

1

An animator is tasked with depicting that this baby wants the cupcake, not the candy.

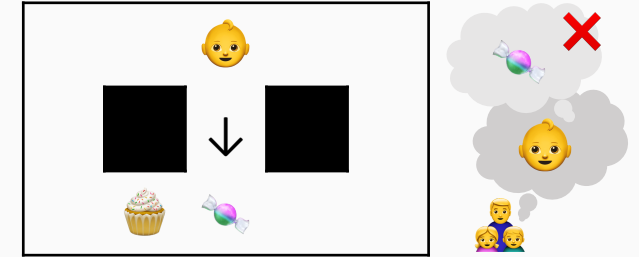

In which direction should she make the baby start crawling?

2

If she simply mimics a rational agent, she would move the baby **south** (along the shortest path)...

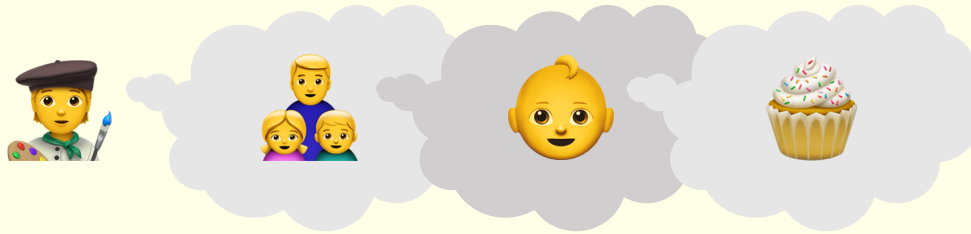

...but that motion is highly ambiguous! In fact, it “looks” more like the baby wants the candy.

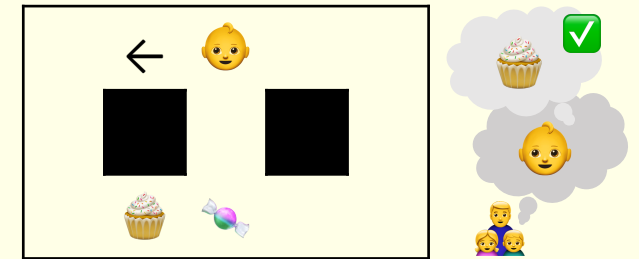

3

What if she instead considers what motion best conveys the baby’s desires to an *audience*?

By modeling the audience’s experience, our system can automatically suggest crawling **west** instead.

4

More generally, modeling the audience allows us to naturally capture a wide variety of storytelling elements in a single, principled computational framework...

Plot twists

Mime

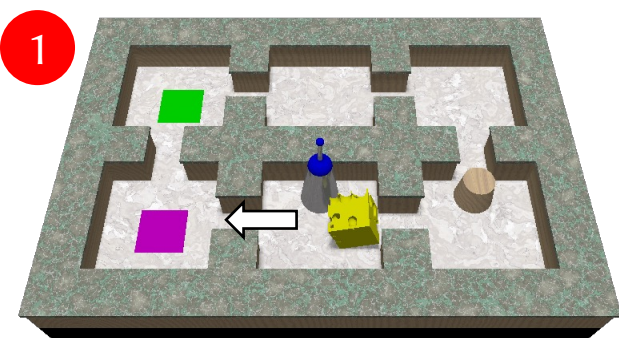

Irony

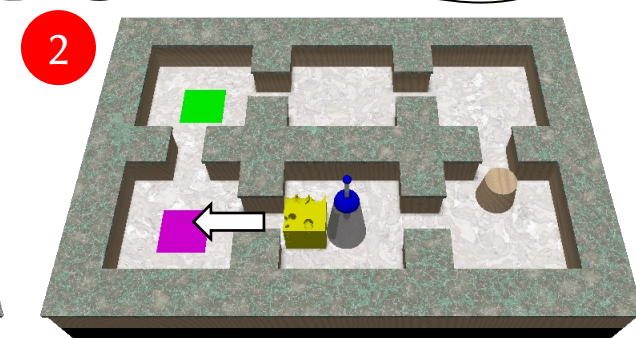

Flashbacks

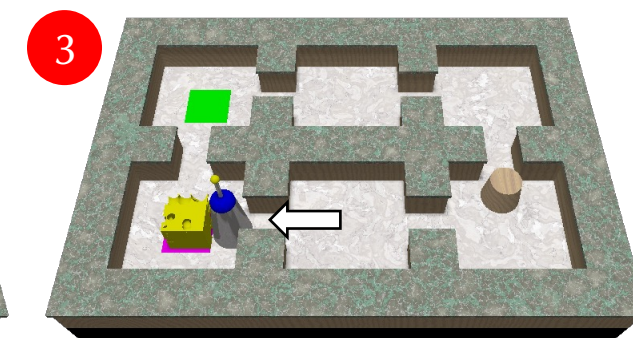

Robot helps cheese (inverse inverse planning; better depiction)

