

The diagram shows a square loop with a central dot. A dashed blue line encircles the loop, with arrows indicating a clockwise direction. The phase difference between the top and bottom segments of this dashed line is labeled $\gamma = \theta_2 - \theta_1$. The phase difference between the left and right segments is labeled $\phi = \gamma_1 - \gamma_2$. The left segment of the dashed line is labeled γ_1 with a downward arrow, and the right segment is labeled γ_2 with a downward arrow. The top and bottom segments of the dashed line are labeled $\rho e^{i\theta_1}$ and $\rho e^{i\theta_2}$ respectively, with arrows pointing left. The central dot is surrounded by a circle, and the loop itself is a thick gray line.

Figure 1 shows a 2x3 grid of photographs. The top row shows three plants in a control group (no treatment). The bottom row shows three plants in a treated group (with treatment). The columns represent different treatments: Control, 100 mg/L, and 200 mg/L. The plants in the treated group show significantly reduced growth compared to the control group.
