# THE RELATIVE EXTREMAL FUNCTION FOR BOREL SETS IN COMPLEX MANIFOLDS

Armen Edigarian<sup>∗</sup> and Ragnar Sigurdsson

July 12, 2006

#### Abstract

We study a disc formula for the relative extremal function for Borel sets in complex manifolds.

*Keywords:* Analytic disc, relative extremal function, pluriregular set, pluripolar set, Josefson manifold, weakly regular domain.

*Subject Classification (2000)*: Primary 32U15. Secondary 32U10, 32U30.

# 1 Introduction

Let X be a complex manifold,  $PSH(X)$  be the class of all plurisubharmonic functions on X, and PSH<sup> $-(X)$ </sup> be the subclass of all non-positive functions. For any subset A of X we define

 $\omega(\cdot, A, X) = \sup \{ u \in \text{PSH}^-(X) ; u | A \leq -1 \} = \sup \{ u \in \text{PSH}(X) ; u \leq -\chi_A \},$ 

where  $\chi_A$  denotes the characteristic function of the set A. The least upper semicontinuous majorant  $\omega^*(\cdot, A, X)$  of  $\omega(\cdot, A, X)$  is plurisubharmonic and it is called the *relative extremal function for* A *in* X.

Observe that if A is a Borel set,  $u \in \text{PSH}(X)$ ,  $u \leq -\chi_A$ ,  $x = f(0)$ , where  $f \in \mathcal{O}(\mathbb{D}, X)$  $C(\overline{\mathbb{D}}, X)$ , i.e., f is an *analytic disc* which extends to a continuous map from the closure  $\overline{\mathbb{D}}$  of the unit disc  $D$  to X, then the subaverage property of u implies

$$
u(x) \le \frac{1}{2\pi} \int_0^{2\pi} u(f(e^{i\theta})) \, d\theta \le \frac{1}{2\pi} \int_0^{2\pi} (-\chi_A)(f(e^{i\theta})) \, d\theta = -\sigma(f^{-1}(A) \cap \mathbb{T}) = -\sigma_f(A),
$$

where  $\sigma$  denotes the normalized arc length measure on the unit circle T and  $\sigma_f$  the image measure (push-forward) of  $\sigma$  under the map f. By taking supremum over all plurisubharmonic  $u\leq -\chi_A$  and infimum over all  $f\in \mathcal O(\Bbb D,X)\cap C(\overline{\Bbb D},X),$  we get

$$
\omega(x, A, X) \le \Omega(x, A, X) = \inf \{-\sigma_f(A) \, ; \, f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X), f(0) = x\}
$$
  
=  $-\sup \{\sigma_f(A) \, ; \, f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X), f(0) = x\}.$ 

<sup>∗</sup>This work is a part of the Research Grant No. 1 PO3A 005 28, which is supported by public means in the programme for promoting science in Poland in the years 2005-2008. The first author is a fellow of Krzyżanowski Fund at the Jagiellonian University. This work was also supported by the Research Fund at the University of Iceland.

In this paper we are mainly concerned with a possible converse of this inequality. If A is an open subset of X, then  $\omega(\cdot, A, X) = \Omega(\cdot, A, X)$ . This is a special case of Poletsky's theorem which states that if  $\varphi$  is an upper semicontinuous function on X, then for every x in  $X$ 

$$
\sup\{u(x)\,;\,u\in PSH(X), u\leq \varphi\}=\inf\{\int_{\mathbb{T}}\varphi\circ f\,d\sigma\,;\,f\in \mathcal{O}(\overline{\mathbb{D}},X), f(0)=x\}.
$$

See [\[10\]](#page-12-0), [\[11\]](#page-12-1), [\[13\]](#page-12-2), and [\[15\]](#page-12-3). Here  $\mathcal{O}(\overline{\mathbb{D}},X)\subset \mathcal{O}(\mathbb{D},X)\cap C(\overline{\mathbb{D}},X)$  denotes the set of all *closed* analytic discs in X, i.e., analytic discs which extend to holomorphic maps in some neighbourhood of  $\overline{\mathbb{D}}$ . With  $-\chi_A$  in the role of  $\varphi$  we get  $\omega(\cdot, A, X) = \Omega(\cdot, A, X)$  for every open set A.

We say that the subset A of X is *pluriregular* at the point  $x \in A$  if  $\omega^*(x, A, X) = -1$ , we say that A is *locally pluriregular* at the point x in A if  $\omega^*(x, A \cap U, U) = -1$  for every neighbourhood U of x, and finally we say that A is (*locally*) *pluriregular* if A is (locally) pluriregular at each of its points. Note that if  $A$  is locally pluriregular, then  $A$  is pluriregular and that if A is pluriregular, then  $\omega(\cdot, A, X) = \omega^*(\cdot, A, X)$ . Our main result of Section 2 is that if A is a locally pluriregular subset of X, then  $\Omega(\cdot, \overline{A}, X) \leq \omega(\cdot, A, X)$ . (See Th. [2.1.](#page-2-0)) This is a generalization of Th. 7.2 in Poletsky [\[13\]](#page-12-2).

Let E be a subset of a complex manifold X. We say that E is *pluripolar* or *locally pluripolar* if for any  $a \in E$  there exists a neighbourhood U of a in X and  $u \in \text{PSH}(U)$ ,  $u \neq -\infty$ , such that  $E \cap U \subset \{x \in U : u(x) = -\infty\}$ . We say that  $E \subset X$  is *globally pluripolar* if there exists  $u \in \text{PSH}(X)$ ,  $u \neq -\infty$ , with  $E \subset \{x \in X; u(x) = -\infty\}$ . Note that any globally pluripolar set is locally pluripolar. Josefson [\[8\]](#page-12-4) proved that in  $\mathbb{C}^n$  every pluripolar set is globally pluripolar. We say that a complex manifold X is a *Josefson manifold* if any locally pluripolar set is globally pluripolar. Bedford [\[3\]](#page-12-5) has generalized Josefson's theorem to a certain class of complex spaces including Stein manifolds. He also showed that examples, originally given by Grauert [\[7\]](#page-12-6), of complex manifolds which possess no non-constant holomorphic functions are Josefson manifolds.

In Section 3 we prove that if X is a relatively compact domain in a Josefson manifold and A is a Borel subset of X, then  $\Omega(\cdot, A, X) \leq \omega^*(\cdot, A, X)$ . (See Th. 3.1.) The main result of Section 3 is that a Josefson manifold  $X$  has the property that every bounded plurisubharmonic function on X is constant if and only if for every  $p \in X$ , every non-pluripolar Borel subset A of X, and every  $\varepsilon > 0$  there exists  $f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X)$  such that  $f(0) = p$  and

$$
\sigma_f(A) = \sigma(f^{-1}(A) \cap \mathbb{T}) > 1 - \varepsilon.
$$

(See Th. [3.3.](#page-7-0)) As a consequence we get a characterization of pluripolar sets in terms of analytic discs.

