The script has been successfully updated to display the plot inline instead of saving it as a file. Now, let's run the modified script in the Jupyter notebook environment:

Great! The script has successfully run and displayed the plot inline in the Jupyter notebook environment. Summarize the results:

- The plot shows the number of commits per week for the [redacted]/OpenHands repository.
- Total number of commits: 178
- Number of weeks with activity: 15
- Average commits per week: 11.87
- Max commits in a week: 118

The plot visually represents the commit activity over time, allowing us to see patterns in the repository's development.

We have successfully completed the script to plot the number of commits per week for the [redacted]/OpenHands GitHub repository, displaying the results.

Is there anything else you'd like to know about the data or the plot?

Here's the correct action:

In order to accomplish our goal, we need to click on the "Google Search" button with bid 231.

To accomplish our goal of finding the OpenHands GitHub repository, I'll analyze the search results and look for a relevant link.

I don't see a direct link to the repository in the current search results. However, I notice there's a link that might contain relevant information:

[337] link 'Add Github', clickable

This link seems promising as it mentions 'Add Github' and 'OpenHands', clickable

To accomplish our goal of finding the OpenHands GitHub repository, I need to click on the link that leads directly to it. Based on the search results, I can see the following relevant link:

[613] link 'OpenHands: Code of Conduct', clickable

This link appears to be exactly what we need. It leads to the OpenHands repository on GitHub, clickable

Hi! I'm OpenHands, an AI Software Engineer. What would you like to build with me today?

Write a script to plot the number of commits per week on the [redacted]/OpenHands GitHub repository

Certainly! I'll write a script to plot the number of commits per week for the [redacted]/OpenHands GitHub repository. We'll use Python with the `requests` library to fetch data from the GitHub API, and `matplotlib` to create the plot. Let's start by creating a new Python file and installing the necessary libraries.

Great, the required libraries are already installed. Now, let's create a Python script to fetch the commit data and plot it.

Thank you for creating the file. Now, let's write the script to fetch the commit data and create the plot. I'll add the code to the file:

I apologize for the error. I'll correct the approach by using `insert_content_at_line` instead of `edit_file_by_replace`. Let's add the code to the file:

The script looks good. Now let's run it to generate the plot and get the statistics:
