Abstract

Large language models, sometimes referred to as foundation models, have transformed multiple fields of research. However, smaller languages risk falling behind due to high training costs and small incentives for large companies to train these models. To combat this, the Danish Foundation Models project seeks to provide and maintain open, well-documented, and high-quality foundation models for the Danish language. This is achieved through broad cooperation with public and private institutions, to ensure high data quality and applicability of the trained models. We present the motivation of the project, the current status, and future perspectives.

1 Introduction

In recent years, the field of machine learning has witnessed a paradigm shift, driven by the emergence of *foundation models*: Models that are pre-trained on large quantities of data, that can be adapted to multiple downstream tasks (Bommasani et al., 2021; Devlin et al., 2019). Training larger models on more extensive and diverse datasets has demonstrated improved performance across tasks (Brown et al., 2020; Kaplan et al., 2020; Touvron et al., 2023). As a consequence, training better foundation models has become an active area of research. Strategies for this include increasing computational resources, increasing dataset sizes (Kaplan et al., 2020), and improving training efficiency

by, e.g., removing low-quality data samples (Rae et al., 2021), proposing new training regimes (Clark et al., 2020a), new model architectures (Sun et al., 2023), or changes to, e.g., the attention mechanism (Dao, 2023).

1.1 The Case for Danish Foundation Models

Foundation models are predominantly developed for the English language, with only a few models developed with multilingual capabilities (e.g. (Workshop et al., 2022)). Although models trained on mostly English data have shown impressive performance on languages with limited representation in the training data (Zhu et al., 2023), these models inherently carry assumptions and cultural biases that may not seamlessly transfer between languages and cultures (Cao et al., 2023). For example, norms related to firearms or social security and welfare differ markedly between USA and Denmark. With respect to spoken language, Danish has a very distinct phonological structure (Basbøll, 2005; Trecca et al., 2021).

Despite this, multilingual models perform well on specific benchmarks for low-resource languages, for instance, in *Scandinavian Embedding Benchmark (SEB)* (Enevoldsen et al., 2023) – which seeks to evaluate the document representations of a model – multilingual models achieve superior performance for Danish and Swedish. However, evidence from high-quality benchmarks demonstrates that purpose-built monolingual models, or those restricted to closely related languages, often outperform their multilingual counterparts. Examples

*Equal Contributions

Table 1: A representative sample of different foundation model categories used for Danish: structured learning (e.g. encoders), generative models (e.g. decoders), search and ranking models (embeddings), and speech. Languages are denoted using a flag and multilingual is denoted with a globe.

	Model weights	Code Available	Model card	Data sheet	Language	Validated for Danish

*: Proper validation is not possible as the training data is not known (test data might be included).

†: Finetuned models are validated for Danish ASR, but there are no existing benchmarks for Danish.

of this can be seen in the success of Norwegian, Danish, and Swedish models as documented in ScandEval (Nielsen, 2021) or of Italian models in UINAUIL (Basile et al., 2023).

Developing Danish foundation models by a public institution becomes imperative due to the limited incentive for large tech companies to invest in languages spoken by smaller populations. Additionally, foundation models applied nationally seek to solve a different set of tasks than general-purpose models. Use cases such as healthcare services or citizen-state interactions will have high priority, while assistive technologies, e.g., programming, will be less central for national models (Landsforening et al., 2023; Sundhedsinnovation, 2023). National use cases also require different restrictions relating to privacy and governance, which necessitate local solutions without the need to send sensitive data to foreign service providers.

In the Nordics, collaborations between academia and libraries can be particularly fruitful due to similar archival laws and the possibility for data-sharing agreements, which allow the sharing of extensive and otherwise closed-source, resources with the research community. This makes it possible to publish models trained on otherwise inaccessible, high-quality datasets (Kummervold et al., 2021).

