

# How-to LLM-Prompt $\rho_{how-to}^{llm}$

## Structured Task Instructions

Your task is to tell me what are the useful attributes to distinguish a  $g_n$  in an image.

Specifically, you can complete the task by following the instructions:

1. Understand the example delimited by  $< >$ .
2. List the useful attributes to distinguish a  $g_n$  in an image.
3. Output a Python list object that contains the listed useful attributes.

## In-context Example

===

$<$ bird $>$

The useful attributes for distinguishing bird species in an image of a bird:

['bill shape', 'wing color', 'upperparts color', 'underparts color', 'breast pattern', 'back color', 'tail shape', 'upper tail color', 'head pattern', 'breast color', 'throat color', 'eye color', 'bill length', 'forehead color', 'under tail color', 'nape color', 'belly color', 'wing shape', 'size', 'shape', 'back pattern', 'tail pattern', 'belly pattern', 'primary color', 'leg color', 'bill color', 'crown color', 'wing pattern', 'habitat']

===

## Output Instruction

===

$<$   $g_n$   $>$

The useful attributes for distinguishing  $g_n$  in an image:
