

(a) Variational quantum circuit: the dashed square indicates repeated model with CNOT gates for entangling quantum states, and  $R_X(\alpha)$ ,  $R_Y(\beta)$ ,  $R_Z(\gamma)$  represent Pauli-X, Y, Z gates with free parameters  $\alpha, \beta, \gamma$

$$R_Y(\beta) = \begin{bmatrix} \cos \frac{\beta}{2} & -\sin \frac{\beta}{2} \\ \sin \frac{\beta}{2} & \cos \frac{\beta}{2} \end{bmatrix} \quad \text{Pauli-Y}$$

$$\begin{array}{c} \text{---} \bullet \text{---} \\ | \\ \text{---} \oplus \text{---} \end{array} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{bmatrix} \quad \text{CNOT gate}$$

$$R_X(\alpha) = \begin{bmatrix} \cos \frac{\alpha}{2} & -i \sin \frac{\alpha}{2} \\ -i \sin \frac{\alpha}{2} & \cos \frac{\alpha}{2} \end{bmatrix} \quad \text{Pauli-X}$$

$$R_Z(\gamma) = \begin{bmatrix} \exp(-i\frac{\gamma}{2}) & 0 \\ 0 & \exp(i\frac{\gamma}{2}) \end{bmatrix} \quad \text{Pauli-Z}$$

(b) Matrix representation for the Quantum gates applied in the VQC
