Anonymization Fiascos

Disturbing Headlines and Paper Titles

- § "A Face Is Exposed for AOL Searcher No. 4417749" [Barbaro & Zeller '06]
- § "Robust De-anonymization of Large Datasets (How to Break Anonymity of the Netflix Prize Dataset)" [Narayanan & Shmatikov '08]
- ▶ "Matching Known Patients to Health Records in Washington State Data" [Sweeney '13]
- § "Harvard Professor Re-Identifies Anonymous Volunteers In DNA Study" [Sweeney et al. '13]
- § ... and many others

In general, removing identifiers and applying anonymization heuristics is not always enough!

Why is Anonymization Hard?

§ High-dimensional/high-resolution data is essentially unique:

§ Lower dimension and lower resolution is more private, but less useful:

Why is Anonymization Hard?

§ High-dimensional/high-resolution data is essentially unique:

§ Lower dimension and lower resolution is more private, but less useful:

Managing Expectations

Unreasonable Privacy Expectations

- ▶ Privacy for free? No, privatizing requires removing information (\Rightarrow accuracy loss)
- \rightarrow Absolute privacy? No, your neighbour's habits are correlated with your habits

Reasonable Privacy Expectations

- § Quantitative: offer a knob to tune accuracy vs. privacy loss
- \triangleright Plausible deniability: your presence in a database cannot be ascertained
- ► Prevent targeted attacks: limit information leaked even in the presence of side knowledge

The Promise of Differential Privacy

Quote from [\[Dwork and Roth, 2014\]](#page-70-0):

Differential privacy describes a promise, made by a data holder, or curator, to a data subject: "You will not be affected, adversely or otherwise, by allowing your data to be used in any study or analysis, no matter what other studies, data sets, or information sources, are available."

Quotes from the 2017 Gödel Prize citation awarded to Dwork, McSherry, Nissim and Smith: Differential privacy was carefully constructed to avoid numerous and subtle pitfalls that other attempts at defining privacy have faced.

The intellectual impact of differential privacy has been broad, with influence on the thinking about privacy being noticeable in a huge range of disciplines, ranging from traditional areas of computer science (databases, machine learning, networking, security) to economics and game theory, false discovery control, official statistics and econometrics, information theory, genomics and, recently, law and policy.

Outline

1. [We Need Mathematics to Study Privacy? Seriously?](#page-2-0)

- 2. [Differential Privacy: Definition, Properties and Basic Mechanisms](#page-8-0)
- 3. [Differentially Private Machine Learning: ERM and Bayesian Learning](#page-38-0)
- 4. [Variations on Differential Privacy: Concentrated DP and Local DP](#page-45-0)
- 5. [Final Remarks](#page-65-0)

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0)

A randomized mechanism $\mathcal{M} : X \to Y$ is e-differentially private if for all neighbouring inputs $x\simeq x'$ and for all sets of outputs $E\subseteq Y$ we have

- \blacktriangleright The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0)

A randomized mechanism $\mathcal{M} : X \to Y$ is ε -differentially private if for all neighbouring inputs $x \simeq x'$ and for all sets of outputs $E \subseteq Y$ we have

- \rightarrow The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0)

A randomized mechanism $\mathcal{M} : X \to Y$ is ε -differentially private if for all neighbouring inputs $x \simeq x'$ and for all sets of outputs $E \subseteq Y$ we have

- \rightarrow The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0) A randomized mechanism $\mathcal{M} : X \to Y$ is e-differentially private if for all neighbouring inputs $x \simeq x'$ and for all sets of outputs $E \subseteq Y$ we have

- \rightarrow The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0)

A randomized mechanism $\mathcal{M} : X \to Y$ is ε -differentially private if for all neighbouring inputs $x \simeq x'$ and for all sets of outputs $E \subseteq Y$ we have

- \rightarrow The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0)

A randomized mechanism $\mathcal{M} : X \to Y$ is ε -differentially private if for all neighbouring inputs $x\simeq x'$ and for all sets of outputs $E\subseteq Y$ we have

- \rightarrow The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

Ingredients

- Input space X (with symmetric neighbouring relation \approx)
- Output space Y (with σ -algebra of measurable events)
- **Privacy parameter** $\varepsilon \ge 0$

Differential Privacy [\[Dwork et al., 2006,](#page-70-1) [Dwork, 2006\]](#page-69-0)

A randomized mechanism $\mathcal{M} : X \to Y$ is ε -differentially private if for all neighbouring inputs $x \simeq x'$ and for all sets of outputs $E \subseteq Y$ we have

 $\mathbb{P}[\mathcal{M}(x) \in E] \leq e^{\varepsilon} \mathbb{P}[\mathcal{M}(x') \in E]$

Intuitions behind the definition:

- \blacktriangleright The neighbouring relation \simeq captures what is protected
- \triangleright The probability bounds capture how much protection we get

The Randomized Response Mechanism [\[Warner, 1965\]](#page-73-0)

- \rightarrow n individuals answer a survey with one binary question
- ▶ The truthful answer for individual *i* is $x_i \in \{0, 1\}$
- \blacktriangleright Each individual answers truthfully $(y_i = x_i)$ with probability $e^\varepsilon/(1+e^\varepsilon)$ and falsely $\left(y_i = \bar{x}_i \right)$ with probability $1/(1 + e^{\varepsilon})$
- Elet's denote the mechanism by $(y_1, \ldots, y_n) = RR_{\epsilon}(x_1, \ldots, x_n)$

Intuition: Provides plausible deniability for each individual's answer

Claim: RR_{ε} is ε -DP (free-range organic proof on the whiteboard)

