

The diagram illustrates an equality between two configurations of a system. On the left, a central circular node labeled  $\epsilon$  is connected to two square nodes, each labeled  $S$ . The square nodes are positioned vertically above and below the circular node, with lines connecting them. On the right, a similar central circular node labeled  $\epsilon$  is shown, but it is not connected to any square nodes. Instead, it is followed by a dot and the expression  $\det S$ . The entire expression is enclosed in a large, light gray rounded rectangle.

$$\begin{array}{c} \square S \\ | \\ \bigcirc \epsilon \\ | \\ \square S \end{array} = \begin{array}{c} \bigcirc \epsilon \\ \cdot \det S \end{array}$$