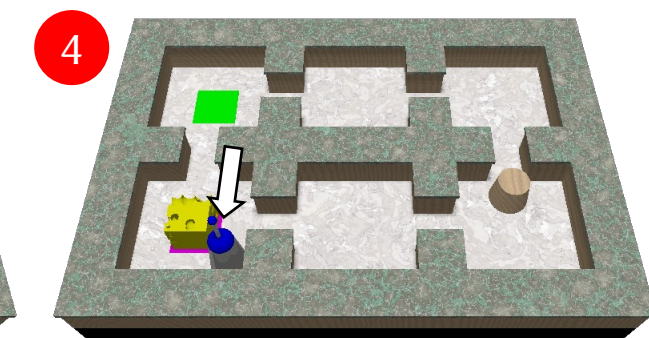

The cheese moves towards pink.

The robot pushes the cheese along.

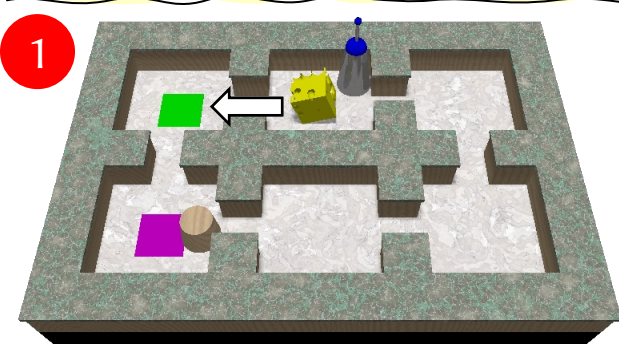

It deposits the cheese on pink.

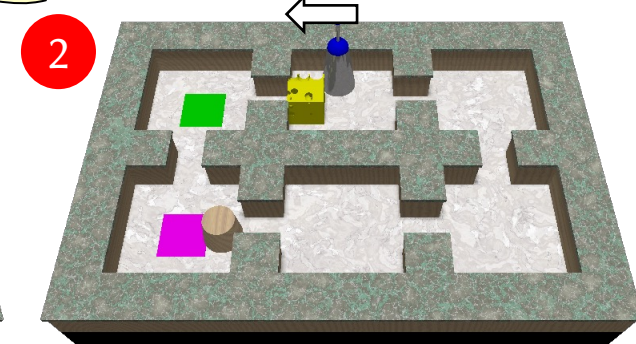

Finally, it recedes to the corner.

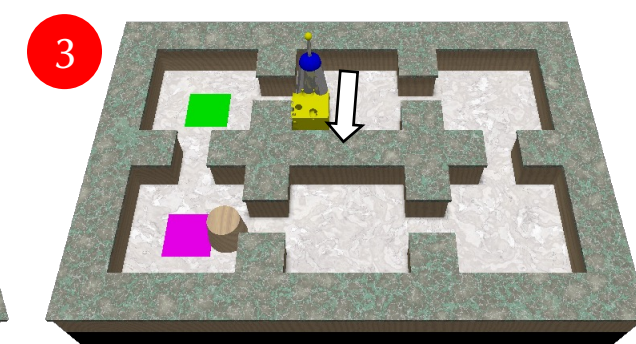

A. Character; robot hinders (3.1.1)

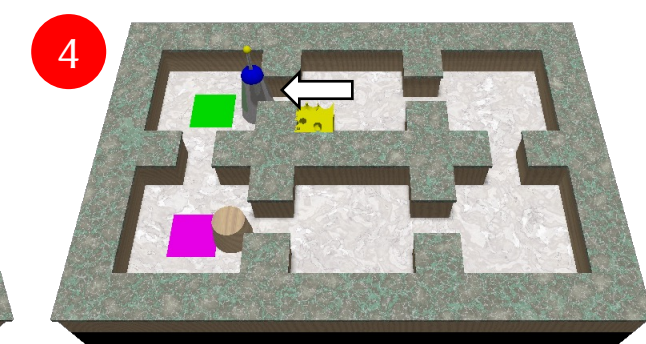

The cheese moves towards green.

The robot begins following.

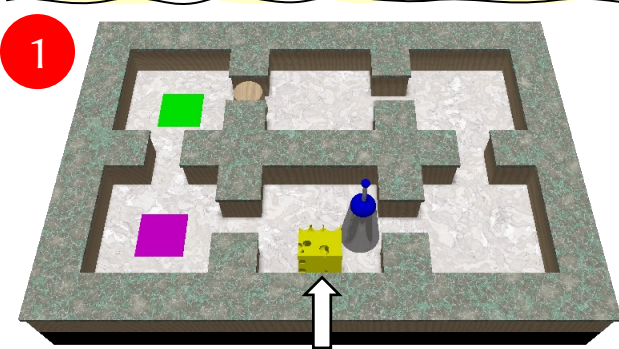

It turns and pushes the cheese into the corner.

