

Q) How to alleviate the congestion?
R) AQMs can be used to drain packets and improve the QoS.

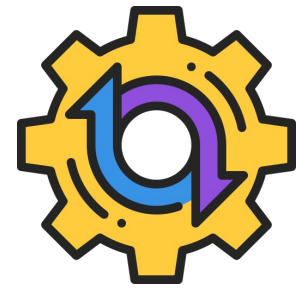

Network Operator

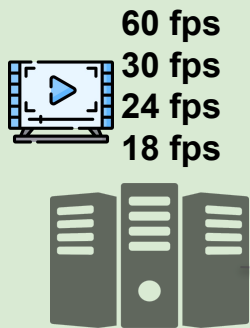

Q) The network traffic is dynamic. So, what is the ideal threshold (target delay) for AQMs?

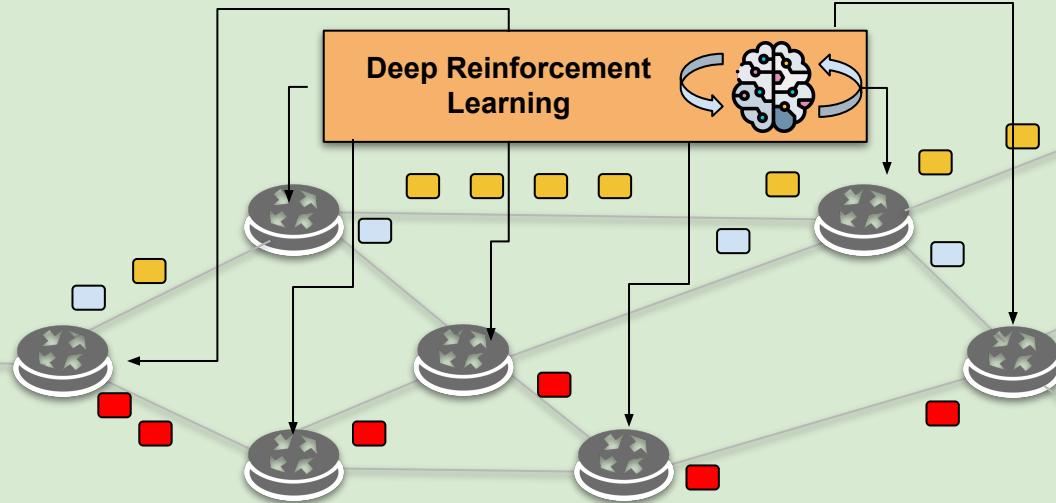

Network Operator

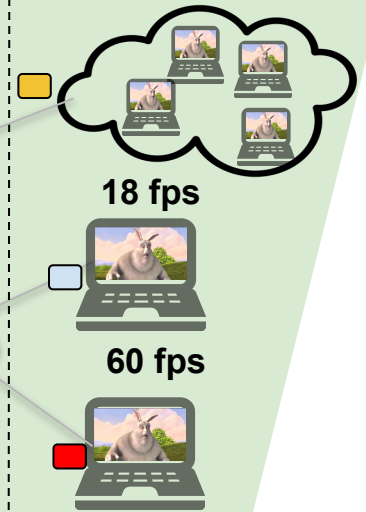

In this work, we introduce **DESiRED** (Dynamic, Enhanced, and Smart iRED), a **P4-based AQM** that leverages precise network feedback from **In-band Network Telemetry (INT)** to feed a **Deep Reinforcement Learning (DRL)** model. This model dynamically adjusts the target delay based on rewards that maximize the QoS application.
