NOTE. — Column 1: Source number. A “B” before the number refers to a borderline source not part of the master source list. Columns 2 & 3: Right ascension and Declination of the source in J2000 decimal degrees coordinates. Column 4: “Average OAA” = “Average Off-Axis Angle”, the average angle on the sky between the source and the aimpoint of the observation in the merged observation. Column 5: “Tot Src Counts” refers to the number of source counts extracted in all of the source regions in observations 5935-5949. Column 6: “Tot Bkg Counts” refers to the number of background counts expected in the source region based on the nearby annular merged background extraction. Columns 7, 8 & 9: Soft (0.5-1 keV), Medium (1-2 keV), and Hard (2-8 keV) background-subtracted counts with Gehrels (1986) errors. Column 10: “PSF %” is the average fraction of the point spread function enclosed by the source extraction region. Column 11: “Var Stat” is the variability statistic as defined in equation (1) between ObsIDs 5935-5949. Column 12: “Var Obs” are the two observations corresponding to column 11. Column 12: “Var Stat” is the variability statistic as defined in equation (1) between the merged observation and ObsID 735. Abbreviations of table values: “OC” = “Off Chip”. “NA” = “Not Applicable/Available”. This occurs in the case of the variability statistic when the source is only on the chips in one of ObsIDs 5935-5949 or off the ObsID 735 chips.

NOTE. — Column 1: Source number. A “B” before the number refers to a borderline source not part of the master source list. Column 2: The model used for fitting the spectrum (“plaw” = power law and “bbod” = blackbody). Column 3: Γ = Powerlaw Index, kT = Blackbody Temperature (keV) of the best-fit model. Column 4: “Model Normalization” is the model normalization in units of photons $\text{keV}^{-1} \text{ cm}^{-2} \text{ s}^{-1}$ at 1 keV for the power-law model and $L_{39}/(D_{10})^2$, where L_{39} is the source luminosity in units of $10^{39} \text{ erg s}^{-1}$ and D_{10} is the distance to the source in units of 10 kpc for the blackbody model. Column 5: The best-fit column density for the source which includes galactic foreground and intrinsic source absorption. A value is “0.04” indicates that the best-fit is on the galactic foreground minimum column density (the lower bound will then be “NA”). Column 6: “C-stat (DOF)” is the total best-fit C-statistic and number of degrees of freedom for the source and background models together. Column 7: The 0.5–8.0 keV luminosity calculated from the best fit model. The uncertainties are estimated by scaling the luminosity by the uncertainty in the counts, which was calculated from the 90% Bayesian confidence intervals, (Kraft et al. 1991). Column 8: Other details about the source extraction.

Abbreviations of table values: “OC” = “Off Chip”. “NA” = “Not Applicable/Available”. This occurs when: in the case of source 62, the model is too complicated to be listed in the table; Sherpa fails to find the confidence interval; the source has zero flux so that Γ or kT is not defined. An “f” indicates that the parameter was frozen during the spectral fitting. “RS ObsID” indicates that the source was on the readout streak in the specified ObsID. “POC ObsID” indicates that the source was partially off of the chip in the specified ObsID. “S#” indicates the Swartz source number that this source is matched to. “VC #” indicates that the source was very close to another source.

(†) Sherpa’s JD pileup model (Davis 2001) was used in addition to the power-law fit