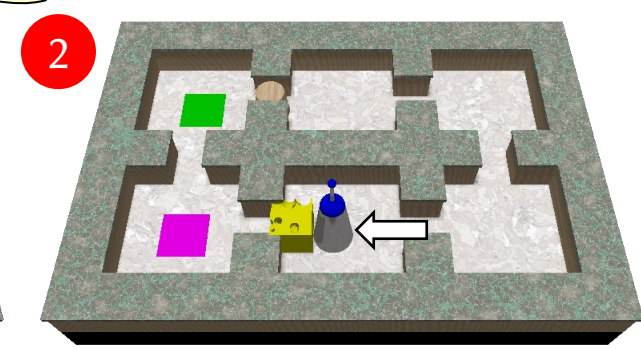

Finally, it blocks the path to green, but does not step on green.

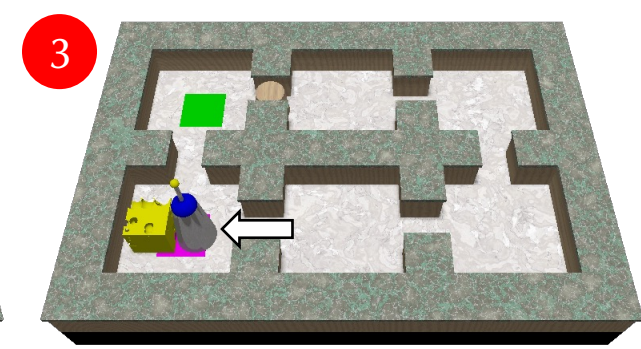

C. Plot twist; help → hinder (3.1.2)

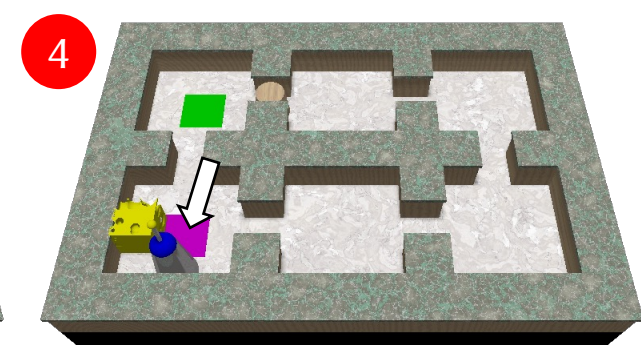

The cheese moves towards pink.

The robot helps by pushing.

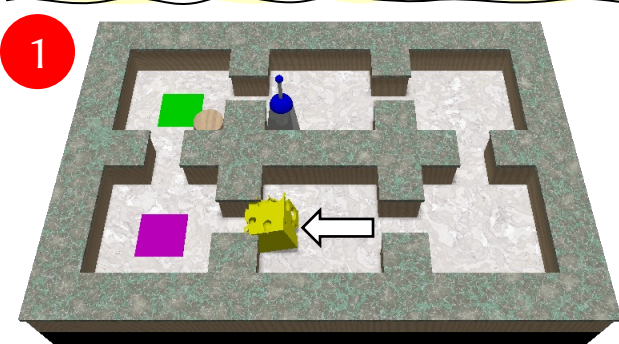

Surprise! It keeps pushing, knocking the cheese off pink!

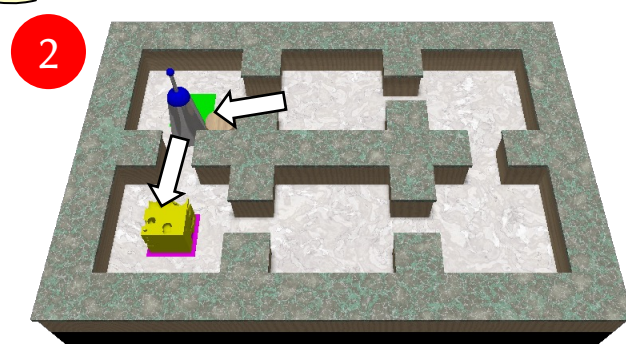

Then it looms by pink, daring the cheese to try returning.

