

Summing multilinear operators and sequence classes

Geraldo Botelho* and Davidson Freitas†

Abstract

We construct a general framework that generates classes of multilinear operators between Banach spaces which encompasses, as particular cases, the several classes of summing type multilinear operators that have been studied individually in the literature. Summing operators by blocks in the isotropic and anisotropic cases are taken into account. The classes we create are shown to be Banach ideals of multilinear operators and applications to coherence and coincidence theorems are provided.

1 Introduction

A. Pietsch systematized the theory of ideals of linear operators (operator ideals) in [57] and, shortly after, sketched the theory of ideals of multilinear operators in [58]. This field has proved to be quite fruitful and a large number of contributions have appeared in the last decades, see, e.g., [1, 3, 4, 10, 14, 16, 23, 24, 25, 30, 39, 51, 62]. Several authors have devoted their efforts to study multilinear generalizations of the ideals of absolutely $(q; p)$ -summing linear operators to the multilinear context. Several promising classes of multilinear operators have arisen from these efforts, for example, the class of absolutely summing multilinear operators, initiated in [12, 58], and the class of multiple summing operators introduced in [45] and, independently, in [19]. Also, other operator ideals defined, or characterized, by the transformation of vector-valued sequences, were transposed to the multilinear case, and, again, in different manners. In this paper we construct an abstract framework that recover as particular instances all these classes of multilinear operators that have been individually studied in the literature.

Throughout the paper, $d \geq 1$ is a natural number, $\mathcal{L}(E_1, \dots, E_d; F)$ denotes the Banach space of continuous d -linear operators from $E_1 \times \dots \times E_d$ to F , where E_1, \dots, E_d, F will always be Banach spaces over $\mathbb{K} = \mathbb{R}$ or \mathbb{C} , endowed with the usual operator norm. The topological dual of the Banach space E is denoted by E^* and the closed unit ball of E by B_E . For the general theory of multilinear operators we refer to [40, 48].

According to the first transposition of the absolutely summing operators to the multilinear setting, which goes back to [58], an operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is said to be

Keywords: Banach spaces, summing multilinear operators, Banach ideals, sequence classes.

absolutely $(q; p_1, \dots, p_d)$ -summing, $\frac{1}{q} \leq \frac{1}{p_1} + \dots + \frac{1}{p_d}$ and $q, p_1, \dots, p_d \in [1, \infty)$, if there exists a constant $C > 0$ such that

$$\left(\sum_{j=1}^k \|A(x_j^1, \dots, x_j^d)\|^q \right)^{\frac{1}{q}} \leq C \cdot \prod_{i=1}^d \sup_{\varphi_i \in B_{E_i^*}} \left(\sum_{j=1}^k \|\varphi_i(x_j^i)\|^{p_i} \right)^{\frac{1}{p_i}}, \quad (1)$$

for every $k \in \mathbb{N}$ and all $x_j^i \in E_i$, $j = 1, \dots, k$, $i = 1, \dots, d$.

Going deeper into the multilinear aspects of the theory, Matos [45] and Bombal, Villanueva and Pérez-García [19] define a multilinear operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ to be multiple $(q; p_1, \dots, p_d)$ -summing, $q \geq p_r$, $r = 1, \dots, d$, if there exists a constant $C \geq 0$ such that

$$\left(\sum_{j_1, \dots, j_d=1}^k \|A(x_{j_1}^1, \dots, x_{j_d}^d)\|^q \right)^{\frac{1}{q}} \leq C \cdot \prod_{i=1}^d \sup_{\varphi_i \in B_{E_i^*}} \left(\sum_{j=1}^k \|\varphi_i(x_j^i)\|^{p_i} \right)^{\frac{1}{p_i}}, \quad (2)$$

for every $k \in \mathbb{N}$ and all $x_j^i \in E_i$, $j = 1, \dots, k$, $i = 1, \dots, d$.

We are interested in the following four directions in which the theory has been developed nowadays:

(i) An operator A is absolutely $(q; p_1, \dots, p_d)$ -summing if and only if, for all E_i -valued weakly p_i -summable sequences $(x_j^i)_{j=1}^\infty$, $i = 1, \dots, d$, the sequence $(A(x_j^1, \dots, x_j^d))_{j=1}^\infty$ is absolutely q -summable in F . Several new classes of multilinear operators appeared considering other types of summability of sequences, such as: p -dominated operators [18, 60], almost summing operators [20, 52, 55]; weakly $(q; p_1, \dots, p_d)$ -summing operators [18, 24, 44, 59], strongly Cohen p -summing operators [2, 30, 46]. A unification of all these types of operators was proposed in [24] by means of the concept of sequence classes.

(ii) The definition (2) of multiple summing operators takes into account the sum over all indices independently, that is, all multi-indices $(n_1, \dots, n_d) \in \mathbb{N}^d$, whereas the definition (1) considers only the diagonal $D(\mathbb{N}^d) := \{(j, \dots, j) : j \in \mathbb{N}\}$ of \mathbb{N}^d . The sum in all/several indices has been deeply explored, including in the study of classical inequalities and applications to other areas (see, e.g., [16, 38, 47, 56]).

(iii) Another direction is the consideration of sums over sets of indices other than the diagonal or the whole \mathbb{N}^d , including arbitrary subsets of \mathbb{N}^d , usually referred to as blocks. For some recent works in this direction, see [3, 6, 13, 17, 29, 65].

(iv) The replacement of the sum in the left-hand side of (2) with iterated sums of the type

$$\left(\sum_{j_1=1}^\infty \left(\dots \left(\sum_{j_d=1}^\infty \|A(x_{j_1}^1, \dots, x_{j_d}^d)\|^{q_d} \right)^{\frac{q_{d-1}}{q_d}} \dots \right)^{\frac{q_1}{q_2}} \right)^{\frac{1}{q_1}}$$

has led to very interesting results, including applications to the study of classical inequalities, such as Bohnenblust-Hille's inequality and Hardy-Littlewood's inequality, see, e.g., [3, 4, 5, 6, 7, 8, 9, 15, 16, 51]. This is the anisotropic case, whereas the other cases are the isotropic ones.

A unification of all these directions was attempted by the authors in [26], where a number of classes already considered in the literature are recovered as particular instances of an abstract scheme. The fact that some already studied classes, including some important ones, are not encompassed by the construction in [26] impelled us to construct a new environment, which we present in this paper, encompassing, as particular instances, all classes of summing-type multilinear operators defined, or characterized, by the transformation of sequences that have been investigated thus far.

The construction and the proof that the classes we create are Banach ideals of multilinear operators are presented in Section 2. In Section 3 we show that our construction recovers the classes studied in the literature, including some classes not recovered in [26]. In Section 4 we give applications to the theory of coherent ideals and coincidence theorems.

2 The construction

Throughout the paper, d and k are natural numbers with $1 \leq k \leq d$, (j^1, \dots, j^d) is an element of \mathbb{N}^d , $\mathcal{I} = \{I_1, \dots, I_k\}$ is a partition of $\{1, \dots, d\}$, that is, an ordered collection of pairwise disjoint subsets of $\{1, \dots, d\}$ whose union is $\{1, \dots, d\}$. For $x \in E$, we write $x \cdot e_j = (0, \dots, 0, x, 0, \dots) \in E^{\mathbb{N}}$ and $x * e_j = (0, \dots, 0, x, 0, \dots, 0) \in E^d$, where x is placed at the j -th coordinate.

2.1 Blocks in \mathbb{N}^d

Definition 2.1. Given d sequences of natural numbers $(j_n^r)_{n=1}^{\infty}$, $r = 1, \dots, d$, such that the correspondence

$$(n_1, \dots, n_k) \in \mathbb{N}^k \mapsto \sum_{s=1}^k \sum_{r \in I_s} j_{n_s}^r * e_r \quad (3)$$

is injective, the *block of \mathbb{N}^d associated to the partition $\mathcal{I} = \{I_1, \dots, I_k\}$ and to the sequences $(j_n^r)_{n=1}^{\infty}$, $r = 1, \dots, d$* , is the subset of \mathbb{N}^d defined by

$$B_{\mathcal{I}} = \left\{ \sum_{s=1}^k \sum_{r \in I_s} j_{n_s}^r * e_r \in \mathbb{N}^d : n_1, \dots, n_k \in \mathbb{N} \right\}. \quad (4)$$

The understanding of the expression $\sum_{s=1}^k \sum_{r \in I_s} j_{n_s}^r * e_r$ is crucial in our construction. This finite sum represents an element $(j_{m_1}^1, \dots, j_{m_d}^d) \in \mathbb{N}^d$, where $m_n = m_l = n_s$ for some $s \in \{1, \dots, k\}$ whenever $n, l \in I_s$, that is, each natural $j_{m_r}^r$ is indexed by $m_r = n_s$ for every $r \in I_s$. Obviously the injectivity guarantees that each position of the block is achieved exactly once. The idea is not to check the injectivity of a given expression (3), but, given $B \subseteq \mathbb{N}^d$, to find a partition of $\{1, \dots, d\}$ and d sequences of naturals such that B is a block of \mathbb{N}^d associated to the partition and to the sequences.

Let us see some blocks we shall use later.

Example 2.2. Given an arbitrary partition $\mathcal{I} = \{I_1, \dots, I_k\}$ of $\{1, \dots, d\}$, defining $(j_n^1)_{n=1}^\infty = \dots = (j_n^d)_{n=1}^\infty = (n)_{n=1}^\infty$, the correspondence

$$(n_1, \dots, n_k) \in \mathbb{N}^k \mapsto \sum_{s=1}^k \sum_{r \in I_s} j_{n_s}^r * e_r = \sum_{s=1}^k \sum_{r \in I_s} n_s * e_r = \sum_{r \in I_1} n_1 * e_r + \dots + \sum_{r \in I_k} n_k * e_r,$$

is injective: if

$$\sum_{r \in I_1} n_1 * e_r + \dots + \sum_{r \in I_k} n_k * e_r = \sum_{r \in I_1} m_1 * e_r + \dots + \sum_{r \in I_k} m_k * e_r,$$

then $n_1 = m_1$ for every $r \in I_1, \dots, n_k = m_k$ for every $r \in I_k$, that is, $(n_1, \dots, n_k) = (m_1, \dots, m_k)$.

In the case of an arbitrary partition, this block shall be used in Section 3.3. It shall also be used for the following two specific partitions. Denoting by $\mathcal{I}_t := \{1, \dots, d\}$ the trivial partition ($k = 1$), we get the diagonal

$$B_{\mathcal{I}_t} := D(\mathbb{N}^d) = \{(j, \dots, j) \in \mathbb{N}^d\}.$$

And denoting by $\mathcal{I}_d := \{\{r\} : r = 1, \dots, d\}$ the discrete partition ($k = d$), the corresponding block is $B_{\mathcal{I}_d} = \mathbb{N}^d$.

Example 2.3. Let us see that every infinite subset of \mathbb{N}^d is a block associated to the trivial partition \mathcal{I}_t in the sense of Definition 2.1. Given $B \subset \mathbb{N}^d$ infinite, choose a bijection $\sigma: \mathbb{N} \rightarrow B$. For each $(j^1, \dots, j^d) \in B$ let $n \in \mathbb{N}$ be such that $(j^1, \dots, j^d) = \sigma(n)$. For $r \in \{1, \dots, d\}$ and $n \in \mathbb{N}$, call j_n^r the r -th coordinate of $\sigma(n)$. So, the correspondence (3)

$$n \in \mathbb{N} \mapsto \sum_{r=1}^d j_n^r * e_r = j_n^1 * e_1 + \dots + j_n^d * e_d = (j_n^1, \dots, j_n^d) = \sigma(n) \in B,$$

is the bijection σ itself and $B_{\mathcal{I}_t} = \{\sigma(n) : n \in \mathbb{N}\} = B$.

