## I. SUPPORTING DATA

Tables S1, S2, S5 and S6 summarizes the lattice parameters and atomic positions as a function of pressure for each identified crystal structure at  $T = 50$  K. The R factor of the structural solutions is reported in Tables S3 ( $Fddd$ ) and S4 ( $C2/c$ ) along with the isotropic displacement parameter ( $U_{iso}$ ), reciprocal space coverage, number of refined reflections, number of refined parameters and data completeness. The R factor is related to refinements on the square structure parameter  $F^2$ . For the  $C2/c$  structures, the Li positions were fixed to the center of the  $\text{LiO}_6$  octahedra. All Li and O sites have the same isotropic displacement parameters and  $U_{iso}(\text{Li}) = U_{iso}(\text{O})$  for the  $C2/c$  structures. All the atomic positions were standardized using the software VESTA<sup>1</sup>.

TABLE S1. Lattice parameters and atomic coordinates of  $\beta\text{-Li}_2\text{IrO}_3$  with  $Fddd$  (No. 70,  $Z = 16$ ) space-group symmetry extracted from single crystal analysis at  $T = 50$  K.  $x = y = 1/8$  and  $y = z = 1/8$  for the 16g and 16e Wyckoff positions, respectively.