The field of Danish NLP is steadily growing, with datasets for pre-training (Strømberg-Derczynski et al., 2021-05-12), multiple task-specific datasets (Zeinert et al., 2021; Anonymous), and several pre-trained and fine-tuned models (Højmark-Bertelsen, 2021; Møllerhøj, 2019; Ciosici and Derczynski, 2022). Despite this growth, the current landscape remains constrained in several key dimensions. First, the diversity of model architectures is severely limited, with no practically usable and open generative models. This significantly limits the potential applications within Danish contexts, as generative models are fundamental for developing tools such as virtual assistants. Second, prior to the Danish Foundation Models (DFM) project, a concerning trend highlighted by benchmark evaluations from ScandEval and SEB, was that multilingual – and even monolingual Norwegian models – outperformed their Danish counterparts (Nielsen, 2021; Enevoldsen et al., 2023). This performance disparity can be attributed to the following factors: ① *computational resources*: Existing Danish models have been trained for relatively few compute hours on modest hardware, compared to their international counterparts (Ciosici and Derczynski, 2022; Højmark-Bertelsen, 2021; Rae et al., 2021). ② *optimal resource utilization*: Most Dan-

ish language models use older architectures that are neither as compute- nor data-efficient as newer model architectures (He et al., 2021; Clark et al., 2020b; Devlin et al., 2019). ③ *lack of training data*: models are trained on DAGW (Strømberg-Derczynski et al., 2021-05-12) or the Danish part of Common Crawl, which has at least 100x fewer tokens than modern English models (e.g. (Rae et al., 2021)). Similarly, prior to DFM, Danish models have typically only employed minor filtering on the data source even though near-deduplication and quality filters have been shown to be beneficial (Rae et al., 2021; Lee et al., 2021).

A crucial aspect of the current state of Danish language models is the mode of development and maintenance. Many of these models are created by motivated individuals who, unfortunately, lack the necessary resources and incentives to dedicate significant time to the documentation and maintenance of their models and datasets. This documentation, which includes aspects such as model cards and datasheets (Gebru et al., 2021; Mitchell et al., 2019), is paramount for adoption in critical applications such as healthcare or public services. It provides valuable insights into the models’ capabilities and highlights potential biases and limitations, a crucial step towards responsible and ethical AI development. Additionally, Danish lacks a number of benchmarks for evaluating the quality of language models. For example, no benchmarks exist for text generation or search and retrieval.

Although the Danish language model ecosystem is evolving, it faces critical challenges regarding model diversity, scale, data quality, and documentation. Addressing these limitations is essential for the Danish NLP community to build robust, effective, and responsible language models that can meet the unique linguistic and cultural nuances of the Danish language, as well as the Danish national context.

2 Danish Foundation Models

To resolve these issues, we present the DFM project as a broad and open collaboration between academia, industry, and the open-source community. The DFM project has four main aims:

1. To develop and maintain *state-of-the-art language models for Danish* for applications within both text and speech.
2. To extensively *validate* foundation models for Danish in a representative set of tasks.

3. To maintain a high standard of *documentation* of models such as model cards (Mitchell et al., 2019) and datasheets (Gebru et al., 2021).
4. To *open-source* not only the models but also all components required for reproducibility such as pre-processing, training, and validation code.

Through these four guiding principles, DFM aspires to increase the quality and adoption of Danish language models. The emphasis on validating all relevant models enables users to critically assess and evaluate which model is best suited for their task, whether Danish, multilingual, or proprietary solutions. The high standard of documentation of DFM models promises to provide trustworthy and transparent models in compliance with expected EU regulations. Datasets will be open to the extent possible within GDPR and proprietary restrictions.

2.1 Dataset

To bridge this gap, we present the **Danish Colossal Corpus (DCC)**: a composite corpus of text and speech from multiple domains. The text portion of DCC consists of the Danish Gigaword Corpus (Strømberg-Derczynski et al., 2021-05-12), reddit-da, HopeTwitter¹, DaNews, and **Netarkivet Text (NAT)**. DCC contains >100 billion text tokens spanning distinctly different domains, including news, social media, web, legal documents, and more. The speech portion consists of DaRadio, and DaTV, covering approximately 140.000 hours of unlabelled speech, and 900 hours of transcribed speech.