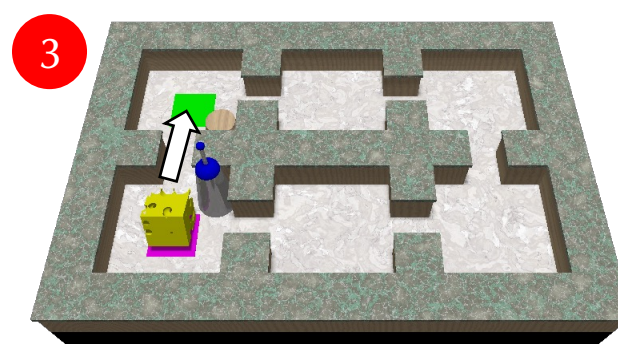

D. Plot twist; hinder → help (3.1.2)

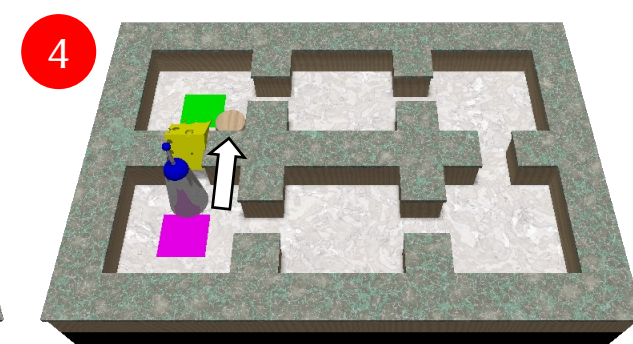

The cheese moves to pink.

The robot comes, presumably to push it off.

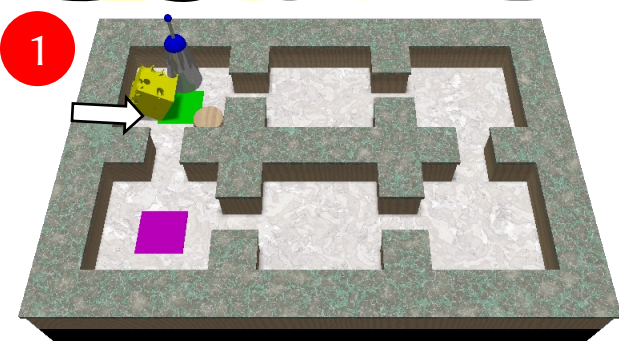

Aha! The cheese actually wants green, not pink!

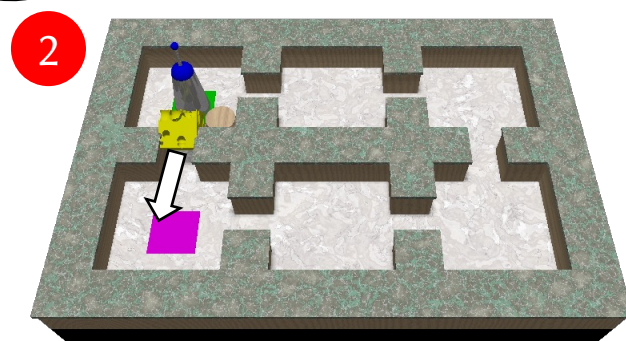

The robot helps it get there.

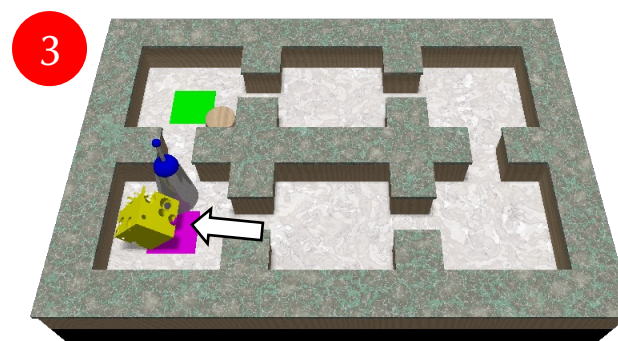

E. Irony (3.1.3)

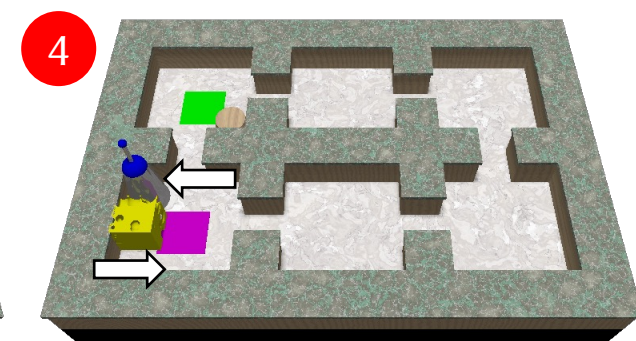

The cheese moves to green.

The robot pushes it to pink.

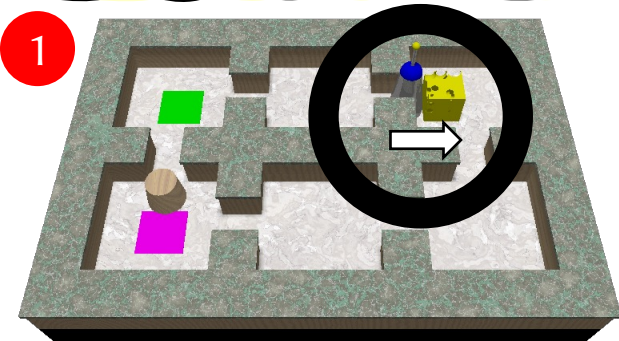

The cheese tries to leave...