Utility: Averaging the (unbiased) answers \tilde{y}_i from RR_{ε} satisfies w.h.p.

$$
\left|\frac{1}{n}\sum_{i=1}^n x_i - \frac{1}{n}\sum_{i=1}^n \tilde{y}_i\right| \leq \mathcal{O}\left(\frac{1}{\epsilon\sqrt{n}}\right)
$$

The Randomized Response Mechanism [\[Warner, 1965\]](#page-73-0)

- \rightarrow n individuals answer a survey with one binary question
- ▶ The truthful answer for individual *i* is $x_i \in \{0, 1\}$
- \blacktriangleright Each individual answers truthfully $(y_i = x_i)$ with probability $e^\varepsilon/(1+e^\varepsilon)$ and falsely $\left(y_i = \bar{x}_i \right)$ with probability $1/(1 + e^{\varepsilon})$
- Elet's denote the mechanism by $(y_1, \ldots, y_n) = RR_{\epsilon}(x_1, \ldots, x_n)$

Intuition: Provides plausible deniability for each individual's answer

Claim: RR_{ϵ} is ϵ -DP (free-range organic proof on the whiteboard)

Utility: Averaging the (unbiased) answers \tilde{y}_i from RR_{ε} satisfies w.h.p.

$$
\left|\frac{1}{n}\sum_{i=1}^n x_i - \frac{1}{n}\sum_{i=1}^n \tilde{y}_i\right| \leq \mathcal{O}\left(\frac{1}{\epsilon\sqrt{n}}\right)
$$

The Randomized Response Mechanism [\[Warner, 1965\]](#page-73-0)

$$
\left|\frac{1}{n}\sum_{i=1}^n x_i - \frac{1}{n}\sum_{i=1}^n \tilde{y}_i\right| \leq \mathcal{O}\left(\frac{1}{\varepsilon\sqrt{n}}\right)
$$

The Laplace Mechanism (for computing the mean)

Private Mean Computation

- A curator holds one bit $x_i \in \{0, 1\}$ for each of *n* individuals
- \blacktriangleright The curator proceeds by
	- 1. Computing the mean $\mu = \frac{1}{n}$ $\sum_{n=1}^{\infty}$ $i=1, 1, 2i$
	- 2. Sampling noise $Z \sim \text{Lap}(\frac{1}{\varepsilon n})$, and
	- 3. Revealing the noisy mean $\tilde{\mu} = \mu + Z$
- Eet's denote the mechanism by $\tilde{\mu} = \mathcal{M}_{\text{Lap}}(x_1, \ldots, x_n)$

Claim: M_{Lap} is ε -DP (free-range organic proof on the whiteboard)

Utility: The answer returned by the mechanism satisfies w.h.p.

 $|\mu - \tilde{\mu}| \leqslant 0 \left(\frac{1}{\gamma} \right)$

The Laplace Mechanism (for computing the mean)

Private Mean Computation

- ▶ A curator holds one bit $x_i \in \{0, 1\}$ for each of *n* individuals
- \blacktriangleright The curator proceeds by
	- 1. Computing the mean $\mu = \frac{1}{n}$ $\sum_{n=1}^{\infty}$ $i=1, 1, 2i$
	- 2. Sampling noise $Z \sim \text{Lap}(\frac{1}{\varepsilon n})$, and
	- 3. Revealing the noisy mean $\tilde{\mu} = \mu + Z$
- Eet's denote the mechanism by $\tilde{\mu} = \mathcal{M}_{\text{Lap}}(x_1, \ldots, x_n)$

Claim: M_{Lap} is ε -DP (free-range organic proof on the whiteboard)

Utility: The answer returned by the mechanism satisfies w.h.p.

$$
|\mu-\tilde{\mu}|\leqslant \mathcal{O}\left(\frac{1}{\epsilon n}\right)
$$

 $|\mu - \tilde{\mu}| \leqslant 0 \left(\frac{1}{\gamma} \right)$ εn

Approximate Differential Privacy

Ingredients

- Input space X (with symmetric neighbouring relation \simeq)
- Output space Y (with sigma-algebra of measurable events)
- **Privacy parameters** $\varepsilon \ge 0$, $\delta \in [0, 1]$

Approximate Differential Privacy

A randomized mechanism $\mathcal{M} : X \to Y$ is (ε, δ) -differentially private if for all neighbouring inputs $x\simeq x'$ and for all sets of outputs $E\subseteq Y$ we have

- $\rightarrow \delta$ accounts for "bad events" that might result in high privacy losses
- ► Mechanism $\mathcal{M}(x_1, ..., x_n) = x_{\text{Unif}([n])}$ is $(0, 1/n)$ -DP $(⇒$ should take $δ ≪ 1/n)$

Approximate Differential Privacy

Ingredients

- Input space X (with symmetric neighbouring relation \simeq)
- Output space Y (with sigma-algebra of measurable events)
- **Privacy parameters** $\varepsilon \ge 0$, $\delta \in [0, 1]$

Approximate Differential Privacy

A randomized mechanism $\mathcal{M} : X \to Y$ is (ε, δ) -differentially private if for all neighbouring inputs $x\simeq x'$ and for all sets of outputs $E\subseteq Y$ we have

- $\rightarrow \delta$ accounts for "bad events" that might result in high privacy losses
- ► Mechanism $\mathcal{M}(x_1, ..., x_n) = x_{\text{Unif}([n])}$ is $(0, 1/n)$ -DP $(⇒$ should take $δ ≪ 1/n)$

