

Figure 1 is a line plot showing Accuracy (%) on the y-axis (ranging from 80 to 94) versus Cumulative Time (s) on the x-axis (ranging from 0 to 70). The plot compares the performance of nonconvex and CVX solvers for two problem types: Gaussian and Geometric_Algebra. The legend indicates the following series:

- noncvx AdamW lr:1.0e-02 (Dark Blue)
- noncvx AdamW lr:1.0e-03 (Medium Blue)
- noncvx AdamW lr:1.0e-04 (Light Blue)
- CVX Gaussian beta: 1.0e-03 (Cyan)
- CVX Gaussian beta: 1.0e-04 (Light Green)
- CVX Gaussian beta: 1.0e-05 (Yellow)
- CVX Geometric_Algebra beta: 1.0e-03 (Orange)
- CVX Geometric_Algebra beta: 1.0e-04 (Red)
- CVX Geometric_Algebra beta: 1.0e-05 (Dark Red)

The plot shows that nonconvex solvers generally achieve higher accuracy faster than CVX solvers. The noncvx AdamW lr:1.0e-02 series shows the fastest convergence, reaching near 92% accuracy within 10 seconds. The CVX Gaussian solvers show a significant performance gap, especially for the beta: 1.0e-03 series, which converges much more slowly. The CVX Geometric_Algebra solvers show a similar performance gap, with the beta: 1.0e-05 series being the fastest among them.
