## I. BEAM SPIN ASYMMETRIES

The extracted asymmetry values for all seven azimuthal modulations in each bin are given in Tables I-VI. The listed asymmetry amplitudes have been corrected for the beam polarization and, if desired, can be further corrected for the relevant twist-2 or twist-3 kinematic depolarization factors defined in Refs [1-3],

$$K_2 \equiv \frac{C(\epsilon, y)}{A(\epsilon, y)}, \quad (1)$$

$$K_3 \equiv \frac{W(\epsilon, y)}{A(\epsilon, y)}, \quad (2)$$

with

$$A(\epsilon, y) \equiv \frac{y^2}{2(1-\epsilon)} = \frac{1}{1+\gamma^2} \left( 1 - y + \frac{1}{2}y^2 + \frac{1}{4}\gamma^2 y^2 \right), \quad (3)$$

$$C(\epsilon, y) \equiv \frac{y^2}{2(1-\epsilon)} \sqrt{1-\epsilon^2} = \frac{y}{\sqrt{1+\gamma^2}} \left( 1 - \frac{1}{2}y \right), \quad (4)$$

$$W(\epsilon, y) \equiv \frac{y^2}{2(1-\epsilon)} \sqrt{2\epsilon(1-\epsilon)} = \frac{y}{\sqrt{1+\gamma^2}} \sqrt{1 - y - \frac{1}{4}\gamma^2 y^2}. \quad (5)$$

Values are reported as percentages (the asymmetry multiplied by 100) with the statistical uncertainty as a superscript and the systematic uncertainty as a subscript:  $A_{LU_{\text{sys}}}^{\text{stat}}$ .

## II. BIN DEFINITIONS AND MEAN KINEMATIC VALUES

The bin edges for the  $x$ ,  $M_h$ ,  $z$  and  $P_h^\perp$  asymmetries are reported in Tables VII-VIII. In Tables IX-XIV the mean values of  $x$ ,  $Q^2$ ,  $M_h$ ,  $z$ ,  $P_h^\perp$ ,  $\theta$ ,  $K_2$  and  $K_3$  are reported for each bin. Figs. 1-4 show plots of seven asymmetry amplitudes for each binning scheme.

Bin	$x$	$M_h$ (GeV)
1	(0.000, 0.118]	(0.270, 0.381]

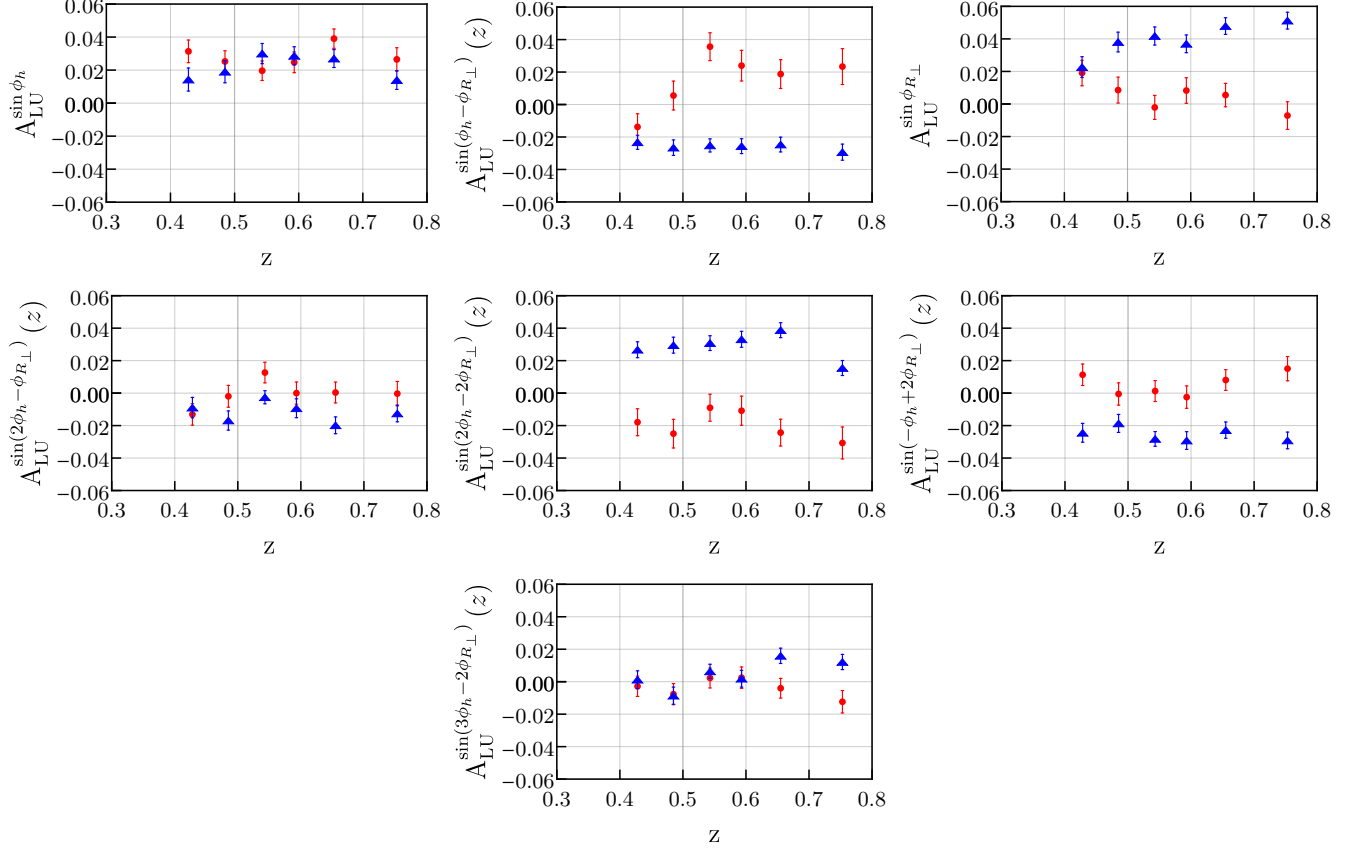

FIG. 3: The seven extracted beam spin asymmetries from the simultaneous fit to all modulations as a function of  $z$  for  $M_h < 0.63$  GeV (red circles) and  $M_h > 0.63$  GeV (blue triangles). Error bars are purely statistical.