Approximate Differential Privacy

Ingredients

- Input space X (with symmetric neighbouring relation \simeq)
- Output space Y (with sigma-algebra of measurable events)
- Privacy parameters $\varepsilon \geqslant 0$, $\delta \in [0, 1]$

Approximate Differential Privacy

A randomized mechanism $\mathcal{M} : X \to Y$ is (ε, δ) -differentially private if for all neighbouring inputs $x\simeq x'$ and for all sets of outputs $E\subseteq Y$ we have

 $\mathbb{P}[\mathcal{M}(x) \in E] \leq e^{\varepsilon} \mathbb{P}[\mathcal{M}(x') \in E] + \delta$

Interpretation

- $\rightarrow \delta$ accounts for "bad events" that might result in high privacy losses
- ► Mechanism $\mathcal{M}(x_1, \ldots, x_n) = x_{\text{Unif}([n])}$ is $(0, 1/n)$ -DP $(\Rightarrow$ should take δ « $1/n)$

Output Perturbation Mechanisms

The Laplace mechanism is an example of a more general class of mechanisms

Global Sensitivity: for any function $f: X \to \mathbb{R}^d$ define $\Delta_p = \sup_{x \simeq x'} \|f(x) - f(x')\|_p$

- A curator holds one vector $x_i \in \mathbb{R}^d$ for each of *n* individuals
- \triangleright The curator computes a function $f(x_1, \ldots, x_n)$ of the data,
- \blacktriangleright samples noise $Z \sim \text{Lap}(\frac{\Delta_1}{\varepsilon})^d$ or $Z \sim \mathcal{N}(0, \sigma^2)^d$ with $\sigma = \frac{\Delta_2 \sqrt{C \log(1/\delta)}}{\varepsilon}$ $\frac{\log(1/\sigma)}{\epsilon}$, and
- Figure reveals the noisy value $f(x_1, \ldots, x_n) + Z$
- Eet's denote the mechanisms $\mathcal{M}_{f,lan}$ and $\mathcal{M}_{f,N}$ respectively
- ► Note the mechanism of the previous slide is $\mathcal{M}_{f,\text{Lap}}$ for $f(x_1, \ldots, x_n) = \frac{1}{n}$ \sum n $\prod_{i=1}^n X_i$

Claim: $\mathcal{M}_{f,lan}$ is ε -DP and $\mathcal{M}_{f,N}$ is (ε, δ) -DP

Output Perturbation Mechanisms

The Laplace mechanism is an example of a more general class of mechanisms

Global Sensitivity: for any function $f: X \to \mathbb{R}^d$ define $\Delta_p = \sup_{x \simeq x'} \|f(x) - f(x')\|_p$

Output Perturbation (with Laplace and Gaussian noise)

- ▶ A curator holds one vector $x_i \in \mathbb{R}^d$ for each of *n* individuals
- ▶ The curator computes a function $f(x_1, \ldots, x_n)$ of the data,
- ► samples noise $Z \sim \text{Lap}(\frac{\Delta_1}{\epsilon})^d$ or $Z \sim \mathcal{N}(0, \sigma^2)^d$ with $\sigma = \frac{\Delta_2 \sqrt{C \log(1/\delta)}}{\epsilon}$ $\frac{\log(1/\sigma)}{\varepsilon}$, and
- Figure reveals the noisy value $f(x_1, \ldots, x_n) + Z$
- Eet's denote the mechanisms $\mathcal{M}_{f, \text{Lap}}$ and $\mathcal{M}_{f, N}$ respectively
- ▶ Note the mechanism of the previous slide is $\mathcal{M}_{f,\text{Lap}}$ for $f(x_1, \ldots, x_n) = \frac{1}{n}$ $\sum_{n=1}^{\infty}$ $\prod_{i=1}^n x_i$

Output Perturbation Mechanisms

The Laplace mechanism is an example of a more general class of mechanisms

Global Sensitivity: for any function $f: X \to \mathbb{R}^d$ define $\Delta_p = \sup_{x \simeq x'} \|f(x) - f(x')\|_p$

Output Perturbation (with Laplace and Gaussian noise)

- ▶ A curator holds one vector $x_i \in \mathbb{R}^d$ for each of *n* individuals
- ▶ The curator computes a function $f(x_1, \ldots, x_n)$ of the data,
- ► samples noise $Z \sim \text{Lap}(\frac{\Delta_1}{\epsilon})^d$ or $Z \sim \mathcal{N}(0, \sigma^2)^d$ with $\sigma = \frac{\Delta_2 \sqrt{C \log(1/\delta)}}{\epsilon}$ $\frac{\log(1/\sigma)}{\varepsilon}$, and
- Figure reveals the noisy value $f(x_1, \ldots, x_n) + Z$
- Eet's denote the mechanisms $\mathcal{M}_{f, \text{Lap}}$ and $\mathcal{M}_{f, N}$ respectively
- ▶ Note the mechanism of the previous slide is $\mathcal{M}_{f,\text{Lap}}$ for $f(x_1, \ldots, x_n) = \frac{1}{n}$ $\sum_{n=1}^{\infty}$ $\prod_{i=1}^n x_i$

Claim: $\mathcal{M}_{f\, \text{Lap}}$ is ε -DP and $\mathcal{M}_{f, \mathcal{N}}$ is (ε, δ) -DP

