

# TPMS2STEP Supplements: Constraints Matrices and Convergence Proof of TPMS2STEP

YAONAIMING ZHAO, QIANG ZOU

Triply periodic minimal surface (TPMS) is emerging as an important way of designing microstructures. However, there has been limited use of commercial CAD/CAM/CAE software packages for TPMS design and manufacturing. This is mainly because TPMS is consistently described in the functional representation (F-rep) format, while modern CAD/CAM/CAE tools are built upon the boundary representation (B-rep) format. One possible solution to this gap is translating TPMS to STEP, which is the standard data exchange format of CAD/CAM/CAE. Following this direction, this paper proposes a new translation method with error-controlling and  $C^2$  continuity-preserving features. It is based on an approximation error-driven TPMS sampling algorithm and a constrained-PIA algorithm. The sampling algorithm controls the deviation between the original and translated models. With it, an error bound of  $2\epsilon$  on the deviation can be ensured if two conditions called  $\epsilon$ -density and  $\epsilon$ -approximation are satisfied. The constrained-PIA algorithm enforces  $C^2$  continuity constraints during TPMS approximation, and meanwhile attaining high efficiency. A theoretical convergence proof of this algorithm is also given. The effectiveness of the translation method has been demonstrated by a series of examples and comparisons. All relevant Refs.: [1–66]

## 1. PART OF CONSTRAINT MATRICES FOR GYROID, DIAMOND, AND SCHWARZ\_P IN CPIA

The constraint matrices for Gyroid, Diamond, and Schwarz\_P that are not given in the article are given here.

For Gyroid, matrices  $\mathbf{T}_{1g}$ - $\mathbf{T}_{7g}$  and  $\mathbf{M}_{ijg}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) are given.

$$\mathbf{T}_{1g} = \begin{bmatrix} 0 & 0 & -1 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{2g} = \begin{bmatrix} 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & -1 \\ 0 & -1 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{3g} = \begin{bmatrix} 0 & -1 & 0 & 1.5 \\ 1 & 0 & 0 & -0.5 \\ 0 & 0 & -1 & 0.5 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{4g} = \mathbf{T}_{1g}\mathbf{T}_{3g}$$

$$\mathbf{T}_{5g} = \mathbf{T}_{4g}^{-1}$$

$$\mathbf{T}_{6g} = \mathbf{T}_{2g}\mathbf{T}_{3g}$$

$$\mathbf{T}_{7g} = \mathbf{T}_{6g}^{-1}$$

The matrices  $\mathbf{M}_{ijg}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) are derived from the method mentioned below. To extract the control points and calculate the first-order and second-order derivatives, three steps are conducted: (1) number the control points; (2) map a specific part of the control points to the corresponding control points (e.g., to calculate the first-order derivatives, the second row of control points are mapped to the first row of control points); and (3) utilize the coordinates of these points to calculate the local first-order and second-order derivatives. In Step 2, the mapping is constructed using a matrix, denoted as  $\mathbf{M}$ .  $\mathbf{M}$  is actually one of  $\mathbf{M}_{ijg}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ). Specifically, if the matrix  $\mathbf{P}$  is the control points, then  $\mathbf{MP}$  sets some rows in  $\mathbf{P}$  to 0 and changes the position of other rows of elements. In the matrix  $\mathbf{MP}$ , a non-zero element at Row  $i$  and Column  $j$  in  $\mathbf{M}$  repositions the  $j$ th line of  $\mathbf{P}$  to the  $i$ th line of  $\mathbf{P}$ . That is, this element maps the  $j$ th control point to the  $i$ th control point. After the mapping, calculations can be done to the control points that are mapped together.