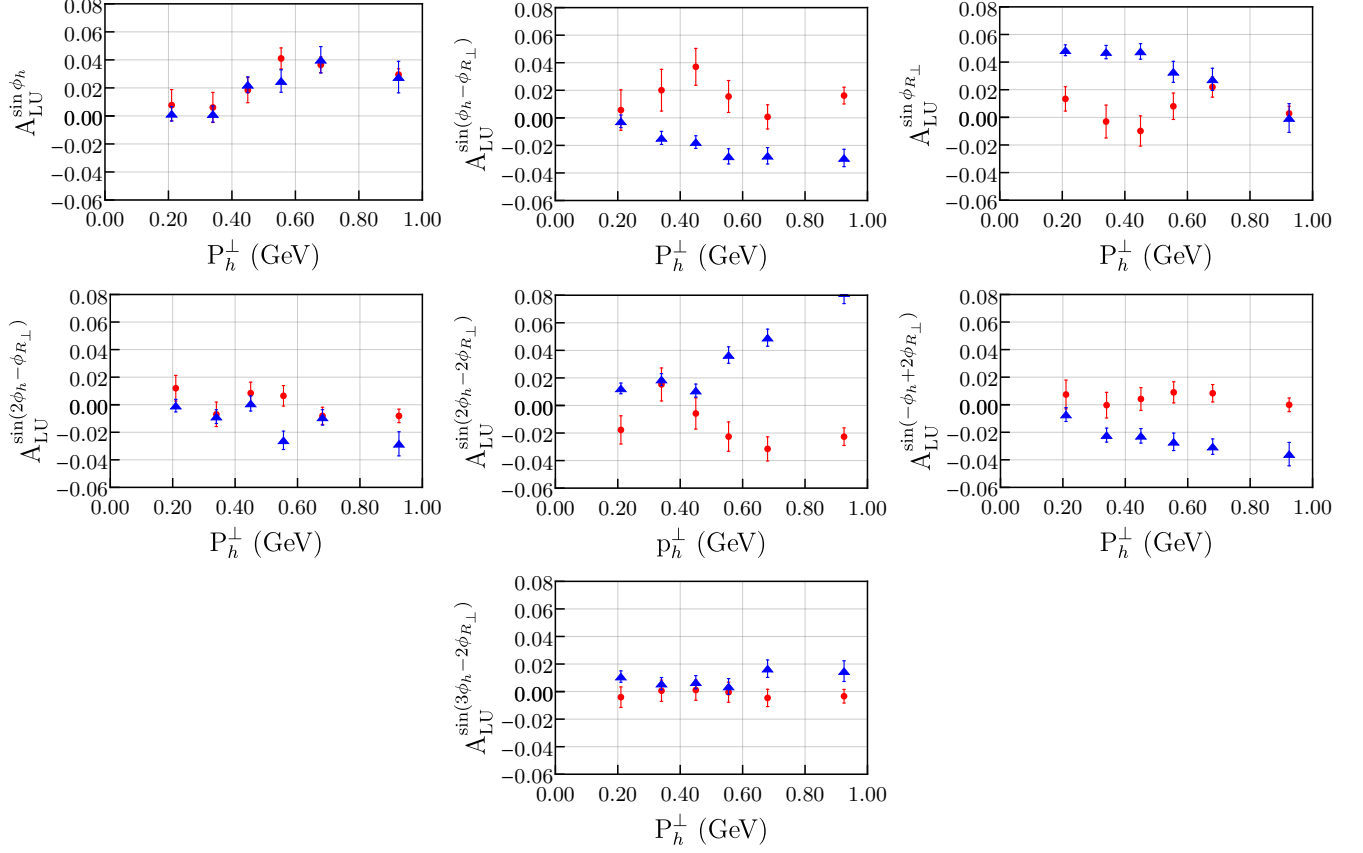

FIG. 4: The seven extracted beam spin asymmetries from the simultaneous fit to all modulations as a function of  $P_h^\perp$  (given in GeV) for  $M_h < 0.63$  GeV (red circles) and  $M_h > 0.63$  GeV (blue triangles). Error bars are purely statistical.

### III. INFLUENCE ON $A_{LU}$ FROM UNPOLARIZED CROSS SECTION MODULATIONS

The unpolarized cross section  $d\sigma_{UU}$ , which resides in the denominator of  $A_{LU}$ , also contains several modulations [3]. Limitations in the CLAS12 acceptance introduce linear dependence between the amplitudes, hence  $A_{LU}$  could be influenced by nonzero amplitudes of  $d\sigma_{UU}$  modulations. These amplitudes have not yet been measured for the relevant kinematical ranges, therefore it is difficult to correct for their impact. Instead, we assume they are no more than 10% and performed a Monte Carlo study to assess their influence on the final  $A_{LU}$  values. Figs. 5-10 show distributions of  $\delta$ , the resulting shift on an  $A_{LU}$  amplitude from nonzero  $d\sigma_{UU}$  amplitudes, for each  $A_{LU}$  measurement bin. In general,  $\delta \lesssim 0.3\%$ .

