

(b)

(c)

A plot showing the normalized effective diffusion coefficient D_{eff}/D_0 on the y-axis (ranging from 0.75 to 1.00) versus the parameter ν on the x-axis (ranging from -0.5 to 0.5). The plot displays several curves for different values of α . The curves are symmetric about $\nu = 0$, where they all reach a maximum value of 1.00. The curves are color-coded: red for $\alpha = 0$, blue for $\alpha = 0.1$, and purple for $\alpha = 0.2$. The red curve is a straight line with a slope of 1. The blue and purple curves are smooth, concave down, and approach 1.00 as ν approaches 0. The purple curve is the highest, followed by the blue curve, and then the red curve.