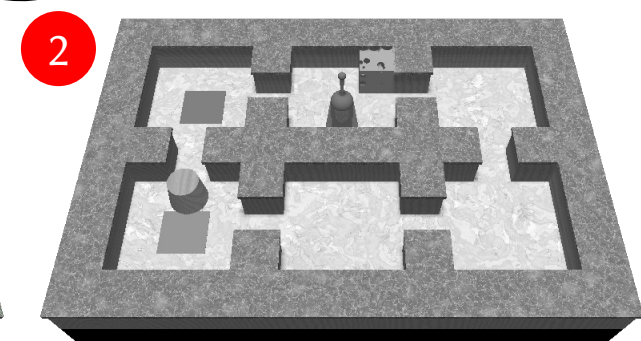

...but the robot “helpfully” guides it back to pink.

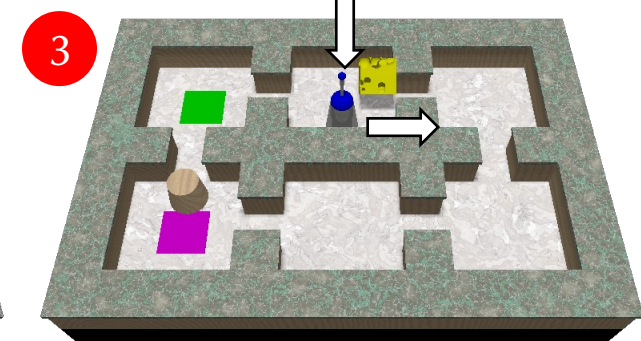

G. Flashback; show helping (3.1.4)

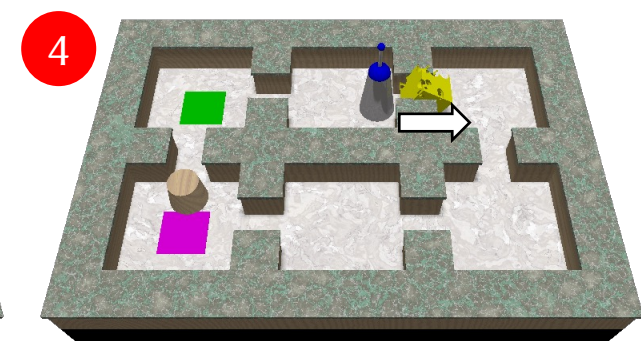

Robot pushes cheese east. Why?

FLASHBACK

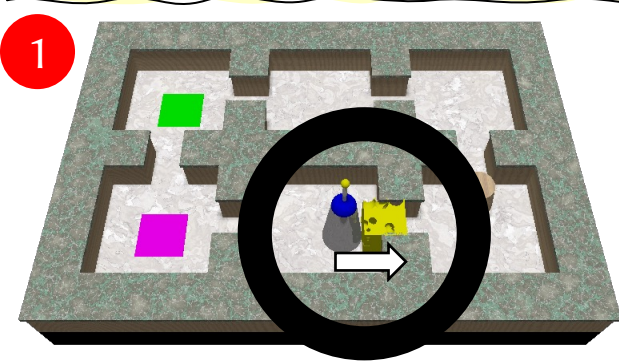

The cheese was heading to pink.

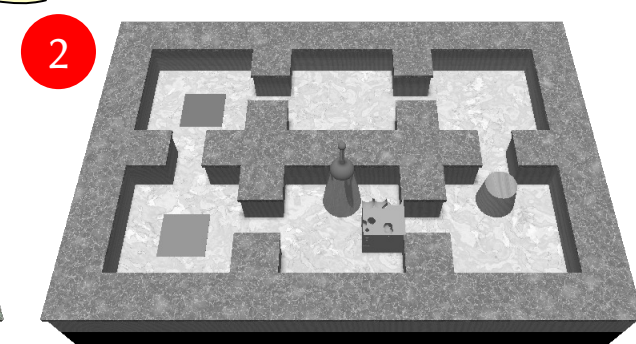

The robot was helping it along.