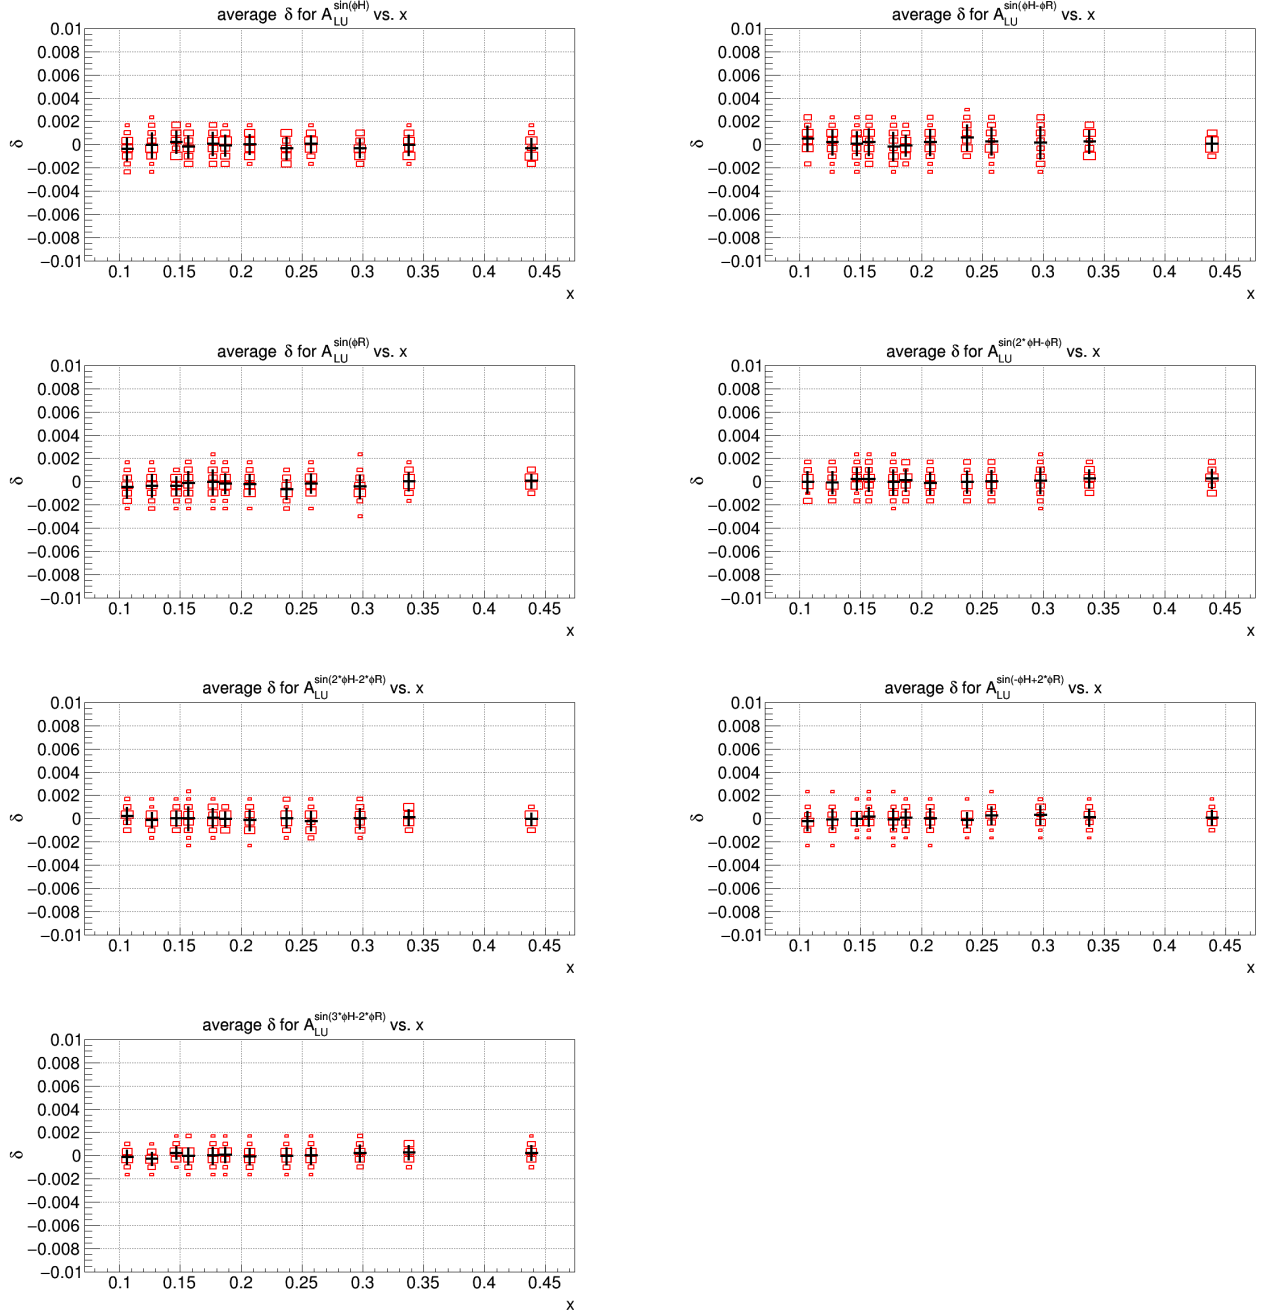

FIG. 5: Distribution of  $\delta$  for each kinematic bin and  $\sigma_{LU}$  modulation; this is for the binning in  $x$ . One histogram entry (red box plot) corresponds to one  $\sigma_{UU}$  amplitude injection; the size of the red box is proportional to the number of entries in that bin. The black crosses for each kinematic bin indicate the mean  $\delta$  for each kinematic bin, and the vertical size of the black cross indicates the standard deviation of  $\delta$ .

