

This scatter plot illustrates the relationship between training time and accuracy for different models. The x-axis, 'Training Time (log scale)', spans from 1 to 10,000. The y-axis represents accuracy. A dashed horizontal line at approximately 0.75 accuracy serves as a benchmark. Most models cluster below this line, with training times between 1 and 100. A few models, represented by dark blue stars, achieve higher accuracy (above 0.75) at training times between 300 and 1,500. A single purple circle is located at the bottom right, indicating a model with low accuracy and high training time.
