) S^{+}(\lambda,\mu)}}, \quad C_{H(\lambda')}^{H(\lambda),Q(\lambda'-\lambda)} = \sqrt{C^{\circ}(\lambda';\lambda)} \quad (4.5)$$

for $M \in G(\lambda)$ and $M' \in G(\lambda')$ such that $\widehat{M} = \widehat{M'} \in G(\mu)$. Here $H(\lambda)$, $Q(\gamma)$ $(\gamma \in \mathbb{N}_0^n)$ and $C^{\circ}(\lambda'; \lambda)$ are defined by (2.14), (2.33) and (2.42), respectively. All the Clebsch–Gordan coefficients $C_{M'}^{M,P}$ are real numbers, and we have

$$\zeta_{M} \otimes \zeta_{P} = \sum_{\lambda' \in \Xi^{\circ}(\lambda; l)} \sum_{M' \in G(\lambda')} \langle \zeta_{M} \otimes \zeta_{P}, \tilde{I}_{\lambda'}^{\lambda, l}(\zeta_{M'}) \rangle \tilde{I}_{\lambda'}^{\lambda, l}(\zeta_{M'})$$

$$= \sum_{\lambda' \in \Xi^{\circ}(\lambda; l)} \sum_{M' \in G(\lambda')} C_{M'}^{M, P} \tilde{I}_{\lambda'}^{\lambda, l}(\zeta_{M'})$$
(4.6)

for $M \in G(\lambda)$ and $P \in G((l, \mathbf{0}_{n-1}))$. We set

$$\mathbf{I}_{\lambda'}^{\lambda,l} = \sqrt{\mathbf{b}(\lambda' - \lambda)\mathbf{C}^{\circ}(\lambda'; \lambda)}\,\tilde{\mathbf{I}}_{\lambda'}^{\lambda,l},$$

where $b(\lambda' - \lambda)$ is defined by (2.43). Then the explicit expression (2.39) of $I_{\lambda'}^{\lambda,l}$ follows from (2.16) and (4.4), since

$$\mathbf{c}_{M'}^{M,P} = \sqrt{\frac{\mathbf{b}(\lambda' - \lambda)\mathbf{C}^{\circ}(\lambda';\lambda)\mathbf{r}(M')}{\mathbf{r}(M)\mathbf{r}(P)}}\mathbf{C}_{M'}^{M,P}$$

for $M \in G(\lambda)$, $P \in G((l, \mathbf{0}_{n-1}))$ and $M' \in G(\lambda')$. Here r(M) is defined by (2.16). The equalities (2.41) and (2.40) follow from (4.1) and (4.5), respectively.

4.2 Some lemmas for representations of K_n

Let $\mathbb{C}_{\text{triv}} = \mathbb{C}$ be the trivial $\text{GL}(n, \mathbb{C})$ -module. The purpose of this subsection is to give proofs of Lemma 2.4 and the following three lemmas.

Lemma 4.1. Let $\lambda \in \Lambda_{n,F}$.

(1) The space $\operatorname{Hom}_{K_n}(V_{\lambda} \otimes_{\mathbb{C}} \overline{V_{\lambda}}, \mathbb{C}_{\operatorname{triv}})$ is a 1 dimensional space spanned by the \mathbb{C} -linear map

$$V_{\lambda} \otimes_{\mathbb{C}} \overline{V_{\lambda}} \ni v_1 \otimes \overline{v_2} \mapsto \langle v_1, v_2 \rangle \in \mathbb{C}.$$

(2) Let $\lambda' \in \Lambda_{n,F} \cap \Xi^{\circ}(\lambda)$, and set $l = \ell(\lambda' - \lambda)$. For $\lambda'' \in \Xi^{\circ}(\lambda; l)$ such that $\lambda'' \neq \lambda'$, we have $\operatorname{Hom}_{K_n}(V_{\lambda'} \otimes_{\mathbb{C}} \overline{V_{\lambda''}}, \mathbb{C}_{\operatorname{triv}}) = \{0\}.$

Lemma 4.2. Assume n > 1, and we regard K_{n-1} as a subgroup of K_n via (2.20). Let $\lambda \in \Lambda_{n,F}$ and $\mu \in \Lambda_{n-1,F}$. Then $\operatorname{Hom}_{K_{n-1}}(V_{\lambda} \otimes_{\mathbb{C}} \overline{V_{\mu}}, \mathbb{C}_{\operatorname{triv}})$ is a 1 dimensional space spanned by the \mathbb{C} -linear map

$$V_{\lambda} \otimes_{\mathbb{C}} \overline{V_{\mu}} \ni v_1 \otimes \overline{v_2} \mapsto \langle R_{\mu}^{\lambda}(v_1), v_2 \rangle \in \mathbb{C}_{\text{triv}}$$

if $\mu \in \Xi^+(\lambda)$, and is equal to $\{0\}$ otherwise. Here R^{λ}_{μ} is defined by (2.22). Moreover, if $\mu \in \Xi^+(\lambda)$, then

$$\sum_{M \in G(\mu)} r(M)^{-1} \, \xi_{M[\lambda]} \otimes \overline{\xi_M}$$

is a unique \mathbb{Q} -rational K_{n-1} -invariant vector in $V_{\lambda} \otimes_{\mathbb{C}} \overline{V_{\mu}}$ up to scalar multiple.

Lemma 4.3. Let $\lambda, \lambda' \in \Lambda_{n,F}$ such that $\ell(\lambda' - \lambda) \geq 0$. Let $l \in \mathbb{N}_0$. If $F = \mathbb{R}$, we assume $l \in \{0,1\}$. Then $\operatorname{Hom}_{K_n}(V_{\lambda'} \otimes_{\mathbb{C}} \overline{V_{\lambda}} \otimes_{\mathbb{C}} \overline{V_{(l,\mathbf{0}_{n-1})}}, \mathbb{C}_{\operatorname{triv}})$ is a 1 dimensional space spanned by the \mathbb{C} -linear map

$$V_{\lambda'} \otimes_{\mathbb{C}} \overline{V_{\lambda}} \otimes_{\mathbb{C}} \overline{V_{(l,\mathbf{0}_{n-1})}} \ni v_1 \otimes \overline{v_2} \otimes \overline{v_3} \mapsto \langle I_{\lambda'}^{\lambda,l}(v_1), v_2 \otimes v_3 \rangle \in \mathbb{C}_{\mathrm{triv}}$$

if $\lambda' \in \Xi^{\circ}(\lambda; l)$, and is equal to $\{0\}$ otherwise. Moreover, if $\lambda' \in \Xi^{\circ}(\lambda; l)$, then

$$\sum_{M' \in G(\lambda')} \sum_{M \in G(\lambda)} \sum_{P \in G((l, \mathbf{0}_{n-1}))} \frac{c_{M'}^{M, P}}{r(M')} \xi_{M'} \otimes \overline{\xi_M} \otimes \overline{\xi_P}, \tag{4.7}$$

is a unique \mathbb{Q} -rational K_n -invariant vector in $V_{\lambda'} \otimes_{\mathbb{C}} \overline{V_{\lambda}} \otimes_{\mathbb{C}} \overline{V_{(l,\mathbf{0}_{n-1})}}$ up to scalar multiple.

Since proofs of Lemmas 2.4, 4.1, 4.2 and 4.3 are easy for $F = \mathbb{C}$, the main concern is the case of $F = \mathbb{R}$. We have $\Lambda_{n,\mathbb{R}} = \{(\mathbf{1}_j, \mathbf{0}_{n-j}) \mid 0 \leq j \leq n\}$ with $\mathbf{1}_j = (1, 1, \cdots, 1) \in \mathbb{Z}^j$ and $\mathbf{0}_{n-j} = (0, 0, \cdots, 0) \in \mathbb{Z}^{n-j}$. Here we erase the symbol $\mathbf{1}_j$ if j = 0, and erase the symbol $\mathbf{0}_{n-j}$ if j = n. Let $0 \leq l \leq n$, and we regard the l-th exterior power $\bigwedge^l(\mathrm{M}_{n,1}(\mathbb{C}))$ of $\mathrm{M}_{n,1}(\mathbb{C})$ as a $\mathrm{GL}(n,\mathbb{C})$ -module via the action derived from the matrix multiplication. Then we have $V_{(\mathbf{1}_l,\mathbf{0}_{n-l})} \simeq \bigwedge^l(\mathrm{M}_{n,1}(\mathbb{C}))$ as $\mathrm{GL}(n,\mathbb{C})$ -modules via the correspondence

$$\zeta_M \leftrightarrow \mathfrak{e}_{i_1} \wedge \mathfrak{e}_{i_2} \wedge \cdots \wedge \mathfrak{e}_{i_l}$$
 $(M \in G((\mathbf{1}_l, \mathbf{0}_{n-l})))$

with $1 \le i_1 < i_2 < \dots < i_l \le n$ such that $\gamma_i^M = 1$ $(i \in \{i_1, i_2, \dots, i_l\})$. Here \mathfrak{e}_j is the matrix unit in $M_{n,1}(\mathbb{C})$ with 1 at the (j,1)-th entry $(1 \le j \le n)$ and 0 at other entries. We identify $V_{(1,0)}$ with $\Lambda^l(M_{n,1}(\mathbb{C}))$ via this isomorphism.

other entries. We identify $V_{(\mathbf{1}_l,\mathbf{0}_{n-l})}$ with $\bigwedge^l(\mathrm{M}_{n,1}(\mathbb{C}))$ via this isomorphism. We have $\mathrm{O}(n)=\mathrm{SO}(n)\sqcup\mathrm{SO}(n)k_0$ with $k_0=\mathrm{diag}(1,1,\cdots,1,-1)\in\mathrm{O}(n)$ and $\mathrm{SO}(n)=\{k\in\mathrm{O}(n)\mid\det k=1\}$. The complexification $\mathfrak{so}(n)_{\mathbb{C}}$ of the associated Lie algebra $\mathfrak{so}(n)$ of $\mathrm{SO}(n)$ is given by $\mathfrak{so}(n)_{\mathbb{C}}=\bigoplus_{1\leq i< j\leq n}\mathbb{C}E_{i,j}^{\mathfrak{so}(n)}$ with $E_{i,j}^{\mathfrak{so}(n)}=E_{i,j}-E_{j,i}$. Here we understand $k_0=-1$ and $\mathfrak{so}(1)_{\mathbb{C}}=\{0\}$ if n=1. Let us recall some facts in the highest weight theory [17, Theorem 4.28] for $\mathrm{SO}(n)$. Let m be the largest integer such that $2m\leq n$. When $n\geq 2$, for an irreducible representation (τ,V_{τ}) of $\mathrm{SO}(n)$, there is a nonzero vector v_0 in V_{τ} such that, for $1\leq i\leq m$ and $2i+1\leq j\leq n$,

$$\tau(E_{2i-1,2i}^{\mathfrak{so}(n)})v_0 = \sqrt{-1}\lambda_i v_0, \qquad \tau(E_{2i-1,j}^{\mathfrak{so}(n)} + \sqrt{-1}E_{2i,j}^{\mathfrak{so}(n)})v_0 = 0$$

with some $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_m) \in \mathbb{Z}^m$. Such vector v_0 is unique up to nonzero scalar multiple, and we call v_0 an SO(n)-highest weight vector of weight λ . The weight $\lambda_{\tau} = \lambda$ is called the highest weight of τ , and $\tau \mapsto \lambda_{\tau}$ gives the bijection from the set of equivalence classes of irreducible representations of SO(n) to the set of $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_{m-1}, \lambda_m) \in \Lambda_m$ satisfying

$$\begin{cases} (\lambda_1, \lambda_2, \cdots, \lambda_{m-1}, -\lambda_m) \in \Lambda_m & \text{if } n \text{ is even,} \\ \lambda_m \ge 0 & \text{if } n \text{ is odd.} \end{cases}$$

For $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_{m-1}, \lambda_m) \in \Lambda_m$ such that $\lambda_m \geq 0$, we take a representation $(\tau_{\mathfrak{so}(n),\lambda}, V_{\mathfrak{so}(n),\lambda})$ of $\mathrm{SO}(n)$ so that $\tau_{\mathfrak{so}(n),\lambda}$ is a direct sum of two irreducible representations with highest weights λ and $(\lambda_1, \lambda_2, \dots, \lambda_{m-1}, -\lambda_m)$ if n = 2m and $\lambda_m > 0$, and $\tau_{\mathfrak{so}(n),\lambda}$ is an irreducible representation with highest weight λ otherwise. By Weyl's dimension formula [17, Theorem 4.48], we have

$$\dim V_{\mathfrak{so}(n),(i+1,\mathbf{1}_{h-1},\mathbf{0}_{m-h})} = \frac{(2i+n)}{(i+l)(i+n-l)} \frac{(i+n-1)!}{i!(n-1-l)!(l-1)!} \tag{4.8}$$

for $1 \le h \le m$ and $i \in \mathbb{N}_0$.

Lemma 4.4. Retain the notation. Let $0 \le l \le n$. As an O(n)-module, $V_{(\mathbf{1}_l,\mathbf{0}_{n-l})}$ is irreducible and $V_{(\mathbf{1}_l,\mathbf{0}_{n-l})} \ne V_{(\mathbf{1}_{l'},\mathbf{0}_{n-l'})}$ for any $0 \le l' \le n$ such that $l' \ne l$. We set $h = \min\{l, n-l\}$. When $n \ge 2$, we have

$$V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})} \simeq V_{\mathfrak{so}(n),(\mathbf{1}_{b},\mathbf{0}_{m-b})}$$
 as $SO(n)$ -modules. (4.9)

Proof. For $1 \le i_1 < i_2 < \dots < i_l \le n$ and $\varepsilon_1, \varepsilon_2, \dots, \varepsilon_n \in \{\pm 1\}$, we have

$$\tau_{(\mathbf{1}_{l},\mathbf{0}_{n-l})}(\operatorname{diag}(\varepsilon_{1},\varepsilon_{2},\cdots,\varepsilon_{n}))\,\mathfrak{e}_{i_{1}}\wedge\mathfrak{e}_{i_{2}}\wedge\cdots\wedge\mathfrak{e}_{i_{l}}$$

$$=\varepsilon_{i_{1}}\varepsilon_{i_{2}}\cdots\varepsilon_{i_{l}}\,\mathfrak{e}_{i_{1}}\wedge\mathfrak{e}_{i_{2}}\wedge\cdots\wedge\mathfrak{e}_{i_{l}}.$$

By this equality, we know that $\operatorname{Hom}_{\mathcal{O}(n)}(V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})},V_{(\mathbf{1}_{l'},\mathbf{0}_{n-l'})})=\{0\}$ for any $0\leq l'\leq n$ such that $l'\neq l$. Hence, our task is to show (4.9) and the irreducibility of $V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})}$ as an $\mathcal{O}(n)$ -module.