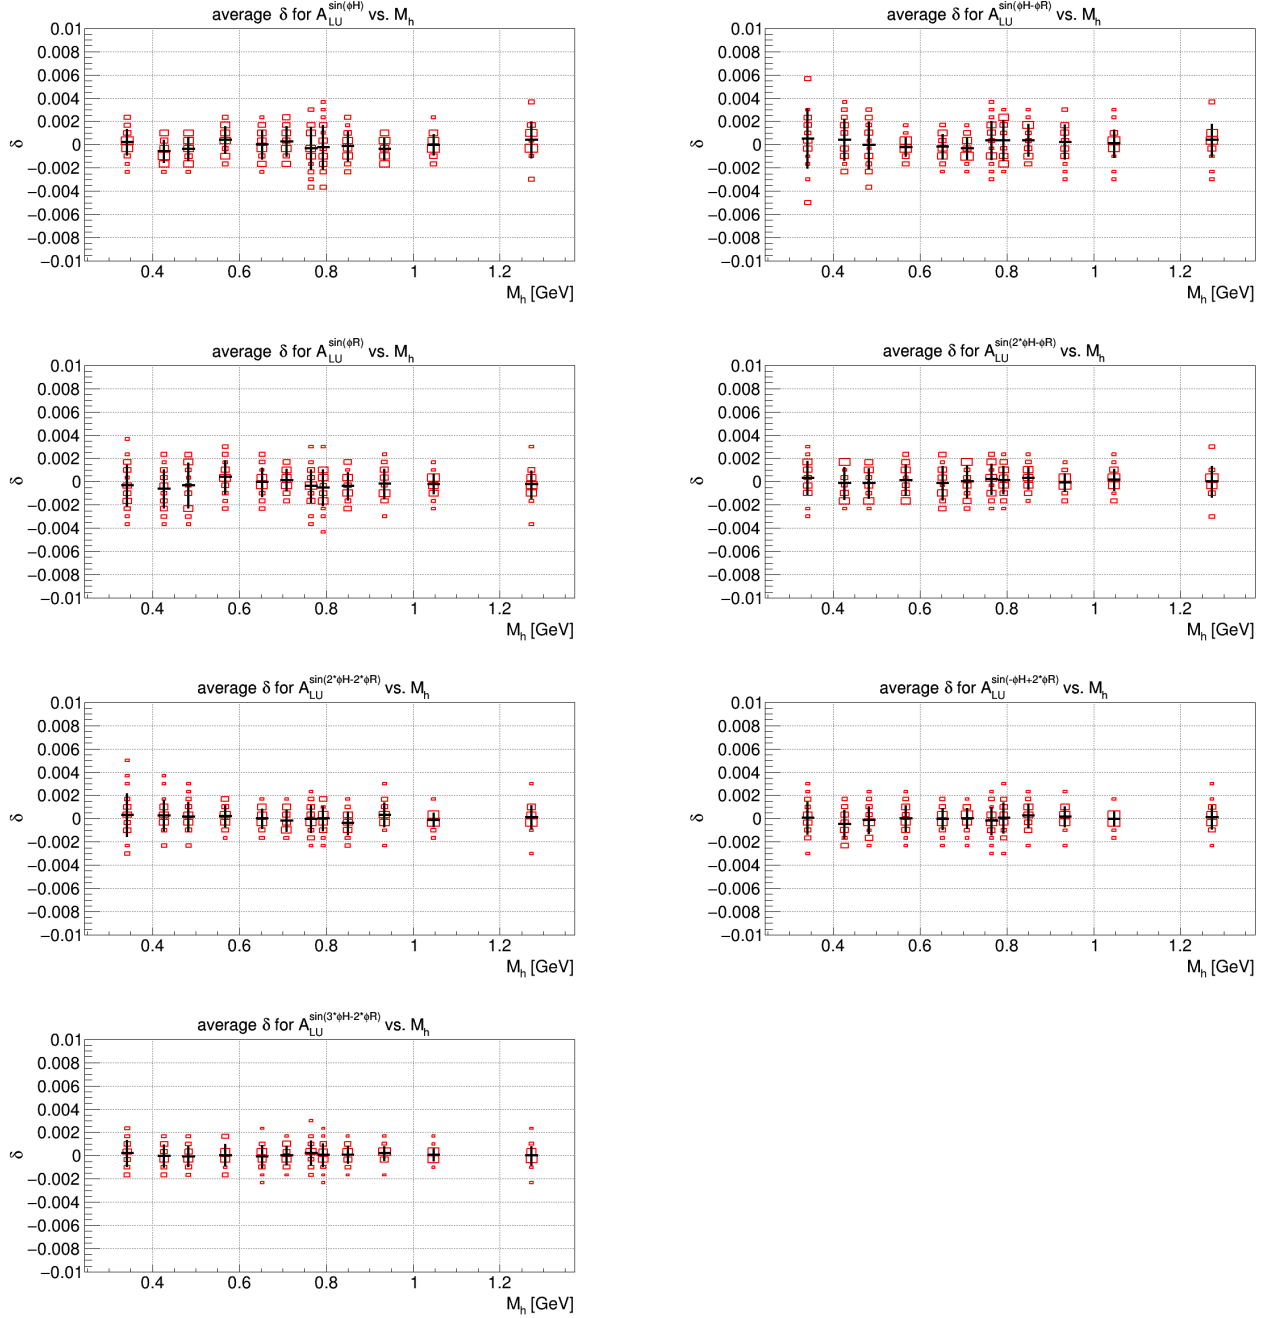

FIG. 6: Distribution of  $\delta$  for each kinematic bin and  $\sigma_{LU}$  modulation; this is for the binning in  $M_h$ . One histogram entry (red box plot) corresponds to one  $\sigma_{UU}$  amplitude injection; the size of the red box is proportional to the number of entries in that bin. The black crosses indicate the mean  $\delta$  for each kinematic bin, and the vertical size of the black cross indicates the standard deviation of  $\delta$ .

