

Key technology

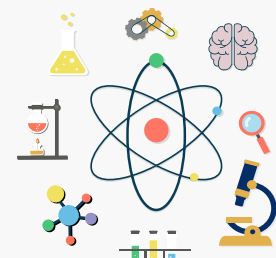

01

Language modeling.
Core training techniques - next-token prediction and masked language modeling.

02

Human feedback reinforcement learning.
It is a method used in the training of LLMs.

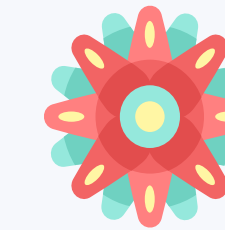

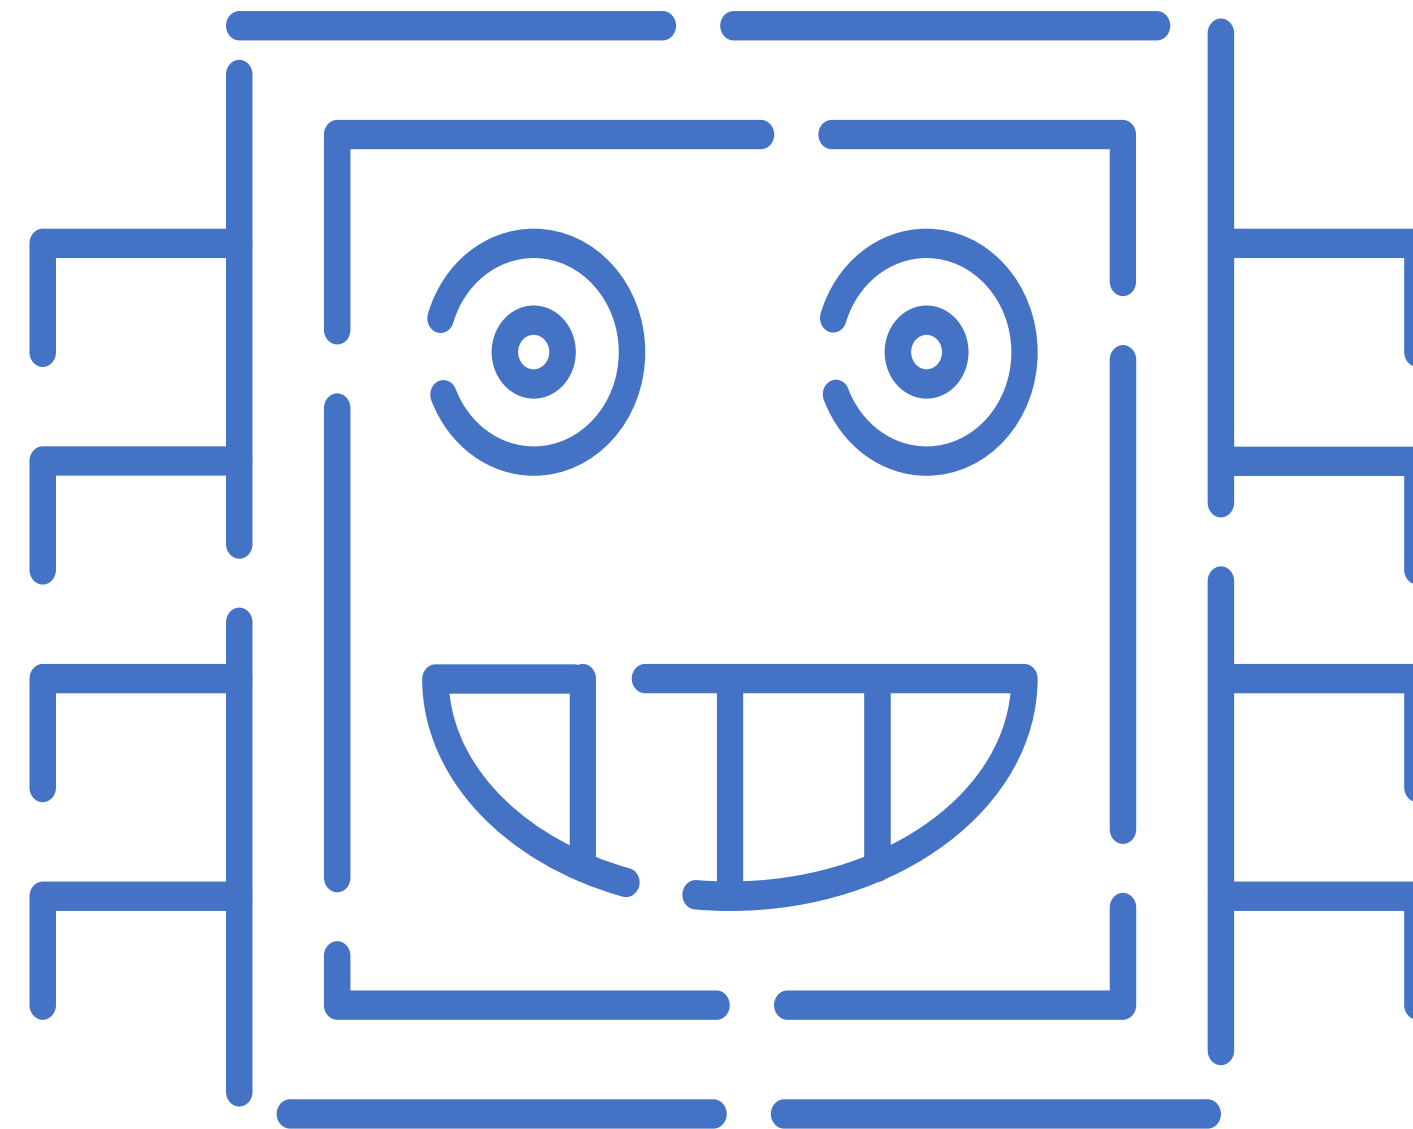

03

Deep Neural Networks.
DNNs consist of multiple layers of interconnected neuron.

04

Self-Supervised Learning.
It falls under unsupervised learning.

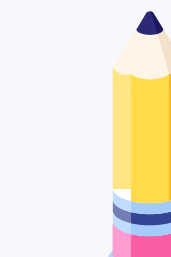

05

Transformer.
The attention mechanism is used to construct the global dependency relationship between input and output.

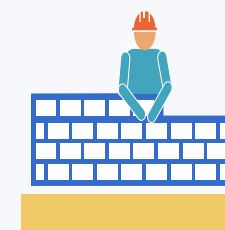

06

LLM diagnosis and application evaluation.
University builds platform for large model ability detection and analysis.

07

Prompt Engineering.
It refers to the ability to interact with LLMs. Through prompts, machines match corresponding results, thereby creating productivity.

08

Learning cognitive mechanism.
The process of learners' knowledge construction is studied.