In the case of $n \geq 2$ and $n \neq 2l$, the isomorphism (4.9) follows from [17, Examples in Chapter IV, §7], and we note that $V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})}$ is an irreducible O(n)-module. In the case of n=1, the irreducibility of an O(1)-module $V_{(\mathbf{1}_{l},\mathbf{0}_{1-l})}$ is trivial. Let us consider the case of n=2l. By direct computation, for $\varepsilon \in \{\pm 1\}$, we can confirm that

$$v_{\varepsilon} = (\mathfrak{e}_1 + \sqrt{-1}\mathfrak{e}_2) \wedge (\mathfrak{e}_3 + \sqrt{-1}\mathfrak{e}_4) \wedge \cdots \\ \cdots \wedge (\mathfrak{e}_{n-3} + \sqrt{-1}\mathfrak{e}_{n-2}) \wedge (\mathfrak{e}_{n-1} + \varepsilon\sqrt{-1}\mathfrak{e}_n)$$

is an SO(n)-highest weight vector of weight $(\mathbf{1}_{l-1}, \varepsilon)$ in $V_{(\mathbf{1}_l, \mathbf{0}_l)}$ and satisfies $\tau_{(\mathbf{1}_l, \mathbf{0}_{n-l})}(k_0)v_{\varepsilon} = v_{-\varepsilon}$. Since dim $V_{(\mathbf{1}_l, \mathbf{0}_l)} = \dim V_{\mathfrak{so}(n), \mathbf{1}_l}$ by (4.8), we know that (4.9) holds and $V_{(\mathbf{1}_l, \mathbf{0}_l)}$ is an irreducible O(n)-module.

Proof of Lemma 2.4. The assertion for $F = \mathbb{R}$ follows immediately from Lemma 4.4. The assertion for $F = \mathbb{C}$ follows immediately from the highest weight theory [17, Theorem 4.28] for U(n).

Lemma 4.5. Assume $n \geq 2$. Let $1 \leq l \leq n-1$. We set $h = \min\{l, n-l\}$. Let $I_l \colon V_{(\mathbf{1}_{l-1}, \mathbf{0}_{n-l+1})} \to V_{(\mathbf{1}_{l}, \mathbf{0}_{n-l})} \otimes_{\mathbb{C}} V_{(\mathbf{1}, \mathbf{0}_{n-1})}$ be a \mathbb{C} -linear map defined by

$$\mathrm{I}_l(\mathfrak{e}_{i_1}\wedge\mathfrak{e}_{i_2}\wedge\cdots\wedge\mathfrak{e}_{i_{l-1}})=\sum_{j=1}^n(\mathfrak{e}_{i_1}\wedge\mathfrak{e}_{i_2}\wedge\cdots\wedge\mathfrak{e}_{i_{l-1}}\wedge\mathfrak{e}_j)\otimes\mathfrak{e}_j$$

for $i_1, i_2, \dots, i_{l-1} \in \{1, 2, \dots, n\}$. Here we understand $I_1(1) = \sum_{j=1}^n \mathfrak{e}_j \otimes \mathfrak{e}_j$ if l = 1. Then I_l is an O(n)-homomorphism. Moreover, there is an SO(n)-submodule V' of $V_{(\mathbf{1}_l, \mathbf{0}_{n-l})} \otimes_{\mathbb{C}} V_{(\mathbf{1}, \mathbf{0}_{n-1})}$ such that $V' \simeq V_{\mathfrak{so}(n), (2, \mathbf{1}_{h-1}, \mathbf{0}_{m-h})}$ and

$$V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})} \otimes_{\mathbb{C}} V_{(\mathbf{1},\mathbf{0}_{n-1})}$$

$$= I_{(\mathbf{1}_{l+1},\mathbf{0}_{n-l-1})}^{(\mathbf{1}_{l},\mathbf{0}_{n-l}),1} (V_{(\mathbf{1}_{l+1},\mathbf{0}_{n-l-1})}) \oplus I_{l}(V_{(\mathbf{1}_{l-1},\mathbf{0}_{n-l+1})}) \oplus V',$$

$$(4.10)$$

where $I_{(\mathbf{1}_{l+1},\mathbf{0}_{n-l-1})}^{(\mathbf{1}_{l},\mathbf{0}_{n-l}),1}$ is the U(n)-homomorphism given by (2.39).

Proof. For $v \in V_{(\mathbf{1}_{l-1}, \mathbf{0}_{n-l+1})}$ and $1 \le i < j \le n$, we have

$$I_{l}(\tau_{(\mathbf{1}_{l-1},\mathbf{0}_{n-l+1})}(E_{i,j}^{\mathfrak{so}(n)})v) = (\tau_{(\mathbf{1}_{l},\mathbf{0}_{n-l})} \otimes \tau_{(\mathbf{1},\mathbf{0}_{n-1})})(E_{i,j}^{\mathfrak{so}(n)})I_{l}(v),$$

$$I_{l}(\tau_{(\mathbf{1}_{l-1},\mathbf{0}_{n-l+1})}(k_{0})v) = (\tau_{(\mathbf{1}_{l},\mathbf{0}_{n-l})} \otimes \tau_{(\mathbf{1},\mathbf{0}_{n-1})})(k_{0})I_{l}(v)$$

by direct computation. Hence, I_l is an O(n)-homomorphism.

For an SO(n)-highest weight vector v of weight λ in $V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})}$, we note that $v\otimes (\mathfrak{e}_{1}+\sqrt{-1}\mathfrak{e}_{2})$ is an SO(n)-highest weight vector of weight $\lambda+(1,\mathbf{0}_{m-1})$ in $V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})}\otimes_{\mathbb{C}}V_{(\mathbf{1},\mathbf{0}_{n-1})}$. Hence, by Lemma 4.4, there is an SO(n)-submodule V' of $V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})}\otimes_{\mathbb{C}}V_{(\mathbf{1},\mathbf{0}_{n-1})}$ such that $V'\simeq V_{\mathfrak{so}(n),(2,\mathbf{1}_{h-1},\mathbf{0}_{m-h})}$ and

$$\left(\mathrm{I}_{(\mathbf{1}_{l+1},\mathbf{0}_{n-l-1})}^{(\mathbf{1}_{l},\mathbf{0}_{n-l}),1}(V_{(\mathbf{1}_{l+1},\mathbf{0}_{n-l-1})})\oplus\mathrm{I}_{l}(V_{(\mathbf{1}_{l-1},\mathbf{0}_{n-l+1})})\right)\cap V'=\{0\}$$

By (4.8), we know that dim $V_{(\mathbf{1}_{l},\mathbf{0}_{n-l})} \otimes_{\mathbb{C}} V_{(1,\mathbf{0}_{n-1})}$ is equal to

$$\dim V_{(\mathbf{1}_{l+1},\mathbf{0}_{n-l-1})} + \dim V_{(\mathbf{1}_{l-1},\mathbf{0}_{n-l+1})} + \dim V_{\mathfrak{so}(n),(2,\mathbf{1}_{h-1},\mathbf{0}_{m-h})}.$$

This implies that (4.10) holds.

Lemma 4.6. Let (τ, V_{τ}) and $(\tau', V_{\tau'})$ be finite dimensional representations of $GL(n, \mathbb{C})$. Let $\langle \cdot, \cdot \rangle$ be a U(n)-invariant hermitian inner product on V_{τ} . Let $\{v_i\}_{i=1}^d$ be an orthonormal basis of V_{τ} .

(1) A \mathbb{C} -linear map $\Psi_1 \colon \operatorname{Hom}_{\mathbb{C}}(V_{\tau'}, V_{\tau}) \to \operatorname{Hom}_{\mathbb{C}}(V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}}, \mathbb{C}_{\operatorname{triv}})$ defined by

$$\Psi_1(f)(v' \otimes \overline{v}) = \langle f(v'), v \rangle \qquad (f \in \operatorname{Hom}_{\mathbb{C}}(V_{\tau'}, V_{\tau}), \ v' \in V_{\tau'}, \ v \in V_{\tau})$$

is bijective, and its inverse map is given by

$$\Psi_1^{-1}(f)(v') = \sum_{i=1}^d f(v' \otimes \overline{v_i}) v_i \quad (f \in \operatorname{Hom}_{\mathbb{C}}(V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}}, \mathbb{C}_{\operatorname{triv}}), \ v' \in V_{\tau'}).$$

Moreover, we have $\Psi_1(\operatorname{Hom}_{K_n}(V_{\tau'}, V_{\tau})) = \operatorname{Hom}_{K_n}(V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}}, \mathbb{C}_{\operatorname{triv}}).$

(2) A \mathbb{C} -linear map $\Psi_2 \colon V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}} \to \operatorname{Hom}_{\mathbb{C}}(V_{\tau}, V_{\tau'})$ defined by

$$\Psi_2(v' \otimes \overline{v_1})(v_2) = \langle v_2, v_1 \rangle v' \qquad (v_1, v_2 \in V_\tau, v' \in V_{\tau'})$$

is bijective, and its inverse map is given by

$$\Psi_2^{-1}(f) = \sum_{i=1}^d f(v_i) \otimes \overline{v_i} \qquad (f \in \operatorname{Hom}_{\mathbb{C}}(V_{\tau}, V_{\tau'})).$$

Moreover, we have $\Phi_2((V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}})^{K_n}) = \operatorname{Hom}_{K_n}(V_{\tau}, V_{\tau'})$, where $(V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}})^{K_n}$ is the subspace of $V_{\tau'} \otimes_{\mathbb{C}} \overline{V_{\tau}}$ consisting of all K_n -invariant vectors.

Proof. The former part of the statement (1) follows from definition. The latter part of the statement (1) follows from

$$\Psi_1(f)((\tau' \otimes \overline{\tau})(k)v' \otimes \overline{v}) = \langle f(\tau'(k)v'), \tau(k)v \rangle = \langle \tau(k^{-1})f(\tau'(k)v'), v \rangle$$
$$= \Psi_1(\tau(k^{-1}) \circ f \circ \tau'(k))(v' \otimes \overline{v})$$

for $f \in \text{Hom}_{\mathbb{C}}(V_{\tau'}, V_{\tau}), v' \in V_{\tau'}, v \in V_{\tau} \text{ and } k \in K_n.$

The former part of the statement (2) follows from definition. The latter part of the statement (2) follows from

$$\Psi_2((\tau' \otimes \overline{\tau})(k)v' \otimes \overline{v_1})(v_2) = \langle v_2, \tau(k)v_1 \rangle \tau'(k)v' = \langle \tau(k^{-1})v_2, v_1 \rangle \tau'(k)v'$$
$$= \tau'(k)\Psi_2(v' \otimes \overline{v_1})(\tau(k^{-1})v_2)$$

for
$$v_1, v_2 \in V_{\tau}, v' \in V_{\tau'}$$
 and $k \in K_n$.

Proof of Lemma 4.1. Let $\lambda \in \Lambda_{n,F}$. By Lemma 2.4, we note that the space $\operatorname{Hom}_{K_n}(V_\lambda, V_\lambda)$ is a 1 dimensional space spanned by the identity map. Hence, we obtain the statement (1) by Lemma 4.6 (1).

Let $\lambda' \in \Lambda_{n,F} \cap \Xi^{\circ}(\lambda)$, and we set $l = \ell(\lambda' - \lambda)$. By the decompositions (2.36), (4.10) and Lemma 4.4, we have $\operatorname{Hom}_{K_n}(V_{\lambda'}, V_{\lambda''}) = \{0\}$ for $\lambda'' \in \Xi^{\circ}(\lambda; l)$ such that $\lambda'' \neq \lambda'$. Hence, we obtain the statement (2) by Lemma 4.6 (1).

Proof of Lemma 4.2. By (2.21) and Lemma 2.4, we know that $\operatorname{Hom}_{K_{n-1}}(V_{\lambda}, V_{\mu})$ is equal to $\mathbb{C} R^{\lambda}_{\mu}$ if $\mu \in \Xi^{+}(\lambda)$, and is equal to $\{0\}$ otherwise. By Lemma 4.6, we obtain the former part of the assertion, and know that, if $\mu \in \Xi^{+}(\lambda)$,

$$\sum_{M \in \mathcal{G}(\mu)} \mathcal{R}^{\lambda}_{\mu}(\zeta_{M[\lambda]}) \otimes \overline{\zeta_{M[\lambda]}}$$

is a unique K_{n-1} -invariant vector in $V_{\mu} \otimes_{\mathbb{C}} \overline{V_{\lambda}}$ up to scalar multiple. Hence, by (2.15) and the properties of complex conjugate representations in §2.6, we obtain the latter part of the assertion.

Proof of Lemma 4.3. By the decompositions (2.36), (4.10) and Lemma 4.4, we know that $\operatorname{Hom}_{K_n}(V_{\lambda'}, V_{\lambda} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})})$ is equal to $\mathbb{C} \operatorname{I}_{\lambda'}^{\lambda,l}$ if $\lambda' \in \Xi^{\circ}(\lambda; l)$, and is equal to $\{0\}$ otherwise. By Lemma 4.6, we obtain the former part of the assertion, and know that, if $\lambda' \in \Xi^{\circ}(\lambda; l)$,

$$\sum_{M' \in G(\lambda')} I_{\lambda'}^{\lambda,l}(\zeta_{M'}) \otimes \overline{\zeta_{M'}}$$

is a unique K_n -invariant vector in $V_{\lambda} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})} \otimes_{\mathbb{C}} \overline{V_{\lambda'}}$ up to scalar multiple. Hence, by (2.15) and the properties of complex conjugate representations in §2.6, we obtain the latter part of the assertion.

4.3 Polynomial functions

We set

$$\Lambda_n^{\text{poly}} = \{ \lambda = (\lambda_1, \lambda_2, \cdots, \lambda_n) \in \Lambda_n \mid \lambda_n \ge 0 \}.$$

We denote by $\mathcal{P}(\mathcal{M}_{n,n'}(\mathbb{C}))$ the subspace of $C(\mathcal{M}_{n,n'}(\mathbb{C}))$ consisting of all polynomial functions. Let $l \in \mathbb{N}_0$. We denote by $\mathcal{P}_l(\mathcal{M}_{n,n'}(\mathbb{C}))$ the subspace of $\mathcal{P}(\mathcal{M}_{n,n'}(\mathbb{C}))$ consisting of all degree l homogeneous polynomial functions. We regard $\mathcal{P}_l(\mathcal{M}_{n,n'}(\mathbb{C}))$ as a $GL(n,\mathbb{C}) \times GL(n',\mathbb{C})$ -module via the action $L \boxtimes R$ which is defined in §2.9. Let $q = \min\{n, n'\}$. Then the GL(n)-GL(n') duality [4, Theorem 5.6.7] asserts that

$$\mathcal{P}_l(\mathcal{M}_{n,n'}(\mathbb{C})) \simeq \bigoplus_{\lambda \in \Lambda_q^{\mathrm{poly}}, \ \ell(\lambda) = l} V_{(\lambda,\mathbf{0}_{n-q})}^{\vee} \boxtimes_{\mathbb{C}} V_{(\lambda,\mathbf{0}_{n'-q})}$$

as $\mathrm{GL}(n,\mathbb{C}) \times \mathrm{GL}(n',\mathbb{C})$ -modules. Since $V_{(\lambda,\mathbf{0}_{n-q})}^{\vee} \simeq \overline{V_{(\lambda,\mathbf{0}_{n-q})}}$ as $\mathrm{U}(n)$ -modules, we also have

$$\mathcal{P}_{l}(\mathcal{M}_{n,n'}(\mathbb{C})) \simeq \bigoplus_{\lambda \in \Lambda_{q}^{\text{poly}}, \ \ell(\lambda) = l} \overline{V_{(\lambda,\mathbf{0}_{n-q})}} \boxtimes_{\mathbb{C}} V_{(\lambda,\mathbf{0}_{n'-q})}$$
(4.11)

as $U(n) \times GL(n', \mathbb{C})$ -modules.