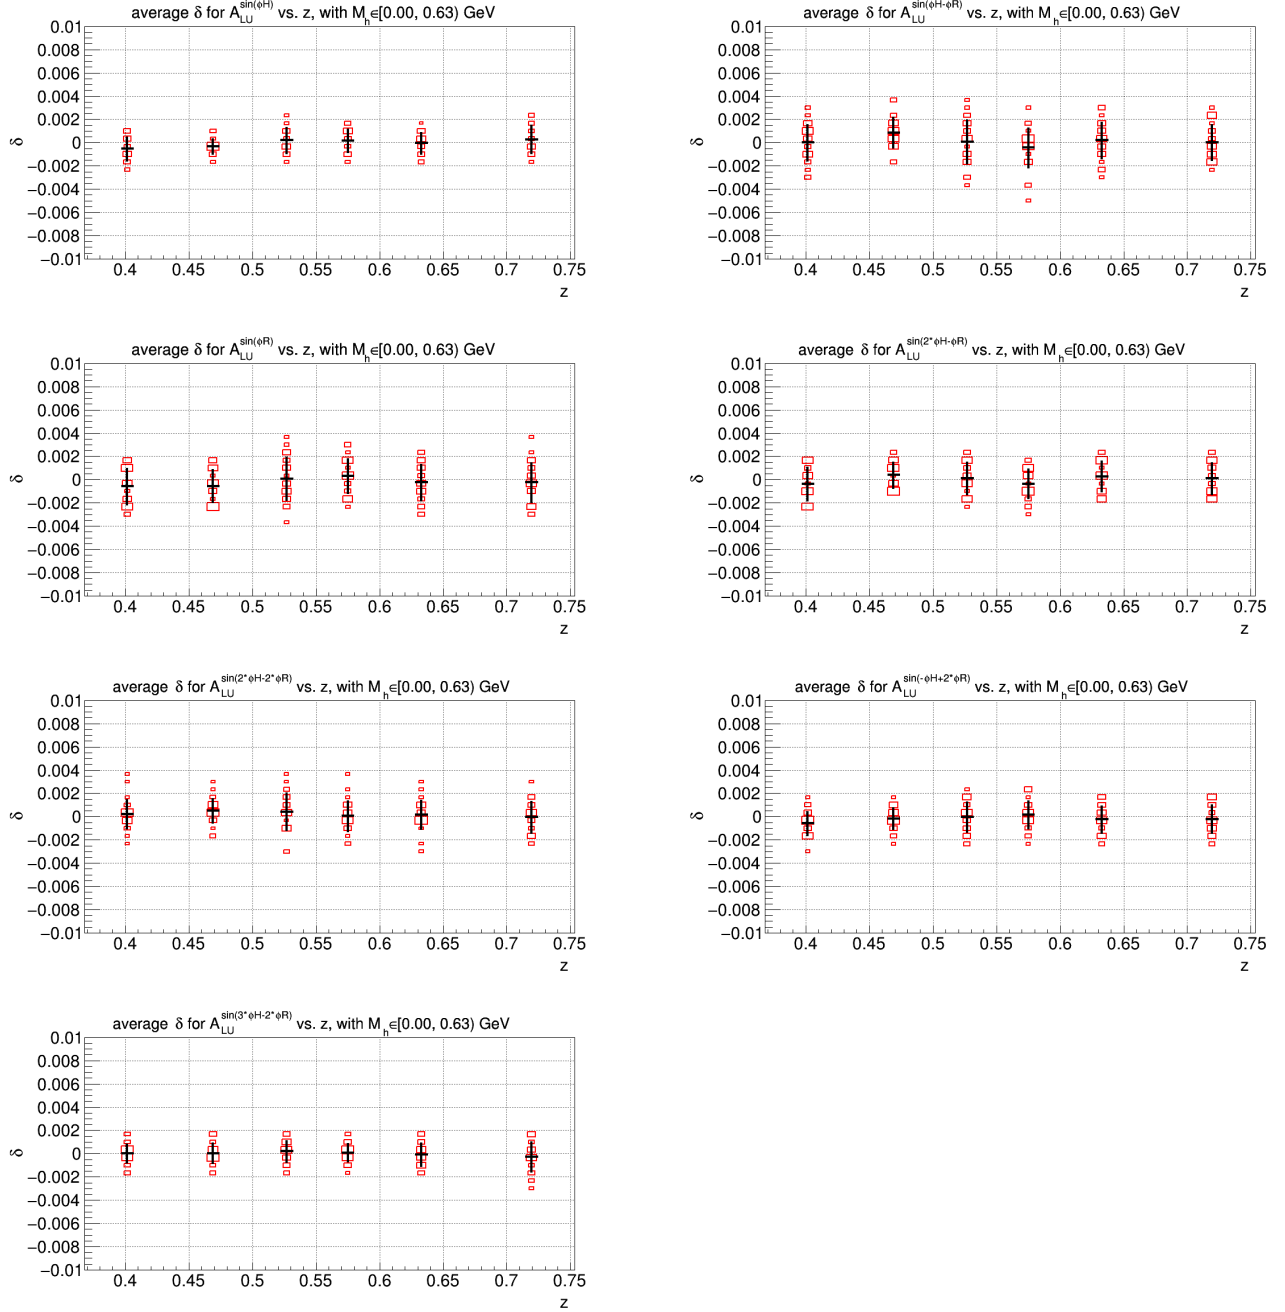

FIG. 7: Distribution of  $\delta$  for each kinematic bin and  $\sigma_{LU}$  modulation; this is for the binning in  $z$ , with  $M_h < 0.63$  GeV. One histogram entry (red box plot) corresponds to one  $\sigma_{UU}$  amplitude injection; the size of the red box is proportional to the number of entries in that bin. The black crosses indicate the mean  $\delta$  for each kinematic bin, and the vertical size of the black cross indicates the standard deviation of  $\delta$ .