By the example above we could restrict ourselves to the trivial partition. We shall not do that because sometimes it is more convenient to recognize a certain subset of \mathbb{N}^d as a block associated to some other partition. It is not difficult to see that not every infinite subset of \mathbb{N}^d is a block associated to the discrete partition.

From now on, we fix the natural numbers $1 \leq k \leq d$, a partition $\mathcal{I} = \{I_1, \dots, I_k\}$ of $\{1, \dots, d\}$, the sequences of natural numbers $(j_n^r)_{n=1}^\infty$, $r = 1, \dots, d$, fulfilling the conditions of Definition 2.1 and, consequently, the block $B_{\mathcal{I}}$ associated to this partition and to these sequences.

2.2 $(B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing operators

By $c_{00}(E)$ and $\ell_\infty(E)$ we denote the spaces of eventually null and bounded E -valued sequences, respectively. The symbol $E \overset{1}{\hookrightarrow} F$ means that E is a linear subspace of F and $\|x\|_F \leq \|x\|_E$ for every $x \in E$.

Definition 2.4. [24, Definition 2.1] A *sequence class* is a rule X that assigns to each Banach space E a Banach space $X(E)$ of E -valued sequences, with the usual sequence operations, such that $c_{00}(E) \subset X(E) \xrightarrow{1} \ell_\infty(E)$ for every E and $\|e_j\|_{X(\mathbb{K})} = 1$ for every $j \in \mathbb{N}$. The sequence class X is *linearly stable* if, regardless of the Banach spaces E and F , $u \in \mathcal{L}(E; F)$ and $(x_j)_{j=1}^\infty \in X(E)$ it holds

$$(u(x_j))_{j=1}^\infty \in X(F) \text{ and } \|(u(x_j))_{j=1}^\infty\|_{X(F)} \leq \|u\| \cdot \|(x_j)_{j=1}^\infty\|_{X(E)}.$$

In this case, the induced map

$$\widehat{u}: X(E) \longrightarrow X(F), \quad \widehat{u}((x_j)_{j=1}^\infty) = (u(x_j))_{j=1}^\infty,$$

is a well defined bounded linear operator.

Plenty of examples can be found in [24, 25, 31, 62, 63]; we mention just a few: for $p \geq 1$, the class $\ell_p(\cdot)$ of absolutely p -summable sequences, the class $\ell_p^w(\cdot)$ of weakly p -summable sequences, the class $c_0(\cdot)$ of norm null sequences, the class $\ell_\infty(\cdot)$ of bounded sequences, the class $\ell_p^u(\cdot)$ of unconditionally p -summable sequences, the class $\ell_p\langle \cdot \rangle$ of Cohen strongly p -summable sequences. In this section, $X_1, \dots, X_d, Y_1, \dots, Y_k$ denote arbitrary sequence classes.

Given a Banach space F and sequence classes Y_1 and Y_2 , $Y_1(Y_2(F))$ is space of sequences $((x_{j_1, j_2})_{j_2=1}^\infty)_{j_1=1}^\infty \in (Y_2(F))^{\mathbb{N}}$ such that $((x_{j_1, j_2})_{j_2=1}^\infty)_{j_1=1}^\infty \in Y_1(Y_2(F))$. Iterating we construct the space $Y_1(\dots Y_k(F) \dots)$. The next definition is inspired in [3, 11, 13, 14, 26].

Definition 2.5. A continuous d -linear operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is $(\mathcal{I}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing if

$$\left(\dots \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \right) \right)_{n_k=1}^\infty \dots \right)_{n_1=1}^\infty \in Y_1(\dots Y_k(F) \dots), \quad (5)$$

whenever $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, \dots, d$.

The case where \mathcal{I} is the trivial partition \mathcal{I}_t , that is, $k = 1$ and $\mathcal{I}_t = \{1, \dots, d\}$, is called the *isotropic case*. The other cases, where we have mixed sums, are called *anisotropic cases*.

In the d -tuple $\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \in E_1 \times \dots \times E_d$, for each $s \in \{1, \dots, k\}$ the elements in the r -th coordinate, $r \in I_s$, are indexed by $j_{n_s}^r$ which are indexed by n_s , that is, the indices of the r -th coordinates are indexed by the same n_s . Next we see a few illustrative examples, in which the sequences $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, \dots, d$, are given.

Example 2.6. Considering an arbitrary partition $\mathcal{I} = \{I_1, \dots, I_k\}$ and the sequences $(j_n^1)_{n=1}^\infty = \dots = (j_n^d)_{n=1}^\infty = (n)_{n=1}^\infty$, we have

$$\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r = \sum_{r \in I_1} x_{n_1}^r * e_r + \dots + \sum_{r \in I_k} x_{n_k}^r * e_r,$$

that is, all vectors in the r -th coordinate, $r \in I_s$, $s = 1, \dots, k$, are indexed by the same n_s . Take the trivial partition \mathcal{I}_t . For all $n \in \mathbb{N}$ and $x_n^r \in E_r$, $r = 1, \dots, d$,

$$\begin{aligned} \sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r &= \sum_{r \in \{1, \dots, d\}} x_n^r * e_r = x_n^1 * e_1 + \dots + x_n^d * e_d \\ &= (x_n^1, 0, \dots, 0) + \dots + (0, \dots, 0, x_n^d) = (x_n^1, \dots, x_n^d). \end{aligned}$$

Take now the discrete partition $\mathcal{I}_d = \{I_1, \dots, I_d\} = \{\{1\}, \dots, \{d\}\}$. For all $n_r \in \mathbb{N}$ and $x_{n_r}^r \in E_r$, $r = 1, \dots, d$,

$$\begin{aligned} \sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r &= \sum_{s=1}^d \sum_{r \in I_s} x_{n_s}^r * e_r = \sum_{r \in I_1} x_{n_1}^r * e_r + \dots + \sum_{r \in I_d} x_{n_d}^r * e_r \\ &= \sum_{r \in \{1\}} x_{n_1}^r * e_r + \dots + \sum_{r \in \{d\}} x_{n_d}^r * e_r = x_{n_1}^1 * e_1 + \dots + x_{n_d}^d * e_d \\ &= (x_{n_1}^1, 0, \dots, 0) + \dots + (0, \dots, 0, x_{n_d}^d) = (x_{n_1}^1, \dots, x_{n_d}^d). \end{aligned}$$

By $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$ we mean the class of all operators in $\mathcal{L}(E_1, \dots, E_d; F)$ that are $(B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing. Some simplifications will be adopted:

- $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d)$ if $F = \mathbb{K}$.
- $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}({}^d E; F)$ if $E_1 = \dots = E_d = E$.
- $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$ if $X_1 = \dots = X_d = X$.
- $\mathcal{L}_{X_1, \dots, X_d; kY}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$ if $Y_1 = \dots = Y_k = Y$.

Obvious combinations of these simplifications will be used too.

Remark 2.7. In the isotropic case, where the partition is the trivial one, the sequences of natural numbers that define the block depend on a chosen bijection $\sigma: \mathbb{N} \rightarrow B$ (cf. Example 2.3). In this case, in (5) we have a sequence whose terms are $A(x_{j_1}^1, \dots, x_{j_d}^d)$ with $(j_1, \dots, j_d) \in B$, but the order these terms appear in the sequence depend on σ . This dependence no longer exists if the sequence class Y is *symmetric* in the sense that, for every Banach space F and any sequence $(y_j)_{j=1}^{\infty}$ in F , it holds $(y_j)_{j=1}^{\infty} \in Y(F)$ if and only if $(y_{s(j)})_{j=1}^{\infty} \in Y(F)$ for every permutation $s: \mathbb{N} \rightarrow \mathbb{N}$ and, in this case, $\|(y_j)_{j=1}^{\infty}\|_{Y(F)} = \|(y_{s(j)})_{j=1}^{\infty}\|_{Y(F)}$. For instance, the sequence classes $c_0(\cdot)$, $\ell_p(\cdot)$ and $\ell_p^w(\cdot)$, $1 \leq p \leq \infty$, are symmetric. Symmetric spaces of scalar-valued sequences are treated in [37].

Proposition 2.8. *An operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is $(B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing if and only if the induced map $\widehat{A}_{B_{\mathcal{I}}}: X_1(E_1) \times \dots \times X_d(E_d) \rightarrow Y_1(\dots Y_k(F) \dots)$,*

$$\widehat{A}_{B_{\mathcal{I}}}((x_j^1)_{j=1}^{\infty}, \dots, (x_j^d)_{j=1}^{\infty}) = \left(\dots \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \right) \right)_{n_k=1}^{\infty} \dots \right)_{n_1=1}^{\infty},$$

is a well defined continuous d -linear operator.

Proof. To prove the nontrivial implication, assume that A is $(B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing. Of course the induced map $\widehat{A}_{B_{\mathcal{I}}}$ is well defined. We omit the proof of its

d -linearity. We prove its continuity by applying the closed graph theorem for multilinear operators (see [41]). Let $\bar{x}_l^r = (x_{l,j}^r)_{j=1}^\infty$ and $\bar{x}^r = (x_j^r)_{j=1}^\infty$ be sequences in $X(E_r)$, $r \in \{1, \dots, d\}$ and $l \in \mathbb{N}$, such that $\bar{x}_l^r \xrightarrow{l} \bar{x}^r$ in $X_r(E_r)$, $r = 1, \dots, d$, and

$$\widehat{A}_{B_{\mathcal{I}}}(\bar{x}_l^1, \dots, \bar{x}_l^d) \xrightarrow{l} \left(\cdots (z_{n_1, \dots, n_k})_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty \text{ in } Y_1(\cdots Y_k(F) \cdots). \quad (6)$$

The condition $X_r(\cdot) \xrightarrow{l} \ell_\infty(\cdot)$ guarantees that $x_{l,j}^r \xrightarrow{l} x_j^r$ for every $j \in \mathbb{N}$. Since A is continuous, $A(x_{l,j^1}^1, \dots, x_{l,j^d}^d) \xrightarrow{l} A(x_{j^1}^1, \dots, x_{j^d}^d)$ in F for any $j^1, \dots, j^d \in \mathbb{N}$. In particular, as $j_{n_s}^r \in \mathbb{N}$ for all $s \in \{1, \dots, k\}$ and $r \in I_s$,

$$A\left(\sum_{s=1}^k \sum_{r \in I_s} x_{l, j_{n_s}^r}^r * e_r\right) \xrightarrow{l} A\left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}^r}^r * e_r\right) \text{ in } F, \quad (7)$$

for all $n_1, \dots, n_k \in \mathbb{N}$. And since $\widehat{A}_{B_{\mathcal{I}}}(\bar{x}_l^1, \dots, \bar{x}_l^d) =$

$$\widehat{A}_{B_{\mathcal{I}}}((x_{l,j}^1)_{j=1}^\infty, \dots, (x_{l,j}^d)_{j=1}^\infty) = \left(\cdots \left(A\left(\sum_{s=1}^k \sum_{r \in I_s} x_{l, j_{n_s}^r}^r * e_r\right) \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty,$$

from (6) it follows that

$$\left(\cdots \left(A\left(\sum_{s=1}^k \sum_{r \in I_s} x_{l, j_{n_s}^r}^r * e_r\right) \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty \xrightarrow{l} \left(\cdots (z_{n_1, \dots, n_k})_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty$$

in $Y_1(\cdots Y_k(F) \cdots)$. Therefore, for all $n_1, \dots, n_k \in \mathbb{N}$,

$$A\left(\sum_{s=1}^k \sum_{r \in I_s} x_{l, j_{n_s}^r}^r * e_r\right) \xrightarrow{l} z_{n_1, \dots, n_k} \text{ in } F. \quad (8)$$