The purpose of this subsection is to construct polynomial functions, explicitly. We define $\mathrm{U}(n) \times \mathrm{GL}(n,\mathbb{C})$ -homomorphisms $\mathrm{P}_{\lambda}^{\circ} \colon \overline{V_{\lambda}} \boxtimes_{\mathbb{C}} V_{\lambda} \to \mathcal{P}(\mathrm{M}_{n}(\mathbb{C}))$ ($\lambda \in \Lambda_{n}^{\mathrm{poly}}$) by the following lemma.

Lemma 4.7. Let $\lambda \in \Lambda_n^{\text{poly}}$. Then there is a $U(n) \times GL(n, \mathbb{C})$ -homomorphism $P_{\lambda}^{\circ} \colon \overline{V_{\lambda}} \boxtimes_{\mathbb{C}} V_{\lambda} \to \mathcal{P}(M_n(\mathbb{C}))$ characterized by

$$P_{\lambda}^{\circ}(\overline{v_1} \boxtimes v_2)(g) = \langle \tau_{\lambda}(g)v_2, v_1 \rangle \qquad (v_1, v_2 \in V_{\lambda}, \ g \in GL(n, \mathbb{C})). \tag{4.12}$$

Proof. Because of (4.11), there is a nonzero $U(n) \times GL(n, \mathbb{C})$ -homomorphism $P \colon \overline{V_{\lambda}} \boxtimes_{\mathbb{C}} V_{\lambda} \to \mathcal{P}(M_n(\mathbb{C}))$. Since $GL(n, \mathbb{C})$ is dense in $M_n(\mathbb{C})$ and

$$P(\overline{v_1} \boxtimes v_2)(g) = P(\overline{v_1} \boxtimes \tau_{\lambda}(g)v_2)(1_n) \quad (v_1, v_2 \in V_{\lambda}, g \in GL(n, \mathbb{C})), \quad (4.13)$$

we note that

$$\overline{V_{\lambda}} \boxtimes_{\mathbb{C}} V_{\lambda} \ni v_1 \boxtimes v_2 \mapsto \mathrm{P}(v_1 \boxtimes v_2)(1_n) \in \mathbb{C}$$

is a nonzero C-bilinear pairing. Because of

$$P(\overline{\tau_{\lambda}}(k)\overline{v_1} \boxtimes \tau_{\lambda}(k)v_2)(1_n) = P(\overline{v_1} \boxtimes v_2)(1_n) \qquad (k \in U(n))$$

and Lemma 4.1 (1) for $F = \mathbb{C}$, there is a nonzero constant c such that

$$P(\overline{v_1} \boxtimes v_2)(1_n) = c \langle v_2, v_1 \rangle \qquad (v_1, v_2 \in V_\lambda). \tag{4.14}$$

By (4.13) and (4.14), we know that $P_{\lambda}^{\circ} = c^{-1}P$ satisfies (4.12). Since $GL(n, \mathbb{C})$ is dense in $M_n(\mathbb{C})$, we note that (4.12) characterizes P_{λ}° .

When n>1, we define $\mathrm{U}(n-1)\times\mathrm{GL}(n,\mathbb{C})$ -homomorphisms $\mathrm{P}_{\mu}^+\colon\overline{V_{\mu}}\boxtimes_{\mathbb{C}}V_{(\mu,0)}\to\mathcal{P}(\mathrm{M}_{n-1,n}(\mathbb{C}))$ $(\mu\in\Lambda_{n-1}^{\mathrm{poly}})$ by the following lemma.

Lemma 4.8. Assume n > 1 and let $\mu \in \Lambda_{n-1}^{\text{poly}}$. There is a $U(n-1) \times GL(n, \mathbb{C})$ -homomorphism $P_{\mu}^+ : \overline{V_{\mu}} \boxtimes_{\mathbb{C}} V_{(\mu,0)} \to \mathcal{P}(M_{n-1,n}(\mathbb{C}))$ characterized by

$$P_{\mu}^{+}(\overline{\zeta_{M}} \boxtimes v)((1_{n-1}, O_{n-1,1})z) = P_{(\mu,0)}^{\circ}(\overline{\zeta_{M[(\mu,0)]}} \boxtimes v)(z)$$
 (4.15)

for $M \in G(\mu)$, $v \in V_{(\mu,0)}$ and $z \in M_n(\mathbb{C})$. Here $M[(\mu,0)]$ is defined by (2.23). Furthermore, we have

$$P_{\mu}^{+}(\overline{v} \boxtimes \zeta_{M[(\mu,0)]})(z) = P_{\mu}^{\circ}(\overline{v} \boxtimes \zeta_{M})(z^{t}(1_{n-1}, O_{n-1,1}))$$
(4.16)

for $v \in V_{\mu}$, $M \in G(\mu)$ and $z \in M_{n-1,n}(\mathbb{C})$.

Proof. We regard $GL(n-1,\mathbb{C})$ as a subgroup of $GL(n,\mathbb{C})$ via the embedding ι_n defined by (2.20). By the irreducible decomposition (4.11) and Lemma 2.2, the image of a $U(n-1) \times GL(n,\mathbb{C})$ -homomorphism

$$\overline{V_{\mu}} \boxtimes_{\mathbb{C}} V_{(\mu,0)} \ni \overline{\zeta_M} \boxtimes v \mapsto \mathrm{P}_{(\mu,0)}^{\circ} (\overline{\zeta_{M[(\mu,0)]}} \boxtimes v) \in \mathcal{P}(\mathrm{M}_n(\mathbb{C}))$$

is contained in the image of an injective $U(n-1) \times GL(n,\mathbb{C})$ -homomorphism

$$\mathcal{P}(\mathcal{M}_{n-1,n}(\mathbb{C})) \ni p \mapsto (z \mapsto p((1_{n-1}, O_{n-1,1})z)) \in \mathcal{P}(\mathcal{M}_n(\mathbb{C})).$$

Hence, there is a $\mathrm{U}(n-1) \times \mathrm{GL}(n,\mathbb{C})$ -homomorphism $\mathrm{P}_{\mu}^+ \colon \overline{V_{\mu}} \boxtimes_{\mathbb{C}} V_{(\mu,0)} \to \mathcal{P}(\mathrm{M}_{n-1,n}(\mathbb{C}))$ characterized by (4.15). By the irreducible decompositions (4.11) and Lemma 2.2, two injective $\mathrm{U}(n-1) \times \mathrm{GL}(n-1,\mathbb{C})$ -homomorphisms

$$\overline{V_{\mu}} \boxtimes_{\mathbb{C}} V_{\mu} \ni \overline{v} \boxtimes \zeta_{M} \mapsto \mathrm{P}_{\mu}^{+} \left(\overline{v} \boxtimes \zeta_{M[(\mu,0)]} \right) \in \mathcal{P}(\mathrm{M}_{n-1,n}(\mathbb{C})),
\overline{V_{\mu}} \boxtimes_{\mathbb{C}} V_{\mu} \ni \overline{v_{1}} \boxtimes v_{2} \mapsto \left(z \mapsto \mathrm{P}_{\mu}^{\circ} (\overline{v_{1}} \boxtimes v_{2}) (z^{t} (1_{n-1}, O_{n-1,1})) \right) \in \mathcal{P}(\mathrm{M}_{n-1,n}(\mathbb{C}))$$

coincide up to scalar multiple. Hence, (4.16) follows from the equalities

$$P_{\mu}^{+}(\overline{\zeta_{M}}\boxtimes\zeta_{M[(\mu,0)]})((1_{n-1},O_{n-1,1})) = \langle\zeta_{M[(\mu,0)]},\zeta_{M[(\mu,0)]}\rangle = 1$$

and
$$P_{\mu}^{\circ}(\overline{\zeta_{M}}\boxtimes\zeta_{M})(1_{n-1}) = \langle\zeta_{M},\zeta_{M}\rangle = 1 \text{ for } M\in\mathcal{G}(\mu).$$

Let $l \in \mathbb{N}_0$. We define \mathbb{C} -linear maps $\mathrm{p}_{1,n}^{(l)} \colon V_{(l,\mathbf{0}_{n-1})} \to \mathcal{P}(\mathrm{M}_{1,n}(\mathbb{C}))$ and $\mathrm{p}_{n,1}^{(l)} \colon \overline{V_{(l,\mathbf{0}_{n-1})}} \to \mathcal{P}(\mathrm{M}_{n,1}(\mathbb{C}))$ by

$$p_{1,n}^{(l)}(\zeta_{Q(\gamma)})(z) = p_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}})(t_2) = \sqrt{b(\gamma)} z_1^{\gamma_1} z_2^{\gamma_2} \cdots z_n^{\gamma_n}.$$

for $z=(z_1,z_2,\cdots,z_n)\in \mathrm{M}_{1,n}(\mathbb{C})$ and $\gamma=(\gamma_1,\gamma_2,\cdots,\gamma_n)\in \mathbb{N}_0^n$ such that $\ell(\gamma)=l$. Here $Q(\gamma)$ and $\mathrm{b}(\gamma)$ are defined by (2.33) and (2.43), respectively.

Lemma 4.9. Let $l \in \mathbb{N}_0$.

(1) The group $GL(n,\mathbb{C})$ acts on $\mathcal{P}(M_{1,n}(\mathbb{C}))$ by the action R. Then $p_{1,n}^{(l)}$ is a $GL(n,\mathbb{C})$ -homomorphism such that, for $z \in M_n(\mathbb{C})$ and $v \in V_{(l,\mathbf{0}_{n-1})}$,

$$p_{1,n}^{(l)}(v)(e_n z) = P_{(l,\mathbf{0}_{n-1})}^{\circ}(\overline{\zeta_{Q((\mathbf{0}_{n-1},l))}} \boxtimes v)(z).$$
(4.17)

(2) The group U(n) acts on $\mathcal{P}(M_{n,1}(\mathbb{C}))$ by the action L. Then $p_{n,1}^{(l)}$ is a U(n)-homomorphism such that, for $z \in M_n(\mathbb{C})$ and $v \in V_{(l,\mathbf{0}_{n-1})}$,

$$p_{n,1}^{(l)}(\overline{v})(z^t e_n) = P_{(l,\mathbf{0}_{n-1})}^{\circ}(\overline{v} \boxtimes \zeta_{Q((\mathbf{0}_{n-1},l))})(z). \tag{4.18}$$

Proof. Let $\gamma = (\gamma_1, \gamma_2, \cdots, \gamma_n) \in \mathbb{N}_0^n$. By direct computation, we have

$$R(E_{i,i})\mathbf{p}_{1,n}^{(l)}(\zeta_{Q(\gamma)}) = \gamma_{i}\mathbf{p}_{1,n}^{(l)}(\zeta_{Q(\gamma)}),$$

$$R(E_{j,j+1})\mathbf{p}_{1,n}^{(l)}(\zeta_{Q(\gamma)}) = \sqrt{\gamma_{j+1}(\gamma_{j}+1)}\,\mathbf{p}_{1,n}^{(l)}(\zeta_{Q(\gamma+\delta_{j}-\delta_{j+1})}),$$

$$R(E_{j+1,j})\mathbf{p}_{1,n}^{(l)}(\zeta_{Q(\gamma)}) = \sqrt{\gamma_{j}(\gamma_{j+1}+1)}\,\mathbf{p}_{1,n}^{(l)}(\zeta_{Q(\gamma-\delta_{j}+\delta_{j+1})}),$$

$$L(E_{i,i})\mathbf{p}_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}}) = -\gamma_{i}\mathbf{p}_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}}),$$

$$L(E_{j,j+1})\mathbf{p}_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}}) = -\sqrt{\gamma_{j}(\gamma_{j+1}+1)}\,\mathbf{p}_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma-\delta_{j}+\delta_{j+1})}}),$$

$$L(E_{j+1,j})p_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}}) = -\sqrt{\gamma_{j+1}(\gamma_j+1)} p_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma+\delta_j-\delta_{j+1})}})$$

for $1 \leq i \leq n$ and $1 \leq j \leq n-1$. Here we put $\mathrm{p}_{1,n}^{(l)}(\zeta_{Q(\gamma')}) = \mathrm{p}_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma')}}) = 0$ if $\gamma' \not\in \mathbb{N}_0^n$, and denote by δ_i the element of \mathbb{Z}^n with 1 at i-th entry $(1 \leq i \leq n)$ and 0 at other entries. Comparing these formulas with (2.11), (2.12) and (2.13), we know that $p_{1,n}^{(l)}$ is a $GL(n,\mathbb{C})$ -homomorphism. Using (2.24) and

$$L(E_{i,j}^{\mathfrak{u}(n)}) = L(E_{i,j}) \quad (1 \le i, j \le n) \quad \text{on } \mathcal{P}(\mathcal{M}_{n,1}(\mathbb{C})),$$

we further know that $\mathbf{p}_{n,1}^{(l)}$ is a $\mathrm{U}(n)$ -homomorphism. Next, we will prove the equality (4.17). When n=1, this equality follows from $G(l) = \{l\}$ and

$$p_{1,1}^{(l)}(\zeta_{Q(\gamma)})(g) = \langle \tau_l(g)\zeta_l, \zeta_l \rangle = g^l \qquad (g \in GL(1, \mathbb{C})).$$

Assume n > 1. We regard $GL(n-1,\mathbb{C})$ as a subgroup of $GL(n,\mathbb{C})$ via the embedding ι_n defined by (2.20). Because of the irreducible decompositions (4.11) and Lemma 2.2, two injective $U(n-1) \times GL(n,\mathbb{C})$ -homomorphisms

$$\overline{V_{\mathbf{0}_{n-1}}} \boxtimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})} \ni \overline{\zeta_{Q(\mathbf{0}_{n-1})}} \boxtimes v \mapsto (z \mapsto \mathrm{p}_{1,n}^{(l)}(v)(e_n z)) \in \mathcal{P}(\mathrm{M}_n(\mathbb{C})),$$

$$\overline{V_{\mathbf{0}_{n-1}}} \boxtimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})} \ni \overline{\zeta_{Q(\mathbf{0}_{n-1})}} \boxtimes v \mapsto \mathrm{P}_{(l,\mathbf{0}_{n-1})}^{\circ}(\overline{\zeta_{Q((\mathbf{0}_{n-1},l))}} \boxtimes v) \in \mathcal{P}(\mathrm{M}_n(\mathbb{C}))$$

coincide up to scalar multiple. Hence, (4.17) follows from the equalities

$$p_{1,n}^{(l)}(\zeta_{Q((\mathbf{0}_{n-1},l))})(e_n) = 1, \quad P_{(l,\mathbf{0}_{n-1})}^{\circ}(\overline{\zeta_{Q((\mathbf{0}_{n-1},l))}} \boxtimes \zeta_{Q((\mathbf{0}_{n-1},l))})(1_n) = 1.$$

The proof of the equality (4.18) is similar.

