This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Export Data Integration	15-29
Import Data Integration	15-31
Retrieve Job Status	15-33

# 16 Data Management REST APIs

URL Structure for Data Management	16-1
Getting API Versions for Data Management APIs	16-1
Get API Versions for Data Management APIs	16-2

Get Information about a Specific API Version for Data Management APIs	16-3
Running Data Rules in Data Management	16-4
Running Batch Rules	16-7
Retrieve Job Status	16-9

# 17 Account Reconciliation APIs

URL Structure for Account Reconciliation	17-1
Getting API Versions for Account Reconciliation REST APIs	17-1
Get API Versions for Account Reconciliation REST APIs	17-2
Get Information about a Specific API Version for Account Reconciliation REST APIs	17-4
Execute a Job in Account Reconciliation	17-5
Retrieve Periods with a Specific Status	17-7
Change Period Status (Reconciliation Compliance)	17-9
Create Reconciliation (Reconciliation Compliance)	17-11
Delete Profile	17-12
Import Pre-Mapped Balances (Reconciliation Compliance)	17-14
Import Pre-Mapped Transactions (Reconciliation Compliance)	17-15
Import Balances (Reconciliation Compliance)	17-17
Import Profiles (Reconciliation Compliance)	17-19
Import Rates (Reconciliation Compliance)	17-20
Import Pre-Mapped Transactions (Transaction Matching)	17-22
Import Attribute Values	17-24
Monitor Reconciliations (Reconciliation Compliance)	17-26
Import Reconciliation Attributes (Reconciliation Compliance)	17-28
Run Auto Match (Transaction Matching)	17-31
Purge Transactions (Transaction Matching)	17-32
Retrieve Job Status (Reconciliation Compliance)	17-36
Retrieve Job Status (Transaction Matching)	17-37
Export Application Properties	17-40
Import Application Properties	17-42
Export Background Image	17-44
Import Background Image	17-46
Export Logo Image	17-48
Import Logo Image	17-49
Working with Connections in Account Reconciliation	17-51
Create a Connection	17-51
View All Connections	17-53
Update a Connection	17-54
Delete a Connection	17-56
Set Application Access Level	17-57
Retrieve Application Access Level	17-58

View Reconciliation Comments	17-59
Archive Matched Transactions (Transaction Matching)	17-61
Purge Archived Transactions (Transaction Matching)	17-62
Unmatch Matched Transactions (Transaction Matching)	17-64
Update Unmatched Transactions (Transaction Matching)	17-66

# 18 Financial Consolidation and Close REST APIs

Getting API Versions for Financial Consolidation and Close APIs	18-1
Get Information about a Specific API Version for Financial Consolidation and Close APIs	18-1
Perform Journal Actions for Financial Consolidation and Close	18-2
Perform Journal Period Updates for Financial Consolidation and Close	18-4
Retrieve Journals for Financial Consolidation and Close	18-6
Retrieve Journal Details for Financial Consolidation and Close	18-9
Export Consolidation Journals	18-12
Import Consolidation Journals	18-14
Copy Data	18-16
Clear Data	18-18
Validate Metadata	18-20
Generate an Intercompany Matching Report	18-21

# 19 Task Manager REST APIs

Getting API Versions for Task Manager APIs	19-1
Deploy Task Manager Templates	19-1
Update Task Status for Event Monitoring	19-5
Working with Connections in Task Manager	19-7
Create a Connection	19-8
View All Connections	19-11
Update a Connection	19-13
Delete a Connection	19-16

# 20 Supplemental Data Manager REST APIs

Getting API Versions for Supplemental Data Manager APIs	20-1
Import Supplemental Collection Data for Financial Consolidation and Close	20-1
Deploy Form Templates	20-4

# 21 Enterprise Journal REST APIs

Getting API Versions for Enterprise Journal APIs	21-1
Monitor Enterprise Journals for Financial Consolidation and Close	21-1

Execute an Enterprise Journals Job	21-4
Retrieve Enterprise Journals for Financial Consolidation and Close	21-10
Retrieve Enterprise Journal Content for Financial Consolidation and Close	21-12
Retrieve Enterprise Journal Content by Year and Period for Financial Consolidation and Close	21-14
Update Enterprise Journal Posting Status for Financial Consolidation and Close	21-16
Update Validation Status of Enterprise Journals for Financial Consolidation and Close	21-18

# 22 Tax Reporting REST APIs

URL Structure for Tax Reporting	22-1
Getting API Versions for Tax Reporting APIs	22-1
Get Information about a Specific API Version for Tax Reporting	22-1
Copy Data	22-2
Clear Data	22-4

# 23 Enterprise Profitability and Cost Management REST APIs

URL Structure for Enterprise Profitability and Cost Management	23-1	
Getting API Versions for Enterprise Profitability and Cost Management	23-2	
Getting Information About a Specific REST API Version for Enterprise Profitability and Cost		
Management	23-2	
Calculate Model	23-3	
Clear Data By Point of View	23-7	
Copy Data by Point of View	23-10	
Delete Point of View	23-13	
Generate Model Documentation Report	23-16	
Validate Model	23-18	

# 24 Profitability and Cost Management REST APIs

URL Structure for Profitability and Cost Management	24-2
Get API Versions for Profitability and Cost Management REST APIs	24-2
Get Information about a Specific API Version for Profitability and Cost Management	24-5
Apply Data Grants	24-7
Copy ML POV Data	24-9
Create File-Based Application	24-13
Deploy ML Cube	24-16
Enable File-Based Application	24-19
Essbase Data Load for Profitability and Cost Management	24-22
Export Query Results	24-25
Export Template for Profitability and Cost Management	24-29
Generate Program Documentation Report	24-32

Generate Program Documentation Report - Run as a Job	24-35
Import Template for Profitability and Cost Management	24-39
Merge Slices for Profitability and Cost Management	24-42
Optimize ASO Cube	24-43
Retrieve Task Status for Profitability and Cost Management	24-47
Run ML Calculations	24-48
Run ML Clear POV	24-52
Run ML Rule Balancing	24-56
Update Dimensions As a Job	24-60

# **Documentation Accessibility**

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

#### Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

# **Documentation Feedback**

To provide feedback on this documentation, click the feedback button at the bottom of the page in any Oracle Help Center topic. You can also send email to epmdoc\_ww@oracle.com.

# 1 Creating and Running an EPM Center of Excellence

A best practice for EPM is to create a CoE (Center of Excellence).

An **EPM CoE** is a unified effort to ensure adoption and best practices. It drives transformation in business processes related to performance management and the use of technology-enabled solutions.

Cloud adoption can empower your organization to improve business agility and promote innovative solutions. An EPM CoE oversees your cloud initiative, and it can help protect and maintain your investment and promote effective use.

The EPM CoE team:

- Ensures cloud adoption, helping your organization get the most out of your Cloud EPM investment
- · Serves as a steering committee for best practices
- Leads EPM-related change management initiatives and drives transformation

All customers can benefit from an EPM CoE, including customers who have already implemented EPM.

#### How Do I Get Started?

Click to get best practices, guidance, and strategies for your own EPM CoE: Introduction to EPM Center of Excellence.

#### Learn More

- Watch the Cloud Customer Connect webinar: Creating and Running a Center of Excellence (CoE) for Cloud EPM
- Watch the videos: Overview: EPM Center of Excellence and Creating a Center of Excellence.
- See the business benefits and value proposition of an EPM CoE in *Creating and Running an EPM Center of Excellence*.

# 2

# Implementation Best Practices for EPM Cloud REST APIs

Use the implementation best practices listed in this topic when working with the EPM Cloud REST APIs.

Best practices:

- Before using the REST APIs, complete the prerequisites.
- Use the correct authentication, as described in OAuth 2 and Basic Authentication for EPM Cloud REST APIs.
- Understand the URL structure.
- Know how to get the current REST API version.
- Review the sample scenarios to get started quickly.
- Be aware of REST API compatibility.
- Use the Quick Reference to find all of the Oracle Enterprise Performance Management Cloud REST APIs at a glance.

#### Troubleshooting

For help with troubleshooting REST API issues, see Diagnosing REST API Issues in Oracle Enterprise Performance Management Cloud Operations Guide.

# 3 About the REST APIs for EPM Cloud

Review these topics to learn about the REST APIs for Oracle Enterprise Performance Management Cloud and understand important prerequisites and authentication.

Overview of the REST APIs:

- About REST API for Oracle Enterprise Performance Management Cloud
- Implementation Best Practices for EPM Cloud REST APIs
- EPM Cloud REST API Compatibility
- About the Samples
- Audience
- Prerequisites
- OAuth 2 and Basic Authentication for EPM Cloud REST APIs

# About REST API for Oracle Enterprise Performance Management Cloud

This guide describes REST APIs for Oracle Enterprise Performance Management Cloud.

These REST APIs allow service administrators and infrastructure consultants to perform administration tasks in EPM Cloud. This guide assumes that the audience has technical and functional expertise in using and working with REST APIs. See Audience.

EPM Cloud includes these cloud services:

- Planning
- FreeForm
- Planning Modules
- Account Reconciliation
- Financial Consolidation and Close
- Enterprise Profitability and Cost Management
- Profitability and Cost Management
- Tax Reporting
- Narrative Reporting
- Oracle Enterprise Data Management Cloud

You can integrate EPM Cloud environments using:

- A set of REST APIs
- The EPM Automate Utility, a command line tool that is implemented on top of the REST APIs

 Groovy business rules, as described in Oracle Enterprise Performance Management Cloud Groovy Rules Java API Reference.

# EPM Cloud REST API Compatibility

These tables summarize the compatibility for Oracle Enterprise Performance Management Cloud REST APIs.

- EPM Platform
- Planning, FreeForm, Strategic Workforce Planning, and Sales Planning
- Migration
- Security
- Daily Maintenance Window Time
- Managing Users, Groups, and Roles
- Usage Simulation
- Reporting
- Data Integration
- Data Management
- Account Reconciliation
- Financial Consolidation and Close
- Task Manager
- Supplemental Data Manager
- Enterprise Journals
- Tax Reporting
- Enterprise Profitability and Cost Management
- Profitability and Cost Management

**NOTE:** These abbreviations are used in the column headings: **PLN** (Planning), **FF** (FreeForm), **SWP** (Strategic Workforce Planning), **SP** (Sales Planning), **FCC** (Financial Consolidation and Close), **AR** (Account Reconciliation), **EPCM** (Enterprise Profitability and Cost Management), **PCM** (Profitability and Cost Management), and **TR** (Tax Reporting)

For detailed information about REST APIs, see Quick Reference Table – REST API Resource View.