From (7) and (8) we conclude that $\widehat{A}_{B_{\mathcal{I}}}(\bar{x}^1, \dots, \bar{x}^d) = \left(\cdots (z_{n_1, \dots, n_k})_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty$, proving that $\widehat{A}_{B_{\mathcal{I}}}$ is continuous. \square

For an operator $A \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$, we define

$$\|A\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k} = \|\widehat{A}_{B_{\mathcal{I}}}\|. \quad (9)$$

Our next purpose is to prove that $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}$ endowed with $\|\cdot\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k}$ is a Banach multi-ideal in the sense of Pietsch [58] (see also [42]). We recall the definition: a subclass \mathcal{M} of the class of multilinear operators between Banach spaces endowed with a function $\|\cdot\|_{\mathcal{M}}: \mathcal{M} \rightarrow \mathbb{R}$ is a Banach multi-ideal if, for all $d \in \mathbb{N}$ and Banach spaces E_1, \dots, E_d, F , the component

$$\mathcal{M}(E_1, \dots, E_d; F) := \mathcal{L}(E_1, \dots, E_d; F) \cap \mathcal{M}$$

enjoys the following:

- $\mathcal{M}(E_1, \dots, E_d; F)$ is a linear subspace of $\mathcal{L}(E_1, \dots, E_d; F)$ containing the operators of the type

$$\varphi_1 \otimes \dots \otimes \varphi_d \otimes b: E_1 \times \dots \times E_d \longrightarrow F, \quad (x^1, \dots, x^d) \mapsto \varphi_1(x^1) \dots \varphi_d(x^d) \cdot b, \quad (10)$$

where $\varphi_m \in E_m^*$, $m = 1, \dots, d$, and $b \in F$; and, moreover,

$$\|I^d: \mathbb{K}^d \longrightarrow \mathbb{K}, \quad I^d(\lambda^1, \dots, \lambda^d) = \lambda^1 \dots \lambda^d\|_{\mathcal{M}} = 1. \quad (11)$$

- $(\mathcal{M}(E_1, \dots, E_d; F), \|\cdot\|_{\mathcal{M}})$ is a Banach space.
- The multi-ideal property: If $A \in \mathcal{M}(E_1, \dots, E_d; F)$, $u_r \in \mathcal{L}(G_r; E_r)$, $r = 1, \dots, d$, and $t \in \mathcal{L}(F; H)$, then $t \circ A \circ (u_1, \dots, u_d) \in \mathcal{M}(G_1, \dots, G_d; H)$ and

$$\|t \circ A \circ (u_1, \dots, u_d)\|_{\mathcal{M}} \leq \|t\| \cdot \|A\|_{\mathcal{M}} \cdot \|u_1\| \dots \|u_d\|.$$

We omit the proof that $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}$ is a linear subspace. We start by proving the multi-ideal property.

Proposition 2.9. *If the sequence classes $X_1, \dots, X_d, Y_1, \dots, Y_k$ are linearly stable, then $(\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}, \|\cdot\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k})$ enjoys the multi-ideal property.*

Proof. Let $A \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$, $u_r \in \mathcal{L}(G_r; E_r)$, $r = 1, \dots, d$, and $v \in \mathcal{L}(F; H)$ be given. For sequences $(x_j^r)_{j=1}^{\infty} \in X_r(G_r)$, $r \in \{1, \dots, d\}$, the linear stability of X_r gives $(u_r(x_j^r))_{j=1}^{\infty} \in X_r(E_r)$, and since A is $(B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing,

$$\begin{aligned} Y_1(\dots Y_k(F) \dots) \ni \widehat{A}_{B_{\mathcal{I}}}((u_1(x_j^1))_{j=1}^{\infty}, \dots, (u_d(x_j^d))_{j=1}^{\infty}) &= \\ &= \left(\dots \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} u_r(x_{j_{n_s}}^r) * e_r \right) \right)_{n_k=1}^{\infty} \dots \right)_{n_1=1}^{\infty} \\ &= \left(\dots \left(A \circ (u_1, \dots, u_d) \left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \right) \right)_{n_k=1}^{\infty} \dots \right)_{n_1=1}^{\infty}. \end{aligned}$$

This proves that $A \circ (u_1, \dots, u_d) \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(G_1, \dots, G_d; F)$ and that

$$(A \circ (u_1, \dots, u_d))_{B_{\mathcal{I}}}^{\widehat{}} = \widehat{A}_{B_{\mathcal{I}}} \circ (\widehat{u}_1, \dots, \widehat{u}_d),$$

where $\widehat{u}_r: X_r(E_r) \longrightarrow X(F)$ is the linear operator induced by u_r .

Using the linear stability of Y_1, \dots, Y_k we have that the linear operator $\widehat{v}: Y_k(F) \longrightarrow Y_k(H)$ induced by v is linear, continuous and $\|\widehat{v}\| = \|v\|$. The same happens with $\widehat{v}^2 := \widehat{v}: Y_{k-1}(Y_k(F)) \longrightarrow Y_{k-1}(Y_k(H))$ and with its successive induced operators, until we reach the induced operator $\widehat{v}^k: Y_1(\dots Y_k(F) \dots) \longrightarrow Y_1(\dots Y_k(H) \dots)$,

$$\widehat{v}^k \left(\dots (y_{j_1, \dots, j_k})_{j_k=1}^{\infty} \dots \right)_{j_1=1}^{\infty} = \left(\dots (v(y_{j_1, \dots, j_k}))_{j_k=1}^{\infty} \dots \right)_{j_1=1}^{\infty},$$

which is linear continuous and $\|\widehat{v}^k\| = \|\widehat{v}^{k-1}\| = \dots = \|\widehat{v}^2\| = \|v\|$. So, for sequences $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, \dots, d$, since $A \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$, we have

$$\widehat{A}_{B_{\mathcal{I}}}((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) \in Y_1(\dots Y_k(F) \dots),$$

therefore,

$$\begin{aligned} Y_1(\dots Y_k(H) \dots) \ni \widehat{v}^k \circ \widehat{A}_{B_{\mathcal{I}}}((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) \\ = \left(\dots \left(v \circ A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \right) \right)_{n_k=1}^\infty \dots \right)_{n_1=1}^\infty. \end{aligned}$$

proving that $v \circ A \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; H)$ and that $(v \circ A)_{B_{\mathcal{I}}} = \widehat{v}^k \circ \widehat{A}_{B_{\mathcal{I}}}$. It follows that

$$v \circ A \circ (u_1, \dots, u_d) \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(G_1, \dots, G_d; H)$$

and

$$\begin{aligned} \|v \circ A \circ (u_1, \dots, u_d)\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k} &= \|(v \circ A \circ (u_1, \dots, u_d))_{B_{\mathcal{I}}}\| \\ &= \|\widehat{v}^k \circ \widehat{A}_{B_{\mathcal{I}}}(\widehat{u}_1, \dots, \widehat{u}_d)\| \leq \|\widehat{v}^k\| \cdot \|\widehat{A}_{B_{\mathcal{I}}}\| \cdot \prod_{r=1}^d \|\widehat{u}_r\| = \|v\| \cdot \|A\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k} \cdot \prod_{r=1}^d \|u_r\|. \end{aligned}$$

□

Next we identify a Hölder-type condition which is necessary for $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}} \neq \{0\}$ and sufficient for $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}$ to contain the operators of the type (10).

Proposition 2.10. *Suppose that the sequence classes $X_1, \dots, X_d, Y_1, \dots, Y_k$ are linearly stable.*

(a) *If there exists a nonzero operator $A \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$, then*

$$\left(\dots \left(\prod_{s=1}^k \prod_{r \in I_s} \lambda_{j_{n_s}}^r \right)_{n_k=1}^\infty \dots \right)_{n_1=1}^\infty \in Y_1(\dots Y_k(\mathbb{K}) \dots) \quad (12)$$

whenever $(\lambda_j^r)_{j=1}^\infty \in X_r(\mathbb{K})$, $r = 1, \dots, d$.

(b) *If (12) holds, then $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$ contains the operators of the type (10).*

Proof. (a) Let $(x^1, \dots, x^d) \in E_1 \times \dots \times E_d$ be such that $A(x^1, \dots, x^d) \neq 0$. By the Hahn-Banach Theorem there exists $\psi \in F^*$ such that $\psi(A(x^1, \dots, x^d)) = \|A(x^1, \dots, x^d)\|$. Taking successive induced operators as in the proof of Proposition 2.9(2), we end up with a bounded linear operator $\widehat{\psi}^k: Y_1(\dots Y_k(F) \dots) \longrightarrow Y_1(\dots Y_k(\mathbb{K}) \dots)$ given by

$$\widehat{\psi}^k \left(\dots (y_{j_1, \dots, j_k})_{j_k=1}^\infty \dots \right)_{j_1=1}^\infty = \left(\dots (\psi(y_{j_1, \dots, j_k}))_{j_k=1}^\infty \dots \right)_{j_1=1}^\infty.$$

For $r = 1, \dots, d$, let $u_r \in \mathcal{L}(\mathbb{K}; E_r)$ be defined by $u_r(\lambda) = \lambda x^r$, and consider the induced bounded linear operator $\widehat{u}_r \in \mathcal{L}(X(\mathbb{K}), X(E_r))$. By Proposition 2.9 it follows that $\psi \circ A \circ (u_1, \dots, u_d) \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}({}^d\mathbb{K}; \mathbb{K})$. So, for $(\lambda_j^r)_{j=1}^\infty \in X_r(\mathbb{K})$, $r = 1, \dots, d$,

$$\begin{aligned} Y_1(\cdots Y_k(\mathbb{K}) \cdots) &\ni (\psi \circ A \circ (u_1, \dots, u_d))_{B_{\mathcal{I}}} \left((\lambda_j^1)_{j=1}^\infty, \dots, (\lambda_j^d)_{j=1}^\infty \right) \\ &= \|A(x^1, \dots, x^d)\| \cdot \left(\cdots \left(\prod_{s=1}^k \prod_{r \in I_s} \lambda_{j_{n_s}}^r \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty, \end{aligned}$$

where the equality results from a boring computation. Now use that $Y_1(\cdots Y_k(\mathbb{K}) \cdots)$ is a linear space,

(b) Let $I^d: \mathbb{K}^d \rightarrow \mathbb{K}$ be the operator of condition (11). Given scalar sequences $(\lambda_j^r)_{j=1}^\infty \in X_r(\mathbb{K})$, $r = 1, \dots, d$, since

$$I^d \left(\sum_{s=1}^k \sum_{r \in I_s} \lambda_{j_{n_s}}^r * e_r \right) = I^d \left(\sum_{r \in I_1} \lambda_{j_{n_1}}^r * e_r + \cdots + \sum_{r \in I_k} \lambda_{j_{n_k}}^r * e_r \right) = \prod_{s=1}^k \prod_{r \in I_s} \lambda_{j_{n_s}}^r$$

for all $n_1, \dots, n_k \in \mathbb{N}$, the assumption (12) gives that

$$\left(\cdots \left(I^d \left(\sum_{s=1}^k \sum_{r \in I_s} \lambda_{j_{n_s}}^r * e_r \right) \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty = \left(\cdots \left(\prod_{s=1}^k \prod_{r \in I_s} \lambda_{j_{n_s}}^r \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty \quad (13)$$

belongs to $Y_1(\cdots Y_k(\mathbb{K}) \cdots)$, proving that I^d is $(B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k)$ -summing.