For later use, we prepare the following lemmas.

Lemma 4.10. Assume n > 1. Let $\mu \in \Lambda_{n-1}^{\text{poly}}$ and $\gamma \in \mathbb{N}_0^n$. We set $l = \ell(\gamma)$ and

$$p_0(z) = P_u^+(\overline{\zeta_{H(\mu)}} \boxtimes \zeta_{H((\mu,0))})((1_{n-1}, O_{n-1,1})z)p_{1,n}^{(l)}(\zeta_{Q(\gamma)})(e_n z)$$

for $z \in M_n(\mathbb{C})$. Then we have

$$p_0 = \sum_{\lambda' \in \Xi^{\circ}((\mu,0);l)} \sum_{N,N' \in \mathcal{G}(\lambda')} \mathcal{C}_N^{H((\mu,0)),Q((\mathbf{0}_{n-1},l))} \, \mathcal{C}_{N'}^{H((\mu,0)),Q(\gamma)} \, \mathcal{P}_{\lambda'}^{\circ}(\overline{\zeta_N} \boxtimes \zeta_{N'}),$$

where $C_{M'}^{M,P}$ is the Clebsch–Gordan coefficient in §4.1.

Proof. We set $Q_0 = Q((\mathbf{0}_{n-1}, l))$ and $Q_1 = Q(\gamma)$. Let $g \in GL(n, \mathbb{C})$. By Lemmas 4.7, 4.8 and 4.9, we have

$$p_0(g) = \mathbf{P}_{\mu}^{\circ} \left(\overline{\zeta_{H((\mu,0))}} \boxtimes \zeta_{H((\mu,0))} \right) (g) \mathbf{P}_{(l,\mathbf{0}_{n-1})}^{\circ} \left(\overline{\zeta_{Q_0}} \boxtimes \zeta_{Q_1} \right) (g)$$
$$= \left\langle \tau_{(\mu,0)}(g) \zeta_{H((\mu,0))}, \zeta_{H((\mu,0))} \right\rangle \left\langle \tau_{(l,\mathbf{0}_{n-1})}(g) \zeta_{Q_1}, \zeta_{Q_0} \right\rangle$$

$$= \langle (\tau_{(\mu,0)} \otimes \tau_{(l,\mathbf{0}_{n-1})})(g)\zeta_{H((\mu,0))} \otimes \zeta_{Q_1}, \ \zeta_{H((\mu,0))} \otimes \zeta_{Q_0} \rangle.$$

By (4.1), (4.6) and Lemma 4.7, we have

$$p_{0}(g) = \sum_{\lambda' \in \Xi^{\circ}((\mu,0);l)} \sum_{N,N' \in G(\lambda')} C_{N}^{H((\mu,0)),Q_{0}} C_{N'}^{H((\mu,0)),Q_{1}} \langle \tau_{\lambda'}(g)\zeta_{N'},\zeta_{N} \rangle$$

$$= \sum_{\lambda' \in \Xi^{\circ}((\mu,0);l)} \sum_{N,N' \in G(\lambda')} C_{N}^{H((\mu,0)),Q_{0}} C_{N'}^{H((\mu,0)),Q_{1}} P_{\lambda'}^{\circ}(\overline{\zeta_{N}} \boxtimes \zeta_{N'})(g).$$

Since $\mathrm{GL}(n,\mathbb{C})$ is dense in $\mathrm{M}_n(\mathbb{C})$, we obtain the assertion.

Lemma 4.11. Assume n > 1. Let $\mu \in \Lambda_{n-1}^{\text{poly}}$ and $\gamma \in \mathbb{N}_0^{n-1}$. We set $l = \ell(\gamma)$

$$p_0(z) = P_{\mu}^{\circ} (\overline{\zeta_{H(\mu)}} \boxtimes \zeta_{H(\mu)}) (z^{t}(1_{n-1}, O_{n-1,1})) p_{n-1,1}^{(l)} (\overline{\zeta_{Q(\gamma)}}) (z^{t}e_n)$$

for $z \in M_{n-1,n}(\mathbb{C})$. Then we have

$$p_0 = \sum_{\substack{\mu' \in \Xi^{\circ}(\mu; l)}} \sum_{\substack{N \in \mathcal{G}((\mu', 0); \mu') \\ N' \in \mathcal{G}((\mu', 0))}} \mathcal{C}_N^{H((\mu, 0)), Q((\gamma, 0))} \, \mathcal{C}_{N'}^{H((\mu, 0)), Q((\mathbf{0}_{n-1}, l))} \, \mathcal{P}_{\mu'}^+ \big(\overline{\zeta_{\widehat{N}}} \boxtimes \zeta_{N'}\big),$$

where $C_{M'}^{M,P}$ is the Clebsch–Gordan coefficient in §4.1.

Proof. We set $Q_0 = Q((\mathbf{0}_{n-1}, l))$ and $Q_1 = Q((\gamma, 0))$. Let $z = (1_{n-1}, O_{n-1,1})g$ with $g \in G_n$. Then we have $\mathsf{p}_{n-1,1}^{(l)}(\overline{\zeta_{Q(\gamma)}})(z^t e_n) = \mathsf{p}_{n,1}^{(l)}(\overline{\zeta_{Q_1}})(g^t e_n)$ by definition. Hence, by Lemmas 4.7, 4.8 and 4.9, we have

$$\begin{aligned} p_0(z) =& \mathrm{P}_{(\mu,0)}^{\circ} \left(\overline{\zeta_{H((\mu,0))}} \boxtimes \zeta_{H((\mu,0))} \right) (g) \mathrm{P}_{(l,\mathbf{0}_{n-1})}^{\circ} \left(\overline{\zeta_{Q_1}} \boxtimes \zeta_{Q_0} \right) (g) \\ =& \left\langle \tau_{(\mu,0)}(g) \zeta_{H((\mu,0))}, \zeta_{H((\mu,0))} \right\rangle \left\langle \tau_{(l,\mathbf{0}_{n-1})}(g) \zeta_{Q_0}, \ \zeta_{Q_1} \right\rangle \\ =& \left\langle (\tau_{(\mu,0)} \otimes \tau_{(l,\mathbf{0}_{n-1})})(g) \zeta_{H((\mu,0))} \otimes \zeta_{Q_0}, \ \zeta_{H((\mu,0))} \otimes \zeta_{Q_1} \right\rangle. \end{aligned}$$

By (4.1) and (4.6), we have

$$p_0(z) = \sum_{\lambda' \in \Xi^{\circ}((\mu,0);l)} \sum_{N,N' \in G(\lambda')} C_N^{H((\mu,0)),Q_1} C_{N'}^{H((\mu,0)),Q_0} \left\langle \tau_{\lambda'}(g) \zeta_{N'}, \zeta_N \right\rangle.$$

Because of $H((\mu,0)) \in G((\mu,0);\mu)$, $Q_1 \in G((l,\mathbf{0}_{n-1});(l,\mathbf{0}_{n-2}))$ and (4.3), for $\lambda' \in \Xi^{\circ}((\mu,0);l)$ and $N \in G(\lambda')$, we have $C_N^{H((\mu,0)),Q_1} = 0$ unless $\lambda' = (\mu',0)$ and $N \in G((\mu',0);\mu')$ with some $\mu' \in \Xi^{\circ}(\mu;l)$. Hence, we have

$$p_{0}(z) = \sum_{\substack{\mu' \in \Xi^{\circ}(\mu;l)}} \sum_{\substack{N \in G((\mu',0);\mu') \\ N' \in G((\mu',0))}} C_{N}^{H((\mu,0)),Q_{1}} C_{N'}^{H((\mu,0)),Q_{0}} \left\langle \tau_{(\mu',0)}(g)\zeta_{N'},\zeta_{N} \right\rangle$$

$$= \sum_{\substack{\mu' \in \Xi^{\circ}(\mu;l) \\ N' \in G((\mu',0);\mu') \\ N' \in G((\mu',0))}} C_{N}^{H((\mu,0)),Q_{1}} C_{N'}^{H((\mu,0)),Q_{0}} P_{\mu'}^{+} (\overline{\zeta_{\widehat{N}}} \boxtimes \zeta_{N'})(z)$$

by Lemmas 4.7 and 4.8. Since $\{(1_{n-1}, O_{n-1,1})g \mid g \in GL(n, \mathbb{C})\}$ is dense in $M_{n-1,n}(\mathbb{C})$, we obtain the assertion.

4.4 Standard Schwartz functions

For $\lambda \in \Lambda_n^{\text{poly}}$, we define two \mathbb{C} -linear maps

$$\Phi_{\lambda}^{\circ} : \overline{V_{\lambda}} \boxtimes_{\mathbb{C}} V_{\lambda} \ni \overline{v_{1}} \boxtimes v_{2} \mapsto \underline{P_{\lambda}^{\circ}}(\overline{v_{1}} \boxtimes v_{2})(z) \mathbf{e}_{(n)}(z) \in \mathcal{S}_{0}(\mathbf{M}_{n}(F)),
\overline{\Phi_{\lambda}^{\circ}} : V_{\lambda} \boxtimes_{\mathbb{C}} \overline{V_{\lambda}} \ni v_{1} \boxtimes \overline{v_{2}} \mapsto \overline{\underline{P_{\lambda}^{\circ}}(\overline{v_{1}} \boxtimes v_{2})(z)} \mathbf{e}_{(n)}(z) \in \mathcal{S}_{0}(\mathbf{M}_{n}(F))$$

with $z \in M_n(F)$. By the $K_n \times K_n$ -invariance of $\mathbf{e}_{(n)}$ and Lemma 4.7, we know that these are $K_n \times K_n$ -homomorphisms.

When n > 1, for $\mu \in \Lambda_{n-1}^{\text{poly}}$, we define two \mathbb{C} -linear maps

$$\Phi_{\mu}^{+} : \overline{V_{\mu}} \boxtimes_{\mathbb{C}} V_{(\mu,0)} \ni \overline{v_{1}} \boxtimes v_{2} \mapsto P_{\mu}^{+}(\overline{v_{1}} \boxtimes v_{2})(z) \mathbf{e}_{(n-1,n)}(z) \in \mathcal{S}_{0}(\mathbf{M}_{n-1,n}(F)),$$

$$\Phi_{\mu}^{+} : V_{\mu} \boxtimes_{\mathbb{C}} \overline{V_{(\mu,0)}} \ni v_{1} \boxtimes \overline{v_{2}} \mapsto P_{\mu}^{+}(\overline{v_{1}} \boxtimes v_{2})(z) \mathbf{e}_{(n-1,n)}(z) \in \mathcal{S}_{0}(\mathbf{M}_{n-1,n}(F))$$

with $z \in M_{n-1,n}(F)$. By the $K_{n-1} \times K_n$ -invariance of $\mathbf{e}_{(n-1,n)}$ and Lemma 4.8, we know that these are $K_{n-1} \times K_n$ -homomorphisms.

We regard $S_0(\mathcal{M}_{1,n}(F))$ and $S_0(\mathcal{M}_{n,1}(F))$ as K_n -modules via the actions R and L, respectively. Let $l \in \mathbb{N}_0$. Since $b(\gamma) = r(Q(\gamma))^{-1}$ for $\gamma \in \mathbb{N}_0^n$, the \mathbb{C} -linear maps $\varphi_{1,n}^{(l)}$ and $\overline{\varphi}_{1,n}^{(l)}$ in §2.9 satisfy

$$\varphi_{1,n}^{(l)}(v)(z) = \mathbf{p}_{1,n}^{(l)}(v)(z)\mathbf{e}_{(1,n)}(z), \qquad \overline{\varphi}_{1,n}^{(l)}(\overline{v})(z) = \overline{\mathbf{p}_{1,n}^{(l)}(v)(z)}\mathbf{e}_{(1,n)}(z)$$

for $v \in V_{(l,\mathbf{0}_{n-1})}$ and $z \in \mathrm{M}_{1,n}(F)$. By the K_n -invariance of $\mathbf{e}_{(1,n)}$ and Lemma 4.9, we know that these are K_n -homomorphisms. We define two \mathbb{C} -linear maps $\varphi_{n,1}^{(l)} \colon \overline{V_{(l,\mathbf{0}_{n-1})}} \to \mathcal{S}_0(\mathrm{M}_{1,n}(F))$ and $\overline{\varphi}_{n,1}^{(l)} \colon V_{(l,\mathbf{0}_{n-1})} \to \mathcal{S}_0(\mathrm{M}_{1,n}(F))$ by

$$\varphi_{n,1}^{(l)} \colon \overline{V_{(l,\mathbf{0}_{n-1})}} \ni \overline{v} \mapsto \underline{\mathbf{p}_{n,1}^{(l)}(\overline{v})(z)} \mathbf{e}_{(n,1)}(z) \in \mathcal{S}_0(\mathbf{M}_{1,n}(F)),$$

$$\overline{\varphi}_{n,1}^{(l)} \colon V_{(l,\mathbf{0}_{n-1})} \ni v \mapsto \overline{\mathbf{p}_{n,1}^{(l)}(\overline{v})(z)} \mathbf{e}_{(n,1)}(z) \in \mathcal{S}_0(\mathbf{M}_{1,n}(F))$$

with $z \in M_{n,1}(F)$. By the K_n -invariance of $\mathbf{e}_{(n,1)}$ and Lemma 4.9, we know that these are K_n -homomorphisms.

Lemma 4.12. Let $\varepsilon \in \{\pm 1\}$ and $l \in \mathbb{N}_0$. Assume $l \in \{0,1\}$ if $F = \mathbb{R}$. Then, for $v \in V_{(l,0_{n-1})}$, we have

$$\mathcal{F}_{\varepsilon}(\varphi_{n,1}^{(l)}(\overline{v})) = (-\varepsilon\sqrt{-1})^{l}\overline{\varphi}_{1,n}^{(l)}(\overline{v}), \qquad \mathcal{F}_{\varepsilon}(\overline{\varphi}_{n,1}^{(l)}(v)) = (-\varepsilon\sqrt{-1})^{l}\varphi_{1,n}^{(l)}(v),$$

where the Fourier transform $\mathcal{F}_{\varepsilon}$ is defined in (3.15).

