

# Learning Automata with Hankel Matrices

**Borja Balle**

research cambridge  

*[Disclaimer: Work done before joining Amazon]*

# Brief History of Automata Learning

- [1967] Gold: Regular languages are learnable in the limit
- [1987] Angluin: Regular languages are learnable from queries
- [1993] Pitt & Warmuth: PAC-learning DFA is NP-hard
- [1994] Kearns & Valiant: Cryptographic hardness
- [90's, 00's] Clark, Denis, de la Higuera, Oncina, others: Combinatorial methods meet statistics and linear algebra
- [2009] Hsu-Kakade-Zhang & Bailly-Denis-Ralaivola: Spectral learning

# Talk Outline

- Exact Learning
  - Hankel Trick for Deterministic Automata
  - Angluin's  $L^*$  Algorithm
- PAC Learning
  - Hankel Trick for Weighted Automata
  - Spectral Learning Algorithm
- Statistical Learning
  - Hankel Matrix Completion

# The Hankel Matrix

$$H \in \mathbb{R}^{\Sigma^* \times \Sigma^*}$$

$$p \cdot s = p' \cdot s' \Rightarrow H(p, s) = H(p', s')$$

$$f : \Sigma^* \rightarrow \mathbb{R}$$

$$H_f(p, s) = f(p \cdot s)$$

# Closed and Consistent Finite Hankel Matrices

The DFA synthesis algorithm requires:

- Sets of prefixes  $P$  and suffixes  $S$
- Hankel block over  $P' = P \cup P\Sigma$  and  $S$
- **Closed:**  $\text{rows}(P\Sigma) \subseteq \text{rows}(P)$
- **Consistent:**  $\text{row}(p) = \text{row}(p') \Rightarrow \text{row}(p \cdot a) = \text{row}(p' \cdot a)$

# Learning from Membership and Equivalence Queries

- Setup:
  - Two players, **Teacher** and **Learner**
  - Concept class **C** of function from **X** to **Y** (known to **Teacher** and **Learner**)
- Protocol:
  - **Teacher** secretly chooses concept **c** from **C**
  - **Learner**'s goal is to discover the secret concept **c**
  - **Teacher** answers two types of queries asked by **Learner**
    - **Membership queries**: what is the value of  $c(x)$  for some  $x$  picked by the **Learner**?
    - **Equivalence queries**: is **c** equal to hypothesis **h** from **C** picked by the **Learner**?
      - If not, return counter-example  $x$  where  $h(x)$  and  $c(x)$  differ

# Angluin's L\* Algorithm

- 1) Initialize  $P = \{\epsilon\}$  and  $S = \{\epsilon\}$
- 2) Maintain the Hankel block  $H$  for  $P' = P \cup P\Sigma$  and  $S$  using *membership queries*
- 3) Repeat:
  - While  $H$  is not closed and consistent:
    - If  $H$  is not consistent add a distinguishing suffix to  $S$
    - If  $H$  is not closed add a new prefix from  $P\Sigma$  to  $P$
  - Construct a DFA  $A$  from  $H$  and ask an *equivalence query*
    - If *yes*, terminate
    - Otherwise, add all prefixes of counter-example  $x$  to  $P$

Complexity

$O(n)$  EQs and  $O(|\Sigma| n^2 L)$  MQs

# Weighted Finite Automata (WFA)

## Graphical Representation

## Algebraic Representation

$$A = \langle \alpha, \beta, \{A_a\}_{a \in \Sigma} \rangle$$

$$\alpha = \begin{bmatrix} -1 \\ 0.5 \end{bmatrix} \quad A_a = \begin{bmatrix} 1.2 & -1 \\ -2 & 3.2 \end{bmatrix}$$

$$\beta = \begin{bmatrix} 1.2 \\ 0 \end{bmatrix} \quad A_b = \begin{bmatrix} 2 & -2 \\ 0 & 5 \end{bmatrix}$$

## Functional Representation

$$A(x_1 \cdots x_t) = \alpha^\top A_{x_1} \cdots A_{x_t} \beta$$

# Hankel Matrices and WFA

**Theorem (Fliess '74)**

The rank of a *real* Hankel matrix  $H$  equals the minimal number of states of a WFA recognizing the weighted language of  $H$

$$A(p_1 \cdots p_t s_1 \cdots s_{t'}) = \alpha^\top A_{p_1} \cdots A_{p_t} A_{s_1} \cdots A_{s_{t'}} \beta$$

$$\begin{array}{c}
 p \\
 \left[ \begin{array}{cccc}
 \cdot & \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot & \cdot \\
 \cdot & \cdot & A(ps) & \cdot \\
 \cdot & \cdot & \cdot & \cdot
 \end{array} \right]
 \end{array}
 =
 \begin{array}{c}
 s \\
 \left[ \begin{array}{ccc}
 \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot
 \end{array} \right]
 \left[ \begin{array}{ccccc}
 \cdot & \cdot & \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot & \cdot & \cdot \\
 \cdot & \cdot & \cdot & \cdot & \cdot
 \end{array} \right]
 \end{array}$$

# From Hankel Matrices to WFA

$$H_a(p, s) = A(pas)$$

$$A(p_1 \cdots p_t a s_1 \cdots s_{t'}) = \alpha^\top A_{p_1} \cdots A_{p_t} A_a A_{s_1} \cdots A_{s_{t'}} \beta$$

$$\begin{array}{c}
 \begin{matrix} & & s & & \\ & & \cdot & & \\ & & \cdot & & \\ & & \cdot & & \\ & & \cdot & & \\ p & \left[ \begin{array}{cccc} \cdot & \cdot & A(pas) & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \end{array} \right] & = & \left[ \begin{array}{ccc} \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \end{array} \right] & \left[ \begin{array}{ccc} \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot \end{array} \right] & \left[ \begin{array}{cccc} \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \end{array} \right]
 \end{matrix}
 \end{array}$$

$$H = P S$$

$$H_a = P A_a S$$

$$A_a = P^+ H_a S^+$$

# WFA Reconstruction via Singular Value Decomposition

Input: Hankel  $H'$  over  $P' = P \cup P\Sigma$  and  $S$ , number of states  $n$

