

Plane for fixed  $E = 6.23$  shows a Type I solution (bottom curve as  $\nu \rightarrow 0$ ). The remaining curves are of Type II. Note the Type I curve tends to  $\log(3S_c^2)$  or  $\approx 3.95$  as  $\nu \rightarrow 0$ .

*Imperfection sensitivity* can occur due to asymmetric positioning of spots. For any fixed  $\nu > 0$ , Type II solutions no longer connect with Type III solutions in the dual  $E, \nu \rightarrow 0$  limit.