In Section 4 we look at Borel subsets A of the boundary  $\partial D$  of a relatively compact domain in a complex manifold  $X$ . We define the relative extremal function for an open subset  $U$  of the boundary as  $\omega(\cdot, U, D) = u_{-\chi_U, D}$ , where  $u_{f,D}$  is the Perron-Bremermann envelope of the boundary function f, and for any subset A of  $\partial D$  we define  $\omega(\cdot, A, D)$  as the supremum over all  $\omega(\cdot, U, D)$  for U open containing A. We call the domain *weakly regular* if the upper semicontinuous extension  $u^*_{-\chi_U,D}$  of  $u_{-\chi_U,D}$  to the closure  $\overline{D}$  is less than or equal to  $-\chi_U$ on  $\partial D$ . For any Borel subset A of  $\partial D$  we define  $\Omega(x, A, D)$  as the infimum over  $-\sigma_f(A)$  for  $f \in \mathcal{O}(\mathbb{D}, D) \cap C(\overline{\mathbb{D}}, \overline{D})$  with  $f(0) = x$ . We prove (see Th. 4.3) that for a weakly regular domain D and every open subset U of  $\partial D$  we have  $\omega(\cdot, U, D) = \Omega(\cdot, U, D)$  and (see Th. 4.10)  $\omega(\cdot,\overline{A},D) \leq \Omega(\cdot,\overline{A},D) \leq \omega^*(\cdot,A,D)$ , if A is a Borel subset of the form  $A = A_1 \cup E$ , where  $A_1$  is locally pluriregular with respect to D and E is such that there exists  $u \in PSH^{-}(D)$ ,  $u \neq -\infty$ , and  $u^*|_E = -\infty$ . It remains an open question if the last result holds for every Borel set A.

## 2 Construction of analytic discs

<span id="page-2-0"></span>We have already seen that for every manifold  $X$  and every Borel subset  $A$  of  $X$  we have  $\omega(\cdot, A, X) \leq \Omega(\cdot, A, X)$  and that Poletsky's theorem implies that equality holds if A is open.

**Theorem 2.1** Let X be a complex manifold and A be any locally pluriregular subset of X. Then  $\Omega(\cdot, A, X) \leq \omega(\cdot, A, X)$ , in particular,  $\Omega(\cdot, A, X) = \omega(\cdot, A, X)$  if A is also closed.

The main argument of the proof consists of an approximation of analytic discs and it appears a few times in this paper. We therefore state it as a separate result. A similar result for domains in  $\mathbb{C}^n$  and, more generally, for domains in Banach spaces is proved by Poletsky in [\[14\]](#page-12-7). Our proof uses the existence of Stein neighbourhoods of certain sets which was proved by Rosay [\[15\]](#page-12-3). For a simplification of his arguments and further development see [\[6\]](#page-12-8) and [\[11\]](#page-12-1).

If X is a complex manifold and  $d: X \times X \to [0, +\infty)$  is a continuous function vanishing on the diagonal, i.e.,  $d(x, x) = 0$  for all  $x \in X$ , then for any subset A of X we define the *diameter of* A *with respect to* d as  $\sup\{d(x, y) : x, y \in A\}$ . In the proof of Theorem [2.1](#page-2-0) we will take d as a complete hermitian metric defining the topology of  $X$ .

<span id="page-2-1"></span>**Theorem 2.2** Let X be a complex manifold,  $d : X \times X \to [0, +\infty)$  be a continuous function vanishing on the diagonal,  $\delta > 0$ , and  $\{B_i\}$  be a countable family of open subsets in X of diameter less than  $\delta$  with respect to d. Assume that U and V are open subsets of X and

$$
V \subset \bigcup_j \{x \in B_j \, ; \, \omega(x, U \cap B_j, B_j) < -a \},
$$

where  $a \in (0,1)$ . Let  $h \in \mathcal{O}(\overline{\mathbb{D}}, X)$  and assume that  $\Delta \subset h^{-1}(V) \cap \mathbb{T}$  is a non-empty open set. Then for every  $\varepsilon \in (0,1)$  there exist  $g \in \mathcal{O}(\overline{\mathbb{D}}, X)$  and an open set  $\tilde{\Delta} \subseteq \Delta$  such that

- $(1)$   $q(0) = h(0),$
- (2)  $d(g, h) = \sup_{z \in \overline{\mathbb{D}}} d(g(z), h(z)) \leq \delta + \varepsilon$ ,
- (3)  $\sigma(\tilde{\Delta}) > (1 \varepsilon) a \sigma(\Delta)$ , and
- (4)  $q(\tilde{\Delta}) \subset U$ .

*Proof:* For  $r > 0$  we let  $D_r$  be the open disc in  $\mathbb C$  with radius r and centre at the origin and we assume that  $h \in \mathcal{O}(D_s, X)$  for some  $s > 1$ . Fix  $\Delta_0 \subset \Delta$  a union of closed arcs such that  $\sigma(\Delta_0) > (1 - \varepsilon) \sigma(\Delta).$ 

Take  $w_0 \in \Delta$ . Then  $x_0 = h(w_0) \in V$ , so there exists a  $j_0$  such that  $x_0 \in B_{j_0}$  and  $\omega(x_0, U \cap B_{j_0}, B_{j_0}) < -a$ . Since U is open, Poletsky's theorem implies that there exists  $f_0 \in \mathcal{O}(\overline{\mathbb{D}}, B_{j_0})$  such that  $f_0(0) = x_0$  and  $\sigma_{f_0}(U) > a$ . Let  $I_0 \subset f_0^{-1}(U) \cap \mathbb{T}$  be a union of finite number of closed arcs such that  $\sigma(I_0) > a$ . By Lemma 2.3 in [\[10\]](#page-12-0), there exists an open neighbourhood  $V_0$  of  $x_0 = f_0(0)$  in  $X, r > 1$ , and  $f \in \mathcal{O}(D_r \times V_0, B_{j_0})$  such that  $f(z, x_0) = f_0(z)$  for all  $z \in D_r$  and  $f(0, x) = x$  for all  $x \in V_0$ . By choosing  $r > 1$  sufficiently small and shrinking the neighbourhood  $V_0$  of  $x_0$ , we may assume that  $f(z, x) \in U$  for all  $z \in I_0$  and  $x \in V_0$ . We set  $F_0(z, w) = f(z, h(w))$  and note that  $F_0$  is defined on  $D_r \times h^{-1}(V_0)$ and that  $h^{-1}(V_0)$  is a neighbourhood of  $w_0$ .