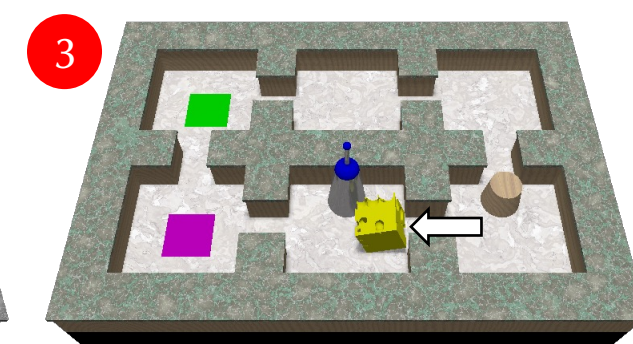

H. Flashback; show hindering (3.1.4)

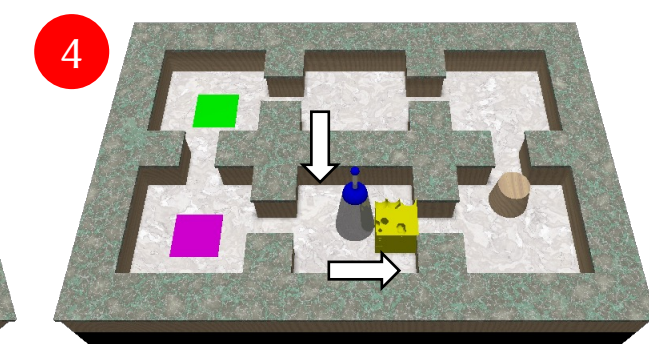

Robot pushes cheese east. Why?

FLASHBACK

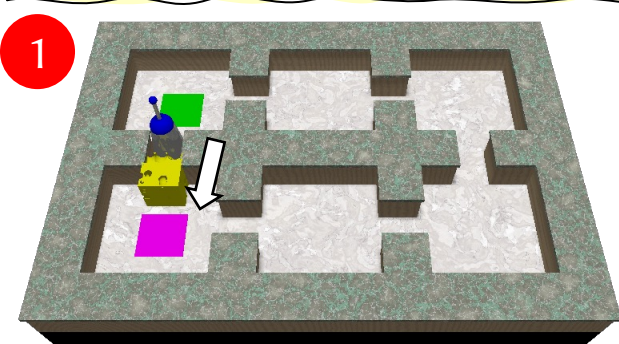

The cheese tries moving to pink.

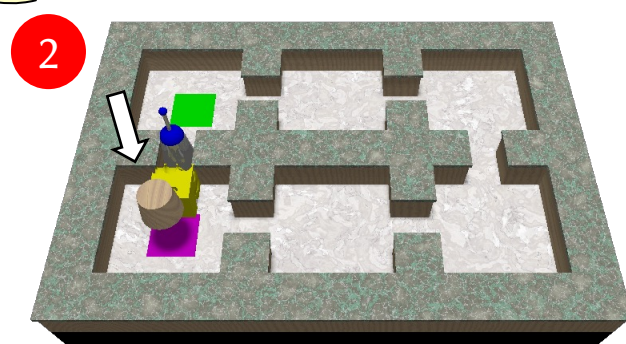

The robot blocks and traps it.

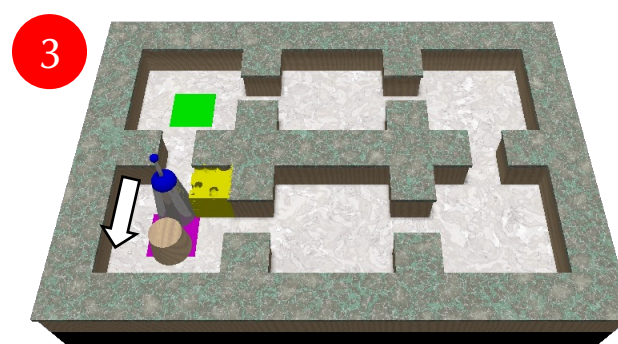

F. Narrative arc (3.1.5)

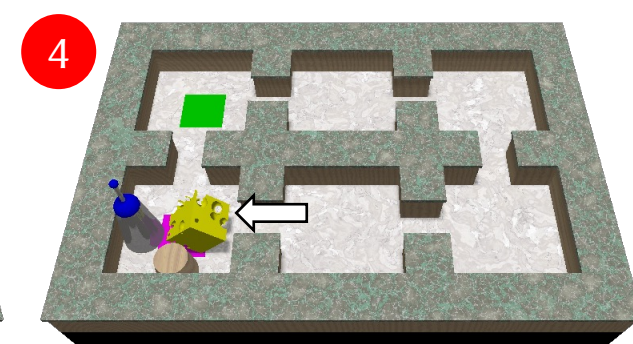

The robot helps the cheese to get to pink.

A table lands in the way!
(Deus ex machina!)