#### **EPM Platform**

# About the Samples

Samples are described for selected integration scenarios and REST API reference sections. A working knowledge of Java, cURL, and Groovy is required to understand these samples.

The Java samples in this guide are coded using pure Java instead of third-party libraries such as Apache HTTP Client. The only JAR files you will need outside of JDK will be for JSON parsing.

This document does not teach REST concepts. As a prerequisite, a prior knowledge of REST programming is required to understand the examples, samples, scenarios, and reference sections.

# Audience

This guide is intended primarily as a tool for infrastructure consultants and administrators of EPM Cloud.

Infrastructure consultants can use the documentation to build custom integration to provide basic and innovative services on top of these cloud services, including Planning, Planning Modules, Account Reconciliation, and Profitability and Cost Management.

Service administrators use this documentation to perform selected administrative tasks using REST APIs and EPM Automate. Completing administrative tasks using EPM Automate and REST APIs as an alternative to using the user interface requires considerable technical and functional expertise. Only technically competent administrators should use this guide to perform these administrative tasks.

# Prerequisites

Prerequisites to using the REST APIs and the EPM Automate Utility include the following:

- Access as a valid user to the cloud service with prerequisites set up for the service. See Getting Started with Oracle Enterprise Performance Management as an Administrator and Getting Started with Oracle Enterprise Performance Management as a User.
- Technical and functional knowledge to understand and execute the EPM Automate Utility and REST APIs, and to administer the product.
- Knowledge of Java, cURL, Groovy, and REST programming.
- Jobs are required for many EPM Automate utility commands and REST APIs. Jobs are actions, such as importing or exporting data that can be started immediately or scheduled for a later time; for example, importing or exporting data. Be sure that you understand how to use jobs as described in Managing Jobs.
- Data load rules define how Data Management loads data from a file. You must have predefined data load rules to load data using REST APIs and EPM Automate Utility. You can also load data using batches defined in Data Management. Using a batch, Service Administrators can combine many load rules in a batch and execute them in serial or parallel mode.
- Business rules are required for some jobs. For example for Planning, you use Calculation Manager to create business rules, which are then deployed into a Planning application. Learn about business rules in *Designing with Calculation Manager for Oracle Enterprise Performance Management Cloud*

# **URL Structure**

For the URL structure to use, see the topic for the REST API:

- Planning and Budgeting REST API URL
- Migration REST API URL
- Data Management REST API URL
- Account Reconciliation REST API URL
- Enterprise Profitability and Cost Management REST API URL
- Profitability and Cost Management REST API URL

In the description and examples of all REST APIs, this guide uses state The state URL> is the first part of your service URL, before the context. For example, if your service URL
is https://epm-acme.epm.us-phoenix-1.ocs.oraclecloud.com/epmcloud, your state URL is
https://epm-acme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is
https://epm2-acme.epm.us6.oraclecloud.com/epmcloud, your state-URL> is https://epm2-acme.epm.us6.oraclecloud.com.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ <code>internal/"</code> in the URL.

For details on the URL structure, see Differences Between Classic and OCI EPM Cloud Environments. To learn about accessing Oracle Cloud and Oracle Enterprise Performance Management Cloud, see Getting Started with Oracle Cloud and Getting Started with Oracle Enterprise Management Cloud for Administrators. 4

# OAuth 2 and Basic Authentication for EPM Cloud REST APIs

All HTTP requests to the REST APIs require authentication. Review these topics to understand OAuth 2 and basic authentication for EPM Cloud REST APIs.

The REST APIs for EPM Cloud support authentication with OAuth 2 and basic authentication:

- Authentication with OAuth 2 Only for OCI (Gen 2) Environments
- Basic Authentication for Classic and OCI (Gen 2) Environments

EPM Cloud REST APIs can connect to Oracle Enterprise Performance Management Cloud through API Gateways, such as Google APIGEE, IBM Data Power, and other reverse proxy servers.

For this to work, configure the gateway or reverse proxy by setting the target as the URL of your EPM Cloud environment without any context such as /epmcloud. Example: https://epm-idDomain.epm.dataCenterRegion.oraclecloud.com. Then, use the reverse proxy URL instead of the EPM Cloud URL in the REST API. For configuration information, see the documentation of your gateway or proxy server.

While configuring the proxy settings, be sure to pass the response code from EPM Cloud to EPM Cloud REST API without modifying it in any manner to allow REST API processing code to correctly process response codes such as 200, 206, 400, 404, 500, 501, and so on. For example, for IBM Datapower, set proxy HTTP Response to ON. Additionally, the API gateway should allow HTTP methods (GET, POST, PUT, PATCH, and DELETE).

Note that REST APIs cannot be run by users who are set up for basic authentication with multifactor authentication (MFA).

# Authentication with OAuth 2 - Only for OCI (Gen 2) Environments

In EPM Cloud environments on Oracle Cloud Infrastructure (OCI) / Gen 2 architecture, you can use an OAuth 2 access token to issue REST APIs on EPM Cloud to satisfy the requirement of avoiding the use of passwords in your environment.

#### Setting Up Authentication with OAuth 2

In order to access EPM Cloud REST APIs with OAuth 2, an EPM Cloud Service Administrator has to request the Domain Administrator to set up an OAuth 2 client and provide the Identity Domain Cloud Service (IDCS) URL and Client ID.

Overview of the steps:

- Step 1. Register an OAuth client. This is a one-time setup step that requires user interaction with IDCS Administrator privileges.
- Step 2. Obtain and securely store the first refresh token. This step requires user interaction. It is a one-time step for each user that needs to invoke REST APIs with OAuth 2.

• Step 3. Obtain an access token from the refresh token. This step is easily automated. Once automation has been implemented, it can run without user interaction.

The following sections provide detailed information about each step.

#### Step 1: Register an OAuth Client

Registering an OAuth client is a one-time process. The first step is to update the service provider configuration to authorize requests from the REST client application. As a security measure, any client application that accesses Oracle Cloud resources must be authorized to do so. An IDCS Administrator enables this authorization by registering a client and providing the appropriate registration information to the client's users.

A client application in IDCS is used to obtain an access token. A valid access token (also called a Bearer token) is sufficient authorization to invoke a REST API.

Oracle Enterprise Performance Management Cloud uses a role-based access control mechanism to permit only authorized users access to the service. For details, see About EPM Cloud User and Role Management. This requires that any OAuth 2 access token used to access EPM Cloud REST APIs contains a user context.

A grant type is a standard method to obtain an access token. There are a few different Grant Types as listed here that could be used to obtain an access token. An access token obtained by any of the supported grant types is acceptable as long as the access token is in the context of the user that would be invoking the REST APIs.

In this document, we describe the use of the Device Code Grant Type. EPM Automate has built-in support for the Device Code Grant type.

While the Device Code Grant Type would work in a majority of environments, it might not be right for every implementation. Any of the Grant Types that allow creating an access token with a user context would be suitable for EPM Cloud REST APIs. In addition to the Device Code Grant Type, the following Grant Types support access tokens in the context of an end user:

- Authorization Code Grant Type
- Resource Owner Password Credentials Grant Type
- Assertion Grant Type when access token is in the context of the end user
- Implicit Grant Type

The next section highlights the steps to create a sample OAuth 2 client using the Device Code Grant Type to request an access token. It also demonstrates how to use the access token to invoke EPM Cloud's Get Daily Maintenance Window REST API.

Refer to the Oracle Identity Cloud Service documentation for more details on the Supported Access Grant Types.

The Identity Cloud Service Administrator follows the steps in this topic to create a public client using the Identity Cloud Service Administrator console. The IDCS Administrator then shares the Identity Cloud Service tenant URLand client ID with the EPM Cloud Service Administrator.

If you have an Oracle Identity Cloud Services domain, log in to the Oracle IDCS Administrator console to register an OAuth 2 Client as described in Detailed Information for Using IDCS Administrator Console to Register an OAuth 2 Client.

If your domain is a domain under Oracle Identity and Access Management, follow the instructions in Detailed Information for Using IAM Console to Register an OAuth 2 Client.

Detailed Information for Using IDCS Administrator Console to Register an OAuth 2 Client

- **1.** From the **Applications** drawer, click **Add** at the top of the page.
- 2. In the Add Application dialog box, select Mobile Application.
- 3. In the App Details section, enter a name for the REST client.
- 4. Optional: Add other details.
- 5. Click Next.
- 6. In the Authorization section, under Allowed Grant Types, unselect the Implicit check box and select the Refresh Token and Device Code check boxes.
- 7. Under the Token Issuance Policy section:
  - a. Under Grant the client access to Identity Cloud Service Admin APIs, click Add.
  - b. Select Identity Domain Administrator.
  - c. Click Add to close the pop-up.
- 8. Click Next and then Finish to complete creating this OAuth 2 client application.
- 9. Note the client ID value on the pop-up.
- 10. Click Activate to activate the client, and then click OK.

Detailed Information for Using IAM Console to Register an OAuth 2 Client

- 1. Log in to your account at https://cloud.oracle.com/
- Click the hamburger menu on the top left and choose Identity and Security and then click Domains on the dialog box.
- 3. From the Domains table, choose the appropriate domain (OracleIdentityCloudService by default). This brings you to the Domain Overview page.
- Note the Domain URL in the Domain Information section of the page. This is the tenantbase-URL that will be required to request a token.
- 5. To create an OAuth 2 client, click **Applications** in the Identity Domain.
- 6. Click the Add application button,
- 7. Choose **Mobile Application** on the pop-up menu and then click the **Launch Workflow** button.
- 8. Enter a name and a description to document the use of this OAuth 2 client.
- 9. Click the Next button on the bottom left.
- On the Client configuration step, in the Authorization section, select Refresh token and Device code and unselect Implicit.
- 11. In the Token Issuance policy section:
  - a. Enable Add app roles.
  - **b.** Click the **Add roles** button.
  - c. Choose Identity Domain Administrator on the slide-in dialog box.
  - d. Click the Add button to close the slide-in dialog box.
- 12. Click Finish to complete the configuration and Activate to activate the application.
- **13.** Note the Client ID value in the General Information section of the OAuth Configuration.

The IDCS Administrator provides the IDCS URL and client ID to the EPM Cloud Service Administrator.