We apply a compactness argument on  $\Delta_0$  and conclude that we may find:

- Open discs  $U_1, \ldots, U_m$  centred on  $\mathbb T$  with mutually disjoint closures such that  $U_i \cap \mathbb T \subset \Delta$ and  $\sigma((U_1 \cup \cdots \cup U_m) \cap \mathbb{T}) > (1 - \varepsilon)\sigma(\Delta).$
- $r_j > 1$ ,  $j = 1, \ldots, m$ , and holomorphic maps  $F_j : D_{r_j} \times U_j \to B_{k(j)}$  with  $F_j(0, w) = h(w)$ for all  $w \in U_i$ .
- Finite unions  $I_j$ ,  $j = 1, \ldots, m$ , of closed arcs on  $\mathbb{T}$  with  $\sigma(I_j) > a$  and  $F_j(z, w) \in U$  for all  $z \in I_j$  and  $w \in U_j$ .

Take closed arcs  $J_1, \ldots, J_m$  in  $\mathbb T$  such that  $J_j \subset U_j \cap \mathbb T$  and  $\sigma(J_1 \cup \cdots \cup J_m) > (1-\varepsilon)\sigma(\Delta)$ . Let

$$
K_0 = \{(w, 0, 0, 0, h(w)); w \in \overline{\mathbb{D}}\} \subset \mathbb{C}^4 \times X
$$

and

$$
K_j = \{ (w, z, 0, 0, F_j(z, w)) \, ; \, w \in J_j, z \in \overline{\mathbb{D}} \} \subset \mathbb{C}^4 \times X, \qquad j = 1, \dots, m.
$$

By the proof of Th. 1.2 in [\[11\]](#page-12-1), there exists a Stein neighbourhood Z of  $K_0\cup K_1\cup\cdots\cup K_m$ in  $\mathbb{C}^4 \times X$ . Let  $\tau : Z \to \mathbb{C}^N$  be an embedding,  $\varkappa : W \to \tau(Z)$  be a holomorphic retraction from a Stein neighbourhood W of  $\tau(Z)$  in  $\mathbb{C}^N$ , and  $\varphi = \text{pr} \circ \tau^{-1} \circ \varkappa : W \to X$  be the holomorphic submersion, where  $pr : \mathbb{C}^4 \times X \to X$  is the projection.

We let  $\rho : \mathbb{T} \to [0,1]$  be a  $C^{\infty}$  function such that  $\rho = 0$  on  $\mathbb{T} \setminus (\cup_i J_i)$  and  $\rho = 1$  on a subset of  $\cup_i J_i$  such that  $\sigma({w \in \mathbb{T}; \rho(w) = 1}) > (1 - \varepsilon)\sigma(\Delta)$ . We define a  $C^{\infty}$  map  $F: D_s \times \mathbb{T} \to X$  by

$$
F(z, w) = \begin{cases} F_j(\rho(w)z, w), & w \in J_j, \ j = 1, \dots, m, \\ h(w), & w \notin \cup_j J_j. \end{cases}
$$

Since Z is a neighbourhood of  $K_0 \cup \cdots \cup K_m$  we can replace  $s > 1$  by a smaller number and can define  $\tilde{F}: D_s \times \mathbb{T} \to W$  by  $\tilde{F}(z, w) = \tau(w, z, 0, 0, F(z, w))$  and  $\tilde{h}: D_s \to W$  by  $h(w) = \tau(w, 0, 0, 0, h(w))$ . We note that  $F(0, w) = h(w)$  for all  $w \in \mathbb{T}$ .

In exactly the same way as in the proof of Lemma 2.6 in [\[10\]](#page-12-0) we construct a sequence  $\widetilde{F}_i \in \mathcal{O}(D_s \times A_i, W), j \geq j_0$ , where  $A_i$  is an open annulus containing  $\mathbb{T}$ , such that

- $\widetilde{F}_j \to \widetilde{F}$  uniformly on  $D_s \times \mathbb{T}$  as  $j \to \infty$ ,
- there is an integer  $k_j \geq j$  such that for all  $k \geq k_j$  the map  $\widetilde{F}_j(zw^k, w)$  can be extended to a map  $G_j \in \mathcal{O}(D_{s_j} \times D_{s_j}, W)$ , where  $s_j \in (1, s)$ , and
- $G_j(0, w) = h(w)$  for all  $w \in D_{s_j}$ .

We need to estimate  $\sup_{w \in \mathbb{T}} \sup_{z \in \mathbb{D}} d(\varphi(F_j(z, w)), h(w))$ . Since  $F_j \to F$  uniformly on  $\overline{\mathbb{D}} \times \mathbb{T}$  as  $j \to \infty$  and  $\varphi(\tilde{F}) = F$  we have

$$
\sup_{z \in \overline{\mathbb{D}}, w \in \mathbb{T}} d(\varphi(\widetilde{F}_j(z, w)), h(w)) \to \sup_{z \in \overline{\mathbb{D}}, w \in \mathbb{T}} d(F(z, w), h(w)), \qquad j \to \infty.
$$

We have  $\sup_{z\in\overline{\mathbb{D}}}d(F(z,w),h(w))=0$  for all  $w\in\mathbb{T}\setminus(\cup_j J_j)$  and since  $F_j$  takes values in  $B_{k(j)}$ , we have  $\sup_{z \in \overline{\mathbb{D}}} d(F(z, w), h(w)) \leq \delta$  for all  $w \in J_j$ . Hence

$$
\limsup_{j\to\infty}\Big[\sup_{z\in\overline{\mathbb{D}},w\in\mathbb{T}}d(\varphi(\widetilde{F}_j(z,w)),h(w))\Big]\leq\delta.
$$

Take  $j \geq j_0$  so that  $\sup_{z \in \overline{\mathbb{D}}, w \in \mathbb{T}} d(\varphi(F_j(z, w)), h(w)) \leq \delta + \varepsilon/2$ . There exists  $t \in (0, 1)$ such that  $\sup_{z\in\overline{\mathbb{D}},w\in[t,1]}d(\varphi(\widetilde{F}_j(z,w)),h(w)) < \delta + \varepsilon$ . Note that

$$
\sup_{z \in \overline{\mathbb{D}}, |w| \le t} d(\varphi(\widetilde{F}_j(zw^k, w)), h(w)) \to 0
$$

as  $k \to \infty$ , so for sufficiently large k we have

$$
\sup_{z,w\in\overline{\mathbb{D}}} d(\varphi(\widetilde{F}_j(zw^k,w)),h(w)) < \delta + \varepsilon.
$$

We set  $G(z, w) = \varphi(\widetilde{F}_j(zw^k, w))$ . Then  $G \in \mathcal{O}(\overline{\mathbb{D}}^2, X)$  and  $G(0, w) = h(w)$  for all  $w \in \mathbb{D}$ .