For $\varphi_r \in E_r^*$, $r = 1, \dots, d$, and $b \in F$, considering the operator $u: \mathbb{K} \rightarrow F$ given by $u(\lambda) = \lambda b$, by Proposition 2.9 we get

$$\varphi_1 \otimes \cdots \otimes \varphi_d \otimes b = u \circ I^d \circ (\varphi_1, \dots, \varphi_d) \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F).$$

□

Now it is quite natural to suppose the Hölder-type condition (12) together with the corresponding norm inequality.

Definition 2.11. Let $X_1, \dots, X_d, Y_1, \dots, Y_k$ be sequence classes. We say that the $(d+k)$ -tuple $(X_1, \dots, X_d, Y_1, \dots, Y_k)$ is $B_{\mathcal{I}}$ -compatível if, regardless of the scalar sequences $(\lambda_j^r)_{j=1}^\infty \in X_r(\mathbb{K})$, $r = 1, \dots, d$, it holds

$$\left(\cdots \left(\prod_{s=1}^k \prod_{r \in I_s} \lambda_{j_{n_s}}^r \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty \in Y_1(\cdots (Y_k(\mathbb{K}) \cdots)) \quad \text{and} \quad (14)$$

$$\left\| \left(\cdots \left(\prod_{s=1}^k \prod_{r \in I_s} \lambda_{j_{n_s}}^r \right)_{n_k=1}^\infty \cdots \right)_{n_1=1}^\infty \right\|_{Y_1(\cdots (Y_k(\mathbb{K}) \cdots))} \leq \prod_{r=1}^d \|(\lambda_j^r)_{j=1}^\infty\|_{X_r(\mathbb{K})}. \quad (15)$$

In some cases the compatibility condition sounds familiar:

Example 2.12. For $q, p_1, \dots, p_d \geq 1$, Hölder's inequality asserts that $\frac{1}{q} \leq \frac{1}{p_1} + \dots + \frac{1}{p_d}$ if and only if the $(d+1)$ -tuple $(\ell_{p_1}(\cdot), \dots, \ell_{p_d}(\cdot); \ell_q(\cdot))$ is \mathbb{N}^d -compatible.

For further examples, see Propositions 3.1, 3.3 and 3.5.

In the next lemma we need to regard a vector $(x^1, \dots, x^d) \in E_1 \times \dots \times E_d$ by means of the partition $\mathcal{I} = \{I_1, \dots, I_k\}$ in the following way:

$$\sum_{s=1}^k \sum_{r \in I_s} x^r * e_r = \sum_{r \in I_1} x^r * e_r + \dots + \sum_{r \in I_k} x^r * e_r = (x^1, \dots, x^d). \quad (16)$$

Lemma 2.13. *If the sequence classes $X_1, \dots, X_d, Y_1, \dots, Y_k$ are linearly stable and $A \in \mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$, then $\|A\| \leq \|A\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k}$.*

Proof. Given $(x^1, \dots, x^d) \in E_1 \times \dots \times E_d$ and $r = 1, \dots, d$, consider the sequence $(y_j^r)_{j=1}^\infty = x^r \cdot e_{j_1^r}$. So, $\sum_{s=1}^k \sum_{r \in I_s} y_{j_{n_s}}^r * e_r$ has some null coordinate if $n_s \neq 1$ for some $s \in \{1, \dots, k\}$. If $n_1 = \dots = n_k = 1$, then $\sum_{s=1}^k \sum_{r \in I_s} y_{j_{n_s}}^r * e_r = \sum_{s=1}^k \sum_{r \in I_s} x^r * e_r$. Thus, applying [24, Lemma 2.4] repeated times, we get

$$\begin{aligned} \left\| \widehat{A}_{B_{\mathcal{I}}} \left((y_j^1)_{j=1}^\infty, \dots, (y_j^d)_{j=1}^\infty \right) \right\|_{Y_1(\dots Y_k(F) \dots)} &= \\ &= \left\| \left(\dots \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} y_{j_{n_s}}^r * e_r \right) \right)_{n_k=1} \dots \right)_{n_1=1} \right\|_{Y_1(\dots Y_k(F) \dots)} \\ &= \left\| \left(\dots \left(\left(A \left(\sum_{s=1}^k \sum_{r \in I_s} y_{j_1}^r * e_r \right) \right) \cdot e_1 \right) \dots \right) \cdot e_1 \right\|_{Y_1(\dots Y_k(F) \dots)} \\ &= \left\| A \left(\sum_{s=1}^k \sum_{r \in I_s} x^r * e_r \right) \right\|_F = \|A(x^1, \dots, x^d)\|_F, \end{aligned}$$

where the last equality comes from (16). To complete the proof, note that

$$\begin{aligned} \|A(x^1, \dots, x^d)\|_F &= \left\| \widehat{A}_{B_{\mathcal{I}}} \left((y_j^1)_{j=1}^\infty, \dots, (y_j^d)_{j=1}^\infty \right) \right\|_{Y_1(\dots Y_k(F) \dots)} \leq \|\widehat{A}_{B_{\mathcal{I}}}\| \cdot \prod_{r=1}^d \|(y_j^r)_{j=1}^\infty\|_{X_r(E_r)} \\ &= \|\widehat{A}_{B_{\mathcal{I}}}\| \cdot \prod_{r=1}^d \|x^r \cdot e_{j_1^r}\|_{X_r(E_r)} = \|A\|_{B_{\mathcal{I}}; X_1, \dots, X_d; Y_1, \dots, Y_k} \cdot \prod_{r=1}^d \|x^r\|_{E_r}. \end{aligned}$$

□

Proposition 2.14. *If the sequence classes $X_1, \dots, X_d, Y_1, \dots, Y_k$ are linearly stable, then the expression (9) defines a norm on the class $\mathcal{L}_{X_1, \dots, X_d; Y_1, \dots, Y_k}^{B_{\mathcal{I}}}$.*

Proof. If $\|A\|_{B_{\mathcal{T};X_1,\dots,X_d;Y_1,\dots,Y_k}} = 0$, then $A = 0$ by Lemma 2.13. The remaining norm axioms follow from the linearity of the correspondence $A \mapsto \widehat{A}_{B_{\mathcal{T}}}$. \square

Theorem 2.15. *Let $X_1, \dots, X_d, Y_1, \dots, Y_k$ be $B_{\mathcal{T}}$ -compatible linearly stable sequence classes. Then $(\mathcal{L}_{X_1,\dots,X_d;Y_1,\dots,Y_k}^{B_{\mathcal{T}}}, \|\cdot\|_{B_{\mathcal{T};X_1,\dots,X_d;Y_1,\dots,Y_k}})$ is a Banach ideal of d -linear operators.*

Proof. Bearing in mind Propositions 2.10(b), 2.9 and 2.14, all that is left to prove is the equality $\|I^d\|_{B_{\mathcal{T};X_1,\dots,X_d;Y_1,\dots,Y_k}} = 1$ and the completeness. For the equality, in

$$1 = \|I^d\| \leq \|I^d\|_{B_{\mathcal{T};X_1,\dots,X_d;Y_1,\dots,Y_k}} \leq 1,$$

the first inequality comes from Lemma 2.13 and the second from an obvious combination of (13) with (15). The completeness of the space $\mathcal{L}_{X_1,\dots,X_d;Y_1,\dots,Y_k}^{B_{\mathcal{T}}}(E_1, \dots, E_d; F)$ with respect to the norm $\|\cdot\|_{B_{\mathcal{T};X_1,\dots,X_d;Y_1,\dots,Y_k}}$ can be proved by a standard argument using Lemma 2.13 and the fact that convergence in a sequence class implies coordinatewise convergence, which follows from the assumption $X(\cdot) \xrightarrow{1} \ell_{\infty}(\cdot)$. We omit the (long and boring) details. \square

3 Recovering the already studied classes

In this section we show that the several classes of summing multilinear operators defined by the transformation of vector-valued sequences that have been studied in the literature are particular instances of our general construction. This includes, in particular, some classes that were not recovered in [26].

3.1 $(X_1, \dots, X_d; Y)$ -summing operators

Given sequence classes X_1, \dots, X_d, Y , an operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is $(X_1, \dots, X_d; Y)$ -summing according to [24] if $(A(x_n^1, \dots, x_n^d))_{n=1}^{\infty} \in Y(F)$ whenever $(x_j^r)_{j=1}^{\infty} \in X_r(E_r)$, $r = 1, \dots, d$. The space $\mathcal{L}_{X_1,\dots,X_d;Y}(E_1, \dots, E_d; F)$ of such operators become a Banach space with the norm

$$\|A\|_{X_1,\dots,X_d;Y} = \|\widehat{A}: X(E_1) \times \dots \times X(E_d) \longrightarrow Y(F)\|.$$

Moreover, the class $\mathcal{L}_{X_1,\dots,X_d;Y}$ is a Banach ideal of d -linear operators if the underlying sequence classes are linearly stable and satisfy the condition $X_1(\mathbb{K}) \cdots X_d(\mathbb{K}) \xrightarrow{1} Y(\mathbb{K})$, meaning that $(\lambda_j^1 \cdots \lambda_j^d)_{j=1}^{\infty} \in Y(\mathbb{K})$ and $\|(\lambda_j^1 \cdots \lambda_j^d)_{j=1}^{\infty}\|_{Y(\mathbb{K})} \leq \prod_{r=1}^d \|(\lambda_j^r)_{j=1}^{\infty}\|_{X_r(\mathbb{K})}$ whenever $(\lambda_j^r)_{j=1}^{\infty} \in X_r(\mathbb{K})$, $r = 1, \dots, d$.

To recover this class we recall the diagonal block $D(\mathbb{N}^d) = \{(j, \dots, j) : j \in \mathbb{N}\}$ from Example 2.2 associated to the trivial partition and to the sequences $(j_n^1)_{n=1}^{\infty} = \dots = (j_n^d)_{n=1}^{\infty} = (n)_{n=1}^{\infty}$.