- Example Robustness to post-processing: M is (ε, δ) -DP, then $F \circ M$ is (ε, δ) -DP
- ► Composition: if M_j , $j = 1, ..., k$, are $(\varepsilon_j, \delta_j)$ -DP, then $\vec{x} \mapsto (M_1(\vec{x}), ..., M_k(\vec{x}))$ is $(\sum_j \varepsilon_j, \sum_j \delta_j)$ -DP. In the homogeneous case this yields $(\kappa\varepsilon, k\delta)$ -DP
- \blacktriangleright Advanced composition: if M_j , $j = 1, ..., k$, are (ε, δ) -DP, then $\vec{x} \mapsto (M_1(\vec{x}), ..., M_k(\vec{x}))$ is $(\varepsilon \sqrt{k \log(1/\delta^\prime)} + \varepsilon (\mathrm{e}^\varepsilon - 1) k, k \delta + \delta^\prime)$ -DP for any $\delta^\prime > 0$
- ► Group privacy: if M is (ε, δ) -DP with respect to $x \simeq x'$, then M is $(t\varepsilon, t e^{t\varepsilon} \delta)$ with respect to $x \simeq^t x'$ (ie. t changes)
- ▶ Protects against side knowledge: if attacker has prior $P_{prior}^{x_i}$ and computes $P_{posterior}^{x_i}$ after observing $\mathcal{M}(\vec{x})$ from ε -DP mechanism, then dist $(P_{prior}^{x_i}, P_{posterior}^{x_i}) = \mathcal{O}(\varepsilon)$

- Example Robustness to post-processing: M is (ε, δ) -DP, then $F \circ M$ is (ε, δ) -DP
- ► Composition: if \mathcal{M}_j , $j = 1, ..., k$, are $(\varepsilon_j, \delta_j)$ -DP, then $\vec{x} \mapsto (\mathcal{M}_1(\vec{x}), ..., \mathcal{M}_k(\vec{x}))$ is $(\sum_j \varepsilon_j, \sum_j \delta_j)$ -DP. In the homogeneous case this yields $(k\varepsilon, k\delta)$ -DP
- \blacktriangleright Advanced composition: if M_j , $j = 1, ..., k$, are (ε, δ) -DP, then $\vec{x} \mapsto (M_1(\vec{x}), ..., M_k(\vec{x}))$ is $(\varepsilon \sqrt{k \log(1/\delta^\prime)} + \varepsilon (\mathrm{e}^\varepsilon - 1) k, k \delta + \delta^\prime)$ -DP for any $\delta^\prime > 0$
- ► Group privacy: if M is (ε, δ) -DP with respect to $x \simeq x'$, then M is $(t\varepsilon, t e^{t\varepsilon} \delta)$ with respect to $x \simeq^t x'$ (ie. t changes)
- ▶ Protects against side knowledge: if attacker has prior $P_{prior}^{x_i}$ and computes $P_{posterior}^{x_i}$ after observing $\mathcal{M}(\vec{x})$ from ε -DP mechanism, then dist $(P_{prior}^{x_i}, P_{posterior}^{x_i}) = \mathcal{O}(\varepsilon)$

- Example Robustness to post-processing: M is (ε, δ) -DP, then $F \circ M$ is (ε, δ) -DP
- ► Composition: if \mathcal{M}_j , $j = 1, ..., k$, are $(\varepsilon_j, \delta_j)$ -DP, then $\vec{x} \mapsto (\mathcal{M}_1(\vec{x}), ..., \mathcal{M}_k(\vec{x}))$ is $(\sum_j \varepsilon_j, \sum_j \delta_j)$ -DP. In the homogeneous case this yields $(k\varepsilon, k\delta)$ -DP
- Advanced composition: if M_j , $j = 1, ..., k$, are (ε, δ) -DP, then $\vec{x} \mapsto (M_1(\vec{x}), ..., M_k(\vec{x}))$ is $(\varepsilon \sqrt{k \log(1/\delta^\prime)} + \varepsilon (e^\varepsilon-1) k, k\delta + \delta^\prime)$ -DP for any $\delta^\prime > 0$
- ► Group privacy: if M is (ε, δ) -DP with respect to $x \simeq x'$, then M is $(t\varepsilon, t e^{t\varepsilon} \delta)$ with respect to $x \simeq^t x'$ (ie. t changes)
- ▶ Protects against side knowledge: if attacker has prior $P_{prior}^{x_i}$ and computes $P_{posterior}^{x_i}$ after observing $\mathcal{M}(\vec{x})$ from ε -DP mechanism, then dist $(P_{prior}^{x_i}, P_{posterior}^{x_i}) = \mathcal{O}(\varepsilon)$

- Robustness to post-processing: M is (ε, δ) -DP, then $F \circ M$ is (ε, δ) -DP
- ► Composition: if \mathcal{M}_j , $j = 1, ..., k$, are $(\varepsilon_j, \delta_j)$ -DP, then $\vec{x} \mapsto (\mathcal{M}_1(\vec{x}), ..., \mathcal{M}_k(\vec{x}))$ is $(\sum_j \varepsilon_j, \sum_j \delta_j)$ -DP. In the homogeneous case this yields $(k\varepsilon, k\delta)$ -DP
- Advanced composition: if M_j , $j = 1, ..., k$, are (ε, δ) -DP, then $\vec{x} \mapsto (M_1(\vec{x}), ..., M_k(\vec{x}))$ is $(\varepsilon \sqrt{k \log(1/\delta^\prime)} + \varepsilon (e^\varepsilon-1) k, k\delta + \delta^\prime)$ -DP for any $\delta^\prime > 0$
- ► Group privacy: if M is (ε, δ) -DP with respect to $x \simeq x'$, then M is $(t\varepsilon, t e^{t\varepsilon} \delta)$ with respect to $x \simeq^t x'$ (ie. t changes)
- ▶ Protects against side knowledge: if attacker has prior $P_{prior}^{x_i}$ and computes $P_{posterior}^{x_i}$ after observing $\mathcal{M}(\vec{x})$ from ε -DP mechanism, then dist $(P_{prior}^{x_i}, P_{posterior}^{x_i}) = \mathcal{O}(\varepsilon)$