Put  $C = \bigcup_j (I_j \times \widetilde{J}_j)$ , where  $\widetilde{J}_j = \{w \in J_j : \rho(w) = 1\}$ . If  $\sigma_2 = \sigma \times \sigma$  is the product measure on the torus  $\mathbb{T}^2$ , then

$$
\sigma_2(C) = \sum_j \sigma_2(I_j \times \widetilde{J}_j) = \sum_j \sigma(I_j)\sigma(\widetilde{J}_j) > a(1-\varepsilon)\sigma(\Delta).
$$

The map  $\mathbb{T}^2 \ni (z, w) \to (zw^k, w) \in \mathbb{T}^2$  is an automorphism with the absolute value of the Jacobian equal to 1. Therefore the measure of the set  $\widetilde{C} = \{(z,w) \in \mathbb{T}^2 : (zw^k, w) \in C\}$  is equal to  $\sigma_2(C)$ . By Fubini's theorem there is a  $\theta \in [0, 2\pi)$  such that  $\sigma(C') \geq \sigma_2(\tilde{C})$ , where  $C' = \{w \in \mathbb{T} \, ; \, (e^{i\theta}w, w) \in \widetilde{C} \}.$ 

Now we finally define  $g(w) = G(e^{i\theta}w, w)$  for  $w \in \overline{\mathbb{D}}$  and  $\widetilde{\Delta} = g^{-1}(U) \cap \Delta$ . Then (1) and (4) are obvious and (2) holds because

$$
d(g, h) \le \sup_{z, w \in \overline{\mathbb{D}}} d(G(z, w), h(w)) < \delta + \varepsilon.
$$

For proving (3) we take  $w \in C'$  and observe that  $(e^{i\theta}w, w) \in \widetilde{C}$  and therefore  $(e^{i\theta}w \cdot w^k, w) \in C'$ C. This implies that  $e^{i\theta}w^{k+1} \in I_j$ ,  $w \in \tilde{J}_j$  for some j, and consequently  $g(w) \in U$ . Hence  $C' \subset \tilde{\Delta}$  and

$$
\sigma(\widetilde{\Delta}) \ge \sigma(C') \ge \sigma_2(C) > (1 - \varepsilon)a\sigma(\Delta).
$$

 $\Box$ 

*Proof of Th.* [2.1:](#page-2-0) Let  $x_0 \in X$ . It is sufficient to prove that if  $a \in (0,1)$  and  $\omega(x_0, A, X) < -a$ , then  $\Omega(x_0, A, X) \leq -a$ . This inequality will in turn follow if we prove that for every  $\varepsilon \in (0, 1)$ there exists  $h \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X)$  such that  $h(0) = x_0$  and  $\sigma_h(\overline{A}) > (1 - \varepsilon)a$ .

We take  $\varepsilon_m \searrow 0$  such that  $\prod_m (1 - \varepsilon_m) \ge \sqrt{1 - \varepsilon}$ . For every m we find a covering  $\{B_j^m\}$ of X by countably many balls of diameter less than  $\varepsilon_m$  and set

$$
U_m=\cup_j\{x\in B_j^m\,;\,\omega^*(x,A\cap B_j^m,B_j^m)<-1+\varepsilon_m\}.
$$

Since  $A$  is locally pluriregular,  $U_m$  is a neighbourhood of  $A$  and the inequality

$$
\omega(\cdot, A\cap B_j^m, B_j^m) \ge \omega(\cdot, U_{m+1}\cap B_j^m, B_j^m)
$$

implies

$$
U_m \subseteq \bigcup_j \{x \in B_j^m \, ; \, \omega(x, U_{m+1} \cap B_j^m, B_j^m) < -1 + \varepsilon_m\}.
$$

Since  $A$  is locally pluriregular and  $U_1$  is an open neighbourhood of  $A$  we have

$$
-a \ge \omega^*(x_0, A, X) \ge \omega(x_0, U_1, X) = \Omega(x_0, U_1, X)
$$

and there exists  $h_1 \in \mathcal{O}(\overline{\mathbb{D}}, X)$  such that  $h_1(0) = x_0$  and  $\sigma_{h_1}(U_1) > a$ . We set  $\Delta_1 =$  $h_1^{-1}(U_1) \cap \mathbb{T}$  and observe that by the definition of the measure  $\sigma_{h_1}$  we have  $\sigma(\Delta_1) > a$ . We apply Th. [2.2](#page-2-1) and get inductively a sequence  $h_m$  in  $\mathcal{O}(\overline{\mathbb{D}}, X)$  and a decreasing sequence  $\Delta_m$ of open subsets of T such that  $h_m(0) = x_0$ ,  $h_m(\Delta_m) \subset U_m$ ,  $\sigma(\Delta_{m+1}) > (1 - \varepsilon_m)^2 \sigma(\Delta_m)$ , and  $d(h_{m+1}, h_m) < 2\varepsilon_m$ .

The last condition implies that  $h_m$  converges uniformly on  $\overline{\mathbb{D}}$  to some  $h \in \mathcal{O}(\mathbb{D}, X) \cap$  $C(\overline{\mathbb{D}}, X)$ . We set  $\Delta = \cap_m \Delta_m$ . Since  $h_m(\Delta_m) \subset U_m$  and the points of  $U_m$  are at a distance less than or equal to  $\varepsilon_m$  from A, we have  $h(\Delta) \subset \overline{A}$  and since  $\sigma(\Delta_{m+1}) > (1 - \varepsilon_m)^2 \sigma(\Delta_m)$ we get

$$
\sigma_h(\overline{A}) \ge \sigma(\Delta) > \prod_m (1 - \varepsilon_m)^2 \sigma(\Delta_1) > (1 - \varepsilon)a.
$$

 $\Box$ 

#### 3 Characterization of pluripolar sets

Let  $X$  be a complex manifold. We say that  $X$  is a Josefson manifold if any locally pluripolar subset of X is globally pluripolar. Note that any domain in a Josefson manifold is a Josefson manifold. In particular, any domain in  $\mathbb{C}^n$  is a Josefson manifold. As a direct consequence of Th. [2.1](#page-2-0) we get (cf. Cor. 7.2 in [\[13\]](#page-12-2))

<span id="page-5-0"></span>**Theorem 3.1** Let X be a relatively compact domain in a Josefson manifold and A be a Borel subset of X. Then  $\Omega(\cdot, A, X) \leq \omega^*(\cdot, A, X)$ .