$\mathbf{M}_{ijg}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) are given as:

$$\begin{aligned}\mathbf{M}_{11g} &= \sum_{i=0}^{n-5} \mathbf{J}_{n^2-n+2+i, n^2-2n+2+i} \\ \mathbf{M}_{21g} &= \sum_{i=0}^{n-5} \mathbf{J}_{n^2-2n+2+i, n^2-2n+2+i} \\ \mathbf{M}_{31g} &= \sum_{i=0}^{n-7} \mathbf{J}_{n^2-n+3+i, n^2-3n+3+i} \\ \mathbf{M}_{41g} &= \sum_{i=0}^{n-7} \mathbf{J}_{n^2-2n+3+i, n^2-3n+3+i} \\ \mathbf{M}_{51g} &= \sum_{i=0}^{n-7} \mathbf{J}_{n^2-3n+3+i, n^2-3n+3+i}\end{aligned}$$

where  $\mathbf{J}_{i,j}$  is the matrix with a unique non-zero element 1 at the position  $(i, j)$  and  $n$  is the number of control points of the approximation surface in the  $u$  and  $v$  direction.

$$\begin{aligned}\mathbf{M}_{12g} &= \sum_{i=0}^{n-5} \mathbf{J}_{2n+in, 2n+1+in} \\ \mathbf{M}_{22g} &= \sum_{i=0}^{n-5} \mathbf{J}_{2n+1+in, 2n+1+in} \\ \mathbf{M}_{32g} &= \sum_{i=0}^{n-7} \mathbf{J}_{3n+in, 3n+2+in} \\ \mathbf{M}_{42g} &= \sum_{i=0}^{n-7} \mathbf{J}_{3n+1+in, 3n+2+in} \\ \mathbf{M}_{52g} &= \sum_{i=0}^{n-7} \mathbf{J}_{3n+2+in, 3n+2+in}\end{aligned}$$

$$\begin{aligned}\mathbf{M}_{13g} &= \sum_{i=0}^{n-3} \mathbf{J}_{2+i, n+2+i} \\ \mathbf{M}_{23g} &= \sum_{i=0}^{n-5} \mathbf{J}_{n+2+i, n+2+i} \\ \mathbf{M}_{33g} &= \sum_{i=0}^{n-7} \mathbf{J}_{3+i, 2n+3+i} \\ \mathbf{M}_{43g} &= \sum_{i=0}^{n-7} \mathbf{J}_{n+3+i, 2n+3+i} \\ \mathbf{M}_{53g} &= \sum_{i=0}^{n-7} \mathbf{J}_{2n+3+i, 2n+3+i}\end{aligned}$$

$$\mathbf{M}_{14g} = \sum_{i=0}^{n-5} \mathbf{J}_{3n-1+in, 3n-2+in}$$

$$\mathbf{M}_{24g} = \sum_{i=0}^{n-5} \mathbf{J}_{3n-2+in, 3n-2+in}$$

$$\mathbf{M}_{34g} = \sum_{i=0}^{n-7} \mathbf{J}_{4n-1+in, 4n-3+in}$$

$$\mathbf{M}_{44g} = \sum_{i=0}^{n-7} \mathbf{J}_{4n-2+in, 4n-3+in}$$

$$\mathbf{M}_{54g} = \sum_{i=0}^{n-7} \mathbf{J}_{4n-3+in, 4n-3+in}$$

For Diamond, matrices  $\mathbf{T}_{1d}$ ,  $\mathbf{T}_{2d}$ ,  $\mathbf{N}_1$ , and  $\mathbf{N}_2$  are given.  $\mathbf{M}_{ijd}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) are the same as  $\mathbf{M}_{ijg}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) mentioned before, respectively.

$$\mathbf{T}_{1d} = \begin{bmatrix} 0 & -1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{2d} = \begin{bmatrix} -\frac{1}{2} & -\frac{1}{2} & \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} \\ -\frac{1}{2} & -\frac{1}{2} & -\frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{N}_1 = \begin{bmatrix} \mathbf{I}_{n^2 \times n^2} & \mathbf{0}_{n^2 \times n^2} \\ \mathbf{0}_{n^2 \times n^2} & \mathbf{0}_{n^2 \times n^2} \end{bmatrix}_{2n^2 \times 2n^2}$$

$$\mathbf{N}_2 = \begin{bmatrix} \mathbf{0}_{n^2 \times n^2} & \mathbf{I}_{n^2 \times n^2} \\ \mathbf{0}_{n^2 \times n^2} & \mathbf{0}_{n^2 \times n^2} \end{bmatrix}_{2n^2 \times 2n^2}$$

where  $n$  is the number of control points of the approximation surface in the  $u$  and  $v$  direction.

