# 1 Induction energy with multiconfigurational wave functions at the $m^4$ cost

Begin with the induction interaction energy expression introduced in ref S1

$$E_{\text{ind}}^{(2)} = E_{\text{ind}}^{(2)}(A \leftarrow B) + E_{\text{ind}}^{(2)}(B \leftarrow A) , \quad (1)$$

$$E_{\text{ind}}^{(2)}(A \leftarrow B) = -4 \sum_{\mu \in A} \frac{\left( \sum_{p > q \in A} [\tilde{\mathbf{Y}}_{\mu}^A]_{pq} \bar{\Omega}_{pq}^B \right)^2}{\omega_{\mu}^A} , \quad (2)$$

$[E_{\text{ind}}^{(2)}(B \leftarrow A)]$  is defined analogously to  $E_{\text{ind}}^{(2)}(A \leftarrow B)$ , where  $\bar{\Omega}^B$  is a vector of the modified interaction potential defined as

$$\forall_{p > q \in A} \quad \bar{\Omega}_{pq}^B = (n_p^{1/2} + n_q^{1/2}) \langle p | \hat{\Omega}_B | q \rangle \quad (3)$$

$$\hat{\Omega}_B(\mathbf{r}) = v^B(\mathbf{r}) + \int \frac{\rho^B(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} d\mathbf{r}' . \quad (4)$$

Equations are written in the natural orbitals representation of the monomer A and  $n_p, n_q$  denote natural occupation numbers,  $\forall_p 0 \leq n_p \leq 1$ . Using the expression for the frequency-dependent density response function [see Eq. (6) in the main text]

$$[\mathbf{C}^A(\omega)]_{pq,p'q'} = 2 \sum_{\nu} [\tilde{\mathbf{Y}}_{\nu}^A]_{pq} [\tilde{\mathbf{Y}}_{\nu}^A]_{p'q'} \frac{\omega_{\nu}^A}{\omega^2 + (\omega_{\nu}^A)^2} , \quad (5)$$

taken at  $\omega = 0$  leads to

$$E_{\text{ind}}^{(2)}(A \leftarrow B) = -2 [\bar{\mathbf{C}}^A(0)]^T \bar{\Omega}^B , \quad (6)$$

where

$$\forall_{p > q \in A} \quad [\bar{\mathbf{C}}^A(0)]_{pq} = \sum_{p' > q' \in A} [\mathbf{C}^A(0)]_{pq,p'q'} \bar{\Omega}_{p'q'}^B \quad (7)$$

(analogous equations hold for the monomer  $B$ ). The vector  $\bar{\mathbf{C}}^A(0)$  can be easily found from Eq. (8) in the main text, written for  $\omega = 0$  and projected on  $\bar{\Omega}^B$ ,

$$\mathcal{A}_+ \mathcal{A}_- \bar{\mathbf{C}}^A(0) = \mathcal{A}_+ \bar{\Omega}^B \quad (8)$$

where the  $\mathcal{A}_+$ ,  $\mathcal{A}_-$  are the hessian matrices constructed for the monomer  $A$ . Multiply Eq. (8) by  $[\mathcal{A}_+]^{-1}$  to obtain

$$\mathcal{A}_- \bar{\mathbf{C}}^A(0) = \bar{\Omega}^B \quad . \quad (9)$$

Splitting  $\mathcal{A}_-$  into zeroth- and first-order terms in the coupling constant  $\alpha$ , see Eq. (13) in the main text taken for  $\alpha = 1$ ,

$$\mathcal{A}_- = \mathcal{A}_-^{(0)} + \mathcal{A}_-^{(1)} \quad (10)$$

leads to

$$\bar{\mathbf{C}}^A(0) = [\mathcal{A}_-^{(0)}]^{-1} \bar{\Omega}^B - [\mathcal{A}_-^{(0)}]^{-1} \mathcal{A}_-^{(1)} \bar{\mathbf{C}}^A(0) \quad , \quad (11)$$

which gives rise to the iterative scheme

$$[\bar{\mathbf{C}}^A(0)]_{i+1} = [\bar{\mathbf{C}}^A(0)]_0 - [\mathcal{A}_-^{(0)}]^{-1} \mathcal{A}_-^{(1)} [\bar{\mathbf{C}}^A(0)]_i \quad , \quad (12)$$

where

$$[\bar{\mathbf{C}}^A(0)]_0 = [\mathcal{A}_-^{(0)}]^{-1} \bar{\Omega}^B \quad . \quad (13)$$

As it has been discussed in the main text, the matrix  $\mathcal{A}_-^{(0)}$  is block diagonal with the largest blocks of the  $M_{s_2}^2 \times M_{s_2}^2$  size, where  $M_{s_2}$  denotes the number of the active orbitals. Consequently, the cost of its inversion is negligible if the number of the active orbitals is much smaller than that of the virtual orbitals. All matrix multiplications in the proposed iterative are of the  $m^4$  cost.

The iterative algorithm presented in Eq. (12), has been implemented in GAMMCor using the DIIS acceleration technique.

## 2 Additional Results

Figure S1: Convergence of the  $E_{disp}^{(2)}$  energy component as a function of the  $n$ -parameter, see Eqs.(11) and (14) in the main text, computed for benzen-cyclopentane complex in ground-state. Results obtained for aug-cc-pVTZ basis set.

Figure S2: Differences of density between ground and  $\pi \rightarrow \pi^*$  and  $n \rightarrow \pi^*$  excited states respectively. Each isosurface consists of 6 contours of the difference density, generated to encompass 50%, 40%, 30%, 20%, 10% and 1% of the overall density, respectively.

Table S1: Convergence of the dispersion energy with  $n = 6, 8, \dots, 14$  with respect to the SAPT(CAS) reference.  $E_{\text{disp}}^{(2)}$  is the reference SAPT(CAS) dispersion energy. Basis set is aug-cc-pVTZ. Energy unit is  $\mu E_h$ .