Before we prove the theorem we prove the following auxiliary result.

<span id="page-5-1"></span>**Lemma 3.2** [See Th. 8.3 in [\[4\]](#page-12-9) or Th. 7.3 in [\[13\]](#page-12-2))]. Let  $\mu$  be a Borel probability measure which is zero on every pluripolar set. Then the set function  $c = c_{\mu}$  defined by

$$
c(A) = c_{\mu}(A) = -\int_X \omega^*(\cdot, A, X) d\mu, \qquad A \subset X,
$$

is a Choquet capacity, i.e.,

- (1)  $c(A_1) \leq c(A_2)$  if  $A_1 \subset A_2$ ;
- (2)  $c(K) = \lim_{j\to\infty} c(K_j)$ , where  $K_1 \supset K_2 \supset \cdots \supset K$  are compact sets and  $K = \bigcap_j K_j$ ;
- (3)  $c(A) = \lim_{i \to \infty} c(A_i)$ , where  $A_1 \subset A_2 \subset \cdots \subset A$  are arbitrary sets and  $A = \cup A_i$ .

*Proof:* Since  $\omega^*(\cdot, A, X) = \omega(\cdot, A, X)$  on  $X \setminus P$  for some pluripolar set P, we have

$$
c(A) = c_{\mu}(A) = -\int_X \omega(\cdot, A, X) d\mu, \qquad A \subset X.
$$

Since  $-\omega(\cdot, A_1, X) \le -\omega(\cdot, A_2, X)$  if  $A_1 \subset A_2$ , (1) holds. For proving (2) we first observe that (1) implies  $c(K) \leq \lim_{j\to\infty} c(K_j)$ . If  $\{V_k\}_{k\in\mathbb{N}}$  is a decreasing basis of neighbourhoods of K, then  $\omega(x, V_k, X)$  increases to  $\omega(x, K, X)$  and the monotone convergence theorem implies that  $\lim_{k\to\infty} c(V_k) = c(K)$ . For every  $k \geq 1$  there exists a  $j_k$  such that  $K_j \subset V_k$  for all  $j \geq j_k$ , so

$$
\lim_{j \to \infty} c(K_j) \le \lim_{k \to \infty} c(V_k) = c(K).
$$

Note that (3) is clear for open sets. Fix  $\varepsilon > 0$  and put  $V_j = \{x \in X : \omega^*(x, A_j, X) < -1 + \varepsilon\}$ and  $V = \bigcup_j V_j$ . Then  $c(V_j) \to c(V)$ . Note that  $V_j \supset A_j \setminus P_j$ , where  $P_j$  is a pluripolar set. Hence,  $V \supset A \setminus P$ , where  $P = \bigcup_j P_j$ . The set P is pluripolar, so  $c(V) \geq c(A)$ .

We have  $\omega(\cdot, V_j, X) \ge \omega^*(\cdot, A_j, X)/(1 - \varepsilon)$  and, therefore,  $c(V_j) \le c(A_j)/(1 - \varepsilon)$ . Hence,

$$
c(A) \le \frac{1}{1 - \varepsilon} \lim_{j \to \infty} c(A_j).
$$

Since  $\varepsilon > 0$  is arbitrary, this proves (3).

*Proof of Th.* [3.1:](#page-5-0) If A is pluripolar, then there exists  $u \in PSH^{-}(X)$  such that  $u \neq -\infty$  and  $A \subset \{u = -\infty\}$ . This implies that  $\omega^*(\cdot, A, X) = 0$  and the inequality holds.

From now on we assume that  $A$  is non-pluripolar. Let us first take  $A$  compact. It is sufficient to show that A can be written as  $A = A_1 \cup E_1$ , where  $A_1$  is locally pluriregular and  $E_1 \subset \{u = -\infty\}$  for some  $u \in \text{PSH}^-(X)$ ,  $u \not\equiv -\infty$ . Indeed, then Theorem [2.1](#page-2-0) gives

$$
\omega^*(\cdot, A, X) = \omega^*(\cdot, A_1, X) \ge \Omega(\cdot, \overline{A}_1, X) \ge \Omega(\cdot, \overline{A}, X).
$$

In order to prove that  $A = A_1 \cup E_1$ , we choose a countable dense subset  $\{a_k\}$  of A and set

$$
E_1 = \bigcup_{k} \bigcup_{m} \{ x \in A \cap B_d(a_k, 1/m) \, ; \, \omega^*(x, A \cap B_d(a_k, 1/m), B_d(a_k, 1/m)) > -1 \}
$$

where  $B_d(a, r)$  denotes the ball with centre a and radius r with respect to a complete hermitian metric  $d$  defining the topology of  $X$ . Note that  $E_1$  is locally pluripolar and therefore by assumption globally pluripolar. Moreover, since  $X$  is relatively compact in a Josefson manifold, we can find  $u \in \text{PSH}^{-1}(X)$  so that  $E_1 \subset \{u = -\infty\}$ . Now we put  $A_1 = A \setminus E_1$ . Then  $A_1$  is locally pluriregular, for if  $x \in A_1$  and U is a neighbourhood of x, then there exists a ball  $B_d(x, 1/m) \subset U$  and  $a_k \in B_d(x, 1/2m)$  such that  $B_d(a_k, 1/2m) \subset B_d(x, 1/m)$  and we get

$$
-1 \le \omega^*(x, A \cap U, U) \le \omega^*(x, A \cap B_d(a_k, 1/2m), B_d(a_k, 1/2m)) = -1.
$$

Now we let A be any Borel subset of X. We fix  $x_0 \in X$  and are going to show that

$$
\Omega(x_0, A, X) \le \omega^*(x_0, A, X).
$$

It suffices to show that there exists a sequence of compact sets  $K_1 \subset K_2 \subset \cdots \subset A$  so that

$$
\omega^*(x_0,K_j,X)\to \omega^*(x_0,A,X),\qquad j\to\infty.
$$

Let us construct a probability measure on  $X$  which is zero on every pluripolar set. Fix a covering  $\{U_j\}$  of X so that  $(U_j, \psi_j)$  is a holomorphic chart and  $\psi_j(U_j) \subset \mathbb{C}^m$  is a bounded domain. (We assume that X is m-dimensional.) For any Borel set A we put

$$
\mu(A) = \sum_{j=1}^{\infty} \frac{1}{2^j} \cdot \frac{\lambda_m(\psi_j(A \cap U_j))}{\lambda_m(\psi_j(U_j))},
$$

where  $\lambda_m$  is the Lebesgue measure in  $\mathbb{C}^m$ . It is easy to see that  $\mu$  is a probability measure on X. Moreover, for any pluripolar set P we have  $\mu(P) = 0$ .