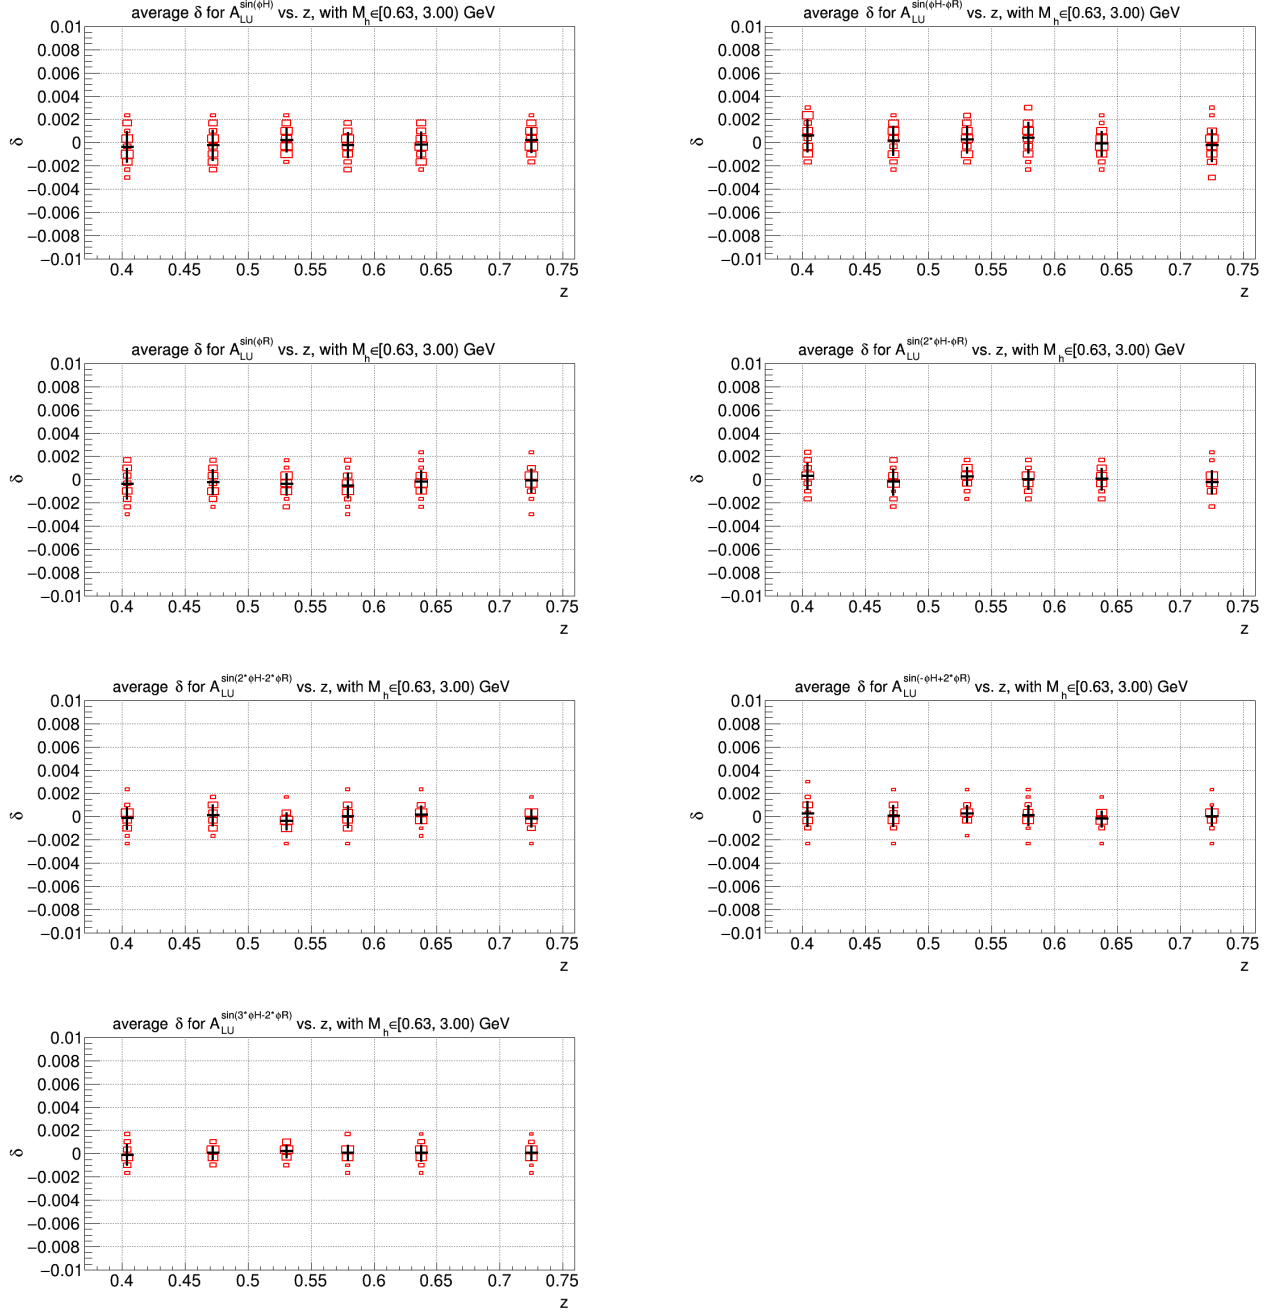

FIG. 8: Distribution of  $\delta$  for each kinematic bin and  $\sigma_{LU}$  modulation; this is for the binning in  $z$ , with  $M_h > 0.63$  GeV. One histogram entry (red box plot) corresponds to one  $\sigma_{UU}$  amplitude injection; the size of the red box is proportional to the number of entries in that bin. The black crosses indicate the mean  $\delta$  for each kinematic bin, and the vertical size of the black cross indicates the standard deviation of  $\delta$ .