#### Step 2. Obtain and securely store the first refresh token

After the Domain Administrator has registered the REST client and provided the IDCS URL and client ID, an EPM Cloud user executes the following steps to get a valid refresh token.

1. Issue the following unauthenticated request to the Identity Cloud Service URL:

```
curl --location --request POST 'https://tenant-base-url/oauth2/v1/device' \
--header 'Content-Type: application/x-www-form-urlencoded;charset=utf-8' \
--data-urlencode 'response_type=device_code' \
--data-urlencode 'scope=urn:opc:idm:_myscopes__ offline_access' \
--data-urlencode 'client_id=<CLIENT ID OF OAUTH2 APPLICATION>'
```

Here, the value of tenant-base-url is the IDCS URL provided by the Domain Administrator or the Domain URL from the IAM console. It is of the form idcs-<alphanumericvalue>.identity.oraclecloud.com. Similarly, the value for the CLIENT ID OF THE OAUTH2 APPLICATION is also provided by the Domain Administrator or retrieved from the Application's General Information section in IAM. It is an alphanumeric value.

A valid response contains a device code, user code, and verification URI:

```
{
   "expires_in": 300,
   "device_code": "4d03f7bc-f7a5-4795-819a-5748c4801d35",
   "user_code": "SDFGHJKL",
   "verification_uri": "https://tenant-base-url/ui/v1/device"
}
```

The user\_code from the response is needed in the second step below, while device\_code from the response is needed in the third step below.

**Note**: Steps 2 and 3 are time-sensitive because the user code and device code expire 300 seconds (5 minutes) after creation. If the codes expire before these steps can be completed, redo the first step of this section to issue an unauthenticated request to the IDCS URL to receive a new pair of user and device codes.

2. Open the verification uri in a supported web browser.

At this stage, it is important to know that if a user already has an active browser session, the user will not be prompted for re-authentication. If the token is to be generated in context of the currently signed-in user, then proceed with 2b. However, if the token is to be generated in the context of a different user, please sign-out of the current session and navigate to the verification\_uri and continue with 2a.

- a. When prompted for credentials, authenticate the user who will be invoking the REST API. These credentials could be credentials for a SAML 2.0 compliant Identity Provider or a native IDCS credential.
- **b.** When prompted for a code in the browser session, enter the user\_code from the response payload.
- c. When the Successful message is displayed, it is recommended to log out of the browser session and close the browser window.

 Within 5 minutes of executing the first step of this section and after executing the second step, issue the following request to the Identity Cloud Service URL:

```
curl --location --request POST 'https://tenant-base-url/oauth2/v1/token' \
--header 'Content-Type: application/x-www-form-urlencoded;charset=utf-8' \
--data-urlencode 'grant_type=urn:ietf:params:oauth:grant-type:device_code' \
--data-urlencode 'device_code=<DEVICE CODE FROM THE PAYLOAD OF RESPONSE IN
FIRST STEP>' \
--data-urlencode 'client id=<CLIENT ID OF THE OAUTH2 APPLICATION>'
```

Here the value of tenant-base-url is the IDCS URL provided by the Domain Administrator, the device\_code value is obtained from the response in Step 1, and client\_id is the same client\_id used in the first step of this section.

The response contains the first refresh token:

```
{
    "access_token": "eyJ4NXQjUzI.....evRJChXTRfzn6WlCw",
    "token_type": "Bearer",
    "expires_in": 3600,
    "refresh_token": "AQIDBAWF1.....RVkxNCB7djF9NCA="
}
```

#### Secure and Protect the Tokens and Client ID

With OAuth 2, tokens are used instead of user credentials to access resources on EPM Cloud. A refresh token and client ID are used to get a new access token and a new refresh token. Thus, to ensure security of EPM Cloud, it is important to securely encrypt and store the client\_id and any tokens. The REST client must securely store the refresh token and client id.

For EPM Automate, use the encrypt command to create an epw file for OAuth 2.

#### Step 3: Obtain an Access Token from the Refresh Token

This step is required every time a new access token is required. The REST client uses the latest refresh token and client id to get an access token. It uses the access token as authorization to invoke REST APIs. It also ensures that the latest refresh token and client ID are stored securely.

The REST client uses the Refresh Token Grant type to get a new access token and a new refresh token. As mentioned above, this step can be automated. Once automated, it does not require user interaction.

To obtain a valid access token with this Grant Type, the REST client issues the following request to the IDCS URL:

```
curl --location --request POST 'https://tenant-base-url/oauth2/v1/token' \
--header 'Content-Type: application/x-www-form-urlencoded' \
--data-urlencode 'grant_type=refresh_token' \
--data-urlencode 'client_id=<DECRYPTED CLIENT ID OF OAUTH2 APPLICATION FROM
SECURE STORE>' \
--data-urlencode 'refresh token=<DECRYPTED REFRESH TOKEN FROM SECURE STORE>'
```

Here, the value of tenant-base-url is the IDCS URL provided by the Domain Administrator, and the refresh\_token and client\_id are obtained from the secure store where there were previously stored.

**Note**: While the client\_id and refresh\_token are stored securely, it is important that both refresh\_token and client\_id are decrypted to use in any request. All requests to Oracle IDCS and EPM Cloud are securely transmitted using the https protocol.

Example response:

```
{
"access_token": "eyJj5M4QjUkI.....abSjZaa86PlseS4lrt7R2",
   "token_type": "Bearer",
   "expires_in": 3600,
   "refresh_token": "AAyyilYBAWD4....FVkxefd8kjoJr6HJPA="
}
```

The REST client saves the new refresh token for future use (see Secure and Protect the Token and Client ID) and uses the access token as authorization while invoking the REST API (see Use the Access Token).

#### Use the Access Token

In order to invoke an EPM Cloud REST API, the REST client must provide the access token (obtained in the previous step) in the authorization header as follows:

Authorization: Bearer <access token>

For example, to get the Automated Maintenance Window start time, the client application submits a GET request to this EPM Cloud endpoint /interop/rest/v1/services/ dailymaintenance using the access token in the authorization header.

```
curl --location --request GET 'https://epm-host/interop/rest/v1/services/
dailymaintenance' \
--header "Authorization: Bearer eyJ5M4QjUkI...abSjZaa86PlseS4lrt7R2"
```

#### **Frequently Asked Questions**

## OAuth 2 was set up following the documentation before EPM Cloud Release 23.07. Is that configuration still valid?

Yes, the existing configuration will continue to work with existing OAuth 2 support for REST APIs and EPM Automate. However, it is highly recommended to use the updated procedure as it provides greater clarity and might be required for future updates.

## How do I change my existing configuration created before EPM Cloud Release 23.07 to be consistent with the current procedure?

The following steps will bring your existing configuration in line with the documented configuration:

- For the Oracle Cloud Services, on the Configuration tab under Resources, unselect the Is Refresh Token Allowed checkbox.
- For the OAuth 2 client application, under Token Issuance Policy, remove the Resource or Resources selected and add the Identity Administrator Role to the Client as described in Step 7 for IDCS Administrator console or Step 11 for IAM console.

For EPM Automate, create a new epw file using the updated instructions in EPM Automate Commands, and then save the new refresh token and client id and use it to authorize access.

#### Can the expiry time of a refresh token be modified?

The expiry time of the refresh token is configurable in Identity Cloud Service by the Domain Administrator on a per EPM Cloud environment basis. The client requesting the refresh token cannot modify the expiry time or duration. The client should request a new refresh token before the old one expires, in order to not repeat the initial setup again. The default expiry period is 604800 seconds, which is 7 days.

#### What error is returned when the refresh token has expired?

Executing a refresh token grant flow with an expired refresh token results in a 400 Bad *Request* response and the following payload:

```
{ "error": "invalid_grant",
   "error_description": "Token is expired for client : <CLIENT_ID>",
   "ecid": "UsbMB0KCV00000000"
}
```

#### What error is returned when the refresh token is invalid?

Executing a refresh token grant flow with an invalid refresh token results in a 400 Bad Request response and the following payload:

```
{ "error": "invalid_grant",
   "error_description": "The given token in the request is invalid",
   "ecid": "UsbMB0KCV00000000"
}
```

#### What errors are returned for other issues?

A 400 Bad Request response with the following payloads are returned when there is an error:

Invalid request (for example, not all request parameters are supplied):

```
{
    "error": "invalid_request",
    "error_description": "The request contains invalid parameters or values"
}
```

Invalid grant (for example, using a token that has already been used) :

```
{
    "error": "invalid_grant",
    "error_description": "The token has already been consumed"
}
```

Invalid scope (for example, providing invalid scope):

```
{
    "error": "invalid_scope",
    "error_description": "Invalid scope"
}
```

#### What error is returned when an invalid or expired access token is provided?

When an invalid or expired access token is provided in a request, the server responds with a 401 Unauthorized response with the following HTML in the payload:

```
<html>
<head><title>401 Authorization Required</title></head>
<body>
<center><h1>401 Authorization Required</h1></center>
<hr>
</body>
</html>
```

#### Can a token be requested with multiple scopes?

Multiple scopes across different resources (EPM Cloud environments) are not supported by Identity Cloud Service. Each token request can support only one resource. Requests for multiple scopes within the same resource are supported with space delimited scopes. Requesting multiple scopes across different resources results in a *400 Bad Request* response with the following payload:

```
{
"error": "invalid_scope",
"error_description": "Invalid scope"
}
```

## Can a valid token received for one EPM Cloud environment be used to access all EPM Cloud environments in the same IDCS domain?

The EPM Cloud Service Administrator for an environment provisions each user with predefined and application roles and specific access for that environment. The same user may be provisioned with different privileges on different environments in the same IDCS domain. The functionality that a user is able to perform on any EPM Cloud environment is dependent on the roles and access the user has on that environment. Thus, a valid, unexpired bearer token received for one EPM Cloud environment can be used across all EPM Cloud environments in the same IDCS domain for authentication purposes. However, the authorization of what a particular user can do on a particular EPM Cloud environment is dependent on the roles the user has on that environment.

#### What information is logged in the access log with OAuth?

The access log shows the user name, just as it does with basic authorization. The client ID and access token are not logged.

When using multiple scripts to run EPM REST APIs, the refresh token grant type seems to fail randomly with a message that the token is already consumed. What is the resolution?

Each refresh token is a single use token. After first use, the same token cannot be reused. Trying to use a particular token after it has already been used results in the message, *The token is already consumed*.