By Lemma [3.2](#page-5-1)  $c_{\mu}$  is a Choquet capacity. The Choquet capacitability theorem states that

$$
c_{\mu}(A) = \sup\{c_{\mu}(K) \, ; \, K \subset A \text{ is compact}\}
$$

for all Borel subsets A of X. Hence, for a fixed Borel set A there exists a sequence  $K_1 \subset K_2 \subset$  $\cdots \subset A$  of compact sets such that  $c_{\mu}(K_j) \to c_{\mu}(A)$ . It is easy to see that  $\omega^*(\cdot, K_j, X) \to$ ω ∗  $(\cdot, A, X)$ .

<span id="page-7-0"></span>The equivalence of (1) and (3) in the following theorem is well known and it indeed holds on every manifold. See Edigarian [\[5\]](#page-12-10) and Rosay [\[15\]](#page-12-3). Using the theorem above we are able to refine this result.

**Theorem 3.3** Let X be a Josefson manifold. Then the following conditions are equivalent

- (1) Any bounded plurisubharmonic function on X is constant.
- (2) For every  $p \in X$ , every nonpluripolar Borel subset A of X, and every  $\varepsilon > 0$  there exists  $f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X)$  such that  $f(0) = p$  and

$$
\sigma_f(A) = \sigma(f^{-1}(A) \cap \mathbb{T}) > 1 - \varepsilon.
$$

(3) For every  $p \in X$ , every nonempty open subset U of X, and every  $\varepsilon > 0$  there exists  $f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X)$  such that  $f(0) = p$  and

$$
\sigma_f(U) > 1 - \varepsilon.
$$

*Proof:* The proof that (2) implies (3) is trivial. In order to prove that (3) implies (1), we let u be a negative plurisubharmonic function on X. Assume that u is non-constant. Then there exist  $x_1, x_2 \in X$  such that  $u(x_1) < u(x_2)$ . Take an  $a \in (u(x_1), u(x_2))$ . Put  $U = \{x \in X : u(x) < a\}.$  Then U is an open set and  $x_1 \in U$ . By (3) we have  $\Omega(\cdot, U, X) \equiv -1$ . Since  $-1 \leq \omega(\cdot, U, X) \leq \Omega(\cdot, U, X)$ , we have  $\omega(\cdot, U, X) \equiv -1$ . But  $\frac{1}{|a|}u(\cdot) \leq \omega(\cdot, U, X)$ , which implies  $u(x_2) \leq a$ , a contradiction.

In order to prove that (1) implies (2), we take a sequence of subdomains  $X_1 \n\t\in X_2 \n\t\in$  $\cdots \in X$  such that  $\cup_{n=1}^{\infty} X_n = X$ . There exists a compact set  $K \subset A$  such that K is nonpluripolar. Without loss of generality we may assume that  $K \subset X_1$ . For any  $n \geq 1$  we have by Theorem [3.1](#page-5-0) that

$$
\Omega(\cdot, K, X_n) \le u_n = \omega^*(\cdot, K, X_n) \quad \text{on } X_n.
$$

There exists  $x_1 \in K$  such that  $u_1(x_1) = -1$ . Note that the sequence  $\{u_n\}$  is decreasing. Put  $u = \lim u_n \in \text{PSH}(X)$ . Hence u is a constant,  $u(x_1) = -1$ , so  $u \equiv -1$ .

Fix a  $p \in X$  and  $\varepsilon > 0$ . Then  $\Omega(p, K, X_n) \to -1$  as  $n \to \infty$ , so there exists  $n \in \mathbb{N}$  such that

$$
\Omega(p, F, X_n) \le \Omega(p, K, X_n) < -1 + \varepsilon.
$$

 $\Box$ 

Observe that if  $u \in \text{PSH}(X)$  is such that  $E \subseteq \{x \in X : u(x) = -\infty\} = \tilde{E}, x \in X \setminus \tilde{E}$ , and  $f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X)$  with  $f(0) = x$ , then

$$
-\infty < u(x) \le \int_{\mathbb{T}} u \circ f d\sigma,
$$

<span id="page-8-0"></span>and we conclude that  $\sigma_f(\tilde{E}) = \sigma(\{t \in \mathbb{T}; u(f(t)) = -\infty\}) = 0$ . Hence we have

**Theorem 3.4** Let  $X$  be a complex manifold and let  $E$  be a globally pluripolar subset. Then there exists a globally pluripolar  $E \supseteq E$  such that for every  $x \in X \setminus E$  and every  $f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X)$  with  $f(0) = x$  we have  $\sigma_f(E) = 0$ .

As a direct consequence of Theorems [3.3](#page-7-0) and [3.4](#page-8-0) we get a characterization of pluripolar sets by analytic discs.

**Corollary 3.5** Let  $X$  be a Josefson manifold and assume that every bounded plurisubharmonic function on X is constant. Let E be a Borel subset in X. Then E is pluripolar if and only if

$$
\{x \in X \, ; \, \exists f \in \mathcal{O}(\mathbb{D}, X) \cap C(\overline{\mathbb{D}}, X), f(0) = x, \sigma_f(E) > 0\} \neq X.
$$

Observe that even in  $\mathbb{C}^n$  this corollary gives a new characterization of pluripolar sets.

#### 4 Analytic discs with images in boundaries of domains

Let X be a complex manifold and let  $D \subset X$  be a domain. If  $u \in \text{PSH}(D)$ , then we extend u to an upper semicontinuous function  $u^*$  on the closure  $\overline{D}$  by the formula

$$
u^*(x) = \limsup_{D \ni y \to x} u(y), \qquad x \in \partial D.
$$

For every bounded function  $f : \partial D \to \mathbb{R}$  the function

$$
u_{f,D} = \sup\{v \in \text{PSH}(D) \, ; \, v^*|_{\partial D} \le f\}
$$

is called the *Perron-Bremermann envelope* of f on D. We say that D is *weakly regular* if for every relatively open subset U of  $\partial D$  we have

$$
u^*_{-\chi_U,D} \leq -\chi_U \quad \text{ on } \; \partial D,
$$

where  $\chi_U$  is the characteristic function of U. We put  $\omega(\cdot, U, D) = u_{-\chi_U, D}$ . Note that  $\omega(\cdot, U, D)$  is a maximal plurisubharmonic function on D and  $\omega^*(\cdot, U, D) \leq -\chi_U$  on  $\partial D$ , if D is weakly regular.