Proof. It suffices to show the assertion for $v = \zeta_{Q(\gamma)}$ with $\gamma \in \mathbb{N}_0^n$ such that $\ell(\gamma) = l$. For $t = (t_1, t_2, \dots, t_n) \in M_{1,n}(F)$, we have

$$\begin{split} \mathcal{F}_{\varepsilon}(\varphi_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}}))(t) &= \int_{\mathcal{M}_{n,1}(F)} \varphi_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}})(z) \psi_{-\varepsilon}(tz) \, d_F z \\ &= \sqrt{\mathbf{b}(\gamma)} \prod_{i=1}^n \int_F z_i^{\gamma_i} \exp\left(-\pi \mathbf{c}_F \overline{z_i} z_i - \pi \varepsilon \mathbf{c}_F \sqrt{-1}(t_i z_i + \overline{t_i z_i})\right) d_F z_i \end{split}$$

$$= \sqrt{\mathrm{b}(\gamma)} (-\varepsilon \sqrt{-1} \, \overline{t_i})^{\gamma_i} \exp(-\pi \mathrm{c}_F \overline{t_i} t_i) = (-\varepsilon \sqrt{-1})^l \overline{\varphi}_{1,n}^{(l)} (\overline{\zeta_{Q(\gamma)}})(t).$$

Here the third equality follows from the elementary formula

$$\int_{F} z^{m} \exp\left(-\pi c_{F} \overline{z}z + \pi c_{F} \sqrt{-1}(zt + \overline{zt})\right) d_{F}z = (\sqrt{-1} \, \overline{t})^{m} \exp(-\pi c_{F} \overline{t} \, t) \quad (4.19)$$

for $(t \in \mathbb{R}, m \in \{0,1\})$ or $(t \in \mathbb{C}, m \in \mathbb{N}_0)$ according as $F = \mathbb{R}$ or $F = \mathbb{C}$. Moreover, we have

$$\mathcal{F}_{\varepsilon}(\overline{\varphi}_{n,1}^{(l)}(\zeta_{Q(\gamma)}))(t) = \overline{\mathcal{F}_{-\varepsilon}(\varphi_{n,1}^{(l)}(\overline{\zeta_{Q(\gamma)}}))(t)}$$
$$= \overline{(\varepsilon\sqrt{-1})^{l}\overline{\varphi}_{1,n}^{(l)}(\overline{\zeta_{Q(\gamma)}})(t)} = (-\varepsilon\sqrt{-1})^{l}\varphi_{1,n}^{(l)}(\zeta_{Q(\gamma)})(t),$$

and completes the proof.

5 The proofs of the Main theorems

5.1 Explicit calculations for the Godement sections

In this subsection, we calculate the Godement sections in $\S 3$, explicitly, at the minimal K_n -types of principal series representations.

Lemma 5.1. Let $a = \operatorname{diag}(a_1, a_2, \dots, a_n) \in A_n$, $u \in U_n$, $\lambda \in \Lambda_n$ and $M \in G(\lambda)$. Then we have the following equalities

$$\langle \tau_{\lambda}(ua)\zeta_{M}, \zeta_{M} \rangle = \langle \tau_{\lambda}(au)\zeta_{M}, \zeta_{M} \rangle = \prod_{i=1}^{n} a_{i}^{\gamma_{i}^{M}},$$
 (5.1)

$$\eta_{\rho_n}(a) \int_{U_n} \mathbf{e}_{(n)}(ua) \, du = \eta_{-\rho_n}(a) \int_{U_n} \mathbf{e}_{(n)}(au) \, du = \frac{\mathbf{e}_{(n)}(a)}{|\det a|_F^{(n-1)/2}}, \quad (5.2)$$

where $\gamma^M = (\gamma_1^M, \gamma_2^M, \dots, \gamma_n^M)$ is the weight of M defined by (2.10).

Proof. By (2.11) and (2.13), we have

$$\tau_{\lambda}(a)\zeta_{M} = \left(\prod_{i=1}^{n} a_{i}^{\gamma_{i}^{M}}\right)\zeta_{M}, \quad \tau_{\lambda}(u)\zeta_{M} = \zeta_{M} + \sum_{N \in G(\lambda), \ \gamma^{M} >_{\text{lex}}\gamma^{N}} p_{M,N}(u)\zeta_{N},$$

where $p_{M,N}$ is a polynomial function on U_n and $>_{\text{lex}}$ is the lexicographical order. The equality (5.1) follows from these equalities and the orthonormality of $\{\zeta_M\}_{M\in G(\lambda)}$. The equality (5.2) follows from direct computation

$$\eta_{\rho_n}(a) \int_{U_n} \mathbf{e}_{(n)}(ua) \, du = \eta_{-\rho_n}(a) \int_{U_n} \mathbf{e}_{(n)}(au) \, du$$

$$= \prod_{i=1}^n a_i^{-(n+1-2i)c_F/2} \exp(-\pi c_F a_i^2) \prod_{j=1}^{i-1} \int_F \exp(-\pi c_F a_i^2 \overline{u_{i,j}} u_{i,j}) \, d_F u_{i,j}$$

$$= \prod_{i=1}^{n} a_i^{-(n-1)c_F/2} \exp(-\pi c_F a_i^2) = \frac{\mathbf{e}_{(n)}(a)}{|\det a|_F^{(n-1)/2}}.$$

Here the first equality follows from the substitution $u \to aua^{-1}$, and the third equality follows from the substitution $u_{i,j} \to a_i^{-1} u_{i,j}$ and the elementary formula (4.19) with t = m = 0.

For $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_n) \in \Lambda_n$, $M = (m_{i,j})_{1 \leq i \leq j \leq n} \in G(\lambda)$ and $l \in \mathbb{Z}$, we define $\lambda + l \in \Lambda_n$ and $M + l \in G(\lambda + l)$ by

$$\lambda + l = (\lambda_1 + l, \lambda_2 + l, \cdots, \lambda_n + l), \qquad M + l = (m_{i,j} + l)_{1 \le i \le j \le n},$$

and denote $\lambda + (-l)$ and M + (-l) simply by $\lambda - l$ and M - l, respectively. For $\lambda \in \Lambda_n, l \in \mathbb{Z}, g \in \mathrm{GL}(n, \mathbb{C})$ and $M, N \in \mathrm{G}(\lambda)$, we have

$$(\det g)^l \langle \tau_{\lambda}(g)\zeta_M, \zeta_N \rangle = \langle \tau_{\lambda+l}(g)\zeta_{M+l}, \zeta_{N+l} \rangle.$$

Lemma 5.2. Let $d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n$ and $\nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n$.

(1) Assume n > 1. We take \widehat{d} and $\widehat{\nu}$ as in §3.1. If $d \in \Lambda_{n,F}$, we have

$$g_{d_{n},\nu_{n}}^{+}\left(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\Phi_{\widehat{d}-d_{n}}^{+}(\overline{\zeta_{H(\widehat{d})-d_{n}}}\boxtimes\zeta_{M-d_{n}})\right)$$

$$=\frac{1}{\dim V_{\widehat{d}}}\left(\prod_{i=1}^{n-1}\Gamma_{F}(\nu_{n}-\nu_{i}+1;d_{i}-d_{n})\right)f_{d,\nu}(\zeta_{M})$$
(5.3)

for $M \in G(d)$. If $-d \in \Lambda_{n,F}$, we have

$$g_{d_{n},\nu_{n}}^{+}\left(\bar{f}_{\widehat{d},\widehat{\nu}}(\overline{\zeta_{H(-\widehat{d})}}),\overline{\Phi_{-\widehat{d}+d_{n}}^{+}}(\zeta_{H(-\widehat{d})+d_{n}}\boxtimes\overline{\zeta_{M+d_{n}}})\right)$$

$$=\frac{1}{\dim V_{-\widehat{d}}}\left(\prod_{i=1}^{n-1}\Gamma_{F}(\nu_{n}-\nu_{i}+1;d_{n}-d_{i})\right)\bar{f}_{d,\nu}(\overline{\zeta_{M}})$$
(5.4)

for $M \in G(-d)$. Here $f_{d,\nu}$ and $\bar{f}_{d,\nu}$ are defined by (2.25) and (2.26), respectively. (2) Let $l \in \mathbb{Z}$ and $s \in \mathbb{C}$ such that Re(s) is sufficiently large. If $d \in \Lambda_{n,F}$ and $d+l \in \Lambda_n^{poly}$, we have

$$g_{l,s}^{\circ}\left(f_{d,\nu}(\zeta_{H(d)}), \overline{\Phi_{d+l}}(\zeta_{M+l} \boxtimes \overline{\zeta_{H(d)+l}})\right) = \frac{1}{\dim V_d} \left(\prod_{i=1}^n \Gamma_F(s+\nu_i; d_i+l)\right) f_{d,\nu}(\zeta_M) \qquad (M \in G(d)).$$

$$(5.5)$$

If $-d \in \Lambda_{n,F}$ and $-d-l \in \Lambda_n^{\text{poly}}$, we have

$$g_{l,s}^{\circ}(\bar{\mathbf{f}}_{d,\nu}(\overline{\zeta_{H(-d)}}), \Phi_{-d-l}^{\circ}(\overline{\zeta_{M-l}} \boxtimes \zeta_{H(-d)-l}))$$

$$= \frac{1}{\dim V_{-d}} \left(\prod_{i=1}^{n} \Gamma_{F}(s + \nu_{i}; -d_{i} - l) \right) \bar{\mathbf{f}}_{d,\nu}(\overline{\zeta_{M}}) \qquad (M \in G(-d)).$$
(5.6)

Proof. First, we consider the proof of the statement (1). Since the proofs of (5.3) and (5.4) are similar, here we will prove only (5.3). Assume n > 1 and $d \in \Lambda_{n,F}$. We define a \mathbb{C} -linear map $g_+ \colon V_d \to I(d,\nu)$ by

$$\mathbf{g}_+(\zeta_M) = \mathbf{g}_{d_n,\nu_n}^+ \left(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}), \Phi_{\widehat{d}-d_n}^+ \left(\overline{\zeta_{H(\widehat{d})-d_n}} \boxtimes \zeta_{M-d_n} \right) \right) \quad (M \in \mathbf{G}(d)).$$

Then g_+ is a K_n -homomorphism because of (3.1). Since $\operatorname{Hom}_{K_n}(V_d, I(d, \nu))$ is 1 dimensional, there is a constant c_+ such that $g_+ = c_+ f_{d,\nu}$. Let us calculate c_+ . Since (4.12) and (4.16) imply

$$\begin{split} & \Phi_{\widehat{d}-d_n}^+(\overline{\zeta_{H(\widehat{d})-d_n}} \boxtimes \zeta_{H(d)-d_n})((h,O_{n-1,1})) \\ & = \left\langle \tau_{\widehat{d}-d_n}(h)\zeta_{H(\widehat{d})-d_n},\zeta_{H(\widehat{d})-d_n} \right\rangle & \mathbf{e}_{(n-1)}(h) \qquad (h \in G_{n-1}), \end{split}$$

we have

$$c_{+} = c_{+} \mathbf{f}_{d,\nu}(H(d))(1_{n}) = \mathbf{g}_{+}(\zeta_{H(d)})(1_{n})$$

$$= \int_{G_{n-1}} \langle \tau_{\widehat{d}-d_{n}}(h)\zeta_{H(\widehat{d})-d_{n}}, \zeta_{H(\widehat{d})-d_{n}} \rangle \mathbf{e}_{(n-1)}(h)$$

$$\times \mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})})(h^{-1})\chi_{d_{n}}(\det h)|\det h|_{F}^{\nu_{n}+n/2} dh.$$

Decomposing h = kua ($k \in K_{n-1}$, $u \in U_{n-1}$, $a \in A_{n-1}$) and applying Schur's orthogonality [17, Corollary 1.10] for the integration on K_{n-1} with the equalities

$$\chi_{d_n}(\det h) f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})})(h^{-1}) = \eta_{\widehat{\nu}-\rho_{n-1}}(a^{-1}) \overline{\langle \tau_{\widehat{d}-d_n}(k)\zeta_{H(\widehat{d})-d_n}, \zeta_{H(\widehat{d})-d_n} \rangle}$$

and $\dim V_{\widehat{d}-d_n} = \dim V_{\widehat{d}}$, we have

$$\begin{split} c_{+} = & \frac{1}{\dim V_{\widehat{d}}} \int_{A_{n-1}} \left(\int_{U_{n-1}} \left\langle \tau_{\widehat{d}-d_n}(ua) \zeta_{H(\widehat{d})-d_n}, \zeta_{H(\widehat{d})-d_n} \right\rangle \mathbf{e}_{(n-1)}(ua) \, du \right) \\ & \times \eta_{\widehat{\nu}-\rho_{n-1}}(a^{-1}) |\det a|_F^{\nu_n+n/2} \, da. \end{split}$$

By Lemma 5.1 and (2.53), we have

$$c_{+} = \frac{1}{\dim V_{\widehat{d}}} \prod_{i=1}^{n-1} \int_{0}^{\infty} \exp(-\pi c_{F} a_{i}^{2}) a_{i}^{(\nu_{n} - \nu_{i} + 1)c_{F} + d_{i} - d_{n}} \frac{2c_{F} da_{i}}{a_{i}}$$
$$= \frac{1}{\dim V_{\widehat{d}}} \prod_{i=1}^{n-1} \Gamma_{F} (\nu_{n} - \nu_{i} + 1; d_{i} - d_{n}).$$

Hence, the equality (5.3) follows from $g_+ = c_+ f_{d,\nu}$.