- Robustness to post-processing: M is (ε, δ) -DP, then $F \circ M$ is (ε, δ) -DP
- ► Composition: if \mathcal{M}_j , $j = 1, ..., k$, are $(\varepsilon_j, \delta_j)$ -DP, then $\vec{x} \mapsto (\mathcal{M}_1(\vec{x}), ..., \mathcal{M}_k(\vec{x}))$ is $(\sum_j \varepsilon_j, \sum_j \delta_j)$ -DP. In the homogeneous case this yields $(k\varepsilon, k\delta)$ -DP
- Advanced composition: if M_j , $j = 1, ..., k$, are (ε, δ) -DP, then $\vec{x} \mapsto (M_1(\vec{x}), ..., M_k(\vec{x}))$ is $(\varepsilon \sqrt{k \log(1/\delta^\prime)} + \varepsilon (e^\varepsilon-1) k, k\delta + \delta^\prime)$ -DP for any $\delta^\prime > 0$
- ► Group privacy: if M is (ε, δ) -DP with respect to $x \simeq x'$, then M is $(t\varepsilon, t e^{t\varepsilon} \delta)$ with respect to $x \simeq^t x'$ (ie. t changes)
- ▶ Protects against side knowledge: if attacker has prior $P_{prior}^{x_i}$ and computes $P_{posterior}^{x_i}$ after observing $\mathcal{M}(\vec{x})$ from ε -DP mechanism, then dist $(P_{prior}^{x_i}, P_{posterior}^{x_i}) = \mathcal{O}(\varepsilon)$

The Exponential Mechanism

The Laplace and Gaussian mechanisms are examples of a more general class of mechanisms

$$
p_{\mathcal{M}_{f,\text{Lap}}(\mathsf{x})}(y) \varpropto \exp\left(\frac{-\varepsilon\|y - f(\mathsf{x})\|_1}{\Delta_1}\right) \qquad p_{\mathcal{M}_{f,\mathcal{N}}(\mathsf{x})}(y) \varpropto \exp\left(\frac{-\varepsilon^2\|y - f(\mathsf{x})\|_2^2}{C\Delta_2^2\log(1/\delta)}\right)
$$

Exponential Mechanism

- \blacktriangleright Prior distribution over outputs with density π
- ► Scoring function $q: X \times Y \to \mathbb{R}_{\geq 0}$ provides scores for each output y w.r.t. input x
- \triangleright The exponential mechanism $\mathcal{M}_{\pi,q}(x)$ outputs a sample from the distribution with density

The Exponential Mechanism

The Laplace and Gaussian mechanisms are examples of a more general class of mechanisms

Densities of output perturbation mechanisms

$$
p_{\mathcal{M}_{f,\text{Lap}}(x)}(y) \propto \exp\left(\frac{-\varepsilon \|y - f(x)\|_1}{\Delta_1}\right) \qquad p_{\mathcal{M}_{f,\mathcal{N}}(x)}(y) \propto \exp\left(\frac{-\varepsilon^2 \|y - f(x)\|_2^2}{C\Delta_2^2 \log(1/\delta)}\right)
$$

Exponential Mechanism

- \blacktriangleright Prior distribution over outputs with density π
- ► Scoring function $q: X \times Y \to \mathbb{R}_{\geq 0}$ provides scores for each output y w.r.t. input x
- \triangleright The exponential mechanism $\mathcal{M}_{\pi,q}(x)$ outputs a sample from the distribution with density

The Exponential Mechanism

The Laplace and Gaussian mechanisms are examples of a more general class of mechanisms

Densities of output perturbation mechanisms

$$
p_{\mathcal{M}_{f,\text{Lap}}(x)}(y) \propto \exp\left(\frac{-\varepsilon \|y - f(x)\|_1}{\Delta_1}\right) \qquad p_{\mathcal{M}_{f,\mathcal{N}}(x)}(y) \propto \exp\left(\frac{-\varepsilon^2 \|y - f(x)\|_2^2}{C\Delta_2^2 \log(1/\delta)}\right)
$$

Exponential Mechanism

- **•** Prior distribution over outputs with density π
- ► Scoring function $q: X \times Y \to \mathbb{R}_{\geq 0}$ provides scores for each output y w.r.t. input x
- **•** The exponential mechanism $\mathcal{M}_{\pi,q}(x)$ outputs a sample from the distribution with density

 $p_{\pi,q}(y) \propto \pi(y) \exp(-\beta q(x, y))$

Calibrating The Exponential Mechanism

Properties of the Scoring Function

- ► Sensitivity: $\sup_{x \simeq x'} \sup_y |q(x,y) q(x',y)| \leq \Delta$
- ▶ Lipschitz: $\sup_{x \simeq x'} |(q(x, y) q(x', y)) (q(x, y') q(x', y'))| \leq l ||y y'||$

Properties of the Prior

► Strong log-concavity: $\pi(y) = e^{-W(y)}$ for some κ-strongly convex W

Privacy Guarantees for the Exponential Mechanism

Differentially Private Empirical Risk Minimization

Setup: A curator has features and labels $\vec{z} = ((x_1, y_1), \ldots, (x_n, y_n))$ about n individuals and wants to train a model by minimizing over $\theta \in \Theta$

$$
L(\vec{z},\theta) = \frac{1}{n}\sum_{i=1}^{n} \ell(x_i,y_i,\theta) + \frac{R(\theta)}{n}
$$

Examples: logistic regression, SVM, linear regression, DNN, etc.