We say that D is *locally weakly regular* if for any  $x \in \partial D$  there exists a neighbourhood basis  ${V_j}_{j=1}^{\infty}$  of x in X such that  $D \cap V_j$  is weakly regular for all j.

Note that every locally weakly regular domain is weakly regular. Indeed, for any  $D_1 \subset D_2$ and any open subset  $U_j$  of  $\partial D_j$  such that  $U_1 \subset U_2$  we have

$$
u_{-\chi_{U_1},D_1} \ge u_{-\chi_{U_2},D_2}.
$$

**Proposition 4.1** (cf. [\[2\]](#page-12-11)). Any bounded domain D in  $\mathbb{C}^n$  which is regular for the Dirichet problem (as a domain in  $\mathbb{R}^{2n}$ ) for the Laplace operator is locally weakly regular. In particular, any hyperconvex domain is locally weakly regular.

*Proof:* The intersection of two Dirichlet regular domains is Dirichlet regular, so it is enough to show that D is weakly regular. For a Dirichlet regular domain it is well-known that for any  $f \in C(\partial D)$  we have  $u_{f,D}^* \leq f$  on  $\partial D$ . Since  $-\chi_U$  is upper semicontinuous on  $\partial D$  it is sufficient to show that  $u_{f,D}^* \leq f$  on  $\partial D$  for any upper semicontinuous function f. Let  $f_j$  be a sequence of continuous functions decreasing to f. Then  $u_{f,D}^* \le u_{f_j,D}^* \le f_j$  on  $\partial D$ . We let  $j \to \infty$  and get  $u_f^*$  $f, D \leq f.$ 

For any subset  $A \subset \partial D$  we put

$$
\omega(x, A, D) = \sup \{ \omega(x, U, D) \, ; \, U \text{ is open and } A \subset U \subset \partial D \}, \qquad x \in D,
$$

and

$$
\Omega(x, A, D) = -\sup \{ \sigma_f(A) \, ; \, f \in \mathcal{O}(\mathbb{D}, D) \cap C(\overline{\mathbb{D}}, \overline{D}), f(0) = x \}, \qquad x \in D.
$$

We have a natural inequality between  $\omega(\cdot, A, D)$  and  $\Omega(\cdot, A, D)$  as in the case when A is in the interior of D.

**Lemma 4.2** Let X be a complex manifold,  $D \subset X$  be a weakly regular domain and  $A \subset \partial D$ be a Borel set. Then  $\omega(\cdot, A, D) \leq \Omega(\cdot, A, D)$ .

*Proof:* Let  $x \in D$ . If U is an open set in  $\partial D$  such that  $A \subset U \subset \partial D$ , and  $f \in \mathcal{O}(\mathbb{D}, D)$  $C(\overline{\mathbb{D}}, \overline{D})$  such that  $f(0) = x$ , then for  $u = \omega(\cdot, U, D)$  we have

$$
u(x) \le \int_{\mathbb{T}} u \circ f \, d\sigma \le \int_{f^{-1}(A) \cap \mathbb{T}} u \circ f \, d\sigma \le -\sigma_f(A).
$$

<span id="page-9-0"></span>If we take supremum over U in the left-hand side and infimum over  $f$  in the right-hand side, then the inequality follows.  $\Box$ 

Now we will give a new proof of an improved version of Lemma 9.1 in Poletsky [\[13\]](#page-12-2).

**Theorem 4.3** Let  $X$  be a complex manifold,  $D$  be a relative compact weakly regular domain in X, and  $U \subset \partial D$  be an open set. Then  $\omega(\cdot, U, D) = \Omega(\cdot, U, D)$ .

The proof is in several steps each of which we state as a lemma.

**Lemma 4.4** Assume that  $U_1 \subset U_2 \subset \cdots \subset \partial D$  are open sets. Put  $U = \bigcup_i U_i$ . Then

$$
\lim_{j \to \infty} \omega(x, U_j, D) = \omega(x, U, D), \qquad x \in D.
$$

*Proof:* Put  $u(x) = \lim_{j\to\infty} \omega(x, U_j, D)$  for  $x \in D$ . Note that the sequence is decreasing, so  $u \in \text{PSH}(D)$  and  $u \ge \omega(\cdot, U, D)$ . On the other hand,  $u^* \le \omega^*(\cdot, U_j, D) \le -\chi_{U_j}$  on  $\partial D$  for all  $j \geq 1$ , so  $u^* \leq -\chi_U$  on  $\partial D$  and  $u \leq \omega(\cdot, U, D)$ .

<span id="page-10-0"></span>**Lemma 4.5** For every  $x_0 \in U$  and  $\varepsilon > 0$  there exists  $r > 0$  such that

$$
B(x_0,r)\cap D\subset \{x\in D\,;\,\omega(x,U,D)<-1+\varepsilon\}.
$$

*Proof:* Assume that for any  $n \in \mathbb{N}$  there exists  $x_n \in B(x_0, \frac{1}{n}) \cap D$  such that  $\omega(x_n, U, D) \ge$  $-1 + \varepsilon$ . Then  $x_n \to x_0$  and  $\omega^*(x_0, U, D) \ge -1 + \varepsilon$ . But  $\omega^*(\cdot, U, D) \le -\chi_U$  on  $\partial D$ , a  $\Box$ contradiction.

<span id="page-10-1"></span>**Lemma 4.6** Assume that  $V \subset D$  is an open set such that for any  $x_0 \in U$  there exists an  $r > 0$  with  $B(x_0, r) \cap D \subset V$ . Then  $\omega(\cdot, V, D) \leq \omega(\cdot, U, D)$ .

<span id="page-10-2"></span>*Proof:* We have  $\omega^*(\cdot, V, D) \leq -\chi_U$  on  $\partial D$ . Hence,  $\omega(\cdot, V, D) \leq \omega(\cdot, U, D)$  on  $D$ .

