X-MAML

- Most of Machine Learning Methods (e.g. **Deep Neural networks**) need to have a **large** training set
- Low-Resource vs. High-Resource Tasks/Domains/Languages
- Transfer Learning
- Strategic sharing of knowledge has been shown to improve downstream NLP task performance

< □ > < 同 > < 回 > < 回 > < 回 >

- Meta-Learning, or **learning to learn**, tackles the problem of **fast** adaptation on **new** and **few** training data
- Learns structure among multiple tasks, learning new tasks is fast
- Repeatedly simulating the learning process on low-resource domains/languages using many high-resource ones (Gu et al. 2018)

< □ > < 同 > < 回 > < 回 > < 回 >

Multi-Task vs. Meta-Learning in NLP

Multi-Task Learning

Meta Learning

< □ > < 同 > < 回 > < 回 > < 回 >

Figure is adapted from (Dou, K. Yu and Anastasopoulos 2019)

MAML: Model-Agnostic Meta-Learning (Finn et al. 2017)

- Learns a **good parameter** initialization for **fast adaptation** with only **small amount** of data and with a **few gradient** steps
- Model- and Task Agnostic (Any model trained with gradient descent)
- Can be applied in various setting: Classification, Regression, Reinforcement Learning

< □ > < □ > < □ > < □ > < □ > < □ >

- Meta-Learning for Low-Resource Neural Machine Translation (Gu et al. 2018)
- Domain Adaptive Dialog Generation via Meta Learning (Qian and Z. Yu 2019)
- Model-Agnostic Meta-Learning for **Relation Classification** with Limited Supervision (Obamuyide and Vlachos 2019)

< □ > < 同 > < 回 > < 回 > < 回 >

Method: MAML for Cross-Lingual NLU tasks

- Gu et al. (2018) exploit a set of **high-resource auxiliary languages** to improve the performance of a low-resource one in **Machine Translation** task
- Cross-lingual setting in NLU (e.g., Natural Language Inference, Question Answering)
- Only **English** dataset as a **high-resource** language and other languages are in a **low-resource** mode
- We introduce a cross-lingual meta-learning framework (X-MAML)

Nooralahzadeh et. al.

イロト 不得 トイラト イラト 一日

- **9 Pre-training** stage on the high-resource language (i.e, English)
- Meta-learning using one or two low-resource languages as auxiliary tasks
- **3** Zero-shot learning or Fine-tuning on the target languages.

< □ > < 同 > < 回 > < 回 > < 回 >

```
h: High-resource language
L: Set of low-resource languages
M: Model pre-trained on h
\mathcal{T}_i: A batch from Development set of language i in L
\alpha, \beta: Step size
\theta: Initial parameter
\theta'_i: Optimal parameter in \mathcal{T}_i, fast weight
```

- XNLI: Cross-Lingual NLI (Conneau et al. 2018)
 - An extension of the SNLI/MultiNLI corpus in 15 languages
 - Train: 392,702 pairs in English
 - The pairs are annotated with textual entailment and **translated** into 14 languages
 - 2,500 dev, 5,000 test pairs for 15 Languages

A (10) N (10) N (10)

Experiments: Cross-Lingual NLI

- Zero-shot/Few-Shot X-MAML on X-NLI:
 - M: Multi-BERT
 - Baseline: Multi-BERT is trained on English
 - Zero-shot: Evaluated on the test set of each target language
 - Few-shot: Fine-tuned on dev set (2.5k) of target languages, then is evaluated on the test set
 - Apply X-MAML with one or two auxiliary languages
 - Report an average of ${\bf 10}$ runs of X-MAML on XNLI

Nooralahzadeh et. a	Ι.
---------------------	----

Experiments: Cross-Lingual NLI

Zero-shot/Few-Shot X-MAML on X-NLI

- It boosts Multi-BERT performance on cross-lingual NLI
- Alleviates the machine translating step from the foreign language into English in the Multi-BERT setting.

Nooralahzadeh et. al.

EMNLP 2020 13 / 20

Experiments: Multilingual QA

MLQA: Multilingual Question Answering dataset (Lewis et al. 2019)

- MLQA Contains QA instances in 7 languages: English (en), Arabic (ar), German(de), Spanish (es), Hindi (hi), Vietnamese (vi) and Simplified Chinese (zh).
- It includes over **12k QA** instances in English and **5k** for every other language
- This dataset has been used in many recent studies on **cross-lingual transfer learning** (e.g., Hu et al. 2020; Liang et al. 2020).

Zero-Shot X-MAML on MLQA

F1 scores on MLQA test set using zero-shot X-MAML

- Overall, zero-shot learning models with X-MAML outperform the baselines
- Improvement: +1.04%(XLM), +0.89% (XLM-R_{base}) and +1.47% (XLM-R_{large}) in average F_1

- **Cross-lingual transfer** with meta-learning yields improved results even when languages strongly differ from one another
- Zero-shot X-MAML on XNLI, improved transfer performance is achieved for Russian (ru) → Hindi (hi)

Discussion and Analysis

- **WALS**: World Atlas of Language Structure (Dryer and Haspelmath, 2013)
 - Largest openly available typological database
 - \sim 200 linguistic features (i.e, phonological, grammatical, lexical properties) with annotations for more than 2,500 languages
- Investigate whether two languages **sharing** the **same typological feature** is beneficial for performance using **X-MAML**
- Languages with **similar morphosyntactic** properties can be **beneficial** to one another in X-MAML

< □ > < □ > < □ > < □ > < □ > < □ >

Analysis: Typological Correlations (Zero-shot X-MAML)

25A Locus of Marking: Whole-language Typology

"whether the morphosyntactic marking in a language is on the syntactic heads or dependents of a phrase."

Conclusion

- We propose X-MAML, a cross-lingual meta-learning architecture, and study it for two natural language understanding tasks (Natural Language Inference and Question Answering)
- We test X-MAML on cross-lingual few-shot as well as zero-shot learning, across a total of 15 languages
- We observe consistent improvements over strong models including Multilingual BERT and XLM-RoBERTa
- Languages which **share certain morphosyntactic** features tend to benefit from this type of **transfer**

< □ > < □ > < □ > < □ > < □ > < □ >
