

```
int main() {
```

```
    // Create a queue to work on 1st line  
    queue q;
```

```
    // Create buffers from a & b vectors X + 2nd line  
    buffer<float> A { std::begin(a), std::end(a) };  
    buffer<float> B { std::begin(b), std::end(b) };
```

```
{  
    buffer<float> C { c, N };
```

```
    /* The submission command for the kernel  
       execution X + 3rd line*/
```

```
    q.submit([&](handler &cgh) {
```

```
        // In the kernel A and B are read, but C is written 2X + 4th line  
        auto ka = A.get_access<access::mode::read>(cgh);  
        auto kb = B.get_access<access::mode::read>(cgh);  
        auto kc = C.get_access<access::mode::write>(cgh);
```

```
        // Enqueue a parallel kernel 2X + 5th line
```

```
        cgh.parallel_for<class vector_add>(N,  
            [=] (id<1> index) {  
                kc[index] = ka[index] + kb[index];  
            });
```

```
    }); //< End of our commands for this queue
```

```
} //< Buffer C goes out of scope and copies back values to c
```

```
    return 0;
```

```
}
```
