1b. List the Pros and Cons of using TCP versus UDP as the transport protocol in a distributed system. Would it be smarter to make your own transport protocol? Justify your response. (10 pts)

2a. What is the main difference between HTTP and HTTPS?	
2b. Can a web server use both HTTP and HTTPS? Explain your reasoning.	(5 pts)

- 3. In this question, we're going to use the telnet program at the command line to manually make a HTTP request. It should be available on most modern machines, as well as all of the CCIS Linux machines. If you're not familiar with telnet, read the Linux manual page before beginning this question.
- **3a.** Using telnet, connect to the machine toastytech.com on the HTTP port. Issue a HTTP v1.0 request for the file "/evil/", providing no request headers. What is the response code, and what is the server telling you to do? Why might this be the case? (10 pts)

3b. The previous request did not work out the way we expected. Now, make a HTTP v1.1 request for "/evil/" to the same site. What response code do you get now? How much content does the server give you (approximately)? (*Hint: There is one important header you need to be sure to include*) (10 pts)

- 4. Many services "crawl" the web in order to provide useful services; the most common example of this is web search engines like Google. However, the operators of websites often wish to express what parts of their website should and should not be crawled. We're going to explore this functionality in this question.
- **4a.** The robots.txt file is one way this can be accomplished. What is the format of this file, and where should it be placed on your website so that Google et al. can find it? (10 pts)

4b. Locate the robots.txt file for github.com. Give two examples of pages on Github's website that Google would be allowed to index, and two examples that Google would not be allowed to index.

(10 pts)

5a. Wl	nat is the User-Agent HTTP header? How is it used by web servers? (5 pt	ts)
rui Go	ppose that we built a custom web browser, and desired to only allow users who we nning this particular web browser to visit our site (i.e., we did not want to allow users on ogle Chrome to access it for security reasons). Would the User-Agent header be a good y of accomplishing this goal? Why or why not?	on od
cu: an	call that the HTTP Referer header tells the server which web page "referred" it to the rent request. However, this header field has raised a number of privacy concerns. Givexample of privacy issues on sites like Facebook or Twitter that is caused by the Reference.	ve er
_, _,		
oa. If	you were an operator of a site like Facebook, how might you ensure that the users wh	10

click on links to external sites from your site are not subject to these privacy issues? (5 pts)

6.	For the next set of questions, you'll be using the developer tools in your browser. First you should clear your browsers cache; typing CTRL-SHIFT-Delete opens the clear dialog ir Firefox and Chrome. Next, in Firefox, go to Menu -> Web Developer -> Toggle Tools. Ir Chrome, go to Menu -> More Tools -> Developer Tools. Alternatively, in both browser you can type CTRL-SHIFT-I. Once the developer tools are open, go to the "Network" tab, ther browse to cnn.com.
6a.	Wait a few moments for CNN to finish loading. How many total requests did it take for the CNN website to load? (5 pts
ób.	How many requests were for HTML? How many for images? How many for JavaScript? (Hint: the filters in the "Network" tab will help.) (5 pts
бс.	Many of the resources that end up being included into the CNN homepage come from third-parties, i.e., companies that are not CNN. As representative examples, find some requests to <i>outbrain.com</i> , <i>googletagservices.com</i> , and <i>krxd.net</i> and click on them to inspect the HTTF requests and responses. What are these services doing? Why has CNN included them in their homepage (10 pts)

6d. Switch to the JavaScript "Console" tab of the developer tools. Look around, then complete this sentence: "Send your ideas to: ______" (5 pts)