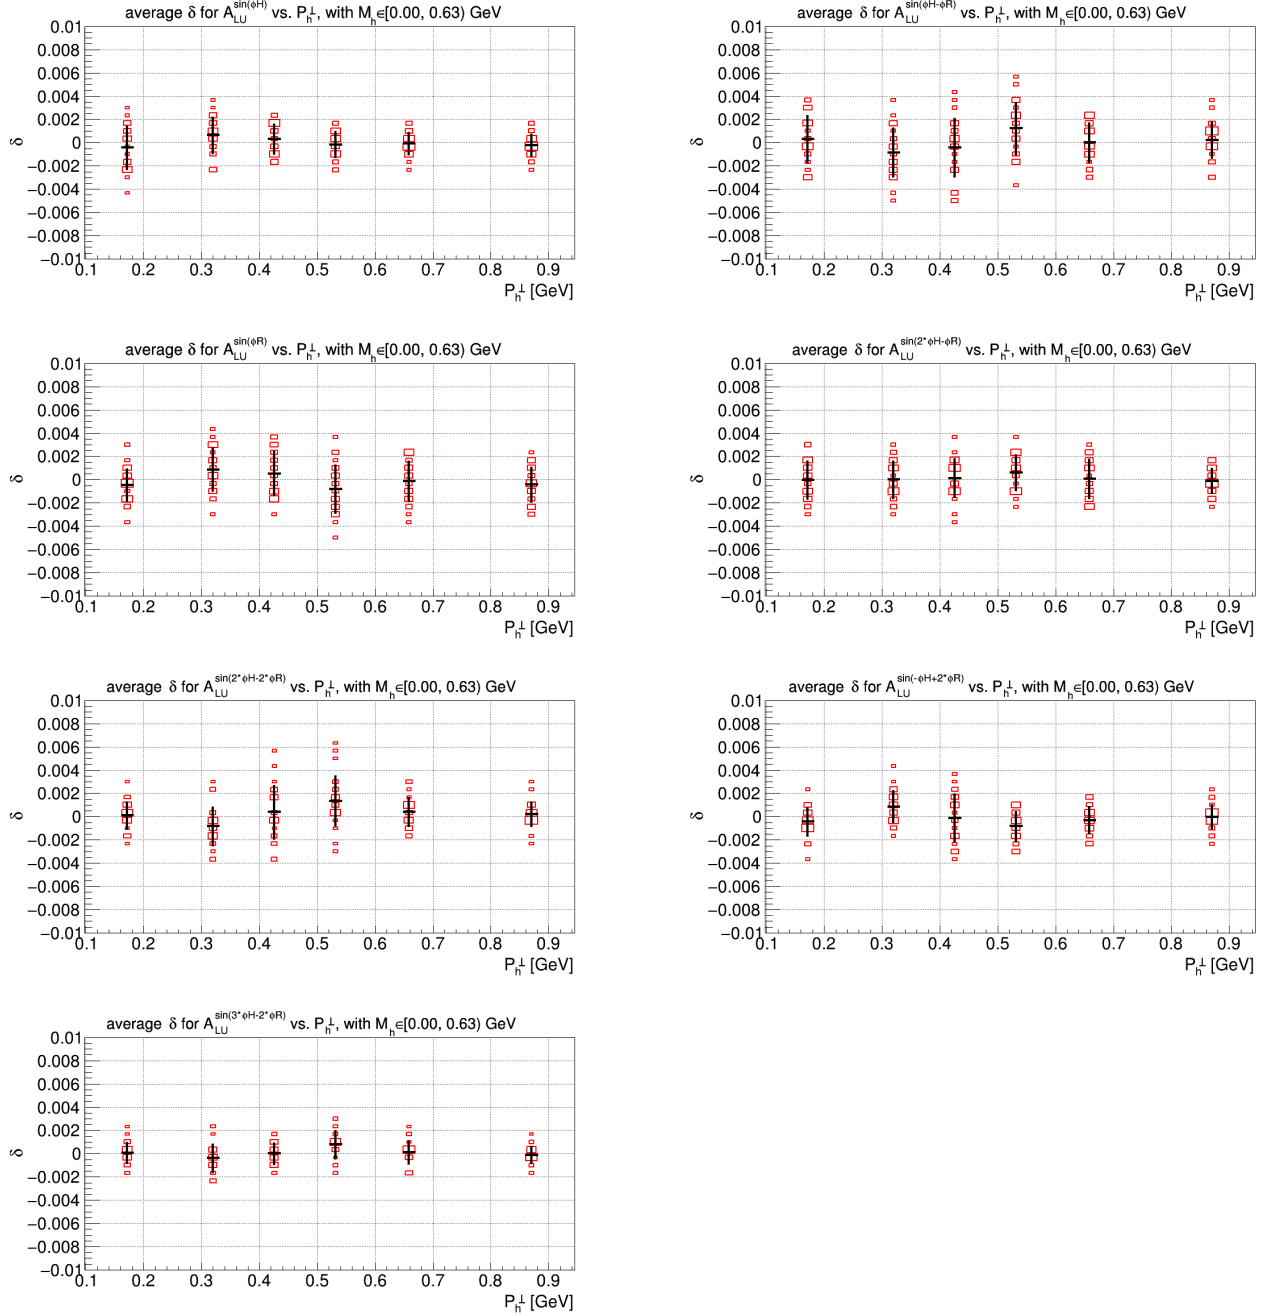

FIG. 9: Distribution of  $\delta$  for each kinematic bin and  $\sigma_{LU}$  modulation; this is for the binning in  $P_h^\perp$ , with  $M_h < 0.63$  GeV. One histogram entry (red box plot) corresponds to one  $\sigma_{UU}$  amplitude injection; the size of the red box is proportional to the number of entries in that bin. The black crosses indicate the mean  $\delta$  for each kinematic bin, and the vertical size of the black cross indicates the standard deviation of  $\delta$ .