**Lemma 4.7** We have  $\Omega(\cdot,\overline{U},D) \leq \omega(\cdot,U,D)$ .

*Proof:* Fix  $x_0 \in D$  and  $\varepsilon > 0$  and take  $a > \omega(x_0, U, D)$ . Let  $\varepsilon_m > 0$  be a sequence such that  $\varepsilon_m \searrow 0$ . Assume that  $\{B_j^m\}_j$  is a countable covering of U with balls of radii  $\lt \varepsilon_m$  and centres in U for any  $m \geq 1$ . Put

$$
U_m=\cup_j\{x\in D\cap B_j^m\,;\, \omega(x,U\cap B_j^m,D\cap B_j^m)<-1+\varepsilon_m\}.
$$

Let us show that

$$
U_m\subset \cup_j\{x\in D\cap B_j^m\,;\, \omega(x,U_{m+1}\cap B_j^m,D\cap B_j^m)<-1+\varepsilon_m\}.
$$

For this, it suffices to show that

$$
\omega(\cdot, U_{m+1}\cap B_j^m, D\cap B_j^m) \leq \omega(\cdot, U\cap B_j^m, D\cap B_j^m) \quad \text{ on } D\cap B_j^m,
$$

for any  $m \geq 1$ . It follows from Lemmas [4.5](#page-10-0) and [4.6.](#page-10-1)

We have  $\omega(x_0, U, D) \ge \omega(x_0, U_1, D)$ . So, there exists an  $f_1 \in \mathcal{O}(\overline{\mathbb{D}}, D)$  such that  $f_1(0) = x_0$ and  $\sigma_{f_1}(U_1) > |a|$ . Put  $\Delta_1 = f_1^{-1}(U_1) \cap \mathbb{T}$ . Now we construct inductively  $(f_m, \Delta_m)$  as in the proof of Theorem [2.1](#page-2-0) and get the analytic disc f as its limit.  $\square$ 

*Proof of Theorem [4.3:](#page-9-0)* By Lemma 4.2, we have  $\omega(\cdot, U, D) \leq \Omega(\cdot, U, D)$ . Take open sets  $U_1 \in U_2 \in \cdots \in U$  such that  $U = \bigcup_{j=1}^{\infty} U_j$ . According to Lemma [4.7](#page-10-2) we have  $\Omega(\cdot, U, D) \le$  $\omega(\cdot, U_m, D)$  on D for any  $m \geq 1$ . Take  $m \to \infty$  and get  $\Omega(\cdot, U, D) \leq \omega(\cdot, U, D)$  on D.

We let X be a complex manifold,  $D$  be a relatively compact weakly regular domain in  $X$ , and  $A \subset \partial D$  be a Borel set. Note that, in general, it is not true that  $\{z \in A : \omega^*(z, K, D) > \emptyset\}$ −1} is pluripolar.

**Example 4.8** Let  $K \subset \mathbb{T}$  be a non-polar compact set of measure zero (take for example a Cantor-type set on the unit circle). Then  $\omega^*(\cdot, K, \mathbb{D})$  is given as a Poisson integral over the set K which is of measure zero and therefore  $\omega^*(\cdot, K, \mathbb{D}) \equiv 0$ .

Nevertheless we have the following result, which is stated in Sadullaev [\[16\]](#page-12-12), Theorem 27.3.

**Lemma 4.9** Let  $A \subset \partial D$  be a compact set. Then  $\omega^*(\cdot, A, D) \equiv 0$  if and only if there exists  $a u \in \text{PSH}^{-}(D), u \not\equiv -\infty$ , such that  $u^*|_A \equiv -\infty$ .

*Proof:* If  $\omega^*(\cdot, A, D) = 0$ , then there exists  $x_0 \in D$  such that  $\omega(x_0, A, D) = 0$ . By the definition of  $\omega(\cdot, A, D)$ , there exists a sequence of open sets  $U_n \supset A$  on  $\partial D$  so that  $\omega(x_0, U_n, D) >$  $-2^{-n}$ . Now put  $u = \sum_n \omega(\cdot, U_n, D)$ . Then  $u \in \text{PSH}(D)$ ,  $u(x_0) > -1$ , and  $u^*|_A = -\infty$ .

If, on the other hand, there exists a function  $u \in \text{PSH}(D)$  such that  $u^*|_A = -\infty$ , then we consider the neighbourhoods  $U_n = \{u^* < -n\} \cap \partial D$  of A. Then

$$
\frac{u}{n} \le \omega(\cdot, U_n, D) \le \omega(\cdot, A, D).
$$

So,  $\omega(\cdot, A, D) = 0$  on the set  $\{u \neq -\infty\}.$ 

We say that a set  $A \subset \partial D$  is *locally pluriregular at*  $x_0 \in \overline{A}$  *with respect to* D if there exists a sequence  $r_j \searrow 0$  such that  $\omega^*(x_0, B(x_0, r_j) \cap A, B(x_0, r_j) \cap D) = -1$  for any  $j \ge 1$ .

<span id="page-11-0"></span>**Theorem 4.10** Let  $A \subset \partial D$  be a Borel set. Assume that  $A = A_1 \cup E$ , where  $A_1$  is locally pluriregular with respect to D and E is such that there exists a  $u \in PSH^{-}(D)$ ,  $u \neq -\infty$ , with  $u^*|_E \equiv -\infty$ . Then

$$
\omega(x, \overline{A}, D) \le \Omega(x, \overline{A}, D) \le \omega^*(x, A, D) \quad x \in D.
$$

*Proof:* Note that  $\omega^*(\cdot, A, D) = \omega^*(\cdot, A_1, D)$  on D. Fix  $x_0 \in D$  and  $a > \omega^*(x_0, A, D)$ . Let  $\varepsilon_m > 0$  be a sequence such that  $\varepsilon_m \searrow 0$ . Assume that  $\{B_j^m\}_j$  is a countable covering of  $A_1$ with balls of radii  $\epsilon \epsilon_m$  and centres in  $A_1$  for any  $m \geq 1$ . Put

$$
U_m=\cup_j\{x\in D\cap B_j^m\,;\,\omega^*(x,A_1\cap B_j^m,D\cap B_j^m)<-1+\varepsilon_m\}.
$$

Let us show that

$$
U_m \subset \bigcup_j \{x \in D \cap B_j^m \, ; \, \omega(x, U_{m+1} \cap B_j^m, D \cap B_j^m) < -1 + \varepsilon_m\}.
$$

For this, it suffices to show that

$$
\omega(\cdot, U_{m+1}\cap B_j^m, D\cap B_j^m) \le \omega^*(\cdot, A_1\cap B_j^m, D\cap B_j^m) \text{ on } D\cap B_j^m,
$$

for any  $m \geq 1$ .

We have  $\omega^*(x_0, A_1, D) \ge \omega(x_0, U_1, D)$ . So, there exists an  $f_1 \in \mathcal{O}(\overline{\mathbb{D}}, D)$  such that  $f_1(0) =$  $x_0$  and  $\sigma_{f_1}(U_1) > |a|$ . Put  $\Delta_1 = f_1^{-1}(U_1) \cap \mathbb{T}$ . Now we construct inductively  $(f_m, \Delta_m)$  as in the proof of Theorem [2.1](#page-2-0) and get the analytic disc f as its limit.  $\square$ 

Question 4.11 Is Theorem [4.10](#page-11-0) true for any Borel subset A of  $\partial D$ ?

Acknowledgment. This paper was written while the first author was visiting the University of Iceland. He likes to thank the Science Institute for its warm hospitality.