- 1) Extract from  $H'$  the matrix  $H$  over  $P$  and  $S$
- 2) Compute the rank  $n$  SVD  $H = U D V^T$
- 3) For each symbol  $a$ :
  - Extract from  $H'$  the matrix  $H_a$  over  $P$  and  $S$
  - Compute  $A_a = D^{-1}U^T H_a V$

Robustness Property  $\|H' - \hat{H}'\| \leq \varepsilon \Rightarrow \|A_a - \hat{A}_a\| \leq O(\varepsilon)$

# Probably Approximately Correct (PAC) Learning

- Fix a class  $\mathcal{D}$  of distributions over  $X$
- Collect  $m$  i.i.d. samples  $Z = (x_1, \dots, x_m)$  from some unknown distribution  $d$  from  $\mathcal{D}$
- An algorithm that receives  $Z$  and outputs a hypothesis  $h$  is a PAC-learner for the class  $\mathcal{D}$  if:
  - Whenever  $m > \text{poly}(|\mathcal{D}|, 1/\epsilon, \log 1/\delta)$ , with probability at least  $1 - \delta$  the hypothesis satisfies  $\text{distance}(d, h) < \epsilon$
- The algorithm is an *efficient* PAC-learner if it runs in poly-time

# Estimating Hankel Matrices from Samples

## Sample

$\left\{ \begin{array}{l} aa, b, bab \text{ (a)}, \\ bbab, abb, babba, abbb, \\ ab, \text{ (a)}, aabba, baa, \\ abbab, baba, bb \text{ (a)} \end{array} \right\}$

## Concentration Bound

$$\|H - \hat{H}\| \leq O\left(\frac{1}{\sqrt{m}}\right)$$

## Empirical Hankel Matrix

	$\epsilon$	$a$	$b$	$aa$	$ab$	...
$\epsilon$	$\frac{0}{16}$	$\frac{3}{16}$	$\frac{1}{16}$	$\frac{1}{16}$	$\frac{1}{16}$	
$a$	$\frac{3}{16}$	$\frac{1}{16}$	$\frac{1}{16}$	$\frac{0}{16}$	$\frac{0}{16}$	
$b$	$\frac{1}{16}$	$\frac{0}{16}$	$\frac{1}{16}$	$\frac{1}{16}$	$\frac{1}{16}$	
$aa$	$\frac{1}{16}$	$\frac{0}{16}$	$\frac{0}{16}$	$\frac{0}{16}$	$\frac{0}{16}$	
$ab$	$\frac{1}{16}$	$\frac{0}{16}$	$\frac{1}{16}$	$\frac{0}{16}$	$\frac{0}{16}$	
$\vdots$						

# Spectral PAC Learning of Stochastic WFA

- Algorithm:
  1. Estimate empirical Hankel matrix
  2. Use spectral WFA reconstruction
- Efficient PAC-learning:
  - Running time: linear in  $m$ , polynomial in  $n$  and size of Hankel matrix
  - Accuracy measure:  $L_1$  distance on all strings of length at most  $L$
  - Sample complexity:  $L^2 |\Sigma| n^{1/2} / \sigma^2 \epsilon^2$
  - Proof: robustness + concentration + telescopic  $L_1$  bound

*Bailly, R., Denis, F., & Ralaivola, L. (2009). Grammatical inference as a principal component analysis problem.*

*Hsu, D., Kakade, S. M., & Zhang, T. (2009). A spectral algorithm for learning hidden markov models.*

# Statistical Learning in the Non-realizable Setting

- Fix an unknown distribution  $d$  over  $X \times Y$  (inputs, outputs)
- Collect  $m$  i.i.d. samples  $Z = ((x_1, y_1), \dots, (x_m, y_m))$  from  $d$
- Fix a hypothesis class  $F$  of functions from  $X$  to  $Y$
- Find a hypothesis  $h$  from  $F$  that has good accuracy on  $Z$

Empirical Risk  
Minimization

$$\min_{h \in F} \frac{1}{m} \sum_{i=1}^m \ell(h(x_i), y_i)$$

- In such a way that it has good accuracy on future  $(x, y)$  from  $d$

$$\mathbb{E}_{(x, y) \sim d} [\ell(h(x), y)] \leq \frac{1}{m} \sum_{i=1}^m \ell(h(x_i), y_i) + \text{complexity}(Z, F)$$

# Learning WFA via Hankel Matrix Completion

$$\left\{ \begin{array}{ll} (bab,1) & (bbb,0) \\ (aaa,3) & (a,1) \\ (ab,1) & (aa,2) \\ (aba,2) & (bb,0) \end{array} \right\}$$

	$\epsilon$	$a$	$b$
$a$	1	2	1
$b$	?	?	0
$aa$	2	3	?
$ab$	1	2	?
$ba$	?	?	1
$bb$	0	?	0

# Generalization Bounds for Learning WFA

- The generalization power of WFA can be controlled by:
  - Bounding the norm of the weights
  - Bounding the norm of the language (in a Banach space)
  - Bounding the norm of the Hankel matrix

$$\mathbb{E}_{(x,y) \sim d}[\ell(A(x), y)] \leq \frac{1}{m} \sum_{i=1}^m \ell(A(x_i), y_i) + \tilde{O} \left( \frac{\|H_A\|_{\star}}{m} + \frac{1}{\sqrt{m}} \right)$$