$\mathbf{I}$  is the identity matrix.  $\mathbf{N}_1$  and  $\mathbf{N}_2$  are designed to satisfy the equations  $\mathbf{N}_1 \mathbf{P} = \begin{pmatrix} \mathbf{P}_1 \\ \mathbf{0} \end{pmatrix}$  and

$\mathbf{N}_2 \mathbf{P} = \begin{pmatrix} \mathbf{P}_2 \\ \mathbf{0} \end{pmatrix}$  where  $\mathbf{P} = \begin{pmatrix} \mathbf{P}_1 \\ \mathbf{P}_2 \end{pmatrix}$ .

For Schwarz\_P, matrices  $\mathbf{T}_{1p}$ - $\mathbf{T}_{4p}$  are given.  $\mathbf{M}_{ijp}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) are the same as  $\mathbf{M}_{ijg}$  ( $i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4$ ) mentioned above.

$$\mathbf{T}_{1p} = \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} & -\frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{4} \\ -\frac{1}{2} & \frac{1}{2} & -\frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{4} \\ -\frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & 0 & -\frac{1}{2} \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{2p} = \begin{bmatrix} \frac{1}{2} & \frac{1}{2} & -\frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{4} \\ \frac{1}{2} & \frac{1}{2} & \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{4} \\ -\frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 0 & \frac{1}{2} \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{3p} = \begin{bmatrix} 0 & -1 & 0 & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T}_{4p} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

## 2. CONVERGENCE PROOFS FOR DIAMOND AND SCHWARZ\_P TPMS

The following sections include the convergence proofs for Diamond and Schwarz\_P TPMS.

**Proposition 1** *The CPIA iterative method for Diamond is convergent and the limit surface is the least-square fitting outcome of the initial data  $\{\mathbf{Q}_{ij}\}_{i=0,j=0}^{m_1,m_2}$ .*

**Proof.** As the result of the iterative procedure of CPIA, two sequences of the control points of the offset surface for Diamond  $\{\mathbf{P}_1^k(u, v), k = 0, 1, \dots\}$  and  $\{\mathbf{P}_2^k(u, v), k = 0, 1, \dots\}$  are generated. To show their convergence, let  $\mathbf{P}^k = \{\mathbf{P}_0^k, \mathbf{P}_1^k, \dots, \mathbf{P}_n^k\}^T$  and  $\mathbf{Q} = \{\mathbf{Q}_0, \mathbf{Q}_1, \dots, \mathbf{Q}_m\}^T$ . Here

$$\mathbf{P} = \begin{pmatrix} \mathbf{P}_1 \\ \mathbf{P}_2 \end{pmatrix} \text{ and } \mathbf{Q} = \begin{pmatrix} \mathbf{Q}_1 \\ \mathbf{Q}_2 \end{pmatrix}.$$

In the (k+1)th iteration, we can derive the coordinates of the newly adjusted control points as:

$$\begin{aligned} \mathbf{P}^{k+1} &= \mathbf{P}^k + (\mathbf{Q} - \mathbf{B}\mathbf{w}\mathbf{P}^k) + \frac{1}{2} \sum_{i=1}^2 ((\mathbf{M}_{24d} - \mathbf{M}_{14d})\mathbf{N}_i\mathbf{P}^k\mathbf{T}_{1d} - (\mathbf{M}_{21d} - \mathbf{M}_{11d})\mathbf{N}_{3-i}\mathbf{P}^k) \\ &+ \frac{1}{2} \sum_{i=1}^2 ((3\mathbf{M}_{44d} - 2\mathbf{M}_{34d} - \mathbf{M}_{54d})\mathbf{N}_i\mathbf{P}^k\mathbf{T}_{1d} - (3\mathbf{M}_{41d} - 2\mathbf{M}_{31d} - \mathbf{M}_{51d})\mathbf{N}_{3-i}\mathbf{P}^k) \\ &+ \frac{1}{2} \sum_{i=1}^2 ((\mathbf{M}_{23d} - \mathbf{M}_{13d})\mathbf{N}_i\mathbf{P}^k\mathbf{T}_{2d} - (\mathbf{M}_{22d} - \mathbf{M}_{12d})\mathbf{N}_{3-i}\mathbf{P}^k) \\ &+ \frac{1}{2} \sum_{i=1}^2 ((3\mathbf{M}_{43d} - 2\mathbf{M}_{33d} - \mathbf{M}_{53d})\mathbf{N}_i\mathbf{P}^k\mathbf{T}_{2d} - (3\mathbf{M}_{42d} - 2\mathbf{M}_{32d} - \mathbf{M}_{52d})\mathbf{N}_{3-i}\mathbf{P}^k) \end{aligned} \quad (\text{S1})$$

The matrices  $\mathbf{T}_{id} (i = 1, 2)$  are given in Sec. 1 and they are invertible matrices where the absolute values of the eigenvalues are all 1, i.e.,  $|\lambda_i(\mathbf{T}_{jd})| = 1, i = 1, 2, 3, 4$  and  $j = 1, 2$ .  $\mathbf{B}$  refers to the B-spline basis function matrix and  $\mathbf{w}$  is the weight matrix. The matrices  $\mathbf{M}_{ijd} (i = 1, 2, 3, 4, 5$  and  $j = 1, 2, 3, 4)$ ,  $\mathbf{N}_1$ , and  $\mathbf{N}_2$  are also given in Sec. 1. To simplify the form of the equations, let  $\alpha_i = 3\mathbf{M}_{4id} - 2\mathbf{M}_{3id} - \mathbf{M}_{5id}$ ,  $\beta_i = \mathbf{M}_{2id} - \mathbf{M}_{1id} (i = 1, 2, 3, 4)$ ,  $\mathbf{D} = \mathbf{I} - \mathbf{B}\mathbf{w}$ , and  $\mathbf{r}^k = \mathbf{P}^k - \mathbf{w}^{-1}\mathbf{B}^{-1}\mathbf{Q}$ .

Then Eq. S1 can be transformed into a new form:

$$\begin{aligned}
\mathbf{r}^{k+1} &= (\mathbf{D} - \frac{1}{2}(\alpha_1 + \beta_1 + \alpha_2 + \beta_2)(\mathbf{N}_1 + \mathbf{N}_2))\mathbf{r}^k + \frac{1}{2}(\alpha_4 + \beta_4)(\mathbf{N}_1 + \mathbf{N}_2)\mathbf{r}^k \mathbf{T}_{1d} + \frac{1}{2}(\alpha_3 + \beta_3)(\mathbf{N}_1 + \mathbf{N}_2)\mathbf{r}^k \mathbf{T}_{2d} \\
&= \dots \\
&= \sum_{i_1=0}^{k+1} \sum_{i_2=0}^{k+1} \sum_{i_3=0}^{k+1} \binom{k+1}{i_1, i_2, i_3} (\mathbf{D} - \frac{1}{2}(\alpha_1 + \beta_1 + \alpha_2 + \beta_2)(\mathbf{N}_1 + \mathbf{N}_2))^{i_1} \\
&\quad \left[ \frac{(\alpha_4 + \beta_4)(\mathbf{N}_1 + \mathbf{N}_2)}{2} \right]^{i_2} \left[ \frac{(\alpha_3 + \beta_3)(\mathbf{N}_1 + \mathbf{N}_2)}{2} \right]^{i_3} \mathbf{r}^0 \mathbf{T}_{1d}^{i_2} \mathbf{T}_{2d}^{i_3}
\end{aligned} \tag{S2}$$