Next, we consider the proof of the statement (2). Since the proofs of (5.5) and (5.6) are similar, here we will prove only (5.5). Assume $d \in \Lambda_{n,F}$ and $d+l \in \Lambda_n^{\text{poly}}$. We define a \mathbb{C} -linear map $g_{\circ} \colon V_d \to I(d,\nu)$ by

$$g_{\circ}(\zeta_M) = g_{l,s}^{\circ}(f_{d,\nu}(\zeta_{H(d)}), \overline{\Phi_{d+l}}(\zeta_{M+l} \boxtimes \overline{\zeta_{H(d)+l}}))$$
 $(M \in G(d)).$

Then g_{\circ} is a K_n -homomorphism because of (3.5). Since $\operatorname{Hom}_{K_n}(V_d, I(d, \nu))$ is 1 dimensional, there is a constant c_{\circ} such that $g_{\circ} = c_{\circ} f_{d,\nu}$. Let us calculate c_{\circ} . By (4.12), we have

$$c_{\circ} = c_{\circ} f_{d,\nu}(H(d))(1_n) = g_{\circ}(\zeta_{H(d)})(1_n)$$

$$= \int_{G_n} f_{d,\nu}(\zeta_{H(d)})(h) \overline{\langle \tau_{d+l}(h)\zeta_{H(d)+l}, \zeta_{H(d)+l} \rangle} \mathbf{e}_{(n)}(h)$$

$$\times \chi_l(\det h) |\det h|_F^{s+(n-1)/2} dh.$$

Decomposing h = auk ($a \in A_n$, $u \in U_n$, $k \in K_n$) and applying Schur's orthogonality [17, Corollary 1.10] for the integration on K_n with the equalities

$$\chi_{l}(\det h)f_{d,\nu}(\zeta_{H(d)})(h) = \eta_{\nu-\rho_{n}}(a)\langle \tau_{d+l}(k)\zeta_{H(d)+l}, \zeta_{H(d)+l}\rangle,$$

$$\tau_{d+l}(h)\zeta_{H(d)+l} = \sum_{M \in G(d)} \langle \tau_{d+l}(k)\zeta_{H(d)+l}, \zeta_{M+l}\rangle \tau_{d+l}(au)\zeta_{M+l}$$

and $\dim V_{d+l} = \dim V_d$, we have

$$c_{\circ} = \frac{1}{\dim V_d} \int_{A_n} \left(\int_{U_n} \overline{\langle \tau_{d+l}(au)\zeta_{H(d)+l}, \zeta_{H(d)+l} \rangle} \mathbf{e}_{(n)}(au) \, du \right)$$

$$\times \eta_{\nu - \rho_n}(a) |\det a|_F^{s+(n-1)/2} \, da.$$

By Lemma 5.1 and (2.53), we have

$$c_{\circ} = \frac{1}{\dim V_d} \prod_{i=1}^{n} \int_{0}^{\infty} \exp(-\pi c_F a_i^2) a_i^{(s+\nu_i)c_F + d_i + l} \frac{2c_F da_i}{a_i}$$
$$= \frac{1}{\dim V_d} \prod_{i=1}^{n} \Gamma_F(s + \nu_i; d_i + l).$$

Hence, the equality (5.5) follows from $g_o = c_o f_{d,\nu}$.

Corollary 5.3. We use the notation in Lemma 5.2 (1). If $d \in \Lambda_{n,F}$, we have

$$W_{\varepsilon}(f_{d,\nu}(\zeta_{M}))(g) = \frac{\left(\dim V_{\widehat{d}}\right)\chi_{d_{n}}(\det g)|\det g|_{F}^{\nu_{n}+(n-1)/2}}{\prod_{i=1}^{n-1}\Gamma_{F}(\nu_{n}-\nu_{i}+1;d_{i}-d_{n})}$$

$$\times \int_{G_{n-1}} \left(\int_{M_{n-1,1}(F)} \Phi_{\widehat{d}-d_{n}}^{+}(\overline{\zeta_{H(\widehat{d})-d_{n}}} \boxtimes \zeta_{M-d_{n}}) \left((h,hz)g\right)\psi_{-\varepsilon}(e_{n-1}z) dz\right)$$

$$\times W_{\varepsilon}(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}))(h^{-1})\chi_{d_{n}}(\det h)|\det h|_{F}^{\nu_{n}+n/2} dh$$

for $M \in G(d)$ and $g \in G_n$. If $-d \in \Lambda_{n,F}$, we have

$$W_{\varepsilon}(\overline{f}_{d,\nu}(\overline{\zeta_M}))(g) = \frac{\left(\dim V_{-\widehat{d}}\right)\chi_{d_n}(\det g)|\det g|_F^{\nu_n + (n-1)/2}}{\prod_{i=1}^{n-1}\Gamma_F(\nu_n - \nu_i + 1; d_n - d_i)}$$

$$\times \int_{G_{n-1}} \left(\int_{\mathcal{M}_{n-1,1}(F)} \overline{\Phi_{-\widehat{d}+d_n}^+}(\zeta_{H(-\widehat{d})+d_n} \boxtimes \overline{\zeta_{M+d_n}}) ((h,hz) g) \psi_{-\varepsilon}(e_{n-1}z) dz \right)$$

$$\times \mathcal{W}_{\varepsilon}(\overline{\mathbf{f}}_{\widehat{d},\widehat{\nu}}(\overline{\zeta_{H(-\widehat{d})}}))(h^{-1}) \chi_{d_n}(\det h) |\det h|_F^{\nu_n+n/2} dh,$$

for $M \in G(-d)$ and $g \in G_n$.

Proof. The assertion follows immediately from (3.3) and Lemma 5.2 (1).

Corollary 5.4. Let $\nu = (\nu_1, \nu_2, \cdots, \nu_n) \in \mathbb{C}^n$ and $d = (d_1, d_2, \cdots, d_n) \in \mathbb{Z}^n$ such that either $d \in \Lambda_{n,F}$ or $-d \in \Lambda_{n,F}$ holds. We take $\Gamma_F(\nu; d)$ as in §2.7. Then $1/\Gamma_F(\nu; d)$ is nonzero if $\Pi_{d,\nu}$ is irreducible.

Proof. Let us give the proof for the case of $d \in \Lambda_{n,F}$. Let $g \in G_n$. By Corollary 5.3 and the entireness of the right hand side of (3.3), it is easy to show that $W_{\varepsilon}(f_{d,\nu}(\zeta_{H(d)}))(g)$ is the product of $1/\Gamma_F(\nu;d)$ and some entire function of ν by induction. The irreducibility of $\Pi_{d,\nu}$ implies that there is some $g \in G_n$ such that $W_{\varepsilon}(f_{d,\nu}(\zeta_{H(d)}))(g) \neq 0$. Hence, we have $1/\Gamma_F(\nu;d) \neq 0$. The proof for the case of $-d \in \Lambda_{n,F}$ is similar.

5.2 Explicit recurrence relations

Let $\varepsilon \in \{\pm 1\}$. Let $(\Pi_{d,\nu}, I(d,\nu))$ and $(\Pi_{d',\nu'}, I(d',\nu'))$ be principal series representations of G_n and $G_{n'}$, respectively, with parameters

$$d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n, \qquad \nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n,$$

$$d' = (d'_1, d'_2, \dots, d'_{n'}) \in \mathbb{Z}^{n'}, \qquad \nu' = (\nu'_1, \nu'_2, \dots, \nu'_{n'}) \in \mathbb{C}^{n'}.$$

Proposition 5.5. Retain the notation. Assume n' = n > 1, $-d' \in \Lambda_{n,F}$ and $d \in \Xi^{\circ}(-d') \cap \Lambda_{n,F}$. Let $l = \ell(d+d')$. $s \in \mathbb{C}$ such that $\operatorname{Re}(s)$ is sufficiently large. Then we have

$$\begin{split} &Z\left(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(d)})), \mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}})), \overline{\varphi}_{1,n}^{(l)}(\overline{\zeta_{Q(d+d')}})\right)\\ &= \mathbf{C}_{H(-\hat{d'})[d]+d'_n}^{H(-d')+d'_n,Q((\mathbf{0}_{n-1},l))} \, \mathbf{C}_{H(d)+d'_n}^{H(-d')+d'_n,Q(d+d')} \\ &\times \frac{\dim V_{-\hat{d'}}}{\dim V_d} \frac{\prod_{i=1}^n \Gamma_F(s+\nu_i+\nu'_n;\,d_i+d'_n)}{\prod_{i=1}^{n-1} \Gamma_F(\nu'_n-\nu'_i+1;\,d'_n-d'_i)} \\ &\times Z\left(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(-\hat{d'})[d]})), \mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{\hat{d'},\hat{\nu'}}(\overline{\zeta_{H(-\hat{d'})}}))\right). \end{split}$$

Proof. Let $\phi_1 = \overline{\Phi^+_{-\widehat{d'}+d'_n}}(\zeta_{H(-\widehat{d'})+d'_n}\boxtimes \overline{\zeta_{H(-d')+d'_n}})$ and $\phi_2 = \overline{\varphi}_{1,n}^{(l)}(\overline{\zeta_{Q(d+d')}})$. By Proposition 3.4, we have

$$\begin{split} &Z\big(s,\,\mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(d)})),\,\mathbf{W}_{-\varepsilon}\big(\mathbf{g}_{d'_{n},\nu'_{n}}^{+}(\bar{\mathbf{f}}_{\widehat{d'},\widehat{\nu'}}(\overline{\zeta_{H(-\widehat{d'})}}),\phi_{1})\big),\,\phi_{2}\big)\\ &=Z\big(s,\,\mathbf{W}_{\varepsilon}\big(\mathbf{g}_{d'_{n},s+\nu'_{n}}^{\circ}(\mathbf{f}_{d,\nu}(\zeta_{H(d)}),\phi_{0})\big),\,\mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{\widehat{d'},\widehat{\nu'}}(\overline{\zeta_{H(-\widehat{d'})}}))\big), \end{split}$$

where $\phi_0(z) = \phi_1((1_{n-1}, O_{n-1,1})z)\phi_2(e_n z) \ (z \in M_n(F))$. Since we have

$$\mathbf{g}_{d'_{n},\nu'_{n}}^{+}(\bar{\mathbf{f}}_{\widehat{d'},\widehat{\nu'}}(\overline{\zeta_{H(-\widehat{d'})}}),\phi_{1}) = \frac{\prod_{i=1}^{n-1} \Gamma_{F}(\nu'_{n} - \nu'_{i} + 1; d'_{n} - d'_{i})}{\dim V_{-\widehat{x'}}} \bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}})$$

by (5.4), it suffices to prove the equality

$$Z(s, \mathbf{W}_{\varepsilon}(\mathbf{g}_{d'_{n}, s+\nu'_{n}}^{\circ}(\mathbf{f}_{d,\nu}(\zeta_{H(d)}), \phi_{0})), \mathbf{W}_{-\varepsilon}(\overline{\mathbf{f}}_{\widehat{d'},\widehat{\nu'}}(\overline{\zeta_{H(-\widehat{d'})}})))$$

$$= \mathbf{C}_{H(-\widehat{d'})+d'_{n},Q((\mathbf{0}_{n-1},l))}^{H(-\widehat{d'})+d'_{n},Q(d+d')} \mathbf{C}_{H(d)+d'_{n}}^{H(-\widehat{d'})+d'_{n}}$$

$$\times \frac{\prod_{i=1}^{n} \Gamma_{F}(s+\nu_{i}+\nu'_{n}; d_{i}+d'_{n})}{\dim V_{d}}$$

$$\times Z(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(-\widehat{d'})[d]})), \mathbf{W}_{-\varepsilon}(\overline{\mathbf{f}}_{\widehat{d'},\widehat{\nu'}}(\overline{\zeta_{H(-\widehat{d'})}}))).$$

$$(5.7)$$

By Lemma 4.10, we have

$$g_{d'_{n},s+\nu'_{n}}^{\circ}(\mathbf{f}_{d,\nu}(\zeta_{H(d)}),\phi_{0}) = \sum_{\lambda'\in\Xi^{\circ}(-d'+d'_{n};l)} \sum_{N,N'\in\mathbf{G}(\lambda')} \mathbf{C}_{N}^{H(-d')+d'_{n},Q((\mathbf{0}_{n-1},l))} \mathbf{C}_{N'}^{H(-d')+d'_{n},Q(d+d')} \\
\times g_{d'_{n},s+\nu'_{n}}^{\circ}(\mathbf{f}_{d,\nu}(\zeta_{H(d)}),\overline{\Phi}_{\lambda'}^{\circ}(\zeta_{N}\boxtimes\overline{\zeta_{N'}})).$$
(5.8)

By (3.6), we note that

$$v \otimes \overline{\zeta_M} \mapsto g_{d'_n, s + \nu'_n}^{\circ} (f_{d, \nu}(v), \overline{\Phi_{\lambda'}^{\circ}}(v_1 \boxtimes \overline{\zeta_{M + d'_n}}))(g)$$

defines an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{\lambda'-d'_n}}, \mathbb{C}_{\operatorname{triv}})$ for $\lambda' \in \Xi^{\circ}(-d' + d'_n; l)$, $v_1 \in V_{\lambda'}$ and $g \in G_n$. Hence, by Lemma 4.1, for $\lambda' \in \Xi^{\circ}(-d' + d'_n; l)$ and $N, N' \in G(\lambda')$, we have

$$g_{d'_n,s+\nu'_n}^{\circ}(f_{d,\nu}(\zeta_{H(d)}), \overline{\Phi_{\lambda'}^{\circ}}(\zeta_N \boxtimes \overline{\zeta_{N'}}))(g) = 0$$

unless $\lambda' = d + d'_n$ and $N' = H(d) + d'_n$. By (5.8) and this equality, we have

$$g_{d'_{n},s+\nu'_{n}}^{\circ}(f_{d,\nu}(\zeta_{H(d)}),\phi_{0})
= \sum_{N \in G(d+d'_{n})} C_{N}^{H(-d')+d'_{n},Q((\mathbf{0}_{n-1},l))} C_{H(d)+d'_{n}}^{H(-d')+d'_{n},Q(d+d')}
\times g_{d'_{n},s+\nu'_{n}}^{\circ}(f_{d,\nu}(\zeta_{H(d)}), \overline{\Phi_{d+d'_{n}}^{\circ}}(\zeta_{N} \boxtimes \overline{\zeta_{H(d)+d'_{n}}})).$$
(5.9)

By (2.28) and (3.5), we note that

$$\zeta_{M} \otimes \overline{v} \mapsto Z\left(s, W_{\varepsilon}\left(g_{d', s + \nu', t}^{\circ}\left(f_{d, \nu}(v_{1}), \overline{\Phi_{d + d'}^{\circ}}\left(\zeta_{M + d'_{n}} \boxtimes \overline{v_{2}}\right)\right)\right), W_{-\varepsilon}(\overline{f}_{\widehat{d'}}|_{\widehat{\nu'}}(\overline{v}))\right)$$

defines an element of $\operatorname{Hom}_{K_{n-1}}(V_d \otimes_{\mathbb{C}} \overline{V_{-\widehat{d'}}}, \mathbb{C}_{\operatorname{triv}})$ for $v_1 \in V_d$ and $v_2 \in V_{d+d'_n}$. Hence, by Lemma 4.2, for $N \in \operatorname{G}(d+d'_n)$, we have

$$Z\big(s, \mathcal{W}_{\varepsilon}\big(g_{d_{n}', s + \nu_{n}'}^{\circ}(\mathbf{f}_{d, \nu}(\zeta_{H(d)}), \overline{\Phi_{d + d_{n}'}^{\circ}}(\zeta_{N} \boxtimes \overline{\zeta_{H(d) + d_{n}'}}))\big), \mathcal{W}_{-\varepsilon}(\overline{\mathbf{f}}_{\widehat{d'}, \widehat{\nu'}}(\overline{\zeta_{H(-\widehat{d'})}}))\big) = 0$$

unless $\widehat{N} = H(-\widehat{d'}) + d'_n$. By (5.5), (5.9) and this equality, we obtain (5.7). \square