The right way is to set up each script with its own refresh token. To do that, execute the procedure to obtain and save the first refresh token once for each script requiring a refresh token, and then set up each script to use its own refresh token. All scripts can still use the same clientID.

## Basic Authentication - for Classic and OCI (Gen 2) Environments

In EPM Cloud environments on Classic or OCI (Gen 2) architecture, the REST APIs support basic authentication (name and password).

If your environment is on Classic Oracle Cloud Infrastructure, use a username in the format identitydomain.username.

If your environment is on OCI (Gen 2) Oracle Cloud Infrastructure, you can use basic authentication by supplying a username in the format of identitydomain.username or only username (without identity domain).

HTTP requests to Oracle Enterprise Performance Management Cloud should supply HTTP Basic Authentication credentials through the **Authorization** header.

#### **Finding Your Identity Domain**

If your environment is on Classic Oracle Cloud Infrastructure, ensure that you are correctly specifying your identity domain when logging into an environment using REST APIs.

Use one of these methods to identify your identity domain:

- Look in the Activity Report for your environment. The name of the identity domain is displayed at the top left corner of the Activity Report. See "About the Activity Report" in *Getting Started with EPM Cloud for Administrators*.
- Derive the identity domain name from the URL that you use to access the environment.
   For example, in this fictitious URL, https://epm exampleDomain.epm.dataCenter.oraclecloud.com/, the identity domain name is
   exampleDomain.

The test and production environments of a subscription usually share the same identity domain. For example, for test environments like as this fictitious URL, https://epm-test-exampleDomain.epm.dataCenter.oraclecloud.com/, the identity domain can be derived as the string enclosed between "test-" and the next ".", in this case, **exampleDomain**.

For production environments like this fictitious URL, <a href="https://epm-exampleDomain.epm.dataCenter.oraclecloud.com/">https://epm-exampleDomain.epm.dataCenter.oraclecloud.com/</a>, the identity domain can be derived as the string enclosed between the first "-" and next ".", in this case, exampleDomain.

Note: In this guide, URLs are shown in the following format: https://<BASE-URL>

When using PowerShell to call EPMCloud REST API, ensure that the Authorization header is always specified. For example:

```
$headers = @{
"Authorization" = "Basic " +
[System.Convert]::ToBase64String([System.Text.Encoding]::UTF8.GetBytes($userNa
me+":"+$userPassword))
}
Invoke-RestMethod -Method 'Get' -Uri $url -Headers $headers
```

# Sample Integration Scenarios

This section provides selected sample scenarios for EPM Cloud REST APIs to help you get started.

#### **Related Topics**

- Scenario 1: Import Metadata into Applications
   This scenario shows how to use EPM Cloud REST APIs to import metadata into applications.
- Scenario 2: Import Data, Run a Calculation Script, and Copy Data from a Block Storage Database to an Aggregate Storage Database
   This scenario shows how to use the EPM Cloud REST APIs to import data, run a calculation script, and copy data from a block storage database to an aggregate storage database.
- Scenario 3: Export and Download Metadata and Data This scenario shows how to use the EPM Cloud REST APIs to export and download metadata and data.
- Scenario 4: Remove Unnecessary Files from a Service Instance This scenario shows how to use the EPM Cloud REST APIs to remove unnecessary files from a service instance.
- Scenario 5: Archive Backups from the Service to Onpremise This scenario shows how to use the EPM Cloud REST APIs to archive backups from the service to onpremise.
- Scenario 6: Refreshing the Application This scenario shows how to use the EPM Cloud REST APIs to refresh the application.
- Scenario 7: Cloning an Instance This scenario shows how to use the EPM Cloud REST APIs to clone an instance.
- Scenario 8: Sample Starter Kit for Consultants Business Intelligence Cloud Integration This scenario provides a sample starter kit for consultants to integrate with Oracle Business Intelligence Cloud.
- Scenario 9: Using Groovy Business Rules to Call REST APIs from Oracle and Other Companies

The scenario shows how to use the Oracle Enterprise Performance Management Cloud Groovy object model to call Oracle REST APIs and REST APIs developed by other companies.

## Scenario 1: Import Metadata into Applications

This scenario shows how to use EPM Cloud REST APIs to import metadata into applications.

#### Example 5-1 Java

```
public void integrationScenarioImportMetadataIntoApplication() throws
Exception {
    uploadFile("accounts.zip");
    executeJob("IMPORT METADATA", "accountMetadata",
```

```
"{importZipFileName:accounts.zip}");
    executeJob("CUBE_REFRESH", null, null);
}
```

Common Functions: See Common Helper Functions for Java.

Dependent APIs: see Java Sample – UploadFile.java and Java Sample – ExecuteJob.java in Upload and Download Files.

#### Example 5-2 cURL

```
funcIntegrationScenarioImportMetadataIntoApplication() {
   funcUploadFile "DemoApplication_HSS_Vision.zip"
   funcExecuteJob "IMPORT_METADATA" "accountMetadata"
   "{importZipFileName=accounts.zip}"
   funcExecuteJob "CUBE_REFRESH" "cubeRefresh"
}
```

#### Example 5-3 Groovy

```
def integrationScenarioImportMetadataIntoApplication() {
    uploadFile("DemoApplication_HSS_Vision.zip")
    executeJob("IMPORT_METADATA", "accountMetadata",
    "importZipFileName=accounts.zip");
    executeJob("CUBE_REFRESH", "cubeRefresh", null);
}
```

Common functions: See CSS Common Helper Functions for Groovy

Scenario 2: Import Data, Run a Calculation Script, and Copy Data from a Block Storage Database to an Aggregate Storage Database

This scenario shows how to use the EPM Cloud REST APIs to import data, run a calculation script, and copy data from a block storage database to an aggregate storage database.

#### Example 5-4 Java

```
public void integrationScenarioImportDataRunCalcCopyToAso() throws Exception {
    uploadFile("data.csv");
    executeJob("IMPORT_DATA", "loadingq1data", "{importFileName:data.csv}");
    executeJob("CUBE_REFRESH", null, null);
    executeJob("PLAN_TYPE_MAP", "CampaignToReporting", "{clearData:false}");
}
```

Common Functions: See Common Helper Functions for Java.

Dependent APIs: see Java Sample – UploadFile.java and Java Sample – ExecuteJob.java in Upload and Download Files.

#### Example 5-5 cURL

```
funcIntegrationScenarioImportDataRunCalcCopyToAso() {
   funcUploadFile "data.csv"
   funcExecuteJob "IMPORT_DATA" "loadingq1data" "{importFileName=data.csv}"
   funcExecuteJob "CUBE_REFRESH","cubeRefresh"
   funcExecuteJob "PLAN_TYPE_MAP" "CampaignToReporting" "{clearData=false}"
}
```

#### Example 5-6 Groovy

```
def integrationScenarioImportDataRunCalcCopyToAso() {
    uploadFile("data.csv");
    executeJob("IMPORT_DATA", "loadingq1data", "importFileName=data.csv");
    executeJob("CUBE_REFRESH", "cubeRefresh", null);
    executeJob("PLAN_TYPE_MAP", "CampaignToReporting", "clearData=false");
}
```

## Scenario 3: Export and Download Metadata and Data

This scenario shows how to use the EPM Cloud REST APIs to export and download metadata and data.

#### Example 5-7 Java

```
public void integrationScenarioExportMetadataAndDataAndDownloadFiles() throws
Exception {
    executeJob("EXPORT_METADATA", "exportentitymetadata",
    "{exportZipFileName:entitydata.zip}");
    executeJob("EXPORT_DATA", "Forecastdata",
    "{exportFileName:forecastdata.zip}");
    listFiles();
    downloadFile("entitydata.zip");
    downloadFile("forecastdata.zip");
}
```

Common Functions: See Common Helper Functions for Java.

Dependent APIs: see Java Sample – DownloadFile.java and Java Sample – ExecuteJob.java in Upload and Download Files.

#### Example 5-8 cURL

```
funcIntegrationScenarioExportMetadataAndDataAndDownloadFiles() {
   funcExecuteJob "EXPORT_METADATA" "exportentitymetadata"
   "{exportZipFileName=entitydata.zip}"
   funcExecuteJob "EXPORT_DATA" "Forecastdata"
   "{exportFileName=forecastdata.zip}"
   funcListFiles
   funcDownloadFile "entitydata.zip"
   }
}
```

#### Example 5-9 Groovy

```
def integrationScenarioExportMetadataAndDataAndDownloadFiles() {
    executeJob("EXPORT_METADATA", "exportentitymetadata",
    "exportZipFileName=entitydata.zip");
    executeJob("EXPORT_DATA", "Forecastdata",
    "exportFileName=forecastdata.zip");
    listFiles();
    downloadFile("entitydata.zip");
    downloadFile("forecastdata.zip");
}
```

## Scenario 4: Remove Unnecessary Files from a Service Instance

This scenario shows how to use the EPM Cloud REST APIs to remove unnecessary files from a service instance.

#### Example 5-10 Java

```
public void integrationScenarioRemoveUnnecessaryFiles() throws Exception {
    listFiles();
    deleteFile("entitymetadata.csv");
    deleteFile("forecastdata.csv");
}
```

Common Functions: See Common Helper Functions for Java.

Dependent APIs: See Java Sample — ListFiles.java and Java Sample — DeleteFile.java in View and Delete Files.

#### Example 5-11 cURL

```
funcIntegrationScenarioRemoveUnnecessaryFiles() {
   funcListFiles
   funcDeleteFile "entitymetadata.csv"
   funcDeleteFile "forecastdata.csv"
}
```

#### Example 5-12 Groovy

```
def integrationScenarioRemoveUnnecessaryFiles() {
    listFiles();
    deleteFile("entitymetadata.csv");
    deleteFile("forecastdata.csv");
}
```

### Scenario 5: Archive Backups from the Service to Onpremise

This scenario shows how to use the EPM Cloud REST APIs to archive backups from the service to onpremise.

#### Example 5-13 Java

```
public void integrationScenarioExportDataAndDownloadFiles() throws Exception {
    executeJob("EXPORT_DATA", "entitydata",
    "{exportFileName:entitydata.zip}");
    executeJob("EXPORT_DATA", "forecastdata",
    "{exportFileName:forecastdata.zip}");
    listFiles();
    downloadFile("entitydata.zip");
    downloadFile("forecastdata.zip");
}
```

Common Functions: See Common Helper Functions for Java.