Private ERM Algorithms

- Output Perturbation: add some noise Z to $\hat{\theta} = \arg\min_{\theta \in \Theta} L(\vec{z}, \theta)$
- ▶ Objective Perturbation: reveal the optimum of $L(\vec{z}, \theta) + \langle \theta, Z \rangle$ for some noise Z
- **•** Gradient Perturbation: optimize $L(\vec{z}, \theta)$ using mini-batch SGD with noisy gradients

Differentially Private Empirical Risk Minimization

Let $\mathcal{M}: X \to Y$ be a randomized mechanism with density function $p_{\mathcal{M}(x)}(y)$

$$
\mathcal{L}_{\mathcal{M}, \times, \times'}(y) = \log \left(\frac{p_{\mathcal{M}(\mathsf{x})}(y)}{p_{\mathcal{M}(\mathsf{x}')}(y)} \right)
$$

 $L_{\mathcal{M},x,x'}=\mathcal{L}_{\mathcal{M},x,x'}(\mathcal{M}(x))$

A mechanism $\mathcal{M}: X \to Y$ is (ε, δ) -DP if for any $x \simeq x'$ we have $\mathbb{P}[L_{\mathcal{M},x,x'} \geqslant \varepsilon] \leqslant \delta$

Let $\mathcal{M}: X \to Y$ be a randomized mechanism with density function $p_{\mathcal{M}(x)}(y)$

Privacy Loss (function)

$$
\mathcal{L}_{\mathcal{M},x,x'}(y) = \log \left(\frac{p_{\mathcal{M}(x)}(y)}{p_{\mathcal{M}(x')}(y)} \right)
$$

 $L_{\mathcal{M},x,x'}=\mathcal{L}_{\mathcal{M},x,x'}(\mathcal{M}(x))$

A mechanism $\mathcal{M}: X \to Y$ is (ε, δ) -DP if for any $x \simeq x'$ we have $\mathbb{P}[L_{\mathcal{M},x,x'} \geqslant \varepsilon] \leqslant \delta$

Let $\mathcal{M}: X \to Y$ be a randomized mechanism with density function $p_{\mathcal{M}(x)}(y)$

Privacy Loss (function)

$$
\mathcal{L}_{\mathcal{M},x,x'}(y) = \log \left(\frac{p_{\mathcal{M}(x)}(y)}{p_{\mathcal{M}(x')}(y)} \right)
$$

Privacy Loss (random variable)

 $L_{\mathcal{M},x,x'}=\mathcal{L}_{\mathcal{M},x,x'}(\mathcal{M}(x))$

A mechanism $\mathcal{M}: X \to Y$ is (ε, δ) -DP if for any $x \simeq x'$ we have $\mathbb{P}[L_{\mathcal{M},x,x'} \geqslant \varepsilon] \leqslant \delta$

Let $\mathcal{M}: X \to Y$ be a randomized mechanism with density function $p_{\mathcal{M}(x)}(y)$

Privacy Loss (function)

$$
\mathcal{L}_{\mathcal{M},x,x'}(y) = \log \left(\frac{p_{\mathcal{M}(x)}(y)}{p_{\mathcal{M}(x')}(y)} \right)
$$

Privacy Loss (random variable)

$$
L_{\mathcal{M},x,x'}=\mathcal{L}_{\mathcal{M},x,x'}(\mathcal{M}(x))
$$

Lemma (Sufficient Condition) A mechanism $\mathcal{M}: X \to Y$ is (ε, δ) -DP if for any $x \simeq x'$ we have $\mathbb{P}[L_{\mathcal{M},x,x'} \geqslant \varepsilon] \leqslant \delta$

1. Setup: $\mathcal{M}(x) = f(x) + Z$ with $Z \sim \mathcal{N}(0, \sigma^2 I)$ with $\sigma = \frac{\Delta_2}{\epsilon}$ a $C \log(1/\delta)$ (for $\varepsilon \le 1$)

2. Compute the distribution of the privacy loss random variable:

$$
\mathcal{L}_{\mathcal{M},x,x'}(y) = \frac{\|y - f(x')\|_2^2 - \|y - f(x)\|_2^2}{2\sigma^2} = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} + \frac{\langle y - f(x), f(x) - f(x')\rangle}{\sigma^2}
$$

$$
L_{\mathcal{M},x,x'} = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} + \frac{\langle Z, f(x) - f(x')\rangle}{\sigma^2} \sim \mathcal{N}\left(\frac{\|f(x) - f(x')\|_2^2}{2\sigma^2}, \frac{\|f(x) - f(x')\|_2^2}{\sigma^2}\right)
$$

3. Use a concentration bound for Gaussian random variables. With probability $\geqslant 1 - \delta$:

4. Assuming
$$
\varepsilon \leq 1
$$
, a bit of algebra shows $\mathbb{P}[L_{\mathcal{M},x,x'} \geq \varepsilon] \leq \delta$ if:
$$
\eta \leq \left(\sqrt{\varepsilon + C_1 \log(1/\delta)} - \sqrt{C_1 \log(1/\delta)}\right)^2 \leq \frac{\varepsilon^2}{C_2 \log(1/\delta)}
$$