Proposition 5.6. Retain the notation. Assume n' = n - 1, $d \in \Lambda_{n,F}$ and $-d' \in \Xi^+(d) \cap \Lambda_{n-1,F}$. Let $l = \ell(\widehat{d} + d')$. Then we have

$$\begin{split} &Z\big(s, \mathcal{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(-d')[d]})), \mathcal{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}}))\big)\\ &= (-\varepsilon\sqrt{-1})^{l} \left(\mathcal{C}_{H(d)-d_{n}}^{H((-d'-d_{n},0)),\,Q((\widehat{d}+d',0))} \, \mathcal{C}_{H(-d')[d]-d_{n}}^{H((-d'-d_{n},0)),\,Q((\mathbf{0}_{n-1},l))}\right)^{-1} \\ &\times \frac{\dim V_{\widehat{d}}}{\dim V_{-d'}} \frac{\prod_{i=1}^{n-1} \Gamma_{F}(s+\nu_{n}+\nu'_{i};\,-d_{n}-d'_{i})}{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n}-\nu_{i}+1;\,-d_{n}+d_{i})} \\ &\times Z\big(s, \mathcal{W}_{\varepsilon}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})})), \mathcal{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}})), \overline{\varphi}_{1,n-1}^{(l)}(\overline{\zeta_{Q(\widehat{d}+d')}})\big). \end{split}$$

Proof. Let $\phi_1 = \Phi_{-d'-d_n}^{\circ}(\overline{\zeta_{H(-d')-d_n}} \boxtimes \zeta_{H(-d')-d_n})$ and $\phi_2 = \varphi_{n-1,1}^{(l)}(\overline{\zeta_{Q(\widehat{d}+d')}})$. By Proposition 3.5, we have

$$Z(s, W_{\varepsilon}(g_{d_{n},\nu_{n}}^{+}(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}), \phi_{0})), W_{-\varepsilon}(\bar{f}_{d',\nu'}(\overline{\zeta_{H(-d')}})))$$

$$= Z(s, W_{\varepsilon}(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})})), W_{-\varepsilon}(g_{d_{n},s+\nu_{n}}^{\circ}(\bar{f}_{d',\nu'}(\overline{\zeta_{H(-d')}}), \phi_{1})), \mathcal{F}_{\varepsilon}(\phi_{2})),$$

where $\phi_0(z) = \phi_1(z^t(1_{n-1}, O_{n-1,1}))\phi_2(z^t e_n)$ $(z \in M_{n-1,n}(F))$. We have

$$g_{d_{n},s+\nu_{n}}^{\circ}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}}),\phi_{1}) = \frac{\prod_{i=1}^{n} \Gamma_{F}(s+\nu_{n}+\nu'_{i};-d_{n}-d'_{i})}{\dim V_{-d'}} \bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}})$$

by (5.6). Because of these equalities and Lemma 4.12, it suffices to prove

$$Z(s, W_{\varepsilon}(g_{d_{n},\nu_{n}}^{+}(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}), \phi_{0})), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{\zeta_{H(-d')}})))$$

$$= C_{H(d)-d_{n}}^{H((-d'-d_{n},0)), Q((\widehat{d}+d',0))} C_{H(-d')[d]-d_{n}}^{H((-d'-d_{n},0)), Q((\mathbf{0}_{n-1},l))}$$

$$\times \frac{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n} - \nu_{i} + 1; -d_{n} + d_{i})}{\dim V_{\widehat{d}}}$$

$$\times Z(s, W_{\varepsilon}(f_{d,\nu}(\zeta_{H(-d')[d]})), W_{-\varepsilon}(\overline{f}_{d',\nu'}(\overline{\zeta_{H(-d')}}))).$$
(5.10)

By Lemma 4.11, we have

$$\begin{split} \mathbf{g}_{d_{n},\nu_{n}}^{+}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\phi_{0}) \\ &= \sum_{\lambda' \in \Xi^{\circ}(-d'-d_{n};l)} \sum_{N \in \mathbf{G}((\lambda',0);\lambda')} \mathbf{C}_{N}^{H((-d'-d_{n},0)),Q((\widehat{d}+d',0))} \\ &\times \mathbf{C}_{N'}^{H((-d'-d_{n},0)),Q((\mathbf{0}_{n-1},l))} \, \mathbf{g}_{d_{n},\nu_{n}}^{+}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\Phi_{\lambda'}^{+}(\overline{\zeta_{\widehat{N}}} \boxtimes \zeta_{N'})). \end{split} \tag{5.11}$$

By (3.2), we note that

$$v \otimes \overline{\zeta_M} \mapsto g_d^+$$
, $(f_{\widehat{d}_{\widehat{o}}}(v), \Phi_{\lambda'}^+(\overline{\zeta_{M-d_n}} \boxtimes v_1))(g)$

defines an element of $\operatorname{Hom}_{K_{n-1}}(V_{\widehat{d}} \otimes_{\mathbb{C}} \overline{V_{\lambda'+d_n}}, \mathbb{C}_{\operatorname{triv}})$ for $\lambda' \in \Xi^{\circ}(-d'-d_n; l)$, $v_1 \in V_{(\lambda',0)}$ and $g \in G_n$. Hence, by Lemma 4.1, for $N \in \operatorname{G}((\lambda',0); \lambda')$, $N' \in \operatorname{G}((\lambda',0))$ and $\lambda' \in \Xi^{\circ}(-d'-d_n; l)$, we have

$$g_{d_n,\nu_n}^+(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\Phi_{\lambda'}^+(\overline{\zeta_{\widehat{N}}}\boxtimes\zeta_{N'}))=0$$

unless $\lambda' = \hat{d} - d_n$ and $\hat{N} = H(\hat{d}) - d_n$. By (5.11) and this equality, we have

$$g_{d_{n},\nu_{n}}^{+}(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\phi_{0})$$

$$= \sum_{N' \in G(d-d_{n})} C_{H(d)-d_{n}}^{H((-d'-d_{n},0)),Q((\widehat{d}+d',0))} C_{N'}^{H((-d'-d_{n},0)),Q((\mathbf{0}_{n-1},l))}$$

$$\times g_{d_{n},\nu_{n}}^{+}(f_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\Phi_{\widehat{d}-d_{n}}^{+}(\overline{\zeta_{H(\widehat{d})-d_{n}}} \boxtimes \zeta_{N'})).$$
(5.12)

By (2.28) and (3.1), we note that

$$\zeta_M \otimes \overline{v} \mapsto Z(s, W_{\varepsilon}(g_{d_n, \nu_n}^+(f_{\widehat{d}, \widehat{\nu}}(v_1), \Phi_{\widehat{d}_{-d_n}}^+(\overline{v_2} \boxtimes \zeta_{M-d_n}))), W_{-\varepsilon}(\overline{f}_{d', \nu'}(\overline{v})))$$

defines an element of $\operatorname{Hom}_{K_{n-1}}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}}, \mathbb{C}_{\operatorname{triv}})$ for $v_1 \in V_{\widehat{d}}$ and $v_2 \in V_{\widehat{d}-d_n}$. Hence, by Lemma 4.2, for $N' \in \operatorname{G}(d-d_n)$, we have

$$Z\big(s,\, \mathcal{W}_{\varepsilon}\big(\mathbf{g}_{d_{n},\nu_{n}}^{+}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}),\Phi_{\widehat{d}-d_{n}}^{+}\big(\overline{\zeta_{H(\widehat{d})-d_{n}}}\boxtimes\zeta_{N'}))\big),\, \mathcal{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}}))\big)=0$$

unless $\widehat{N'} = H(-\widehat{d'}) - d_n$. By (5.3), (5.12) and this equality, we obtain (5.10).

Theorem 5.7. Retain the notation. Assume $d \in \Lambda_{n,F}$ and $-d' \in \Lambda_{n',F}$. We take $\Gamma_F(\nu;d)$ and $\Gamma_F(\nu';d')$ as in §2.7.

(1) Assume n' = n and $d \in \Xi^{\circ}(-d')$. Let $l = \ell(d+d')$. Then we have

$$\begin{split} &Z\big(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(d)})), \mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}})), \overline{\varphi}_{1,n}^{(l)}(\overline{\zeta_{Q(d+d')}})\big)\\ &= \frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}\sqrt{\mathbf{b}(d+d')}\mathbf{C}^{\circ}(d;-d')L(s,\Pi_{d,\nu}\times\Pi_{d',\nu'})}{(\dim V_d)\Gamma_F(\nu;d)\Gamma_F(\nu';d')}. \end{split}$$

(2) Assume n' = n - 1 and $-d' \in \Xi^+(d)$. Then we have

$$\begin{split} &Z\left(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(-d')[d]})), \mathbf{W}_{-\varepsilon}(\overline{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}}))\right) \\ &= \frac{(-\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}L(s, \Pi_{d,\nu}\times\Pi_{d',\nu'})}{(\dim V_{-d'})\sqrt{\mathbf{r}(H(-d')[d])}\Gamma_F(\nu;d)\Gamma_F(\nu';d')}. \end{split}$$

Here r(H(-d')[d]) is defined by (2.16).

Proof. Let us prove the statement (1) by induction with respect to n. First, we consider the case of n = 1. Since

$$W_{\varepsilon}(f_{d_{1},\nu_{1}}(\zeta_{d_{1}}))(ak) = a^{\nu_{1}c_{F}}k^{d_{1}}, \quad W_{-\varepsilon}(\overline{f}_{d'_{1},\nu'_{1}}(\overline{\zeta_{-d'_{1}}}))(ak) = a^{\nu'_{1}c_{F}}k^{d'_{1}},$$

$$\overline{\varphi}_{1,1}^{(d_{1}+d'_{1})}(\overline{\zeta_{d_{1}+d'_{1}}})(ak) = (a\overline{k})^{d_{1}+d'_{1}}\exp(-\pi c_{F}a^{2})$$

for $a \in A_1 = \mathbb{R}_+^{\times}$ and $k \in K_1$, we have

$$Z(s, W_{\varepsilon}(f_{d_1,\nu_1}(\zeta_{d_1})), W_{-\varepsilon}(\overline{f_{d'_1,\nu'_1}}(\overline{\zeta_{-d'_1}})), \overline{\varphi}_{1,1}^{(d_1+d'_1)}(\overline{\zeta_{d_1+d'_1}}))$$

$$= \left(\int_0^\infty \exp(-\pi c_F a^2) a^{(s+\nu_1+\nu_1')c_F+d_1+d_1'} \frac{2c_F da}{a} \right) \left(\int_{K_1} dk \right)$$
$$= \Gamma_F(s+\nu_1+\nu_1'; d_1+d_1') = L(s, \Pi_{d_1,\nu_1} \times \Pi_{d_1',\nu_1'}).$$

Here the second equality follows from (2.53). Next, we consider the case of $n \ge 2$. Let $q = \ell(\hat{d} + \hat{d}')$. By Propositions 5.5 and 5.6, we have

$$\begin{split} &Z\left(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(d)})), \mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{d',\nu'}(\overline{\zeta_{H(-d')}})), \overline{\varphi}_{1,n}^{(l)}(\overline{\zeta_{Q(d+d')}})\right) \\ &= (-\varepsilon\sqrt{-1})^{q} \frac{\mathbf{C}_{H(d)+d'_{n}}^{H(-d')+d'_{n},Q(d+d')}}{\mathbf{C}_{H(d)-d_{n}}^{H((-\hat{d'}-d_{n},0)),Q((\hat{d}+\hat{d'},0))}} \frac{\mathbf{C}_{H(-\hat{d'})+d'_{n},Q((\mathbf{0}_{n-1},l))}^{H(-d')+d'_{n},Q((\mathbf{0}_{n-1},l))}}{\mathbf{C}_{H(-\hat{d'})[d]-d_{n}}^{H((-\hat{d'}-d_{n},0)),Q((\mathbf{0}_{n-1},q))}} \\ &\times \frac{\dim V_{\hat{d}}}{\dim V_{\hat{d}}} \frac{\prod_{i=1}^{n} \Gamma_{F}(s+\nu_{i}+\nu'_{n};\ d_{i}+d'_{n})}{\prod_{i=1}^{n-1} \Gamma_{F}(s+\nu_{n}+\nu'_{i};\ -d_{n}-d'_{i})} \frac{\prod_{i=1}^{n-1} \Gamma_{F}(s+\nu_{n}+\nu'_{i};\ -d_{n}-d'_{i})}{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n}-\nu_{i}+1;\ d'_{n}-d'_{i})} \frac{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n}-\nu_{i}+1;\ -d_{n}+d_{i})}{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n}-\nu_{i}+1;\ -d_{n}+d_{i})} \\ &\times Z\left(s, \mathbf{W}_{\varepsilon}(\mathbf{f}_{\hat{d},\widehat{\nu}})(\zeta_{H(\hat{d})}), \mathbf{W}_{-\varepsilon}(\bar{\mathbf{f}}_{\hat{d'},\widehat{\nu'}}(\overline{\zeta_{H(-\hat{d'})}})), \overline{\varphi}_{1,n-1}^{(q)}(\overline{\zeta_{Q(\hat{d}+\hat{d'})}})\right). \end{split}$$

Moreover, by (4.5), we have

$$\begin{split} &\frac{\mathbf{C}_{H(d)+d_{n}',Q(d+d')}^{H(-d')+d_{n}',Q((\mathbf{0}_{n-1},l))}}{\mathbf{C}_{H(d)-d_{n}}^{H((-\hat{d'}-d_{n},0)),\,Q((\hat{d}+\hat{d'},0))}} \frac{\mathbf{C}_{H(-\hat{d'})[d]+d_{n}'}^{H(-(d')+d_{n}',Q((\mathbf{0}_{n-1},l)))}}{\mathbf{C}_{H(-\hat{d'})[d]-d_{n}}^{H((-\hat{d'}-d_{n},0)),\,Q((\mathbf{0}_{n-1},q))}} \\ &= \sqrt{\frac{l!}{q!(d_{n}+d_{n}')!}} \prod_{h=1}^{n-1} \frac{(d_{h}-d_{n}-h+n)!(-d_{h}'+d_{n}'-h+n-1)!}{(d_{h}+d_{n}'-h+n)!(-d_{h}'-d_{n}-h+n-1)!}}. \end{split}$$

By the above equalities and the induction hypothesis, we obtain the formula in the statement (1).

The statement (2) follows from (4.5), Proposition 5.6, the statement (1) and

$$\frac{1}{\sqrt{r(H(\mu)[\lambda])}} = \sqrt{\prod_{1 \le i \le j \le n-1} \frac{(\mu_i - \mu_j - i + j)!(\lambda_i - \lambda_{j+1} - i + j)!}{(\lambda_i - \mu_j - i + j)!(\mu_i - \lambda_{j+1} - i + j)!}}$$

for
$$\lambda = (\lambda_1, \lambda_2, \dots, \lambda_n) \in \Lambda_n$$
 and $\mu = (\mu_1, \mu_2, \dots, \mu_{n-1}) \in \Xi^+(\lambda)$.

Proof of Theorem 2.5. The equality (2.30) follows from Theorem 5.7 (2). Since (2.29) is an element of $\operatorname{Hom}_{K_{n-1}}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}}, \mathbb{C}_{\operatorname{triv}})$, we completes the proof by Lemma 4.2.