Supposing  $\{\lambda_k(\alpha_i)\} (k = 0, 1, \dots, n-1)$  and  $\{\lambda_l(\beta_j)\} (l = 0, 1, \dots, n-1)$  are the eigenvalues of  $\alpha_i$  and  $\beta_j$  sorted in non-decreasing order.  $n$  is the number of control points in  $u$  and  $v$  direction. Since  $|\lambda_k(\alpha_i)| = 0$  or  $1, i = 1, 2, 3, 4, k = 0, 1, \dots, n-1, |\lambda_l(\beta_j)| = 0$  or  $1, j = 1, 2, 3, 4, l = 0, 1, \dots, n-1, r(\sum_{i=0}^4 \alpha_i) < n, r(\sum_{i=0}^4 \beta_i) < n, |\lambda_i(\mathbf{T}_{jd})| = 1, i = 1, 2, 3, 4, j = 1, 2,$  and  $r(\mathbf{N}_1 + \mathbf{N}_2) = \frac{n}{2} < n,$  their powers have no effect on convergence.  $r(\alpha)$  is the rank of  $\alpha$ .

Let

$$\mathbf{s}^{k+1} = \mathbf{D}^{k+1} \mathbf{r}^0 \tag{S3}$$

Similar to Gyroid, we first show that  $\mathbf{s}^{k+1}$  is convergent. Then we show that  $\mathbf{r}^{k+1}$  is also convergent. To achieve this goal,  $\mathbf{s}^{k+1}$  is turned into the form

$$\mathbf{s}^{k+1} = (\mathbf{I} - \mathbf{B}\mathbf{w})^{k+1} \mathbf{r}^0 \tag{S4}$$

Since  $\mathbf{B}$  is a non-singular matrix, it is positive definite. From Theorem 2.2 in [1], we know that  $\rho(\mathbf{I} - \mathbf{B}) < 1,$  where  $\rho(\mathbf{I} - \mathbf{B})$  is the spectral radius of  $\mathbf{I} - \mathbf{B}.$  With uniform weight assignment,  $\rho(\mathbf{I} - \mathbf{B}\mathbf{w}) < 1.$  Therefore, we get the following equation:

$$\lim_{k \rightarrow \infty} (\mathbf{I} - \mathbf{B}\mathbf{w})^k = \lim_{k \rightarrow \infty} \mathbf{s}^{k+1} = (\mathbf{0})_{n+1} \tag{S5}$$

Then each term in  $\mathbf{r}^{k+1}$  has the same spectral radius as each term in  $\mathbf{s}^{k+1},$  as is proved for Gyroid. So if  $\mathbf{s}^{k+1}$  is convergent,  $\mathbf{r}^{k+1}$  is also convergent, which could be expressed as:

$$\lim_{k \rightarrow \infty} \mathbf{P}^k - \mathbf{w}^{-1} \mathbf{B}^{-1} \mathbf{Q} = \mathbf{0} \tag{S6}$$

So  $\{\mathbf{P}^k\}$  is convergent, and

$$\mathbf{P}^\infty = \mathbf{w}^{-1} \mathbf{B}^{-1} \mathbf{Q} \tag{S7}$$

**Proposition 2** *The CPIA iterative method for Schwarz\_P is convergent and the limit surface is the least-square fitting outcome of the initial data  $\{\mathbf{Q}_{ij}\}_{i=0, j=0}^{m_1, m_2}.$*