1. Setup: $\mathcal{M}(x) = f(x) + Z$ with $Z \sim \mathcal{N}(0, \sigma^2 I)$ with $\sigma = \frac{\Delta_2}{\epsilon_1}$ a $C \log(1/\delta)$ (for $\varepsilon \le 1$) 2. Compute the distribution of the privacy loss random variable:

$$
\mathcal{L}_{\mathcal{M},x,x'}(y) = \frac{\|y - f(x')\|_2^2 - \|y - f(x)\|_2^2}{2\sigma^2} = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} + \frac{\langle y - f(x), f(x) - f(x')\rangle}{\sigma^2}
$$

$$
L_{\mathcal{M},x,x'} = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} + \frac{\langle Z, f(x) - f(x')\rangle}{\sigma^2} \sim \mathcal{N}\left(\frac{\|f(x) - f(x')\|_2^2}{2\sigma^2}, \frac{\|f(x) - f(x')\|_2^2}{\sigma^2}\right)
$$

3. Use a concentration bound for Gaussian random variables. With probability $\geqslant 1 - \delta$:

4. Assuming $\epsilon \leqslant 1$, a bit of algebra shows $\mathbb{P}[L_{\mathcal{M},x,x'}\geqslant \epsilon] \leqslant \delta$ if: C_2 log $(1/\delta)$

$$
1 - \frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1}{2} \right) \right) \right) \right) - \frac{1}{2} \left(\frac{1
$$

1. Setup: $\mathcal{M}(x) = f(x) + Z$ with $Z \sim \mathcal{N}(0, \sigma^2 I)$ with $\sigma = \frac{\Delta_2}{\epsilon_1}$ a $C \log(1/\delta)$ (for $\varepsilon \le 1$) 2. Compute the distribution of the privacy loss random variable:

$$
\mathcal{L}_{\mathcal{M},x,x'}(y) = \frac{\|y - f(x')\|_2^2 - \|y - f(x)\|_2^2}{2\sigma^2} = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} + \frac{\langle y - f(x), f(x) - f(x')\rangle}{\sigma^2}
$$

$$
L_{\mathcal{M},x,x'} = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} + \frac{\langle Z, f(x) - f(x')\rangle}{\sigma^2} \sim \mathcal{N}\left(\frac{\|f(x) - f(x')\|_2^2}{2\sigma^2}, \frac{\|f(x) - f(x')\|_2^2}{\sigma^2}\right)
$$

3. Use a concentration bound for Gaussian random variables. With probability $\geqslant 1 - \delta$:

4. Assuming $\epsilon \leqslant 1$, a bit of algebra shows $\mathbb{P}[L_{\mathcal{M},x,x'}\geqslant \epsilon] \leqslant \delta$ if: C_2 log $(1/\delta)$

$$
0 \leq x \leq \frac{1}{2} \leq \
$$

1. Setup: $\mathcal{M}(x) = f(x) + Z$ with $Z \sim \mathcal{N}(0, \sigma^2 I)$ with $\sigma = \frac{\Delta_2}{\epsilon_1}$ a $C \log(1/\delta)$ (for $\varepsilon \le 1$) 2. Compute the distribution of the privacy loss random variable: ˆ ˙

$$
L_{\mathcal{M},x,x'} \sim \mathcal{N}\left(\frac{\|f(x) - f(x')\|_2^2}{2\sigma^2}, \frac{\|f(x) - f(x')\|_2^2}{\sigma^2}\right) = \mathcal{N}(\eta, 2\eta)
$$

3. Use a concentration bound for Gaussian random variables. With probability $\geqslant 1 - \delta$:

4. Assuming $\epsilon \leqslant 1$, a bit of algebra shows $\mathbb{P}[L_{\mathcal{M},x,x'}\geqslant \epsilon]\leqslant \delta$ if:

$$
\eta = \frac{\|f(x) - f(x')\|_2^2}{2\sigma^2} = \frac{\epsilon^2 \|f(x) - f(x')\|_2^2}{2\Delta_2^2 C \log(1/\delta)} \leq \frac{\epsilon^2}{C_2 \log(1/\delta)}
$$

1. Setup: $\mathcal{M}(x) = f(x) + Z$ with $Z \sim \mathcal{N}(0, \sigma^2 I)$ with $\sigma = \frac{\Delta_2}{\epsilon_1}$ a $C \log(1/\delta)$ (for $\varepsilon \le 1$) 2. Compute the distribution of the privacy loss random variable: ˆ ˙

$$
L_{\mathcal{M},x,x'} \sim \mathcal{N}\left(\frac{\|f(x) - f(x')\|_2^2}{2\sigma^2}, \frac{\|f(x) - f(x')\|_2^2}{\sigma^2}\right) = \mathcal{N}(\eta, 2\eta)
$$

3. Use a concentration bound for Gaussian random variables. With probability $\geqslant 1 - \delta$: $\mathcal{N}(\eta, 2\eta) \leqslant \eta + \sqrt{\mathcal{C}_0\eta\log(1/\delta)} \leqslant \varepsilon$

4. Assuming $\epsilon \leqslant 1$, a bit of algebra shows $\mathbb{P}[L_{\mathcal{M},x,x'}\geqslant \epsilon]\leqslant \delta$ if:

$$
\eta = \frac{\|f(x)-f(x')\|_2^2}{2\sigma^2} = \frac{\varepsilon^2 \|f(x)-f(x')\|_2^2}{2\Delta_2^2 C \log(1/\delta)} \leqslant \frac{\varepsilon^2}{C_2 \log(1/\delta)}
$$