Proposition 3.1. *If the sequence classes X_1, \dots, X_d e Y are linearly stable, then $\mathcal{L}_{X_1,\dots,X_d;Y} = \mathcal{L}_{X_1,\dots,X_d;Y}^{D(\mathbb{N}^d)}$ isometrically and $X_1(\mathbb{K}) \cdots X_d(\mathbb{K}) \xrightarrow{1} Y(\mathbb{K})$ if and only if the $(d+1)$ -tuple (X_1, \dots, X_d, Y) is $D(\mathbb{N}^d)$ -compatible.*

Proof. We have $\mathcal{I}_t = \{I_1\}$ with $I_1 = \{1, \dots, d\}$. For an operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$, $A \in \mathcal{L}_{X_1, \dots, X_d; Y}^{D(\mathbb{N}^d)}(E_1, \dots, E_d; F)$ if and only if, for all sequences $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, \dots, d$,

$$\begin{aligned} Y(F) \ni \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \right) \right)_{n_1=1}^\infty &= \left(A \left(\sum_{r \in \{1, \dots, d\}} x_{j_{n_1}}^r * e_r \right) \right)_{n_1=1}^\infty \\ &= \left(A \left(\sum_{r \in \{1, \dots, d\}} x_{n_1}^r * e_r \right) \right)_{n_1=1}^\infty = (A(x_n^1, \dots, x_n^d))_{n=1}^\infty, \end{aligned}$$

if and only if A is $(X_1, \dots, X_d; Y)$ -summing. The equality of norms follows from $\widehat{A} = \widehat{A}_{D(\mathbb{N}^d)}$. For the second statement, note that $X_1(\mathbb{K}) \cdots X_d(\mathbb{K}) \xrightarrow{1} Y(\mathbb{K})$ if and only if $I^d \in \mathcal{L}_{X_1, \dots, X_d; Y}(\mathbb{K}^d; \mathbb{K})$ and $\|I^d\|_{X_1, \dots, X_d; Y} \leq 1$ if and only if (X_1, \dots, X_d, Y) is $D(\mathbb{N}^d)$ -compatible. \square

We list a few classes of summing operators that Proposition 3.1 recovers as particular cases of our construction:

- The class of absolutely $(q; p_1, \dots, p_d)$ -summing d -linear operators defined in the introduction. In our terminology, this is the class of $(D(\mathbb{N}^d); \ell_{p_1}^w(\cdot), \dots, \ell_{p_d}^w(\cdot); \ell_q(\cdot))$ -summing operators.
- The class of cotype q multilinear operators, $q \geq 1$, considered in [23], which is the class of $(D(\mathbb{N}^d); \text{Rad}(\cdot), \dots, \text{Rad}(\cdot); \ell_q(\cdot))$ -summing operators in our notation.
- The class of weakly summing $(q; p_1, \dots, p_d)$ -summing d -linear operators, $\frac{1}{q} \leq \frac{1}{p_1} + \dots + \frac{1}{p_d}$, studied in, e.g., [18, 24, 44, 59]. This is the class of $(D(\mathbb{N}^d); \ell_{p_1}^w(\cdot), \dots, \ell_{p_d}^w(\cdot); \ell_q^w(\cdot))$ -summing operators.
- The class of type (p_1, \dots, p_d) d -linear operators, $\frac{1}{2} \leq \frac{1}{p_1} + \dots + \frac{1}{p_d} < 1$, treated in [23], which is the class of $(D(\mathbb{N}^d); \ell_{p_1}(\cdot), \dots, \ell_{p_d}(\cdot); \text{Rad}(\cdot))$ -summing operators.

The first two classes above are also encompassed by the construction of [26], the last two ones are not.

3.2 Multiple $(\gamma_s; X_1, \dots, X_d)$ -summing operators

Here we show that all classes of multilinear operators studied in [62] are particular instances of our general construction. This reinforces that this construction goes far beyond the one in [26], because the one and only class among the ones considered in [62] that is recovered in [26] is the class of multiple $(q; p_1, \dots, p_d)$ -summing operators.

To recover the general case from [62] we need to recall the following notions:

- For $d \in \mathbb{N}$, a d -sequence in E is a function $g: \mathbb{N}^d \rightarrow E$. Writing $g(j^1, \dots, j^d) = x_{j^1, \dots, j^d}$ for all $j^1, \dots, j^d \in \mathbb{N}$, g can be represented by $(x_{j^1, \dots, j^d})_{j^1, \dots, j^d=1}^\infty$.
- $c_{00}(E; \mathbb{N}^d) := \left\{ (x_{j^1, \dots, j^d})_{j^1, \dots, j^d=1}^\infty : x_{j^1, \dots, j^d} \neq 0 \text{ only for finitely many } j^1, \dots, j^d \right\}$.
- $\ell_\infty(E; \mathbb{N}^d) = \left\{ (x_{j^1, \dots, j^d})_{j^1, \dots, j^d=1}^\infty : \sup_{j^1, \dots, j^d \in \mathbb{N}} \|x_{j^1, \dots, j^d}\|_E < \infty \right\}$.

- For $k_1, \dots, k^d \in \mathbb{N}$, $e_{k^1, \dots, k^d}: \mathbb{N}^d \longrightarrow \mathbb{K}$ is the d -sequence given by

$$e_{k^1, \dots, k^d}(j^1, \dots, j^d) = \begin{cases} 1, & \text{if } j^1 = k^1, \dots, j^d = k^d \\ 0, & \text{otherwise.} \end{cases}$$

- A d -sequence class is a map $\gamma_s(\cdot; \mathbb{N}^d)$ that assigns to each Banach space E a Banach space $\gamma_s(E; \mathbb{N}^d)$ of E -valued d -sequences with the coordinatewise algebraic operations such that $c_{00}(E; \mathbb{N}^d) \subset \gamma_s(E; \mathbb{N}^d) \xrightarrow{1} \ell_\infty(E; \mathbb{N}^d)$ and $\|e_{k^1, \dots, k^d}\|_{\gamma_s(\mathbb{K}; \mathbb{N}^d)} = 1$ for all $k^1, \dots, k^d \in \mathbb{N}$.

- Given a d -sequence class $\gamma_s(\cdot; \mathbb{N}^d)$ and sequence classes X_1, \dots, X_d , according to [62] an operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is said to be *multiple* $(\gamma_s; X_1, \dots, X_d)$ -*summing* if $\left(A \left(x_{j^1}^1, \dots, x_{j^d}^d\right)\right)_{j^1, \dots, j^d=1}^\infty \in \gamma_s(F; \mathbb{N}^d)$ whenever $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, \dots, d$. The set $\mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m(E_1, \dots, E_d; F)$ of all such operators becomes a Banach space with the norm $\|\cdot\|_{\mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m}$ given by the norm of the induced d -linear operator $\widehat{A}: X_1(E_1) \times \dots \times X_d(E_d) \longrightarrow \gamma_s(F; \mathbb{N}^d)$.

The key to recover these spaces from our framework is to establish an interplay between sequence classes and d -sequence classes. We do that considering the block $B = \mathbb{N}^d$ as in Example 2.3, defined by a fixed bijection $\sigma: \mathbb{N} \longrightarrow \mathbb{N}^d$ and sequences of natural numbers (j_n^r) , $r = 1, \dots, d$, where $\sigma(n) = (j_n^1, \dots, j_n^d)$ for every $n \in \mathbb{N}$. We omit the proof of the following lemma.

Lemma 3.2. *Given a d -sequence class $\gamma_s(\cdot; \mathbb{N}^d)$, the correspondence $E \mapsto Y_{\gamma_s}(E)$, where*

$$Y_{\gamma_s}(E) := \{(g \circ \sigma(n))_{n=1}^\infty \in E^{\mathbb{N}} : g \in \gamma_s(E; \mathbb{N}^d)\}, \quad \|(g \circ \sigma(n))_{n=1}^\infty\|_{Y_{\gamma_s}(E)} := \|g\|_{\gamma_s(E; \mathbb{N}^d)}, \quad (17)$$

is a sequence class.

To get a Banach ideal of multilinear operators, the following condition was imposed on the class $\mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m$ in [62]: the symbol $X_1(\mathbb{K}) \cdots X_d(\mathbb{K}) \xrightarrow{\text{mult}, 1} \gamma_s(\mathbb{K}; \mathbb{N}^d)$ means that $(\lambda_{j^1}^1 \cdots \lambda_{j^d}^d)_{j^1, \dots, j^d=1}^\infty \in \gamma_s(\mathbb{K}; \mathbb{N}^d)$ and

$$\left\| (\lambda_{j^1}^1 \cdots \lambda_{j^d}^d)_{j^1, \dots, j^d=1}^\infty \right\|_{\gamma_s(\mathbb{K}; \mathbb{N}^d)} \leq \prod_{r=1}^d \left\| (\lambda_j^r)_{j=1}^\infty \right\|_{X_r(E_r)}$$

whenever $(\lambda_j^r)_{j=1}^\infty \in X_r(\mathbb{K})$, $r = 1, \dots, d$. The next recovers shows that our construction recovers the general case from [62]. Recall that $\mathcal{L}_{X_1, \dots, X_d; Y_{\gamma_s}}^{\mathbb{N}^d}$ is the class of $(\mathbb{N}^d; X_1, \dots, X_d; Y_{\gamma_s})$ -summing operators in the sense of Section 2.

Proposition 3.3. *Let X_1, \dots, X_d be sequence classes and $\gamma_s(\cdot; \mathbb{N}^d)$ be a d -sequence class such that $X_1(\mathbb{K}) \cdots X_d(\mathbb{K}) \xrightarrow{\text{mult}, 1} \gamma_s(\mathbb{K}; \mathbb{N}^d)$. Then the $(d+1)$ -tuple $(X_1, \dots, X_d, Y_{\gamma_s})$ is \mathbb{N}^d -compatible and*

$$\mathcal{L}_{X_1, \dots, X_d; Y_{\gamma_s}}^{\mathbb{N}^d}(E_1, \dots, E_d; F) = \mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m(E_1, \dots, E_d; F)$$

isometrically for all Banach spaces E_1, \dots, E_d, F .

Proof. Let $(\lambda_j^r)_{j=1}^\infty \in X_r(\mathbb{K})$, $r = 1, \dots, d$, be given. The assumption $X_1(\mathbb{K}) \cdots X_d(\mathbb{K}) \xrightarrow{\text{mult},1} \gamma_s(\mathbb{K}; \mathbb{N}^d)$ gives that $(\lambda_{j_1}^1 \cdots \lambda_{j_d}^d)_{j_1, \dots, j_d=1}^\infty \in \gamma_s(\mathbb{K}; \mathbb{N}^d)$. Defining $g: \mathbb{N}^d \rightarrow \mathbb{K}$ by $g(j^1, \dots, j^d) = \lambda_{j_1}^1 \cdots \lambda_{j_d}^d$, by (17) we get $(g \circ \sigma(n))_{n=1}^\infty \in Y_{\gamma_s}(\mathbb{K})$. Therefore,

$$\left(\lambda_{j_n}^1 \cdots \lambda_{j_n}^d \right)_{n=1}^\infty = (g(j_n^1, \dots, j_n^d))_{n=1}^\infty = (g \circ \sigma(n))_{n=1}^\infty \in Y_{\gamma_s}(\mathbb{K}) \quad e$$

$$\begin{aligned} \left\| \left(\lambda_{j_n}^1 \cdots \lambda_{j_n}^d \right)_{n=1}^\infty \right\|_{Y_{\gamma_s}(\mathbb{K})} &= \|(g \circ \sigma(n))_{n=1}^\infty\|_{Y_{\gamma_s}(\mathbb{K})} = \|g\|_{\gamma_s(\mathbb{K}; \mathbb{N}^d)} \\ &= \left\| (\lambda_{j_1}^1 \cdots \lambda_{j_d}^d)_{j_1, \dots, j_d=1}^\infty \right\|_{\gamma_s(\mathbb{K}; \mathbb{N}^d)} \leq \prod_{r=1}^d \left\| (\lambda_j^r)_{j=1}^\infty \right\|_{X_r(E_r)}, \end{aligned}$$

proving that $(X_1, \dots, X_d, Y_{\gamma_s})$ is \mathbb{N}^d -compatible.