**Proof.** As the result of the iterative procedure of CPIA, a sequence of the control points of the offset surface for Schwarz\_P  $\{\mathbf{P}^k(u, v), k = 0, 1, \dots\}$  is generated. To show its convergence, let  $\mathbf{P}^k = \mathbf{P}_0^k, \mathbf{P}_1^k, \dots, \mathbf{P}_n^k\}^T$  and  $\mathbf{Q} = \{\mathbf{Q}_0, \mathbf{Q}_1, \dots, \mathbf{Q}_m\}^T.$  In the  $(k+1)$ th iteration, we have

$$\begin{aligned}
\mathbf{P}^{k+1} &= \mathbf{P}^k + (\mathbf{Q} - \mathbf{B}\mathbf{w}\mathbf{P}^k) + \frac{1}{2} \sum_{i=1}^4 ((\mathbf{M}_{2ip} - \mathbf{M}_{1ip})\mathbf{P}^k \mathbf{T}_{ip} - (\mathbf{M}_{2ip} - \mathbf{M}_{1ip})\mathbf{P}^k) \\
&\quad + \frac{1}{2} \sum_{i=1}^4 ((3\mathbf{M}_{4ip} - 2\mathbf{M}_{3ip} - \mathbf{M}_{5ip})\mathbf{P}^k \mathbf{T}_{ip} - (3\mathbf{M}_{4ip} - 2\mathbf{M}_{3ip} - \mathbf{M}_{5ip})\mathbf{P}^k)
\end{aligned} \tag{S8}$$

where  $\mathbf{M}_{ijp} (i = 1, 2, 3, 4, 5, j = 1, 2, 3, 4)$  and  $\mathbf{T}_{ip} (i = 1, 2, 3, 4)$  are given in Sec. 1.  $\mathbf{T}_{ip} (i = 1, 2, 3, 4)$  are invertible matrices where the absolute values of the eigenvalues are all 1, i.e.,  $|\lambda_i(\mathbf{T}_{jd})| = 1, i = 1, 2, 3, 4$  and  $j = 1, 2, 3, 4.$   $\mathbf{B}$  and  $\mathbf{w}$  are mentioned in the proof for Gyroid and Diamond.

To simplify the expression of the formulas, let  $\alpha_i = 3\mathbf{M}_{4ip} - 2\mathbf{M}_{3ip} - \mathbf{M}_{5ip}$  and  $\beta_i = \mathbf{M}_{2ip} - \mathbf{M}_{1ip} (i = 1, 2, 3, 4).$

Let  $\mathbf{D} = \mathbf{I} - \mathbf{B}\mathbf{w}$  and  $\mathbf{r}^k = \mathbf{P}^k - \mathbf{w}^{-1}\mathbf{B}^{-1}\mathbf{Q}$ . Then a new form of Eq. S8 could be derived as

$$\begin{aligned} \mathbf{r}^{k+1} &= (\mathbf{D} - \frac{1}{2} \sum_{i=0}^4 (\alpha_i + \beta_i)) \mathbf{r}^k + \frac{1}{2} \sum_{i=0}^4 (\alpha_i + \beta_i) \mathbf{r}^k \mathbf{T}_{ip} \\ &= \dots \\ &= \sum_{i=0}^{k+1} \binom{k+1}{i} (\mathbf{D} - \frac{1}{2} \sum_{n=0}^4 (\alpha_n + \beta_n))^i (\frac{1}{2} \sum_{n=0}^4 (\alpha_n + \beta_n))^{k+1-i} \mathbf{r}^0 \mathbf{T}_{ip}^{k+1-i} \end{aligned} \quad (\text{S9})$$

Supposing  $\{\lambda_k(\alpha_i)\} (k = 0, 1, \dots, n-1)$  and  $\{\lambda_l(\beta_j)\} (l = 0, 1, \dots, n-1)$  are the eigenvalues of  $\alpha_i$  and  $\beta_j$  sorted in non-decreasing order. Since  $|\lambda_k(\alpha_i)| = 0$  or  $1, k = 0, 1, \dots, n-1$ ,  $|\lambda_l(\beta_j)| = 0$  or  $1, l = 0, 1, \dots, n-1$ , and  $r(\sum_{i=0}^4 \beta_i) < n$ , their powers have no effect on convergence. ( $r(\sum_{i=0}^4 \beta_i)$  is the rank of  $(\sum_{i=0}^4 \beta_i)$ ).