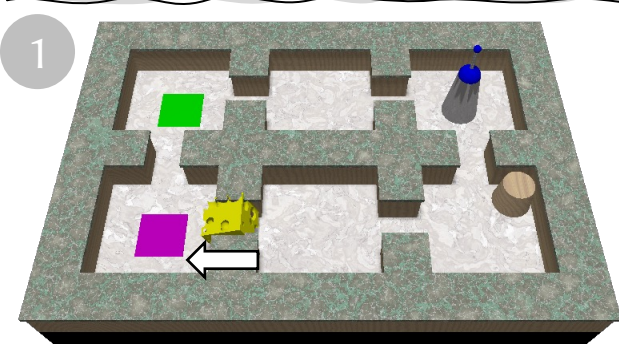

The robot pushes it away...

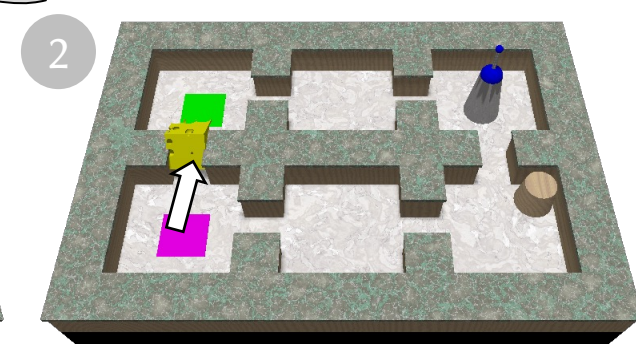

...and the cheese gets to pink.

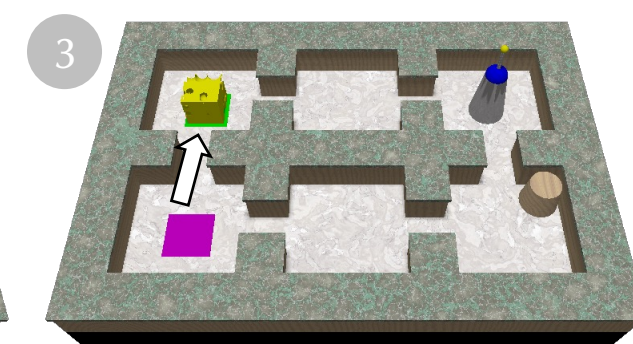

Help (naïve planning baseline)

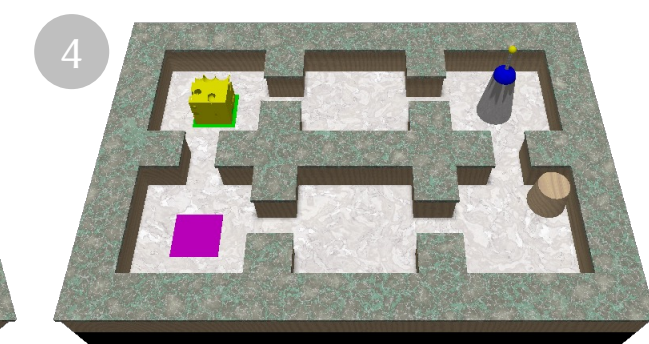

The cheese begins moving.

It makes steady progress to green.

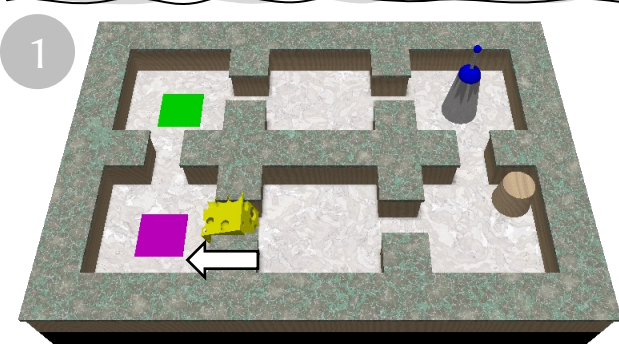

It makes it to green and stays.

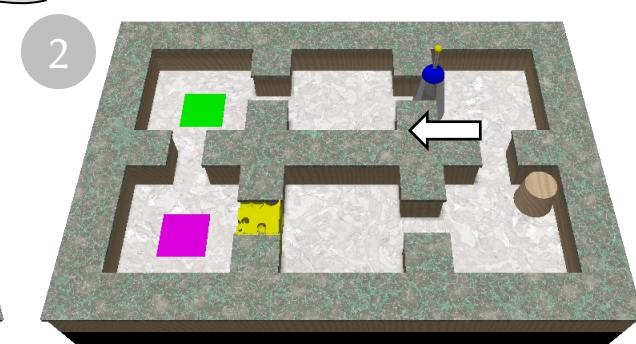

However, the robot remains stationary throughout.