Dependent APIs: See Java Sample — ExecuteJob.java and Java Sample — DownloadFile.java in Upload and Download Files.

#### Example 5-14 cURL

```
funcIntegrationScenarioExportDataAndDownloadFiles() {
   funcExecuteJob "EXPORT_DATA" "entitydata"
   "{exportFileName:entitydata.zip}"
   funcExecuteJob "EXPORT_DATA" "forecastdata"
   "{exportFileName:forecastdata.zip}"
   funcListFiles
   funcDownloadFile "entitydata.zip"
}
```

#### Example 5-15 Groovy

```
def integrationScenarioExportDataAndDownloadFiles() {
    executeJob("EXPORT_DATA", "entitydata", "exportFileName:entitydata.zip");
    executeJob("EXPORT_DATA", "forecastdata",
"exportFileName:forecastdata.zip");
    listFiles();
    downloadFile("entitydata.zip");
    downloadFile("forecastdata.zip");
}
```

## Scenario 6: Refreshing the Application

This scenario shows how to use the EPM Cloud REST APIs to refresh the application.

#### Example 5-16 Java

```
public void integrationScenarioRefreshTheApplication() throws Exception {
    uploadFile("accounts.zip");
    executeJob("IMPORT_METADATA", "accountMetadata",
    "{importZipFileName:accounts.zip}");
    executeJob("CUBE_REFRESH", null, null);
}
```

Common Functions: See Common Helper Functions for Java.

Dependent APIs: See Java Sample — ExecuteJob.java and Java Sample — UploadFile.java in Upload and Download Files.

#### Example 5-17 cURL

```
funcIntegrationScenarioRefreshTheApplication() {
   funcUploadFile "accounts.zip"
   funcExecuteJob "IMPORT_METADATA" "accountMetadata"
"{importZipFileName:accounts.zip}"
   funcExecuteJob "CUBE_REFRESH" "cubeRefresh"
}
```

#### Example 5-18 Groovy

```
def integrationScenarioRefreshTheApplication() {
    uploadFile("accounts.zip");
    executeJob("IMPORT_METADATA", "accountMetadata",
    "importZipFileName:accounts.zip");
    executeJob("CUBE_REFRESH", "cubeRefresh", null);
}
```

## Scenario 7: Cloning an Instance

This scenario shows how to use the EPM Cloud REST APIs to clone an instance.

There are three ways to clone an environment. For this scenario, use one of the following procedures:

- Use Clone Environment user interface
- Use EPM Automate
- Use a REST API

## Scenario 8: Sample Starter Kit for Consultants - Business Intelligence Cloud Integration

This scenario provides a sample starter kit for consultants to integrate with Oracle Business Intelligence Cloud.

A sample starter kit can be used by infrastructure consultants to plan integration for Planning with Business Intelligence Cloud.

#### Prerequisites

- You have accounts for Business Intelligence Cloud, Planning, and Oracle Application Express.
- You have considerable technical and functional expertise with Business Intelligence Cloud, Planning, Oracle Application Express, REST, Groovy, and scripting.

For detailed information, see Sample Starter Kit for Consultants - Integration with Business Intelligence Cloud Service.

# Scenario 9: Using Groovy Business Rules to Call REST APIs from Oracle and Other Companies

The scenario shows how to use the Oracle Enterprise Performance Management Cloud Groovy object model to call Oracle REST APIs and REST APIs developed by other companies.

These tutorials show you how to call a Data Management REST API to execute a data load rule and how to call the Google Places REST API from a Groovy script to add or update employee address information in Planning.

To learn how to use Groovy business rules to call Oracle and external REST APIs:

- Calling a REST API from Oracle Using Groovy
- Calling a REST API from Other Companies Using Groovy

To get an introduction to Groovy business rules:

- Learning Groovy in Oracle EPM Cloud video
- Creating a Groovy Business Rule in Designing with Calculation Manager for Oracle Enterprise Performance Management Cloud
- Introduction to Groovy Business Rules tutorial
- Additional Groovy Tutorials
- EPM Cloud Groovy Rules Java API Reference

6

## Quick Reference Table – REST API Resource View

The REST resources provide powerful APIs that you can use to manage Oracle Enterprise Performance Management Cloud as an alternative to using the web-based user interface.

These tables summarize the REST resource paths.

- EPM Platform
- Planning, FreeForm, Strategic Workforce Planning, and Sales Planning
- Migration
- Security
- Daily Maintenance Window Time
- Managing Users, Groups, and Roles
- Usage Simulation REST APIs
- Reporting REST APIs
- Data Integration REST APIs
- Data Management REST APIs
- Account Reconciliation
- Financial Consolidation and Close
- Task Manager
- Supplemental Data Manager
- Enterprise Journals
- Tax Reporting
- Enterprise Profitability and Cost Management
- Profitability and Cost Management

#### **EPM Platform**

#### Table 6-1 EPM Platform

Rest Resource	Request	More Information
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/jobs</pre>	POST	Execute a Report Bursting Definition
<pre>/HyperionPlanning/rest/epm/{api_version}/ applications/{application}/connections/ {connectionRef}</pre>	GET	Update a Connection
<pre>/HyperionPlanning/rest/epm/{api_version}/ applications/{application}/connections/ {connectionRef}</pre>	GET	View a Connection

#### Table 6-1 (Cont.) EPM Platform

Rest Resource	Request	More Information
/HyperionPlanning/rest/epm/{api_version}/ applications/{application}/connections	GET	View All Connections

#### Planning, FreeForm, Strategic Workforce Planning, and Sales Planning

Rest Resource	Request	More Information
/HyperionPlanning/rest/	GET	Getting API Versions for Planning
/HyperionPlanning/rest/{api_version}	GET	Get Information about a Specific REST API Version for Planning
/HyperionPlanning/rest/{api_version}/ applications/{application}/jobdefinitions	GET	Get Job Definitions
/HyperionPlanning/rest/{api_version}/ applications/{application}/jobs	POST	Execute a Job
/HyperionPlanning/rest/{api_version}/ applications/{application}/jobs/ {jobIdentifier}	GET	Retrieve Job Status
/HyperionPlanning/rest/{api_version}/ applications/{application}/jobs/ {jobIdentifier}/details	GET	Retrieve Job Status Details
/HyperionPlanning/rest/{api_version}/ applications/{application}/jobs/ {jobIdentifier}/childjobs/ {childJobIdentifier}/details	GET	Retrieve Child Job Status Details
/HyperionPlanning/rest/{api_version}/ applications/{application}/dimensions/ {dimname}/members	POST	Add Member
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/dimensions/ {dimname}/members/{member}</pre>	GET	Get Member
/HyperionPlanning/rest/{api_version}/ applications	GET	Get Applications
<pre>/HyperionPlanning/rest/{version}/ applications/{application}/planningunits? q={"scenario":"scenarioName","version":"ver sionName"}}&amp;offset=10&amp;limit=10</pre>	POST	List All Planning Units
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/planningunits? q={"scenario":{"scenario"},"version": {"version"}}&amp;offset={offset}&amp;limit={limit}</pre>	GET	Get Planning Unit History and Annotations
/HyperionPlanning/rest/{api_version}/ applications/{application}/users/{userId}/ photo	GET	Get a Planning Unit Owner Photo

Rest Resource	Request	More Information
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/planningunits/ {puIdentifier}/promotionpath</pre>	GET	Get Planning Unit Promotional Path
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/ planningunits{puhIdentifier}/ availableactions</pre>	POST	Get Available Planning Unit Actions
/HyperionPlanning/rest/{api_version}/ applications/{application}/pufilters	GET	Get Filters with All Possible Values
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/planningunits/ {puhIdentifier}/actions</pre>	POST	Change Planning Unit Status
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/userpreferences</pre>	GET	Get User Preferences
/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/importdataslice	POST	Import Data Slice
/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/exportdataslice	POST	Export Data Slice
/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/cleardataslice	POST	Clear Data Slice
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/ substitutionvariables</pre>	GET	Get All Substitution Variables Defined for the Application
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/ substitutionvariables/MyPeriod</pre>	GET	Get a Substitution Variable Defined for the Application
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/ substitutionvariables</pre>	POST	Create or Update All Substitution Variables Defined for the Application
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables</pre>	GET	Get Substitution Variables Defined at the Plan Type Level
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables? q={"derivedValues":true}</pre>	GET	Get Derived Substitution Variables at the Plan Type Level
/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables/CurrYear	GET	Get a Substitution Variable Defined at the Plan Type Level
<pre>HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables/MyPeriod? q={"derivedValues":true}</pre>	GET	Get a Derived Substitution Variable Defined at the Plan Type Level

## Table 6-2(Cont.) Planning, FreeForm, Strategic Workforce Planning, and SalesPlanning

Rest Resource	Request	More Information
<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables</pre>	POST	Create and Update Substitution Variables at the Plan Type Level
/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables/subvarname	DELETE	Delete a Substitution Variable at the Plan Type Level
/HyperionPlanning/rest/{api_version}/ applications/{application}/ substitutionvariables/subvarname	DELETE	Delete a Substitution Variable for the Application
/HyperionPlanning/rest/{api_version}/ applications/{application}/plantypes/ {plantype}/substitutionvariables:delete	POST	Delete Substitution Variables at the Plan Type Level
/HyperionPlanning/rest/{api_version}/ applications/{application}/	POST	Delete Substitution Variables for the Application

#### Migration

#### Table 6-3 Migration

substitutionvariables:delete

Rest Resource	Request	More Information
Getting REST API Versions for Migration		
/interop/rest/	GET	Get REST API Versions for Migration
/interop/rest/{api_version}	GET	Get Information about a Specific Version of Migration Sample Code
Import and Export Files		
<pre>/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}/migration? q={type:"import"}</pre>	POST	LCM Import (v1)
/interop/rest/v2/snapshots/import	POST	LCM Import (v2)
<pre>/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}/ migrationq={type:"export"}</pre>	POST	LCM Export (v1)
/interop/rest/v2/snapshots/export	POST	LCM Export (v2)
Upload and Download Files		
/interop/rest/11.1.2.3.600/ applicationsnapshots/ {applicationSnapshotName}/contents	POST	Upload
/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}/contents	GET	Download
View and Delete Files		

Table 6-3	(Cont.) Migration	
	(Cont.) Migration	

Rest Resource	Request	More Information
/interop/rest/{api_version}/ applicationsnapshots	GET	List Files (v11.1.2.3.600)
/interop/rest/v2/files/list	GET	List Files (v2)
/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}	DELETE	Delete Files (v11.1.2.3.600)
/interop/rest/v2/files/delete	DELETE	Delete Files (v2)
/interop/rest/v3/files/delete	POST	Delete Files (v3)
Manage Services		
/interop/rest/{api_version}/services	GET	Get Information About All Services
/interop/rest/{api_version}/config/ services/idlesessiontimeout	GET	Get Idle Session Timeout
/interop/rest/{api_version}/config/ services/idlesessiontimeout	PUT	Set Idle Session Timeout
/interop/rest/{api_version}/services/ {service type}/resetservice	POST	Restart the Service Instance (v1)
/interop/rest/v2/config/services/reset	POST	Restart the Service Instance (v2)
<pre>/interop/rest/{api_version}/services/ {servicename}/recreate</pre>	POST	Run Recreate on a Service (11.1.2.3.600)
/interop/rest/v2/config/services/recreate	POST	Run Recreate on a Service (v2)
Manage Application Snapshots		
/interop/rest/{api_version}/ applicationsnapshots	GET	Get Information About All Application Snapshots
/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}	GET	Get Information About a Specific Application Snapshot
<pre>/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}/contents? q={"isLast":false,"isFirst": true,"chunkSize":14,"fileSize":55445}</pre>	POST	Upload Application Snapshot (v1)
/interop/rest/v2/files/upload	POST	Upload Application Snapshot (v2)
/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}/content	GET	Download Application Snapshot (v1)
/interop/rest/v2/files/download	POST	Download Application Snapshot (v2)
/interop/rest/v1/services/{servicename}/ copysnapshot	POST	Copy Application Snapshot (v1)
/interop/rest/v2/snapshots/copyfrominstance	POST	Copy Application Snapshot (v2)
/interop/rest/v1/renamesnapshot	PUT	Rename Application Snapshot (v1)

Rest Resource	Request	More Information
/interop/rest/v2/snapshots/rename	PUT	Rename Application Snapshot (v2)
Copy to and from the Object Store		
/interop/rest/v1/services/copytoobjectstore	POST	Copy to Object Store (v1)
/interop/rest/v2/objectstorage/copyto	POST	Copy to Object Store (v2)
/interop/rest/v2/objectstorage/copyfrom	POST	Copy from Object Store (v2)
/interop/rest/v1/services/copyfile	POST	Copy a File Between Instances (v1)
Working with Oracle Essbase		
/interop/rest/v2/essbase/export	POST	Export Essbase Data (v2)
/interop/rest/diag/v1/services/ essbaseblockanalysisreport	POST	Essbase Block Analysis Report
/interop/rest/{api_version}/config/ services/essbaseqrygovexectime	GET	Get Essbase Query Governor Execution Time
/interop/rest/{api_version}/config/ services/essbaseqrygovexectime	PUT	Set Essbase Query Governor Execution Time
Other		
/interop/rest/v1/services/copyfile	POST	Copy a File Between Instances (v1)
/interop/rest/v2/files/copyfrominstance	POST	Copy a File Between Instances (v2)
/interop/rest/v1/services/clone	POST	Clone an Environment
/interop/rest/v2/backups/list	GET	List Backups - Only for OCI (Gen 2) Environments
/interop/rest/v2/backups/restore	POST	Restore Backup - Only for OCI (Gen 2) Environments

<pre>/epm/rest/{api_version}/fileApplications/ {application}/jobs/updateDimension</pre>	POST	Update Dimensions As a Job

#### Table 6-17 (Cont.) Profitability and Cost Management

## 7 REST Resources and Methods

This section describes the REST APIs for Oracle Enterprise Performance Management Cloud.

Completing administrative tasks using REST APIs as an alternative to using the user interface requires considerable technical and functional expertise. Only technically competent EPM Cloud Administrators should use this guide to perform EPM Cloud Administrator administrative tasks. For prerequisites to using these REST APIs, see Prerequisites.

The predefined and application roles assigned to the user of the REST API determine which APIs can be executed.

## Supported REST Methods

You can use the Oracle Enterprise Performance Management Cloud REST APIs to create and manage resources for selected functionality. These APIs provide an alternative to using the selected components in the web-based user interface.

You can use one of a variety of methods to access the REST APIs. For example, you can access the REST API through client applications such as:

- Web browsers
- cURL

You can also use the REST APIs in REST client applications that are developed in languages such as:

- JavaScript
- Ruby
- Perl
- Java
- Groovy

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

REST describes any simple interface that transmits data over a standardized interface (such as HTTP) without an additional messaging layer, such as SOAP. REST provides a set of design rules for creating stateless services that are viewed as resources, or sources of specific information, and can be identified by their unique URIs. RESTful web services are services that are built according to REST principles and, as such, are designed to work well on the web. Typically, RESTful web services are built on the HTTP protocol and implement operations that map to the common HTTP methods, such as GET, POST, PUT, and DELETE to retrieve, create, update, and delete resources, respectively.

## **REST API Methods**

You can create, view, update, or delete Oracle Enterprise Performance Management Cloud resources using standard HTTP method requests, as summarized in the following table.

Table 7-1 REST API Methods

Method	Description
GET	Retrieve information about the REST API resource
POST	Create a REST API resource
PUT	Update a REST API resource
DELETE	Delete a REST API resource or related component

### **Error Handling**

All REST APIs return JSON output appropriate for the API invoked. HTTP Status codes other than 200 are used as appropriate to indicate various failures, along with JSON for detailed error messages.

## Versioning

The Oracle Enterprise Performance Management Cloud REST API web services are versioned at the API level and expect the version to be included in the URL as shown here. An error will occur if the API version is missing or the provided version is not supported by the API.

For each service's API, you can get version and details for a specific REST API version. For details, see the service's API topics or Current REST API Version.

**Important**: The version number is case-sensitive. For example, if the version number is listed as v1 with a lowercase v, you cannot enter the version number with a capital V as in this incorrect example, V1, which would result in an error. Instead, you must enter the version number with a lowercase v as in this correct example: v1.

#### Examples:

```
https://https://<BASE-URL>/HyperionPlanning/rest/{api_version}/applications/
{applicationName}/jobs
```

https://https://<BASE-URL>/interop/rest/{api version}/applicationsnapshots

where  $\{api\_version\}$  is the current REST API version for the product, for example, v3 for Planning.

## **Current REST API Version**

Use the *Getting API Versions* topic for the Oracle Enterprise Performance Management Cloud business process to get the API version number and details for a specific REST API.

Planning: See Getting API Versions for Planning

- Migration: See Getting API Versions for Migration APIs
- Data Management: See Getting API Versions for Data Integration APIs
- Account Reconciliation: See Getting API Versions for Account Reconciliation REST APIs
- Financial Consolidation and Close: See Getting API Versions for Financial Consolidation and Close APIs
- Profitability and Cost Management: See Get API Versions for Profitability and Cost Management REST APIs
- Profitability and Cost Management: See Getting API Versions for Enterprise Profitability and Cost Management

## **Status Codes**

When you call any of the Oracle Enterprise Performance Management Cloud REST APIs, one of the following standard HTTP status codes is returned in the response header.

HTTP Status Codes	Description
200 OK	The request was successfully completed. A 200 status is returned for a successful GET or POST method.
201 Created	The request has been fulfilled and resulted in a new resource being created. The response includes a Location header containing the canonical URI for the newly created resource.
	A 201 status is returned from a synchronous resource creation or an asynchronous resource creation that completed before the response was returned.
202 Accepted	The request has been accepted for processing, but the processing has not been completed. The request may or may not eventually be acted upon, as it may be disallowed at the time processing actually takes place.
	When specifying an asynchronous (_detached=true_resource creation, for example, when deploying an application, or update, for example, when redeploying an application, a 202 is returned if the underlying operation does not complete in a reasonable amount of time.
	The response contains a Location header of a job resource that the client should poll to determine when the job has finished. It also returns an entity that contains the current state of the job.
400 Bad Request	The request could not be processed because it contains missing or invalid information, such as a validation error on an input field, a missing required value, and so on.
401 Unauthorized	The request is not authorized. The authentication credentials included with this request are missing or invalid.
403 Forbidden	The user cannot be authenticated. The user does not have authorization to perform this request.
404 Not Found	The request includes a resource URI that does not exist
405 Method Not Allowed	The HTTP verb specified in the request (DELETE, GET, POST, PUT) is not supported for this request URI.
406 Not Acceptable	The resource identified by this request is not capable of generating a representation corresponding to one of the media types in the Accept header of the request.
415 Not Acceptable	The client's ContentType header is not correct.

Table 7-2 Status Codes

Table 7-2	(Cont.)	Status	Codes
-----------	---------	--------	-------

HTTP Status Codes	Description
500 Internal Server Error	The server encountered an unexpected condition that prevented it from fulfilling the request.
503 Service Unavailable	The server is unable to handle the request due to temporary overloading or maintenance of the server.

## 8 Planning REST APIs

Use the Planning REST APIs to get the REST API version, manage and execute jobs, and work with members, applications, planning units, user preferences, data slices, and substitution variables.

#### Note:

You can also use these APIs with FreeForm.

These REST APIs are available for Planning. They are also available for FreeForm, as shown in EPM Cloud REST API Compatibility.

- URL Structure for Planning
- Resources and Available Actions
- Getting API Versions for Planning
- Manage Jobs
- Working with Members
- Get Applications
- Manage Planning Units
- Get User Preferences
- Working with Data Slices
- Getting and Setting Substitution Variables
- Deleting Substitution Variables
- Working with Connections

Before you work with the REST APIs, be sure you are familiar with the Implementation Best Practices for EPM Cloud REST APIs.

**Note**: We have removed the following fields from the exception response in REST APIs for Planning and Planning Modules:

- message
- localizedMessage

## **URL Structure for Planning**

This topic shows the general URL structure for Planning REST APIs.

Use the following URL structure to access the Planning REST resources:

https://<BASE-URL>/HyperionPlanning/rest/{api version}/{path}

#### Where:

• <BASE-URL>: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- api\_version: API version you are developing with. The current REST API version for Planning is v3.
- *path*: Identifies the resource.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ <code>internal/"</code> in the URL.

# **Resources and Available Actions**

In the response, the Links section of the response parameters lists links to other resources and available actions for the current resource.

