This document provides supporting evidence for the main manuscript. Section I provides x-ray reflectivity and surface x-ray diffraction measurements that demonstrate the $(\text{La}_{2/3}\text{Sr}_{1/3}\text{MnO}_3)_9/(\text{LaNiO}_3)_3$ $[(\text{LSMO})_9/(\text{LNO})_3]$ high sample quality. In section II, the Ni L_3 -edge RIXS of $(\text{LSMO})_9/(\text{LNO})_3$ is compared with atomic calculations that assume Ni $3d^8$ and $3d^7$ configurations. The x-ray absorption spectroscopy (XAS) and x-ray magnetic circular dichroism (XMCD) data collected at the O K -, Mn $L_{3,2}$ - and Ni L_2 -edges are reported in section III.

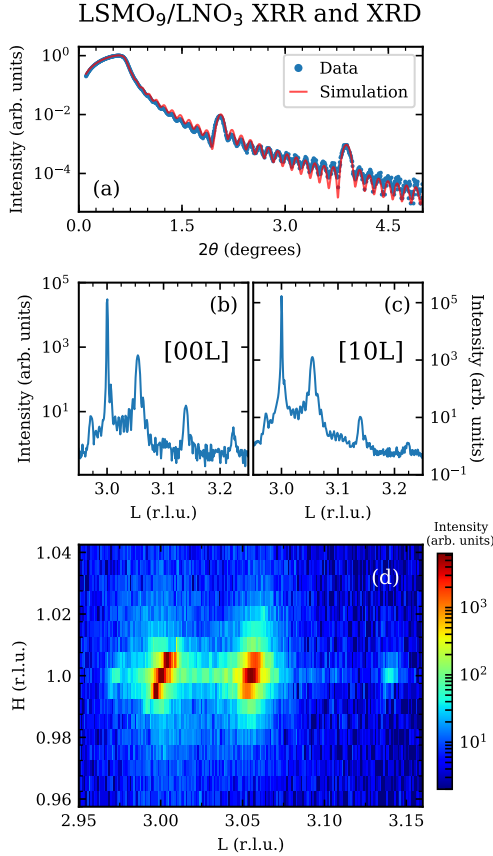

FIG. S1. $(\text{LSMO})_9/(\text{LNO})_3$ superlattice characterization. (a) XRR data together with a simulation that uses the same structural model as that used in the x-ray resonant magnetic reflectivity reported in the main text. (b)&(c) XRD scans along $[00L]$ and $[10L]$ directions, respectively. (d) 2D XRD data around the (103) reflection. The substrate's reciprocal lattice is used as a reference, thus the sharp peaks at (003) and (103) are from SrTiO_3 .

I. SAMPLE CHARACTERIZATION

The $\text{LSMO}_9/\text{LNO}_3$ superlattice studied in the main manuscript was previously investigated in Ref. 1. Nevertheless, we have performed x-ray reflectivity (XRR) and surface x-ray diffraction (XRD) measurements to further confirm the sample quality. Data was collected at room temperature using Cu K_α radiation from a Bruker D8 Discover equipment. The results are displayed in Fig. S1. Both XRR and XRD measurements show well defined finite thickness fringes and superlattice peaks that are consistent with a good quality sample. Additionally, Figure S1(d) demonstrate that the superlattice ab plane is strained to the SrTiO_3 substrate.

FIG. S2. (a)&(b) display the experimental Ni L_3 RIXS data of $\text{LSMO}_9/\text{LNO}_3$ collected with π and σ incident x-ray polarization, respectively. Atomic simulations of Ni $3d^8$ and $3d^7$ RIXS are shown in panels (c)&(d) and (e)&(f), respectively.