Let

$$\mathbf{s}^{k+1} = \mathbf{D}^{k+1} \mathbf{r}^0 \quad (\text{S10})$$

Then the convergence of  $\mathbf{r}^{k+1}$  is the same as  $\mathbf{s}^{k+1}$ . Then we only need to show that  $\{\mathbf{s}^k\}$  is convergent.  $\mathbf{s}^{k+1}$  have another form

$$\mathbf{s}^{k+1} = (\mathbf{I} - \mathbf{B}\mathbf{w})^{k+1} \mathbf{r}^0 \quad (\text{S11})$$

Since  $\mathbf{B}$  is a non-singular matrix, it is positive definite. From Theorem 2.2 in [1], we know that  $\rho(\mathbf{I} - \mathbf{B}) < 1$ , where  $\rho(\mathbf{I} - \mathbf{B})$  is the spectral radius of  $\mathbf{I} - \mathbf{B}$ . With uniform weight assignment,  $\rho(\mathbf{I} - \mathbf{B}\mathbf{w}) < 1$ . Therefore, we have the following equation

$$\lim_{k \rightarrow \infty} (\mathbf{I} - \mathbf{B}\mathbf{w})^k = \lim_{k \rightarrow \infty} \mathbf{s}^{k+1} = (\mathbf{0})_{n+1} \quad (\text{S12})$$

After proving the convergence of  $\mathbf{s}^{k+1}$ ,  $\mathbf{r}^{k+1}$  is also convergent according to the proof for Gyroid. This convergence has the form:

$$\lim_{k \rightarrow \infty} \mathbf{P}^k - \mathbf{w}^{-1}\mathbf{B}^{-1}\mathbf{Q} = \mathbf{0} \quad (\text{S13})$$

So  $\{\mathbf{P}^k\}$  is convergent, and

$$\mathbf{P}^\infty = \mathbf{w}^{-1}\mathbf{B}^{-1}\mathbf{Q} \quad (\text{S14})$$

### 3. THE SECOND ORDER DERIVATIVES OF THE OFFSET EQUATION

Given  $\phi_1, \phi_2$ , and  $\phi_3$  in Section 3.1 of the paper, the real and imaginary parts of the three complex variables, denoted as  $\mathbf{p}_1 \mathbf{p}_2 \mathbf{p}_3$  and  $\mathbf{q}_1 \mathbf{q}_2 \mathbf{q}_3$ , are given as:

$$\begin{aligned} \mathbf{p}_1 &= \text{Re}(\phi_1) \\ \mathbf{p}_2 &= \text{Re}(\phi_2) \\ \mathbf{p}_3 &= \text{Re}(\phi_3) \\ \mathbf{q}_1 &= \text{Im}(\phi_1) \\ \mathbf{q}_2 &= \text{Im}(\phi_2) \\ \mathbf{q}_3 &= \text{Im}(\phi_3) \end{aligned} \quad (\text{S15})$$

To calculate the second order derivatives, the first order and second order derivatives of  $\phi_1$ ,  $\phi_2$ , and  $\phi_3$  are first calculated, given as:

$$\begin{aligned}
\mathbf{p}'_1 &= \text{Re} \left[ -\frac{(1-\tau^2)(8\tau^7-56\tau^3)}{2(\tau^8-14\tau^4+1)^{3/2}} - \frac{2\tau}{\sqrt{\tau^8-14\tau^4+1}} \right] \\
\mathbf{p}'_2 &= \text{Re} \left[ \frac{2i\tau}{\sqrt{\tau^8-14\tau^4+1}} - \frac{i(\tau^2+1)(8\tau^7-56\tau^3)}{2(\tau^8-14\tau^4+1)^{3/2}} \right] \\
\mathbf{p}'_3 &= \text{Re} \left[ \frac{2}{\sqrt{\tau^8-14\tau^4+1}} - \frac{\tau(8\tau^7-56\tau^3)}{(\tau^8-14\tau^4+1)^{3/2}} \right] \\
