

The image displays four Feynman diagrams arranged in a 2x2 grid, representing the production of a W^\pm boson (top row) and an H^\pm boson (bottom row) in a collision of two ρ_1^0 particles.

Top Row (W^\pm production):

- Left Diagram:** Two incoming ρ_1^0 lines (horizontal) meet at a vertex. A vertical line labeled ρ^\pm connects them. From this vertex, a W^\pm boson (represented by a wavy line) is produced, which then decays into two outgoing photons (γ).
- Right Diagram:** Similar to the left, but the W^\pm boson is produced via a different interaction, resulting in a different decay pattern for the two outgoing photons.

Bottom Row (H^\pm production):

- Left Diagram:** Two incoming ρ_1^0 lines meet at a vertex. A vertical line labeled ρ^\pm connects them. From this vertex, an H^\pm boson (represented by a dashed line) is produced, which then decays into two outgoing photons (γ).
- Right Diagram:** Similar to the left, but the H^\pm boson is produced via a different interaction, resulting in a different decay pattern for the two outgoing photons.

The diagrams are summed to give the total amplitude for each process:

- Top row sum: $= A_{W\rho}$
- Bottom row sum: $= A_{H\rho}$