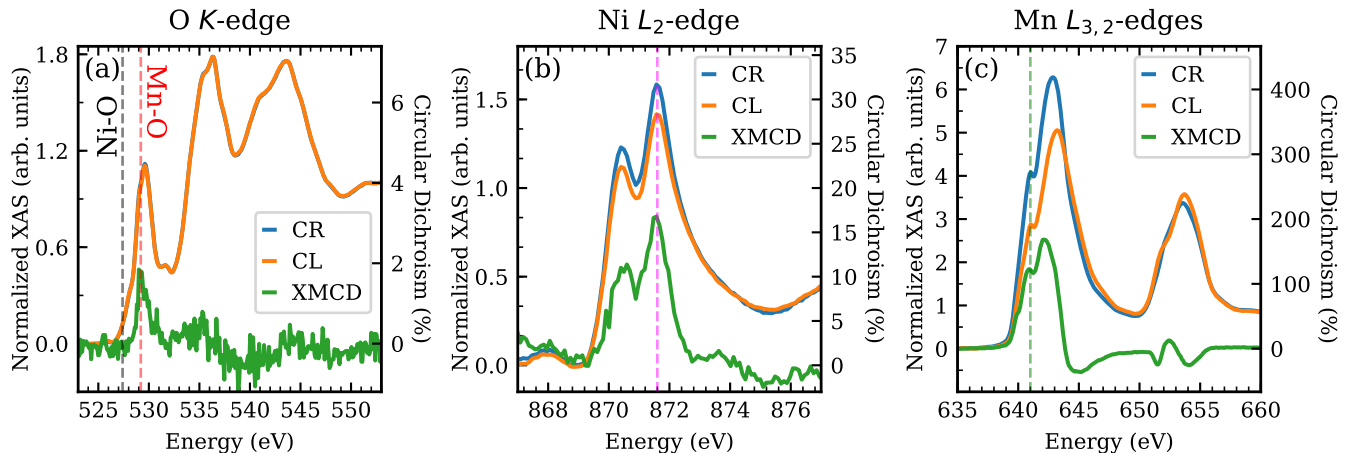

FIG. S3. XAS and XMCD collected at the O K - (a), Ni L_2 - (b), and Mn $L_{3,2}$ -edges (c) of the (LSMO)₉/(LNO)₃ heterostructure. On panel (a), the vertical dashed lines mark the resonant energy of the Ni-O (black) and Mn-O (red) ligand holes. On panels (b)&(c) the dashed lines correspond to the incident x-ray energy used in the data shown on Fig. 3 of the main manuscript.

II. ATOMIC SIMULATIONS OF NI L-EDGE RIXS

Figure S2 displays the Ni L_3 RIXS data of (LSMO)₉/(LNO)₃ together with atomic calculations using Ni $3d^8$ and $3d^7$ as ground states. These results clearly demonstrate that the (LNO)₃ layers are dominated by Ni $3d^8$ ions. The experimental result is also markedly distinct from the broad diagonal feature observed in $RENiO_3$ ($RE = La$ and Nd)^{2,3}.

III. X-RAY ABSORPTION SPECTROSCOPY AND X-RAY MAGNETIC CIRCULAR DICHROISM

XAS and XMCD measurements at the O K -, Mn $L_{3,2}$ - and Ni L_2 -edges of (LSMO)₉/(LNO)₃ were performed at the REIXS beamline of the Canadian Light Source. The

data were collected in total electron yield mode and at 20 K. A permanent magnet with a field of 0.6 T was applied and then removed at low temperature, the measurement was thus performed on remanence. The results are displayed in Fig. S3. While the O K -edge XAS pre-edge is dominated by signal from oxygen ligand holes, the post-edge oscillations are related to both the density of empty states far above the Fermi energy and the photoelectron multiple scattering, thus being less relevant to the current investigation. The XAS and XMCD signal at the Ni L_2 -edge suggests a magnetic Ni²⁺ configuration [Fig. S3(b)], in agreement with previous work¹. The data for the Mn $L_{3,2}$ -edges are also consistent with previous results⁴. The Ni and Mn XAS and XMCD displayed in Fig. S3 were combined with non-resonant tabulated optical constants⁵ to generate the complex index of refraction used in the x-ray resonant magnetic reflectivity (XRMR) simulations. The XRMR fits shown in the main manuscript were performed at the incident x-ray energies marked by the dashed lines in Fig. S3 (b)&(c).
