

# Checklist for Comparison Studies

- i. **Isolate implementational or functional properties**  
Ex: BagNets<sup>1</sup> isolate local feature processing
- ii. **Align experimental conditions**  
Ex: Stimulus timing for humans (short presentation time = core object recognition<sup>2</sup>)
- iii. **Distinguish necessary vs. sufficient**  
Ex: Both shape and texture features are sufficient but not necessary on ImageNet<sup>3,4</sup>
- iv. **Test generalization**  
Ex: Controversial stimuli<sup>5</sup> are useful out-of-distribution data that reveal human inductive bias
- v. **Resisting human bias**  
Ex: Stimulus selection and data analysis influence identified similarities b/w human and machine perception of adversarial examples<sup>6</sup>
