

Plane for fixed $E = 6.23$ shows Type I solution (bottom curve) and two Type II solutions. The Type I curve tends to $\log(3S_c^2) \approx 3.95$ as $\nu \rightarrow 0$.

Type II solutions arise in bifurcation from the symmetric branch when both E and $\nu \rightarrow 0$. In this limit, the single branch with $\log \|\mathbf{S}\|_2^2 \rightarrow -\infty$ is a Type III solution.