All subcorpora are extensively documented in datasheets (Gebru et al., 2021) that can be found on the project’s [website](#). DCC has been thoroughly pre-processed to ensure the highest data quality and scripts are available on the project repository. See Table 2 for an overview of the contents of DCC.

As the DCC is composed of heterogeneous datasets, no common procedure for sharing the data can encompass the entirety of DCC. Some of the data can be shared as-is and in the open (DAGW, reddit-da), others contain sensitive information on persons and can only be shared within the given laws and regulations, while others are the property of organizations that university partners have data processing and data transfer agreements with. For

¹The situation with X.com (formerly Twitter) will be monitored closely with regard to any new restrictions or legal rulings that could impact this data collection.

Table 2: Overview of the subcorpora in DCC.

Name	Description	Size	Open access	Novel corpus
Text				
DAGW	Danish Gigaword	1B tokens	✓	✗
reddit-da	Danish Reddit	<.1B tokens	✓	✗
HopeTwitter	Danish Tweets	0.48B tokens	✗	✓
DaNews	Danish newspapers	0.5B tokens	✗	✓
Netarkivet Text	Danish internet	>100B tokens	✗	✓
Speech				
DaRadio	Danish talk radio	140.000 hours	✗	✓
DaTV	Danish subtitled TV	900	✗	✓

each sub-corpora of DCC, a process for getting access within the given legislation is described in the relevant datasheets mentioned above.

2.2 Current Achievements

Currently, DFM has created state-of-the-art models for speech and text processing and developed a benchmark for Scandinavian embedding models. The best performing Danish text model is `dfm-encoder-large-v1`, according to the ScandEval benchmark (Nielsen, 2023). `dfm-encoder-large-v1` is a continued pre-training of an existing Scandinavian encoder model² trained on the text portion of the DCC. `dfm-encoder-large-v1` has already been integrated into tools such as DaCy (Enevoldsen et al., 2021) and is used within both research and the private and public sectors³.

For speech, a continued pre-training of XLS-R (Babu et al., 2021) for 120,000 steps on DaRadio has been released as `xls-r-300m-danish`. Only one other model of this type exists for Danish, however, it has 95M parameters compared to 300M in `xls-r-300m-danish`, is trained on a vastly smaller dataset, and does not perform as well. A fine-tuned version of the Danish XLS-R model, `xls-r-300m-danish-nst-cv9`, is currently the best-performing wav2vec-based Automatic Speech Recognition (ASR) model for Danish.

Lastly, a new benchmark SEB has been created to investigate and compare embedding models across a wide range of tasks. SEB seeks to evaluate the document representation of existing models and thus does not fine-tune the full model. Instead, it utilizes the document embeddings for classification, bitext-mining, classification, and ranking. The benchmark is planned to expand to address the

under-representation of ranking and search within existing Danish benchmarks.

All models are publicly available on the Hugging Face Hub under the Center for Humanities Computing (CHCAA) organization.

2.3 Planned Projects

DFM will continue to expand on multiple parallel tracks. On the model track, the current priority is to train and open-source generative text models as no such open model ready for production currently exists for the Danish language. Funding has been secured for training a 7B parameter model as a proof-of-concept, which will be further increased and developed in future iterations. In addition, we will fine-tune small and medium-sized Whisper models to improve the utility of ASR systems for the Danish language.

Simultaneously, we will develop open benchmark tasks and datasets for generative models, to ensure and evaluate the quality of Danish and multilingual generative models. No such benchmark currently exists, which poses a significant barrier to developing and comparing different models. The Danish generative benchmark is set to include data from multiple domains such as healthcare, legal, question-answering, and more. The benchmark data and source code will be made publicly available to the extent possible.

2.4 Future Perspectives

The DFM project is set to follow an iterative cycle of model and benchmark development, validation, refinement, and releases. We invite contributions and collaborators from industry and the open-source community alike.