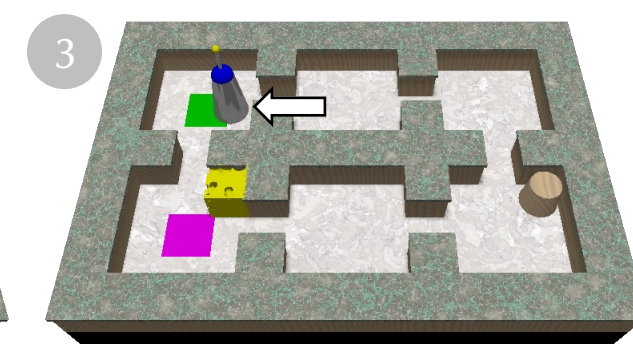

B. Hinder (naïve planning baseline)

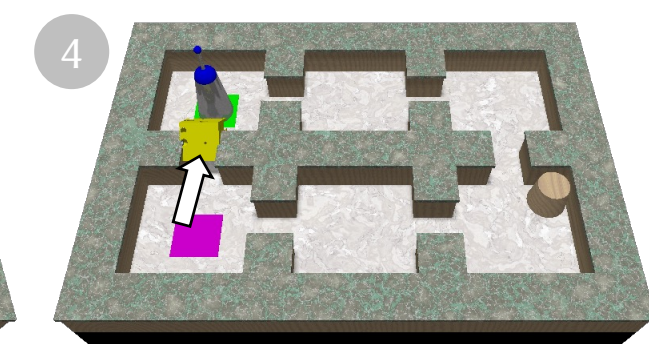

The cheese begins moving.

The robot also begins moving.

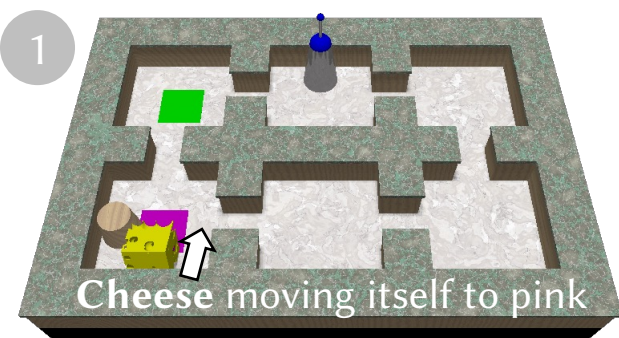

The robot reaches green and rests there.

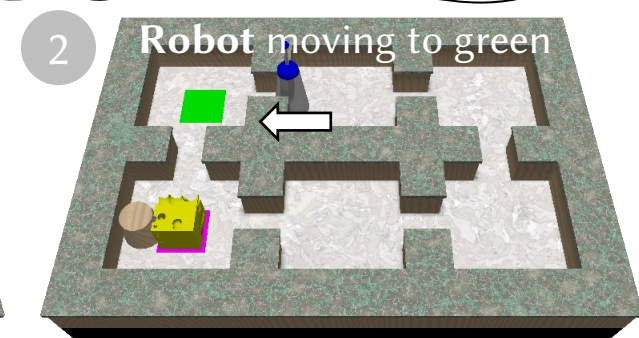

When the cheese gets to green, it is blocked by the robot.

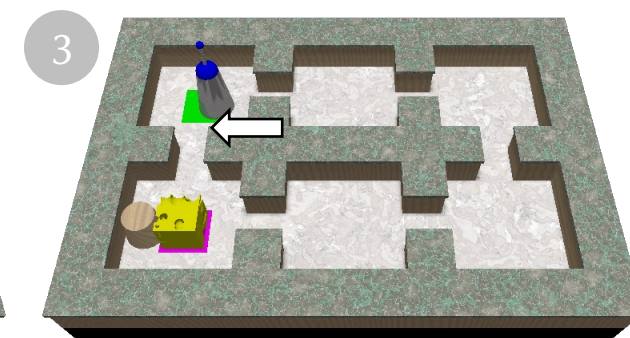

Robot helps cheese (naïve planning; poor depiction)

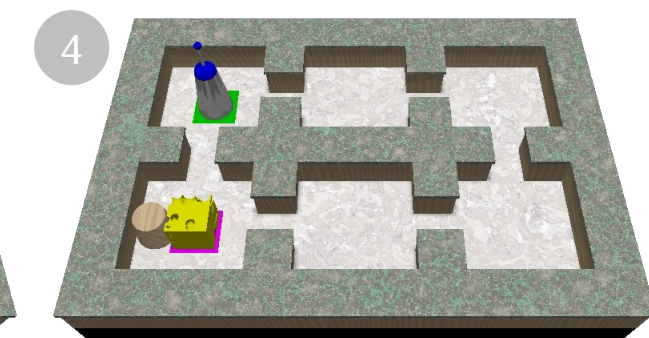

The cheese moves itself onto the pink goal tile and stops.

The robot begins to move, while the cheese stays on the pink goal.

The robot reaches the green goal tile and stops.

Both characters are motionless for the rest of the animation.