Proof of Theorem 2.9 (2). The equality (2.50) follows from Theorem 5.7 (1). Since (2.48) is an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} \overline{V_{(-l,\mathbf{0}_{n-1})}}, \mathbb{C}_{\operatorname{triv}})$, we completes the proof by Lemma 4.3.

Similar to Propositions 5.5 and 5.6, we obtain the following propositions.

Proposition 5.8. Retain the notation. Assume n' = n > 1, $d' \in \Lambda_{n,F}$ and $-d \in \Xi^{\circ}(d') \cap \Lambda_{n,F}$. Let $l = \ell(-d - d')$. Then we have

$$\begin{split} &Z\big(s, \mathbf{W}_{\varepsilon}(\bar{\mathbf{f}}_{d,\nu}(\overline{\zeta_{H(-d)}})), \mathbf{W}_{-\varepsilon}(\mathbf{f}_{d',\nu'}(\zeta_{H(d')})), \varphi_{1,n}^{(l)}(\zeta_{Q(-d-d')})\big) \\ &= \mathbf{C}_{H(\widehat{d'})[-d]-d'_n}^{H(d')-d'_n,Q((\mathbf{0}_{n-1},l))} \, \mathbf{C}_{H(-d)-d'_n}^{H(d')-d'_n,Q(d+d')} \\ &\quad \times \frac{\dim V_{\widehat{d'}}}{\dim V_{-d}} \frac{\prod_{i=1}^n \Gamma_F(s+\nu_i+\nu'_n;-d_i-d'_n)}{\prod_{i=1}^{n-1} \Gamma_F(\nu'_n-\nu'_i+1;-d'_n+d'_i)} \\ &\quad \times Z\big(s, \mathbf{W}_{\varepsilon}(\bar{\mathbf{f}}_{d,\nu}(\overline{\zeta_{H(\widehat{d'})[-d]}})), \mathbf{W}_{-\varepsilon}(\mathbf{f}_{\widehat{d'},\nu'}(\zeta_{H(\widehat{d'})}))\big). \end{split}$$

Proposition 5.9. Retain the notation. Assume n' = n - 1, $-d \in \Lambda_{n,F}$ and $d' \in \Xi^+(-d) \cap \Lambda_{n-1,F}$. Let $l = \ell(-\widehat{d} - d')$. Then we have

$$\begin{split} &Z\left(s, \mathbf{W}_{\varepsilon}(\bar{\mathbf{f}}_{d,\nu}(\overline{\zeta_{H(d')[-d]}})), \mathbf{W}_{-\varepsilon}(\mathbf{f}_{d',\nu'}(\zeta_{H(d')}))\right) \\ &= (-\varepsilon\sqrt{-1})^{l} \left(\mathbf{C}_{H(-d)+d_{n}}^{H((d'+d_{n},0)),\,Q((-\widehat{d}-d',0))} \mathbf{C}_{H(d')[-d]+d_{n}}^{H((d'+d_{n},0)),\,Q((\mathbf{0}_{n-1},l))} \right)^{-1} \\ &\times \frac{\dim V_{-\widehat{d}}}{\dim V_{d'}} \frac{\prod_{i=1}^{n-1} \Gamma_{F}(s+\nu_{n}+\nu'_{i};\,d_{n}+d'_{i})}{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n}-\nu_{i}+1;\,d_{n}-d_{i})} \\ &\times Z\left(s, \mathbf{W}_{\varepsilon}(\bar{\mathbf{f}}_{\widehat{d},\widehat{\varrho}}(\overline{\zeta_{H(-\widehat{d})}})), \mathbf{W}_{-\varepsilon}(\mathbf{f}_{d',\nu'}(\zeta_{H(d')})), \varphi_{1,n-1}^{(l)}(\zeta_{O(-\widehat{d}-d')})\right). \end{split}$$

Similar to Theorem 5.7, we obtain the following theorem using Propositions 5.8 and 5.9.

Theorem 5.10. Retain the notation. Assume $-d \in \Lambda_{n,F}$ and $d' \in \Lambda_{n',F}$. We take $\Gamma_F(\nu;d)$ and $\Gamma_F(\nu';d')$ as in §2.7.

(1) Assume n' = n and $-d \in \Xi^{\circ}(d')$. Let $l = \ell(-d - d')$. Then we have

$$\begin{split} &Z\big(s, \mathbf{W}_{\varepsilon}(\overline{\mathbf{f}}_{d,\nu}(\overline{\zeta_{H(-d)}})), \mathbf{W}_{-\varepsilon}(\mathbf{f}_{d',\nu'}(\zeta_{H(d')})), \varphi_{1,n}^{(l)}(\zeta_{Q(-d-d')})\big)\\ &= \frac{(\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}\sqrt{\mathbf{b}(-d-d')}\mathbf{C}^{\circ}(-d;d')L(s,\Pi_{d,\nu}\times\Pi_{d',\nu'})}{(\dim V_{-d})\mathbf{\Gamma}_F(\nu;d)\mathbf{\Gamma}_F(\nu';d')}. \end{split}$$

(2) Assume n' = n - 1 and $d' \in \Xi^+(-d)$. Then we have

$$Z(s, \mathbf{W}_{\varepsilon}(\overline{\mathbf{f}}_{d,\nu}(\overline{\zeta_{H(d')[-d]}})), \mathbf{W}_{-\varepsilon}(\mathbf{f}_{d',\nu'}(\zeta_{H(d')})))$$

$$= \frac{(\varepsilon\sqrt{-1})^{\sum_{i=1}^{n-1}(n-i)(d_i+d'_i)}L(s, \Pi_{d,\nu} \times \Pi_{d',\nu'})}{(\dim V_{d'})\sqrt{\mathbf{r}(H(d')[-d])}\mathbf{\Gamma}_F(\nu; d)\mathbf{\Gamma}_F(\nu'; d')}.$$

Proof of Theorem 2.9 (1). The equality (2.49) follows from Theorem 5.10 (1) and (2.45). Since (2.47) is an element of $\operatorname{Hom}_{K_n}(V_d \otimes_{\mathbb{C}} \overline{V_{-d'}} \otimes_{\mathbb{C}} V_{(l,\mathbf{0}_{n-1})}, \mathbb{C}_{\operatorname{triv}})$, we completes the proof by Lemma 4.3 and the properties of complex conjugate representations in §2.6.

A Explicit formulas of Whittaker functions

In this appendix, we consider the explicit formulas of the radial parts of Whittaker functions on G_n . Let $\varepsilon \in \{\pm 1\}$, $d = (d_1, d_2, \dots, d_n) \in \mathbb{Z}^n$, and $\nu = (\nu_1, \nu_2, \dots, \nu_n) \in \mathbb{C}^n$. Assume that either $d \in \Lambda_{n,F}$ or $-d \in \Lambda_{n,F}$ holds. We set

$$\widetilde{W}_{d,\nu}^{(\varepsilon)}(a) = \begin{cases} \eta_{-\rho_n}(a) \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\xi_{H(d)}))(a) & \text{if } d \in \Lambda_{n,F}, \\ \eta_{-\rho_n}(a) \mathbf{W}_{\varepsilon}(\overline{\mathbf{f}}_{d,\nu}(\overline{\xi_{H(-d)}}))(a) & \text{if } -d \in \Lambda_{n,F} \end{cases} (a \in A_n).$$

Then we have the following theorem, which is the generalization of the explicit formulas [9, Theorem 14] of spherical Whittaker functions on $GL(n, \mathbb{R})$.

Theorem A.1. Retain the notation, and we assume n > 1. We take \hat{d} and $\hat{\nu}$ as in §3.1. Let $a = \text{diag}(a_1, a_2, \dots, a_n) \in A_n$. Then we have

$$\begin{split} \widetilde{W}_{d,\nu}^{(\varepsilon)}(a) &= \frac{\prod_{i=1}^{n} a_{i}^{\nu_{n} c_{F} + |d_{i} - d_{n}|}}{\prod_{i=1}^{n-1} \Gamma_{F}(\nu_{n} - \nu_{i} + 1; |d_{i} - d_{n}|)} \\ &\times \int_{(\mathbb{R}_{+}^{\times})^{n-1}} \widetilde{W}_{\widehat{d},\widehat{\nu}}^{(\varepsilon)}(t) \prod_{i=1}^{n-1} \exp\left(-\pi c_{F} \left(\frac{t_{i}^{2}}{a_{i+1}^{2}} + \frac{a_{i}^{2}}{t_{i}^{2}}\right)\right) t_{i}^{-\nu_{n} c_{F} - |d_{i} - d_{n}|} \frac{2c_{F} dt_{i}}{t_{i}} \end{split}$$

with $t = \text{diag}(t_1, t_2, \dots, t_{n-1}) \in A_{n-1}$.

Proof. We will prove here only the case of $d \in \Lambda_{n,F}$, since the proof for the case of $-d \in \Lambda_{n,F}$ is similar. By Lemmas 4.7 and 4.8, we have

$$\begin{split} &\Phi_{\widehat{d}-d_n}^+(\overline{\zeta_{H(\widehat{d})-d_n}}\boxtimes\zeta_{H(d)-d_n})((h,hz)a)\\ &=\left(\prod_{i=1}^{n-1}a_i^{d_i-d_n}\right)\left\langle\tau_{\widehat{d}-d_n}(h)\zeta_{H(\widehat{d})-d_n},\,\zeta_{H(\widehat{d})-d_n}\right\rangle\mathbf{e}_{(n-1,n)}((h,hz)a) \end{split}$$

for $h \in G_{n-1}$ and $z \in M_{n-1,1}(F)$. Hence, by Corollary 5.3, we have

$$\begin{split} &\widetilde{W}_{d,\nu}^{(\varepsilon)}(a) = \eta_{-\rho_n}(a) \mathbf{W}_{\varepsilon}(\mathbf{f}_{d,\nu}(\zeta_{H(d)}))(a) \\ &= \frac{\left(\dim V_{\widehat{d}}\right) \prod_{i=1}^n a_i^{(\nu_n + i - 1)c_F + d_i - d_n}}{\prod_{i=1}^{n-1} \Gamma_F(\nu_n - \nu_i + 1; \ d_i - d_n)} \\ &\times \int_{G_{n-1}} \left(\int_{\mathbf{M}_{n-1,1}(F)} \mathbf{e}_{(n-1,n)}((h,hz)a) \psi_{-\varepsilon}(e_{n-1}z) \, dz \right) \mathbf{W}_{\varepsilon}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}))(h^{-1}) \\ &\times \left\langle \tau_{\widehat{d}-d_n}(h) \zeta_{H(\widehat{d})-d_n}, \zeta_{H(\widehat{d})-d_n} \right\rangle \chi_{d_n}(\det h) |\det h|_F^{\nu_n + n/2} \, dh. \end{split}$$

Decomposing $h^{-1} = xtk$ $(x \in N_{n-1}, t = \text{diag}(t_1, t_2, \dots, t_{n-1}) \in A_{n-1}, k \in K_{n-1})$ and applying Schur's orthogonality [17, Corollary 1.10] for the integration on K_{n-1} together with the equalities

$$\langle \tau_{\widehat{d}-d_n}(h)\zeta_{H(\widehat{d})-d_n}, \zeta_{H(\widehat{d})-d_n}\rangle \chi_{d_n}(\det h)$$

$$= \left(\prod_{i=1}^{n-1} t_i^{-d_i + d_n}\right) \overline{\langle \tau_{\widehat{d}}(k) \zeta_{H(\widehat{d})}, \zeta_{H(\widehat{d})} \rangle}$$
 (by Lemma 5.1)

and

$$\begin{split} \mathbf{W}_{\varepsilon}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{H(\widehat{d})}))(h^{-1}) &= \psi_{\varepsilon,n-1}(x)\mathbf{W}_{\varepsilon}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\tau_{\widehat{d}}(k)\zeta_{H(\widehat{d})}))(t) \\ &= \sum_{M \in \mathbf{G}(\widehat{d})} \langle \tau_{\widehat{d}}(k)\zeta_{H(\widehat{d})}, \zeta_{M} \rangle \ \psi_{\varepsilon,n-1}(x)\mathbf{W}_{\varepsilon}(\mathbf{f}_{\widehat{d},\widehat{\nu}}(\zeta_{M}))(t), \end{split}$$

we have

$$\begin{split} \widetilde{W}_{d,\nu}^{(\varepsilon)}(a) = & \frac{\prod_{i=1}^{n} a_i^{(\nu_n + i - 1)c_F + d_i - d_n}}{\prod_{i=1}^{n-1} \Gamma_F(\nu_n - \nu_i + 1; d_i - d_n)} \\ & \times \int_{(\mathbb{R}_+^\times)^{n-1}} \left(\int_{N_{n-1}} \int_{\mathcal{M}_{n-1,1}(F)} \mathbf{e}_{(n-1,n)}((t^{-1}x^{-1}, t^{-1}x^{-1}z)a) \psi_{\varepsilon, n-1}(x) \right. \\ & \times \psi_{-\varepsilon}(e_{n-1}z) \, dz \, dx \right) \widetilde{W}_{\widehat{d},\widehat{\nu}}^{(\varepsilon)}(t) \prod_{i=1}^{n-1} t_i^{-(\nu_n + n - i)c_F - d_i + d_n} \frac{2c_F \, dt_i}{t_i}. \end{split}$$

Let us consider the integral

$$\int_{N_{n-1}} \int_{\mathcal{M}_{n-1,1}(F)} \mathbf{e}_{(n-1,n)}((t^{-1}x^{-1},t^{-1}x^{-1}z)a)\psi_{\varepsilon,n-1}(x)\psi_{-\varepsilon}(e_{n-1}z) dz dx.$$

Substituting $\begin{pmatrix} x^{-1} & x^{-1}z \\ O_{1,n-1} & 1 \end{pmatrix} \to x$, this integral becomes

$$\int_{N} \mathbf{e}_{(n-1,n)}((1_{n-1}, O_{n-1,1})\iota_{n}(t^{-1})xa)\psi_{-\varepsilon,n}(x) dx. \tag{A.1}$$

П

By the elementary formula (4.19) and the equality

$$\mathbf{e}_{(n-1,n)}((1_{n-1}, O_{n-1,1}) \iota_n(t^{-1})xa)$$

$$= \prod_{i=1}^{n-1} \exp(-\pi c_F t_i^{-2} a_i^2) \prod_{j=i+1}^n \exp(-\pi c_F t_i^{-2} a_j^2 x_{i,j} \overline{x_{i,j}}),$$

we know that (A.1) is equal to

$$\prod_{i=1}^{n-1} \exp\left(-\pi c_F \left(\frac{t_i^2}{a_{i+1}^2} + \frac{a_i^2}{t_i^2}\right)\right) t_i^{(n-i)c_F} a_{i+1}^{-ic_F}.$$

Therefore, we obtain the assertion.