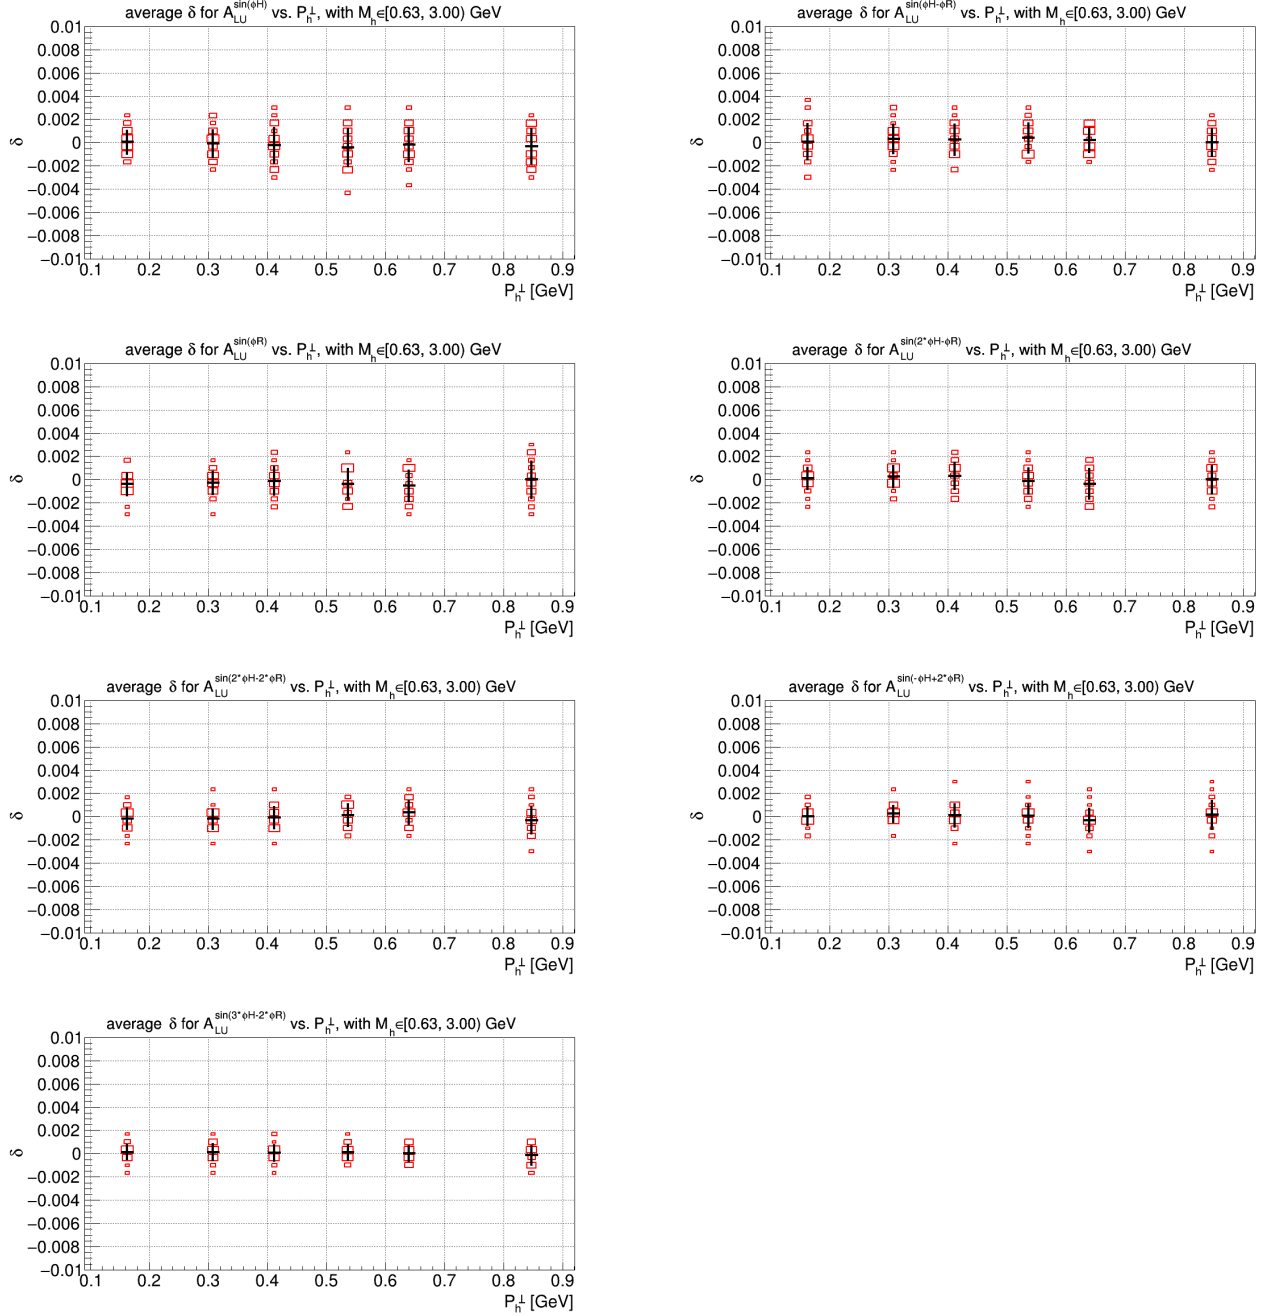

FIG. 10: Distribution of  $\delta$  for each kinematic bin and  $\sigma_{LU}$  modulation; this is for the binning in  $P_h^\perp$ , with  $M_h > 0.63$  GeV. One histogram entry (red box plot) corresponds to one  $\sigma_{UU}$  amplitude injection; the size of the red box is proportional to the number of entries in that bin. The black crosses indicate the mean  $\delta$  for each kinematic bin, and the vertical size of the black cross indicates the standard deviation of  $\delta$ .

#### IV. CORRECTING FOR THE $P_{2,0}$ MODULATION OF THE UNPOLARIZED CROSS SECTION

The full partial wave expansion of the dihadron cross section also includes modulations in  $\theta$ , the dihadron frame decay angle. The modulation  $P_{2,0}(\cos\theta) = (3\cos^2\theta - 1)/2$  of  $d\sigma_{UU}$  is of particular importance and has been studied in other measurements, such as those from HERMES [4], where they employed a similar strategy as our aforementioned Monte Carlo study. Since this modulation is dependent only on  $\theta$  and not on  $\phi_h$  or  $\phi_{R_\perp}$ , we find the shift  $\delta$  on  $A_{LU}$  to be

$$\delta = \frac{AB\langle P_{2,0} \rangle}{1 + B\langle P_{2,0} \rangle}, \quad (6)$$

where  $A$  is the original  $A_{LU}$  amplitude,  $B$  is the amplitude of  $P_{2,0}$ , and  $\langle P_{2,0} \rangle$  is the mean value of  $P_{2,0}$  from the data. Tables XV-XX give the value of  $\langle P_{2,0} \rangle$  for each kinematic bin used in the asymmetry analysis. When a proper measurement of the amplitude of this modulation becomes available, Eq. 6 can be used in combination with the values listed in these tables in order to correct the presented  $A_{LU}$  values.

6	0.727	-0.325

TABLE XVII: Mean values of  $P_{2,0}(\cos \theta)$  for the binning scheme in  $z$ , with  $M_h < 0.63$  GeV.

Bin	$\langle z \rangle$	$\langle P_{2,0}(\cos \theta) \rangle$
1	0.404	-0.477
2	0.474	-0.456
3	0.528	-0.440
4	0.580	-0.424
5	0.638	-0.403
6	0.731	-0.354

TABLE XVIII: Mean values of  $P_{2,0}(\cos \theta)$  for the binning scheme in  $z$ , with  $M_h > 0.63$  GeV.

Bin	$\langle P_h^\perp \rangle$ (GeV)	$\langle P_{2,0}(\cos \theta) \rangle$
1	0.169	-0.427
2	0.311	-0.420
3	0.426	-0.414
4	0.533	-0.408
5	0.653	-0.400
6	0.863	-0.379

TABLE XIX: Mean values of  $P_{2,0}(\cos \theta)$  for the binning scheme in  $P_h^\perp$ , with  $M_h < 0.63$  GeV.

Bin	$\langle P_h^\perp \rangle$ (GeV)	$\langle P_{2,0}(\cos \theta) \rangle$
1	0.160	-0.434
2	0.306	-0.428
3	0.422	-0.424
4	0.530	-0.418
5	0.648	-0.413
6	0.852	-0.402

TABLE XX: Mean values of  $P_{2,0}(\cos \theta)$  for the binning scheme in  $P_h^\perp$ , with  $M_h > 0.63$  GeV.
