

Figure 1 is a line graph showing Accuracy (%) on the y-axis (ranging from 80.0 to 100.0) versus Cumulative Time (s) on the x-axis (ranging from 0 to 25). The graph compares the performance of nonconvex and CVX solvers for two problem types: Geometric_Algebra and Gaussian. The legend indicates the following configurations:

- noncvx AdamW lr:1.0e-02 (Dark Blue)
- noncvx AdamW lr:1.0e-03 (Medium Blue)
- noncvx AdamW lr:1.0e-04 (Light Blue)
- CVX Geometric_Algebra beta: 1.0e-01 (Cyan)
- CVX Geometric_Algebra beta: 1.0e-02 (Green)
- CVX Geometric_Algebra beta: 1.0e-03 (Light Green)
- CVX Gaussian beta: 1.0e-01 (Yellow)
- CVX Gaussian beta: 1.0e-02 (Orange)
- CVX Gaussian beta: 1.0e-03 (Red)

The noncvx AdamW solvers (dark blue, medium blue, and light blue) show rapid convergence to high accuracy (above 92.5%) within the first 5 seconds. The CVX solvers (cyan, green, light green, yellow, orange, and red) show slower convergence, with accuracy increasing significantly after 15 seconds, reaching values between 90.0% and 94.0% by 25 seconds.