Let the sequences $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, \dots, d$, be given. On the one hand, if $A \in \mathcal{L}_{X_1, \dots, X_d; Y_{\gamma_s}}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$ then $\left(A(x_{j_n}^1, \dots, x_{j_n}^d) \right)_{n=1}^\infty \in Y_{\gamma_s}(F)$, hence there exists $g \in \gamma_s(F; \mathbb{N}^d)$ such that $(g \circ \sigma(n))_{n=1}^\infty = \left(A(x_{j_n}^1, \dots, x_{j_n}^d) \right)_{n=1}^\infty$. For every $(j^1, \dots, j^d) \in \mathbb{N}^d$ there is a unique natural number n such that $(j^1, \dots, j^d) = \sigma(n)$, so

$$A(x_{j_1}^1, \dots, x_{j_d}^d) = g \circ \sigma(n) = g(j^1, \dots, j^d).$$

It follows that

$$\gamma_s(F; \mathbb{N}^d) \ni (g(j^1, \dots, j^d))_{j^1, \dots, j^d=1}^\infty = (A(x_{j_1}^1, \dots, x_{j_d}^d))_{j^1, \dots, j^d=1}^\infty,$$

proving that $A \in \mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m(E_1, \dots, E_d; F)$. On the other hand, suppose that $A \in \mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m(E_1, \dots, E_d; F)$. Defining

$$g: \mathbb{N}^d \rightarrow F, \quad g(j^1, \dots, j^d) = A(x_{j_1}^1, \dots, x_{j_d}^d),$$

we have $g \in \gamma_s(F; \mathbb{N}^d)$, from which it follows that

$$Y(F) \ni (g \circ \sigma(n))_{n=1}^\infty = (g(j_n^1, \dots, j_n^d))_{n=1}^\infty = \left(A(x_{j_n}^1, \dots, x_{j_n}^d) \right)_{n=1}^\infty,$$

showing that $A \in \mathcal{L}_{X_1, \dots, X_d; Y_{\gamma_s}}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$. Moreover,

$$\begin{aligned} \|A\|_{\mathcal{L}_{\gamma_s; X_1, \dots, X_d}^m} &= \|\widehat{A}: X_1(E_1) \times \cdots \times X_d(E_d) \rightarrow \gamma_s(F; \mathbb{N}^d)\| \\ &= \sup \left\{ \left\| \left(A(x_{j_1}^1, \dots, x_{j_d}^d) \right)_{j_1, \dots, j_d=1}^\infty \right\|_{\gamma_s(F; \mathbb{N}^d)} : (x_j^r)_{j=1}^\infty \in B_{X_r(E_r)}, r = 1, \dots, d \right\} \\ &= \sup \left\{ \|g\|_{\gamma_s(F; \mathbb{N}^d)} : (x_j^r)_{j=1}^\infty \in B_{X_r(E_r)}, r = 1, \dots, d \right\} \\ &= \sup \left\{ \|(g \circ \sigma(n))_{n=1}^\infty\|_{Y_{\gamma_s}(F)} : (x_j^r)_{j=1}^\infty \in B_{X_r(E_r)}, r = 1, \dots, d \right\} \\ &= \sup \left\{ \left\| \left(A(x_{j_n}^1, \dots, x_{j_n}^d) \right)_{n=1}^\infty \right\|_{Y_{\gamma_s}(F)} : (x_j^r)_{j=1}^\infty \in B_{X_r(E_r)}, r = 1, \dots, d \right\} \\ &= \|A\|_{\mathbb{N}^d; X_1, \dots, X_d; Y_{\gamma_s}}. \end{aligned}$$

□

Example 3.4. Among the classes encompassed by [62], which are recovered by our construction by Proposition 3.3, we mention the following:

(a) The class of multiple (p, q_1, \dots, q_d) -summing multilinear operators studied in, e.g., [16, 22, 28, 38, 47, 56], which, in our terminology, is the class of $(\mathbb{N}^d; \ell_{q_1}^w(\cdot), \dots, \ell_{q_d}^w(\cdot); \ell_p(\cdot))$ -summing operators.

(b) The class of strongly Cohen multiple p -summing operators introduced in [30], which is the class of $(\mathbb{N}^d; \ell_p(\cdot), \dots, \ell_p(\cdot); \ell_p(\cdot))$ -summing operators.

(c) The class of weakly multiple mid $(p; q_1, \dots, q_d)$ -summing operators introduced in [25]. Investigating the sequence spaces introduced in [43], the sequence class $\ell_p^{\text{mid}}(\cdot)$, $1 \leq p < \infty$, of mid p -summable sequences was defined in [25]. The class of multilinear operators we are referring to is the class of $(\mathbb{N}^d; \ell_{q_1}^w(\cdot), \dots, \ell_{q_d}^w(\cdot); \ell_p^{\text{mid}}(\cdot))$ -summing operators.

The following two examples were first studied in [62].

(d) The class of strongly multiple (s, q, p) -mixing operators, $1 \leq q \leq s \leq \infty$, $p \leq q$. This is the class of $(\mathbb{N}^d; \ell_{m(s,q)}(\cdot), \dots, \ell_{m(s,q)}(\cdot); \ell_p(\cdot))$ -summing operators, where $\ell_{m(s,q)}(E)$ is the space of mixed (s, q) -summable E -valued sequences (see [57]).

(e) The class of strongly multiple mid p -summing operators, $1 \leq p < \infty$, which is the class of $(\mathbb{N}^d; \ell_p^{\text{mid}}(\cdot), \dots, \ell_p^{\text{mid}}(\cdot); \ell_p(\cdot))$ -summing operators.

3.3 Partially multiple summing operators

This class of operators was investigated in [3, 6, 13] and it was the main motivation for Definition 2.5. Only a few specific cases of this class were recovered in [26]. Here we will recover the general case of this class as a particular instance of our construction.

Fixed a partition $\mathcal{I} = \{I_1, \dots, I_k\}$ of $\{1, \dots, d\}$ and given $(\mathbf{p}, \mathbf{q}) := (p_1, \dots, p_d, q_1, \dots, q_k) \in [1, \infty)^{d+k}$, $\frac{1}{q_s} \leq \sum_{r \in I_s} \frac{1}{p_r}$ for every $s \in \{1, \dots, k\}$, a d -linear operator $A: E_1 \times \dots \times E_d \rightarrow F$ is said to be \mathcal{I} -partially multiple $(\mathbf{q}; \mathbf{p})$ -summing if there exists a constant $C > 0$ such that

$$\left(\sum_{n_1=1}^{\infty} \left(\dots \left(\sum_{n_k=1}^{\infty} \left\| A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{n_s}^r * e_r \right) \right\|^{q_k} \right)^{\frac{q_{k-1}}{q_k}} \dots \right)^{\frac{q_1}{q_2}} \right)^{\frac{1}{q_1}} \leq C \cdot \prod_{r=1}^d \| (x_j^r)_{j=1}^{\infty} \|_{w, p_r}$$

for any sequences $(x_j^r)_{j=1}^{\infty} \in \ell_{p_r}^w(E_r)$, $r = 1, \dots, d$. The \mathcal{I} -partially multiple $(\mathbf{q}; \mathbf{p})$ -summing norm of A is defined as the infimum of all such constants C and denoted by $\pi_{(\mathbf{q}; \mathbf{p})}(A)$. The Banach space of all such operators is denoted by $\prod_{(\mathbf{q}; \mathbf{p})}^{k, d, \mathcal{I}}(E_1, \dots, E_d; F)$.

Proposition 3.5. *For all Banach spaces E_1, \dots, E_d, F ,*

$$\prod_{(\mathbf{q}; \mathbf{p})}^{k, d, \mathcal{I}}(E_1, \dots, E_d; F) = \mathcal{L}_{\ell_{p_1}^w(\cdot), \dots, \ell_{p_d}^w(\cdot); \ell_{q_1}(\cdot), \dots, \ell_{q_k}(\cdot)}^{B_{\mathcal{I}}}(E_1, \dots, E_d; F)$$

isometrically, where $B_{\mathcal{I}}$ is the block associated to the partition \mathcal{I} and to the sequences $(j_n^1)_{j=1}^{\infty} = \dots = (j_n^d)_{j=1}^{\infty} = (n)_{n=1}^{\infty}$. Moreover, $\frac{1}{q_s} \leq \sum_{r \in I_s} \frac{1}{p_r}$ for every $s \in \{1, \dots, k\}$ if and only if the $(d+k)$ -tuple $(\ell_{p_1}^w(\cdot), \dots, \ell_{p_d}^w(\cdot); \ell_{q_1}(\cdot), \dots, \ell_{q_k}(\cdot))$ is $B_{\mathcal{I}}$ -compatible.

Proof. For an operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$, $A \in \mathcal{L}_{\ell_{p_1}^w(\cdot), \dots, \ell_{p_d}^w(\cdot); \ell_{q_1}(\cdot), \dots, \ell_{q_k}(\cdot)}^{B\mathcal{I}}(E_1, \dots, E_d; F)$ if and only if

$$\begin{aligned} \ell_{q_1}(\dots \ell_{q_k}(F) \dots) \ni & \left(\dots \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{j_{n_s}}^r * e_r \right) \right)_{n_k=1}^\infty \dots \right)_{n_1=1}^\infty = \\ & = \left(\dots \left(A \left(\sum_{s=1}^k \sum_{r \in I_s} x_{n_s}^r * e_r \right) \right)_{n_k=1}^\infty \dots \right)_{n_1=1}^\infty \end{aligned}$$

whenever $(x_j^r)_{j=1}^\infty \in \ell_{p_r}^w(E_r)$, $r = 1, \dots, d$, if and only if $A \in \prod_{(\mathbf{q}; \mathbf{p})}^{k, d, \mathcal{I}}(E_1, \dots, E_d; F)$. Since the induced operators are the same, the norms coincide. Given scalar sequences $(\lambda_j^r)_{j=1}^\infty \in \ell_{p_r}^w(\mathbb{K}) = \ell_{p_r}$, $r = 1, \dots, d$, and writing $I_s = \{r_1^s, \dots, r_{m_s}^s\}$ for every $s = 1, \dots, k$, it is not difficult to check that

$$\begin{aligned} \left\| \left(\dots \left(\prod_{s=1}^k \prod_{r \in I_s} \lambda_{n_s}^r \right)_{n_k=1}^\infty \dots \right)_{n_1=1}^\infty \right\|_{\ell_{q_1}(\dots \ell_{q_k}(\mathbb{K}) \dots)} &= \left\| \left(\prod_{i=1}^{m_1} \lambda_{n_1}^{r_i^1} \right)_{n_1=1}^\infty \right\|_{\ell_{q_1}} \dots \left\| \left(\prod_{i=1}^{m_k} \lambda_{n_k}^{r_i^k} \right)_{n_k=1}^\infty \right\|_{\ell_{q_1}}. \end{aligned}$$

Now the second statement follows from Hölder's inequality and the usual inequalities between ℓ_p -norms. \square

In the next example we recover a class that was studied in [3, 6, 7, 13] as an anisotropic generalization of the multiple $(q; p_1, \dots, p_d)$ -summing operators of Example 3.4(a).

Example 3.6. For $1 \leq p_1, \dots, p_d, q_1, \dots, q_d < \infty$ with $p_r \leq q_r$, $r = 1, \dots, d$, an operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is said to be multiple $(q_1, \dots, q_d; p_1, \dots, p_d)$ -summing if

$$\sum_{n_1=1}^\infty \left(\sum_{n_2=1}^\infty \dots \left(\sum_{n_d=1}^\infty \|A(x_{n_1}^1, \dots, x_{n_d}^d)\|_F^{q_d} \right)^{\frac{q_{d-1}}{q_d}} \dots \right)^{\frac{q_1}{q_2}} < \infty,$$

whenever $(x_j^r)_{j=1}^\infty \in \ell_{p_r}^w(E_r)$, $r = 1, \dots, d$. This is the class recovered in Proposition 3.5 for the discrete partition \mathcal{I}_d .

3.4 Λ -(r, p)-summing operators

In this subsection we show that the class of operators recently studied, independently, in [17] and [61] is also a particular case of our construction.