1. Setup: $\mathcal{M}(x) = f(x) + Z$ with $Z \sim \mathcal{N}(0, \sigma^2 I)$ with $\sigma = \frac{\Delta_2}{\epsilon_1}$ a $C \log(1/\delta)$ (for $\varepsilon \le 1$) 2. Compute the distribution of the privacy loss random variable: ˆ ˙

$$
L_{\mathcal{M},x,x'} \sim \mathcal{N}\left(\frac{\|f(x) - f(x')\|_2^2}{2\sigma^2}, \frac{\|f(x) - f(x')\|_2^2}{\sigma^2}\right) = \mathcal{N}(\eta, 2\eta)
$$

Differential Privacy Without a Trusted Curator

Issues with the Trusted Curator Assumption

- ▶ Single point of failure: a DP curator might have other security vulnerabilities
- \triangleright Conflicting incentives: valuable the data provides incentives for the curator to misbehave
- Requires agreement: a large number of individuals need to agree on who to trust

Randomized response: recall in $(y_1, \ldots, y_n) = RR_{\epsilon}(x_1, \ldots, x_n)$ each y_i depends only on x_i

Multi-Party and Local Differential Privacy

- ▶ Dataset x distributed among m parties, party *i* owns $\vec{x_i}$
- **•** Analyst initiates randomized protocol $\Pi: X \rightarrow Y$ that interacts with the parties
- \triangleright All the outputs produced by party i during $\Pi(x)$ determine a mechanism $\mathcal{M}_i(\vec{x}_i)$
- \blacktriangleright Π is multi-party (ε, δ) -DP if each \mathcal{M}_i is (ε, δ) -DP
- \blacktriangleright When each \vec{x} has size one we talk about *local DP*
- ► Utility loss: the difference between $\mathcal{O}(1/n)$ (Laplace) and $\mathcal{O}(1/\sqrt{n})$ (RR) is characteristical of local DP

Differential Privacy Without a Trusted Curator

- \triangleright All the outputs produced by party i during $\Pi(x)$ determine a mechanism $\mathcal{M}_i(\vec{x}_i)$
- \blacktriangleright Π is multi-party (ε, δ) -DP if each \mathcal{M}_i is (ε, δ) -DP
- \blacktriangleright When each \vec{x} has size one we talk about *local DP*
- ► Utility loss: the difference between $\mathcal{O}(1/n)$ (Laplace) and $\mathcal{O}(1/\sqrt{n})$ (RR) is characteristical of local DP

Differential Privacy Without a Trusted Curator

Issues with the Trusted Curator Assumption

- ▶ Single point of failure: a DP curator might have other security vulnerabilities
- \triangleright Conflicting incentives: valuable the data provides incentives for the curator to misbehave
- \triangleright Requires agreement: a large number of individuals need to agree on who to trust

Randomized response: recall in $(y_1, \ldots, y_n) = RR_{\varepsilon}(x_1, \ldots, x_n)$ each y_i depends only on x_i

Multi-Party and Local Differential Privacy

- ▶ Dataset x distributed among m parties, party *i* owns $\vec{x_i}$
- Analyst initiates randomized protocol $\Pi : X \rightarrow Y$ that interacts with the parties
- Equal the outputs produced by party i during $\Pi(x)$ determine a mechanism $\mathcal{M}_i(\vec{x}_i)$
- \blacktriangleright Π is multi-party (ε, δ) -DP if each \mathcal{M}_i is (ε, δ) -DP
- ▶ When each \vec{x} has size one we talk about local DP
- ► Utility loss: the difference between $\mathcal{O}(1/n)$ (Laplace) and $\mathcal{O}(1/\sqrt{n})$ (RR) is characteristic of local DP

Beyond This Tutorial...

Additional Results

- § More basic mechanisms: sparse vector technique and other selection mechanisms, private data structures
- \triangleright General theorems: everything is randomized response, lower bounds on utility, computational hardness, optimal mechanisms, connections to generalization
- \triangleright Database perspective: answering multiple queries on the same data, adaptive vs. non-adaptive queries
- \triangleright When global sensitivity is atypical: smoothed sensitivity, randomized DP
- § Other privacy definitions: location privacy, pan DP, pufferfish privacy

Suggested Readings

- § "The Complexity of Differential Privacy" [\[Vadhan, 2017\]](#page-72-3)

Some Open Research Directions

Bounds vs. Algorithms

- **Few privacy analysis are tight: randomized response, Laplace mechanism,** ε **-DP** exponential mechanism
- § Most complex mechanisms add too much noise (constants in bounds matter!)
- § Alternative: calibrate noise using "exact" numerical computations instead of bounds
- § Challenges: concentration bounds vs. exact densities, compositions, sub-sampling and other mixtures, approximate sampling

Correctness and Attacks

- \triangleright Given a mechanism, it is not possible to test empirically if it is DP
- § We can only resort to mathematical proofs to establish correctness (can be automated?)
- \triangleright But we should have sanity-check to tools to break DP of candidate implementations
- \triangleright Challenge: from pseudo-code to implementation things can go wrong (floating-point \preccurlyeq

Conclusion

- \triangleright Differential privacy provides a formal notion of privacy satisfying many desirable properties
	- § Precise quantification of the privacy-utility trade-off
	- \triangleright Robustness against powerful adversaries (eg. in the presence of side knowledge)
	- § Applicable to a wide range of data analysis problems
- § Mature research field with a rich toolbox of mechanism design strategies
- \triangleright Natural starting point for application-specific privacy guarantees
- ▶ Several real-world deployments and open source tools
	- § Google Chrome's RAPPOR
	- ▶ Apple's iOS 10
	- § U.S. Census Bureau
	- § GUPT, Microsoft's PINQ, Uber's FLEX