Let $p, q \geq 1$ and $\Lambda \subset \mathbb{N}^d$ be given. An operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is said to be Λ -(q, p)-summing if there exists a constant $C > 0$ such that, for all sequences, $(x_j^r)_{j=1}^\infty \in \ell_p^w(E_r)$, $r = 1, \dots, d$, it holds

$$\left(\sum_{(j^1, \dots, j^d) \in \Lambda} \|A(x_{j^1}^1, \dots, x_{j^d}^d)\|^q \right)^{\frac{1}{q}} \leq C \prod_{r=1}^d \|(x_j^r)_{j=1}^\infty\|_{\ell_p^w(E_r)}. \quad (18)$$

The Λ - (q, p) -summing norm of A is defined as the infimum of these constants C and denoted by $\pi_{q,p}^\Lambda(\cdot)$. Let us see that this class coincides isometrically with our class $\mathcal{L}_{\ell_p^w(\cdot), \dots, \ell_p^w(\cdot); \ell_q(\cdot)}^\Lambda$ if Λ is infinite.

According to Example 2.3, let us fix a bijection $\sigma: \mathbb{N} \rightarrow \Lambda$ and consider, for $r = 1, \dots, d$, the sequence $(j_n^r)_{n=1}^\infty$ in which j_n^r is the r -th coordinate of the d -tuple $\sigma(n) \in \Lambda$. Henceforth we consider Λ as the block associated to the trivial partition \mathcal{I}_t and to the aforementioned sequences of natural numbers. Note that the construction of $\mathcal{L}_{\ell_p^w(\cdot), \dots, \ell_p^w(\cdot); \ell_q(\cdot)}^\Lambda$ does not depend on the bijection σ because the sequence class $\ell_q(\cdot)$ is symmetric (cf. Remark 2.7).

An operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ is Λ - (r, p) -summing \iff there is $C > 0$ as in (18) \iff there is $C > 0$ such that

$$\left(\sum_{n=1}^{\infty} \|A(x_{j_n^1}^1, \dots, x_{j_n^d}^d)\|^q \right)^{\frac{1}{q}} \leq C \prod_{r=1}^d \|(x_j^r)_{j=1}^\infty\|_{\ell_p^w(E_r)} \quad (19)$$

whenever $(x_j^r)_{j=1}^\infty \in \ell_p^w(E_r)$, $r = 1, \dots, d$ (we are using that the series $\sum_{(j_1, \dots, j_d) \in \Lambda} \|A(x_{j_1}^1, \dots, x_{j_d}^d)\|^q$ is unconditionally convergent) $\iff A \in \mathcal{L}_{\ell_p^w(\cdot), \dots, \ell_p^w(\cdot); \ell_q(\cdot)}^\Lambda(E_1, \dots, E_d; F)$. Furthermore,

$$\begin{aligned} \pi_{q,p}^\Lambda(A) &= \inf\{C > 0 : (18) \text{ holds}\} = \inf\{C > 0 : (19) \text{ holds}\} \\ &= \|\widehat{A}_\Lambda\| = \|A\|_{\Lambda; \ell_p^w(\cdot), \dots, \ell_p^w(\cdot); \ell_q(\cdot)}. \end{aligned}$$

4 Downward coherence and coincidence results

Coherence of multi-ideals and coincidence results are classical topics in the theory of multilinear operators (see [34, 35, 36, 52, 53, 63, 64]). They make the interplay between multi-ideals/polynomials ideals and holomorphy types (see [21, 30, 34, 36]), and applications to linear dynamics have been found (recent applications can be found in [32, 33, 49, 50]). In this section we provide applications of our construction to these issues.

The symbol $[\cdot^r]$ means that the r -th coordinate has been omitted, for example:

$$E_1 \times [\cdot^r] \times E_d = E_1 \times \dots \times E_{r-1} \times E_{r+1} \times \dots \times E_d.$$

Given $A \in \mathcal{L}(E_1, \dots, E_d; F)$, for $r = 1, \dots, d$ and $x^r \in E_r$, we define

$$A_{x^r}: E_1 \times [\cdot^r] \times E_d \rightarrow F, \quad A_{x^r}(x^1, [\cdot^r], x^d) = A(x^1, \dots, x^d).$$

It is plain that A_{x^r} is $(d-1)$ -linear, continuous and $\|A_{x^r}\| \leq \|A\| \cdot \|x^r\|$.

A Banach multi-ideal $(\mathcal{M}, \|\cdot\|_{\mathcal{M}})$ is downward coherent if, regardless of the operator $A \in \mathcal{M}(E_1, \dots, E_d; F)$, $r = 1, \dots, d$, and $x^r \in E_r$, it holds $A_{x^r} \in \mathcal{M}(E_1, [\cdot^r], E_d; F)$ and $\|A_{x^r}\|_{\mathcal{M}} \leq \|A\|_{\mathcal{M}} \cdot \|x^r\|$.

4.1 The isotropic case

Throughout this subsection \mathbb{N}^d is regarded as the block associated to the trivial partition \mathcal{I}_t and to the sequences $(j_n^r)_{n=1}^\infty$, $r = 1, \dots, d$, defined by a fixed bijection $\sigma: \mathbb{N} \rightarrow \mathbb{N}^d$,

according to Example 2.3. We denote $\sigma(n) = (j_n^1, \dots, j_n^d)$ for every $n \in \mathbb{N}$. To move from d -linear operators to $(d-1)$ -linear operators we need to regard \mathbb{N}^{d-1} as a block related, in a convenient way, to the sequences that define the block \mathbb{N}^d . We do that by considering the set

$$B = \{(j^1, \dots, j^d) \in \mathbb{N}^d : j^m = 1\}, \quad (20)$$

and defining $n_1 = \min\{n : \sigma(n) \in B\}$, $n_2 = \min\{n \neq n_1 : \sigma(n) \in B\}$, \dots , $n_k = \min\{n : n \notin \{n_1, \dots, n_{k-1}\} \text{ and } \sigma(n) \in B\}$, \dots . Since B is infinite and σ is a bijection, this provides an increasing sequence $(n_k)_{k=1}^\infty$ of natural numbers. For each $m \in \{1, \dots, d\}$, consider the subsequences $(j_{n_k}^r)_{k=1}^\infty$ of $(j_n^r)_{n=1}^\infty$, $r = 1, [\dots], d$. It is not difficult to check that the correspondence

$$k \in \mathbb{N} \mapsto (j_{n_k}^1, [\dots], j_{n_k}^d) \in \mathbb{N}^{d-1}$$

is a bijection, hence \mathbb{N}^{d-1} is a block associated to the trivial partition and to these subsequences. This is how \mathbb{N}^{d-1} shall be regarded from now on.

Definition 4.1. We say that a sequence class X is *0-invariant* if, for every Banach space E and any E -valued sequence $(x_j)_{j=1}^\infty$, it holds

$$(x_j)_{j=1}^\infty \in X(E) \iff (x_j^0)_{j=1}^\infty \in X(E) \text{ e } \|(x_j)_{j=1}^\infty\|_{X(E)} = \|(x_j^0)_{j=1}^\infty\|_{X(E)},$$

where $(x_j^0)_{j=1}^\infty$ stands for the zerofree version of $(x_j)_{j=1}^\infty$, meaning that x_j^0 is the j -th nonzero coordinate of $(x_j)_{j=1}^\infty$, if it exists, or zero otherwise (see [27, Definition 3.1] or, in the case of scalar sequences, [37]).

Most of the usual sequence classes are 0-invariant.

Proposition 4.2. Let X_1, \dots, X_d and Y be sequence classes with Y being 0-invariant, $1 \leq m \leq d$, E_1, \dots, E_d, F be Banach spaces and $a^m \in E_m$. If $A \in \mathcal{L}_{X_1, \dots, X_d; Y}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$, then

$$A_{a^m} \in \mathcal{L}_{X_1, [\dots], X_d; Y}^{\mathbb{N}^{d-1}}(E_1, [\dots], E_d; F) \text{ and } \|A_{a^m}\|_{\mathbb{N}^{d-1}; X_1, [\dots], X_d; Y} \leq \|A\|_{\mathbb{N}^d; X_1, \dots, X_d; Y} \cdot \|a^m\|.$$

Proof. Of course we can suppose $a^m \neq 0$. Let $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r = 1, [\dots], d$ be given. Define $(x_j^m)_{j=1}^\infty := a^m \cdot e_1 = (a^m, 0, 0, \dots) \in X_m(E_m)$. By assumption,

$$Y(F) \ni \widehat{A}_{\mathbb{N}^d}((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) = \left(A(x_{j_n^1}^1, \dots, x_{j_n^d}^d)\right)_{n=1}^\infty = \left(A_{x_{j_n^m}^m}(x_{j_n^1}^1, [\dots], x_{j_n^d}^d)\right)_{n=1}^\infty.$$

Using the set B defined in (20) and considering the corresponding increasing sequence $(n_k)_{k=1}^\infty$ of natural numbers, note that:

- For every $k \in \mathbb{N}$, $A_{x_{j_{n_k}^m}^m}(x_{j_{n_k}^1}^1, [\dots], x_{j_{n_k}^d}^d) = A_{a^m}(x_{j_{n_k}^1}^1, [\dots], x_{j_{n_k}^d}^d)$ as $j_{n_k}^m = 1$ and $x_1^m = a^m$.
- For every $n \in \mathbb{N} \setminus \{n_k : k \in \mathbb{N}\}$, $A_{x_{j_n^m}^m}(x_{j_n^1}^1, [\dots], x_{j_n^d}^d) = 0$ as $j_n^m \neq 1$ and $x_j^m = 0$ for every $j \neq 1$.

Thus, defining $y = \left(A_{x_{j_n^m}^m}(x_{j_n^1}^1, [\dots], x_{j_n^d}^d)\right)_{n=1}^\infty$ and $z = \left(A_{a^m}(x_{j_{n_k}^1}^1, [\dots], x_{j_{n_k}^d}^d)\right)_{k=1}^\infty$, we have that z is a subsequence of y and all the terms of y not belonging to z are null. It

follows that the n -th non-null coordinate of z is equal to the n -th non-null coordinate of y , that is, $y^0 = z^0$. Since Y is 0-invariant,

$$y \in Y(F) \iff y^0 \in Y(F) \iff z^0 \in Y(F) \iff z \in Y(F) \text{ and}$$

$$\begin{aligned} Y(F) \ni \left\| \widehat{A}_{\mathbb{N}^d} \left((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty \right) \right\|_{Y(F)} &= \|y\|_{Y(F)} = \|y^0\|_{Y(F)} = \|z^0\|_{Y(F)} = \|z\|_{Y(F)} \\ &= \left\| \left(A_{a^m} \left(x_{j_{n_k}}^1, [\cdot^m \cdot], x_{j_{n_k}}^d \right) \right)_{k=1}^\infty \right\|_{Y(F)} = \left\| (A_{a^m})_{\widehat{\mathbb{N}^d-1}} \left((x_j^1)_{j=1}^\infty, [\cdot^m \cdot], (x_j^d)_{j=1}^\infty \right) \right\|_{Y(F)}. \end{aligned}$$

This proves that $A_{a^m} \in \mathcal{L}_{X_1, [\cdot^m \cdot], X_d; Y}^{\mathbb{N}^d-1}(E_1, [\cdot^m \cdot], E_d; F)$ and, replacing a^m with $b := \frac{a^m}{\|a^m\|}$, we get

$$\begin{aligned} \|\widehat{A}_{\mathbb{N}^d}\| &= \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r=1, \dots, d}} \left\| \widehat{A}_{\mathbb{N}^d} \left((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty \right) \right\|_{Y(F)} \\ &\geq \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r=1, [\cdot^m \cdot], d}} \left\| \widehat{A}_{\mathbb{N}^d} \left((x_j^1)_{j=1}^\infty, \dots, (x_j^{m-1})_{j=1}^\infty, b \cdot e_1, (x_j^{m+1})_{j=1}^\infty, (x_j^d)_{j=1}^\infty \right) \right\|_{Y(F)} \\ &= \frac{1}{\|a^m\|} \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r=1, [\cdot^m \cdot], d}} \left\| \widehat{A}_{\mathbb{N}^d} \left((x_j^1)_{j=1}^\infty, \dots, (x_j^{m-1})_{j=1}^\infty, a^m \cdot e_1, (x_j^{m+1})_{j=1}^\infty, (x_j^d)_{j=1}^\infty \right) \right\|_{Y(F)} \\ &= \frac{1}{\|a^m\|} \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r=1, [\cdot^m \cdot], d}} \left\| (A_{a^m})_{\widehat{\mathbb{N}^d-1}} \left((x_j^1)_{j=1}^\infty, [\cdot^m \cdot], (x_j^d)_{j=1}^\infty \right) \right\|_{Y(F)} = \frac{\|(A_{a^m})_{\widehat{\mathbb{N}^d-1}}\|}{\|a^m\|}, \end{aligned}$$

from which it follows that

$$\|A_{a^m}\|_{\mathbb{N}^d-1, X_1, [\cdot^m \cdot], X_d; Y} = \|(A_{a^m})_{\widehat{\mathbb{N}^d-1}}\| \leq \|\widehat{A}_{\mathbb{N}^d}\| \cdot \|a^m\| = \|A\|_{\mathbb{N}^d, X_1, \dots, X_d; Y} \cdot \|a^m\|,$$

□

Corollary 4.3. *Let X_1, \dots, X_d and Y be sequence classes with Y being 0-invariant. If $\mathcal{L}_{X_1, \dots, X_d; Y}^{\mathbb{N}^d}(E_1, \dots, E_d; F) = \mathcal{L}(E_1, \dots, E_d; F)$, then:*

- (a) $\mathcal{L}_{X_1, [\cdot^m \cdot], X_d; Y}^{\mathbb{N}^d-1}(E_1, [\cdot^m \cdot], E_d; F) = \mathcal{L}(E_1, [\cdot^m \cdot], E_d; F)$ for every $m = 1, \dots, d$.
- (b) $\mathcal{L}_{X_r; Y}(E_r; F) = \mathcal{L}(E_r; F)$ for every $r = 1, \dots, d$.

Proof. (a) Given $B \in \mathcal{L}(E_1, [\cdot^m \cdot], E_d; F)$, choose $y \in E_m$ with $\|y\| = 1$ and take, by the Hahn-Banach Theorem, $\varphi \in E_m^*$ such that $\|\varphi\| = 1$ and $\varphi(y) = \|y\| = 1$. Considering the operator $A \in \mathcal{L}(E_1, \dots, E_d; F)$ given by $A(x^1, \dots, x^d) = B(x^1, [\cdot^m \cdot], x^d) \cdot \varphi(x^m)$, we have $B = A_y$. By assumption, $A \in \mathcal{L}_{X_1, \dots, X_d; Y}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$, so Proposition 4.2 yields that $B = A_y \in \mathcal{L}_{X_1, [\cdot^m \cdot], X_d; Y}^{\mathbb{N}^d-1}(E_1, [\cdot^m \cdot], E_d; F)$.

(b) Just apply (a) repeatedly. □

By $\Pi_{q;p}(E; F)$ we denote the space of absolutely (q, p) -summing linear operators from E to F . Since the sequence class $\ell_q(\cdot)$ is 0-invariant, we recover the following result from [54] as a particular case of the corollary above.

Corollary 4.4. [54, Corollary 3.4] *Let $q, p_1, \dots, p_d \geq 1$ and E_1, \dots, E_d, F be Banach spaces such that $\mathcal{L}(E_1, \dots, E_d; F) = \mathcal{L}_{\ell_{p_1}^w(\cdot), \dots, \ell_{p_d}^w(\cdot); \ell_q(\cdot)}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$. Then $\Pi_{q;p_r}(E_r; F) = \mathcal{L}(E_r; F)$ for every $r = 1, \dots, d$.*

4.2 The anisotropic case

In this subsection we consider \mathbb{N}^d as the block associated to the discrete partition of $\{1, \dots, d\}$ and to the sequences $(j_n^1)_{n=1}^\infty = \dots = (j_n^d)_{n=1}^\infty = (n)_{n=1}^\infty$. In the same fashion, \mathbb{N}^{d-1} shall be regarded as the block associated to the discrete partition of $\{1, \dots, d-1\}$ and to the sequences $(j_n^1)_{n=1}^\infty = \dots = (j_n^{d-1})_{n=1}^\infty = (n)_{n=1}^\infty$.

Proposition 4.5. *Let X_1, \dots, X_d and Y be sequence classes with Y linearly stable, E_1, \dots, E_d, F be Banach spaces and $a \in E_1$ be given. If $A \in \mathcal{L}_{X_1, \dots, X_d; dY}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$, then $A_a \in \mathcal{L}_{X_2, \dots, X_d; d-1Y}^{\mathbb{N}^{d-1}}(E_2, \dots, E_d; F)$ and*

$$\|A_a\|_{\mathbb{N}^{d-1}; X_2, \dots, X_d; d-1Y} \leq \|A\|_{\mathbb{N}^d; X_1, \dots, X_d; dY} \|a\|.$$

Proof. Of course we can suppose $a \neq 0$. Let the sequences $(x_j^2)_{j=1}^\infty \in X_2(E_2), \dots, (x_j^d)_{j=1}^\infty \in X_d(E_d)$ be given. Consider the sequence $(x_j^1)_{j=1}^\infty := a \cdot e_1 = (a, 0, 0, \dots) \in X_1(E_1)$. By the definition of $\mathcal{L}_{X_1, \dots, X_d; dY}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$,

$$\begin{aligned} Y(\cdots Y(F) \cdots) \ni \widehat{A}_{\mathbb{N}^d}((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) &= \left(\cdots (A(x_{n_1}^1, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_1=1}^\infty \\ &= \left(\left(\cdots (A(a, x_{n_2}^2, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_2=1}^\infty, 0, 0, 0, \dots \right) \\ &= \left(\left(\cdots (A_a(x_{n_2}^2, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_2=1}^\infty, 0, 0, 0, \dots \right) \\ &= \left(\cdots (A_a(x_{n_2}^2, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_2=1}^\infty \cdot e_1. \end{aligned}$$

Since the coordinates of a sequence in $Y(\cdots Y(F) \cdots)$ belong to $Y(\cdots Y(F) \cdots)$, we have

$$\left(\cdots (A_a(x_{n_2}^2, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_2=1}^\infty \in Y(\cdots Y(F) \cdots),$$

which gives $A_a \in \mathcal{L}_{X_2, \dots, X_d; d-1Y}^{\mathbb{N}^{d-1}}(E_2, \dots, E_d; F)$. By [24, Lemma 2.4], $\|y \cdot e_1\|_{Y(F)} = \|y\|_F$ for every $y \in F$, therefore

$$\begin{aligned} \left\| \widehat{A}_{\mathbb{N}^d}(a \cdot e_1, (x_j^2)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) \right\| &= \left\| \left(\cdots (A_a(x_{n_2}^2, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_2=1}^\infty \cdot e_1 \right\| \\ &= \left\| \left(\cdots (A_a(x_{n_2}^2, \dots, x_{n_d}^d))_{n_d=1}^\infty \cdots \right)_{n_2=1}^\infty \right\| = \left\| (A_a)_{\mathbb{N}^{d-1}}((x_j^2)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) \right\| \end{aligned}$$

for all $(x_j^r)_{j=1}^\infty \in X_r(E_r)$, $r \in \{2, \dots, d\}$. Applying this equality to $\frac{a}{\|a\|}$, we get

$$\begin{aligned} \|A\|_{\mathbb{N}^d; X_1, \dots, X_d; Y} &= \|\widehat{A}_{\mathbb{N}^d}\| = \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r \in \{1, \dots, d\}}} \left\| \widehat{A}_{\mathbb{N}^d}((x_j^1)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) \right\| \\ &\geq \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r \in \{2, \dots, d\}}} \left\| \widehat{A}_{\mathbb{N}^d} \left(\frac{a}{\|a\|} \cdot e_1, (x_j^2)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty \right) \right\| \\ &= \frac{1}{\|a\|} \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r(E_r)} \\ r \in \{2, \dots, d\}}} \left\| \widehat{A}_{\mathbb{N}^d}(a \cdot e_1, (x_j^2)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty) \right\| \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{\|a\|} \sup_{\substack{(x_j^r)_{j=1}^\infty \in B_{X_r}(E_r) \\ r \in \{2, \dots, d\}}} \left\| (A_a)_{\mathbb{N}^{d-1}} \left((x_j^2)_{j=1}^\infty, \dots, (x_j^d)_{j=1}^\infty \right) \right\| \\
&= \frac{\|(A_a)_{\mathbb{N}^{d-1}}\|}{\|a\|} = \frac{\|A_a\|_{\mathbb{N}^{d-1}; X_2, \dots, X_d; Y}}{\|a\|}.
\end{aligned}$$

□

Coherence is usually applied for classes of polynomials ideals, which are closely connected to symmetric multilinear operators. Let us see that, in the result above, if the operator is symmetric then we can fix any coordinate, and not only the first one. We assume that symmetric multilinear operators are familiar to the reader.

For $A \in \mathcal{L}({}^d E; F)$, $a \in E$ and $m \in \{1, \dots, d\}$, by A_a^m we mean the operator

$$A_a^m: E^{d-1} \longrightarrow F, \quad A_a^m(x^1, [\cdot], x^d) = A(x^1, \dots, x^{m-1}, a, x^{m+1}, \dots, x^d).$$

Corollary 4.6. *Let X and Y be sequence with Y linearly stable, $a \in E$ and $m \in \{1, \dots, d\}$. If $A \in \mathcal{L}_{dX, dY}^{\mathbb{N}^d}({}^d E; F)$ is a symmetric operator, then $A_a^m \in \mathcal{L}_{d-1X, d-1Y}^{\mathbb{N}^{d-1}}({}^{d-1} E; F)$ and*

$$\|A_a^m\|_{\mathbb{N}^{d-1}; d-1X; d-1Y} \leq \|A\|_{\mathbb{N}^d; dX; dY} \cdot \|a\|.$$

Proof. Considering the permutation $\alpha: \{1, \dots, d\} \longrightarrow \{1, \dots, d\}$ given by

$$\alpha(r) := \begin{cases} m & , \text{ if } r = 1 \\ r - 1 & , \text{ if } r = 2, \dots, m \\ r & , \text{ if } r \geq m, \end{cases}$$

the symmetry of A implies that $A_a^m = A_a^1$. The result follows from Proposition 4.5. □

We finish the paper with some coincidence results, which follow from Proposition 4.5 reasoning similarly to the proof of Corollary 4.3.

Corollary 4.7. *Let X_1, \dots, X_d and Y be sequence classes with Y linearly stable and E_1, \dots, E_d, F be Banach spaces. If $\mathcal{L}(E_1, \dots, E_d; F) = \mathcal{L}_{X_1, \dots, X_d, dY}^{\mathbb{N}^d}(E_1, \dots, E_d; F)$, then $\mathcal{L}(E_2, \dots, E_d; F) = \mathcal{L}_{X_2, \dots, X_d, d-1Y}^{\mathbb{N}^{d-1}}(E_2, \dots, E_d; F)$.*

Corollary 4.8. *Let X, Y be sequence classes with Y linearly stable and E, F be Banach spaces. If $\mathcal{L}({}^d E; F) = \mathcal{L}_{dX, dY}^{\mathbb{N}^d}({}^d E; F)$ for some $d \in \mathbb{N}$, then $\mathcal{L}(E; F) = \mathcal{L}_{X; Y}(E; F)$.*