Name	Description
links	Describes links to other resources and actions applicable on the current resource
rel	Relationship type; the relationship between the current state and the state to which the client will transition
href	The target resource's URI. If the value of rel is "self", this URI is how the resource is accessed currently
action	The HTTP method. For POST, data indicates the parameters and values with which it was invoked

Table 8-1 Resources and Available Actions

# Getting API Versions for Planning

You can get information on REST API versions using a set of REST resources, as summarized here.

**Important**: The version number is case-sensitive. For example, if the version number is listed as v3 with a lowercase v, you cannot enter the version number with a capital V as in this incorrect example, V3, which would result in an error. Instead, you must enter the version number with a lowercase v as in this correct example: v3.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 8-2 Getting REST API Versions

Task	Requ est	REST Resource
Get REST API Versions for Planning	GET	/HyperionPlanning/rest/
Get Information about a Specific REST API Version for Planning	GET	/HyperionPlanning/rest/{api_version}

# Get REST API Versions for Planning

You can use REST APIs to get information about which versions are available and supported. Multiple versions might be supported simultaneously.

Service Administrator, Power User, User, Viewer

#### **REST Resource**

GET /HyperionPlanning/rest/

#### Request

Supported Media Types: application/json

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 8-3 Parameters

Name	Description
items	Version of the API you are developing with
version	The version, such as v3
lifecycle	Possible values: active, deprecated
isLatest	Whether this resource is the latest, true or false

#### Example of Response Body

The following shows an example of the response body in JSON format.

"items": [{

{

```
"version": "v1",
        "lifecycle": "deprecated",
        "isLatest": false,
        "links": [{
            "rel": "canonical",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v1"
        }, {
            "rel": "successor-version",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v2"
        }]
    }, {
        "version": "v2",
        "lifecycle": "deprecated",
        "isLatest": false,
        "links": [{
            "rel": "canonical",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v2"
        }, {
            "rel": "predecessor-version",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v1"
        }, {
            "rel": "successor-version",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3"
        }1
    }, {
        "version": "v3",
        "lifecycle": "active",
        "isLatest": true,
        "links": [{
            "rel": "canonical",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3"
        }, {
            "rel": "predecessor-version",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v2"
        }]
    }],
    "links": [{
        "rel": "self",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/"
    }, {
        "rel": "canonical",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/"
    }, {
        "rel": "current",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3"
```

}]

}

# Get Information about a Specific REST API Version for Planning

You can use REST APIs to get information about a specific REST API version for Planning.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 8-4 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V3	Path	Yes	None

#### **Response Body**

Supported Media Types: application/json

#### Parameters

The following table summarizes the response parameters.

#### Table 8-5 Parameters

Attribute	Description	
version	The version, such as v3	
lifecycle	Lifecycle of the resource, active or deprecated	
isLatest	Whether this resource is the latest, true or false	

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "version": "v3",
    "lifecycle": "active",
    "isLatest": true,
    "links": [{
        "rel": "canonical",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3"
```

```
}, {
    "rel": "predecessor-version",
    "href": "https://<BASE-URL>/HyperionPlanning/rest/v2"
}]
```

# Manage Jobs

}

You can manage jobs using a set of REST resources, as summarized here.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. For additional details, see Job Types.

Jobs:

- Get Job Definitions
- Execute a Job
- Retrieve Job Status
- Retrieve Job Status Details
- Rules
- Ruleset
- Plan Type Map
- Import Data
- Export Data
- Export Metadata
- Import Metadata
- Cube Refresh
- Clear Cube
- Administration Mode
- Compact Cube
- Restructure Cube
- Merge Data Slices
- Optimize Aggregation
- Import Security
- Export Security
- Export Audit
- Export Job Console
- Sort Members
- Import Exchange Rates
- Auto Predict

- Import Cell-Level Security
- Export Cell-Level Security
- Import Valid Intersections
- Export Valid Intersections
- Execute a Report Bursting Definition
- Export Library Documents
- Import Library Documents

## Get Job Definitions

Use this resource to get job definitions for the types of jobs that can be scheduled to run.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. For additional details, see Job Types.

#### **Required Roles**

Service Administrator

#### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/
jobdefinitions

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 8-6 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
jobIdentifier	The ID of the job, such as 224	Path	Yes	None
q	Query string	Query	No	None

Table 8-6 (Cont.) Parameters
------------------------------

Name	Description	Туре	Required	Default
jobType	Optionally, retrieve job definitions for a particular job	2		
	type, such as RULES.			
	These jobs are supported:			
	Rules			
	Ruleset			
	Plan Type Map			
	Import Data			
	Export Data			
	Export Metadata			
	Import Metadata			
	Cube Refresh			
	Clear Cube			
	Administration Mode			
	Compact Cube			
	Restructure Cube			
	Merge Data Slices			
	Optimize Aggregation			
	Import Security			
	Export Security			
	Export Audit			
	Export Job Console			
	Sort Members			
	Import Exchange Rates			
	Auto Predict			
	Import Cell-Level Security			
	Export Cell-Level Security			
	Import Valid Intersections			
	Export Valid Intersections			
	Execute a Report Bursting Definition			
	Export Library Documents			
	Import Library Documents			

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobdefinitions

Specifying an optional jobType, RULES:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobdefinitions?
q={"jobType":"RULES"}

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

Name	Description
items	Collection of job definitions
јоbТуре	Job type, such as RULESET. These jobs are supported:
	Rules
	Ruleset
	Plan Type Map
	Import Data
	Export Data
	Export Metadata
	Import Metadata
	Cube Refresh
	Clear Cube
	Administration Mode
	Compact Cube
	Restructure Cube
	Merge Data Slices
	Optimize Aggregation
	Import Security
	Export Security
	Export Audit
	Export Job Console
	Sort Members
	Import Exchange Rates
	Auto Predict
	Import Cell-Level Security
	Export Cell-Level Security
	Import Valid Intersections
	Export Valid Intersections
	Execute a Report Bursting Definition
	Export Library Documents
jobName	The exact name of the job, such as Financial Statements - Forecast.
type	Application type

#### Table 8-7 Parameters

#### Example of Response Body

The following shows an example of the response body specifying jobType with a value of RULESET.

```
{
   "items": [{
      "jobType": "RULESET",
      "jobName": "Financial Statements - Forecast",
      "links": null
   }, {
      "jobType": "RULESET",
      "jobName": "Financial Statements - Plan",
      "links": null
   }, {
      "jobType": "RULESET",
   }
}
```

```
"jobName": "Revenue Forecast",
        "links": null
    }, {
        "jobType": "RULESET",
        "jobName": "Revenue Plan",
        "links": null
    }, {
        "jobType": "RULESET",
        "jobName": "RS 60 RTP vars test2",
        "links": null
    }],
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
vision/jobdefinitions?q=%7BjobType:RULESET%7D",
        "action": "GET"
    }],
}
```

## Execute a Job

Use this resource to execute several jobs simultaneously by providing the job name and type. The job is expected to be defined in Planning with all the required parameters saved with the job definition. For some job types, the parameters can be either provided or overwritten at runtime.

This topic describes general information for executing a job. Details for each job type are described in separate topics for individual jobs.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. For additional details, see Job Types.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api version}/applications/{application}/jobs

#### Request

Supported Media Types: application/json

Parameters

This table summarizes the request parameters that are generic to all jobs. The following tables describe parameters specific to individual jobs.

Note that all parameter names and values are case sensitive.

#### Table 8-8 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

#### Table 8-8 (Cont.) Parameters

Name	Description	Туре	Required	Default
application	Name of the application for which the job will be executed	Path	Yes	None

#### Example URL and Payload

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs

```
{"jobType":"jobType","jobName":"jobName","parameters":
{"parameter1":"value","parameter2":"value2"}}
```

#### Response

Supported Media Types: application/json

#### Parameters

This table summarizes the response parameters that are generic to all jobs. The following topics describe parameters specific to individual jobs:

- Rules
- Ruleset
- Plan Type Map
- Import Data
- Export Data
- Export Metadata
- Import Metadata
- Cube Refresh
- Clear Cube
- Administration Mode
- Compact Cube
- Restructure Cube
- Merge Data Slices
- Optimize Aggregation
- Import Security
- Export Security
- Export Audit
- Export Job Console
- Sort Members
- Import Exchange Rates
- Auto Predict
- Import Cell-Level Security

- Export Cell-Level Security
- Import Valid Intersections
- Export Valid Intersections
- Execute a Report Bursting Definition
- Export Library Documents
- Import Library Documents

#### Table 8-9 Parameters

Name	Description
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 = cancel pending; 3 = cancelled; 4 = invalid parameter; Integer.MAX_VALUE = unknown
details	Details about the job status, such as "Metadata import was successful" for metadata import
jobID	The ID of the job, such as 145
jobName	The name of the job, such as Refresh Database.
descriptiveStatus	The status of the job, such as Completed or Error

### Rules

Use this REST API to launch a business rule.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator, Power User (if Rule Launch access is granted)

#### **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/
jobs

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request parameters specific to this job. For parameters that are common to all jobs, see Execute a Job.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### Table 8-10 Rules

Name	Description	Required	Default
јорТуре	Rules or RULES (both parameters are supported)	Yes	None

#### Table 8-10 (Cont.) Rules

Name	Description	Required	Default
jobName	The name of a <b>business rule</b> exactly as it is defined in the Planning application.	Yes	None
	<b>Example</b> : RollupUSSales		
parameters	Optionally you can specify the runtime prompts and their values required to execute the business rule.	No, unless default values for the run time prompts are not provided in	Default values for the runtime prompts as provided in Calculation
	Note: The rule is executed against the plan type to which it was deployed.	Calculation Manager.	Manager will be used.
	The value must use JSON syntax.		

#### Example URL and Payload

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs

```
{
   "jobType":"Rules",
   "jobName":"Operating Expense Adj Plan",
   "parameters":
        {
            "MyScenario1":"Current",
            "MyVersion1":"BU Version_1",
            "ToEntity":"CA",
            "Rule_Level_Var":"AZ",
            "planType":"Plan1"
        }
}
```

### Ruleset

Launches a business ruleset.

Supports rulesets with no runtime prompts or runtime prompts with default values. You can add parameters to rulesets for greater flexibility. Use the sample rulesets and POST requests below to help you quickly understand different scenarios when running this job. For details about rulesets, see Designing Business Rulesets.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. For information about creating rulesets, see *Designing with Calculation Manager for Oracle Enterprise Performance Management Cloud*.

#### **Required Roles**

Service Administrator, Power User (if Rule Launch access is granted)

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Require d	Default
јорЛуре	Ruleset or RULESET (both parameters are supported).	Yes	None
jobName	The name of a <b>business ruleset</b> exactly as is defined in the Planning application.	Yes	None
	<b>Example:</b> RollupUSSales		
parameters		No	Default values for the runtime prompts as provided in Calculation Manager will be used.

#### Table 8-11 Ruleset

#### Example URL and Payload

https://<BASE URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs

```
{
   "jobType":"Ruleset",
   "jobName":"Calculate Plan Operating Expenses"
}
```

#### **Example Ruleset Scenarios and POST Requests**

These examples based on the Vision application illustrate how to run rulesets with parameters. For each example, review the sample ruleset in Calculation Manager to understand the sample POST request.

Example 1: Ruleset "Revenue Plan" when variables are merged and not hidden

In Revenue Plan, by default the variables are merged and hidden. When variables are hidden, the default values defined in Calculation Manager will be used when executing the ruleset and any values provided in the payload will be ignored.

#### Sample Ruleset in Calculation Manager

lame				Application	Туре	Description
🛛 🎇 Revenue Plan				Vision		
🤪 Copy Chanr	nel			Vision	Plan1	
🤪 Revenue Pla	an			Vision	Plan1	
Useass Vaviable	-					
Usages Variable	S					
_	S					
Usages Variables	S					
Merge Variables						Lice As Override
_	Name	Scope	Is Hidden	Value		Use As Override Value
Merge Variables		Scope Application	Is Hidden	Value		

#### Sample POST request

```
{
   "jobType":"Ruleset",
   "jobName":"Revenue Plan",
   "parameters":
   {
        "Version":"Worst Case",
        "Department":"No Entity"
   }
}
```

Example 2: Ruleset "Revenue Plan" when variables are not merged and not hidden

lame				Application	Туре	Descri
🛛 🞇 Revenue Plan				Vision		
🤪 Copy Chan	nel			Vision	Plan1	
🤪 Revenue Pl	an			Vision	Plan1	
u	2					
Usages Variable	5					
_						
Merge Variables						
_						
_	Name	Scope	Is Hidden	Value		Use As Ove Value
Merge Variables		Scope Application	Is Hidden	Value •		
Merge Variables	Name		Is Hidden	Value •		
Merge Variables	Name Department	Application	Is Hidden	•		

#### Sample POST request

```
{
  "jobType":"Ruleset",
  "jobName":"Revenue Plan",
  "parameters":
  {
    "Copy Channel.Department":"No Entity",
    "Copy Channel.Version":"Worst Case",
    "Revenue Plan.Department":"New Entity",
    "Revenue Plan.Version":"Best Case"
  }
}
```

**Example 3:** Ruleset "Calculate Plan Operating Expenses" with nested ruleset ("Revenue Plan") and variables are merged and not hidden

Sample Ruleset in Calculation Manager

lame					Application	Туре	Description
🛛 🏡 Calculate Plan Operating Expenses					Vision		
🤪 Operating Expenses Plan					Vision	Plan1	
🤪 Operating Expense Adj Plan					Vision	Plan1	
🤪 Copy Channel					Vision	Plan1	
🔺 🎇 Revenue Plan					Vision		
😝 Copy Chann	el				Vision	Plan1	
🤪 Revenue Pla	n				Vision	Plan1	
Usages Variables	Name	Scope	Is Hidden	Value		l	Jse As Override Value
		<ul> <li>b</li> <li>c</li> </ul>			=		
Operating Expenses Plan	n Version	Application					

#### Sample POST request

```
{
   "jobType":"Ruleset",
   "jobName":"Calulate Plan Operating Expenses",
   "parameters":
   {
        "Department":"Unspecified Entity",
        "Version":"Most Likely"
   }
}
```

**Example 4**: Ruleset "Calculate Plan Operating Expenses" with a nested ruleset ("Revenue Plan") and variables that are not merged and not hidden

#### Sample Ruleset in Calculation Manager

ame				A	Application	Туре	Description
🖓 Calculate Plan Operatin	ig Expenses			V	/ision		
🤪 Operating Expenses	s Plan			V	/ision	Plan1	
🤪 Operating Expense	Adj Plan			V	/ision	Plan1	
🤪 Copy Channel				V	/ision	Plan1	
🔺 🎇 Revenue Plan				V	/ision		
🤪 Copy Channel				V	/ision	Plan1

#### Sample POST request

In this example, the same rule, Copy Channel, appears twice – once under Calculate Plan Operating Expenses, and once under Revenue Plan. This demonstrates how to provide the variables with their fully qualified paths.

```
{
    "jobType":"Ruleset",
    "jobName":"Calculate Plan Operating Expenses",
    "parameters":
    {
        "Operating Expenses Plan.Version":"Most Likely",
        "Operating Expense Adj Plan.Version":"What If",
        "Copy Channel.Department":"Unspecified Entity",
        "Copy Channel.Version":"Working",
        "Revenue Plan.Copy Channel.Department":"New Entity",
        "Revenue Plan.Copy Channel.Version":"Best Case",
        "Revenue Plan.Revenue Plan.Department":"No Entity",
        "Revenue Plan.Revenue Plan.Version":"Worst Case"
    }
}
```

Optionally, you can provide the sequence indexes in the paths, as shown below.

{
 "jobType":"Ruleset",

```
"jobName":"Calculate Plan Operating Expenses",
"parameters":
{
    "(1)Operating Expenses Plan.Version": "Most Likely",
    "(2)Operating Expense Adj Plan.Version": "What If",
    "(3)Copy Channel.Department": "Unspecified Entity",
    "(3)Copy Channel.Version": "Working",
    "(4.1)Revenue Plan.Copy Channel.Department": "New Entity",
    "(4.1)Revenue Plan.Copy Channel.Version": "Best Case",
    "(4.2)Revenue Plan.Revenue Plan.Department": "No Entity",
    "(4.2)Revenue Plan.Revenue Plan.Version": "Worst Case"
}
```

Example 5: Ruleset "Revenue Plan" with variables that are merged and not hidden

This example shows two Revenue Plan rules within a ruleset. This demonstrates how to differentiate the variables when there are multiple variables with the same paths within the same parent in the ruleset.

#### Sample Ruleset in Calculation Manager

lame				Application	Туре	Description
🛚 🞇 Revenue Plan				Vision		
🤪 Copy Chann	nel			Vision	Plan1	
🤪 Revenue Pla	n			Vision	Plan1	
🤪 Revenue Pla	an			Vision	Plan1	
Usages <b>Varia<u>b</u>le</b> s	•					
Merge Variables	•

#### Sample POST request

```
{
   "jobType":"Ruleset",
   "jobName":"Revenue Plan",
   "parameters":
   {
      "(1)Copy Channel.Department":"No Entity",
      "(1)Copy Channel.Version":"Worst Case",
      "(2)Revenue Plan.Department":"New Entity",
      "(2)Revenue Plan.Version":"Best Case",
      "(3)Revenue Plan.Version":"What If",
      "(3)Revenue Plan.Department":"Unspecified Entity"
   }
}
```

## Plan Type Map

Copies data from a block storage cube to an aggregate storage cube or from one to another based on the settings specified in a job of type plan type map.

For details about data maps, see Defining Data Maps in Administering Data Integration for Oracle Enterprise Performance Management Cloud.

This API is not supported for Financial Consolidation and Close or Tax Reporting.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Table 8-12	Plan <sup>-</sup>	Туре	Мар
------------	-------------------	------	-----

Name	Description	Requir ed	Default
јоbТуре	Plan Type Map or PLAN_TYPE_MAP (both parameters are supported)	Yes	None
jobName	The name of a job of type <b>plan type map</b> that is already defined in the application.	Yes	None
	Example: CampaignToReporting		
parameters	Optionally, you can specify these parameters:	No	None
	<ul> <li>clearData - Whether the data in the target database should be moved before copying data (defult: true). The value must use JSON syntax. Example: {clearData:false}</li> </ul>		
	• overrideMembersMap - A map containing the dimension name as the key and a member selection string as a value. Members specified in the map will replace the members in the data map definition during execution.		
	<ul> <li>overrideExclusionMembersMap - A map containing the dimension name as the key and a member selection string as a value. Members specified in the map will be excluded from the member selection in the data map definition during execution. Any members from the evaluated exclusion selection not present in the evaluated member selection from the data map definition will be ignored.</li> </ul>		
	<ul> <li>Notes:</li> <li>The override parameters execute this data map using the specified override members map, clearing data in the target region beforehand if requested. The data map push will error out when the override members map contains members from unmapped dimensions of the target location.</li> </ul>		
	<ul> <li>The member selection string is a comma-separated string consisting of member names, functions or expressions.</li> </ul>		

Example URL and Payload

```
https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs
```

```
{
  "jobType": "PLAN_TYPE_MAP",
  "jobName": "MapReporting",
  "parameters": {
     "cubeLinkName": "name",
     "clearData": true
  }
}
```

Examples of overriding selections of the data map:

```
{
  "jobType": "PLAN TYPE MAP",
  "jobName": " MapReporting",
  "parameters": {
    "cubeLinkName": "MapChannels",
    "clearData": true,
    "overrideMembersMap": {
      "Period": "ILvl0Descendants(Q1)"
    },
    "overrideExclusionMembersMap": {
     "Period": "Jan"
    }
  }
}
  "overrideMembersMap": {
    "Period": "ILvl0Descendants(Q1)"
  }
  "overrideMembersMap": {
    "Period": "ILvl0Descendants(Q1)",
    "Account": "Sales"
  }
```

Examples of excluding members:

```
"overrideExclusionMembersMap": {
    "Period": "Jan"
}
"overrideExclusionMembersMap": {
    "Period": "Jan, Feb, &CurrMonth, ILvl0Descendants(Q1), YearTotal, Red"
}
```

### Import Data

Use this REST API to import data from a file in the repository into the application using the import data settings specified in a job of type Import Data.

You can override some of the parameters of the job definition while executing this job from a REST API.

You can also import data using the parameter values provided, without an explicit predefined Import Data job definition.

For Planning, Financial Consolidation and Close, and Tax Reporting, you can review the rejected data records that have errors. To do this, specify an error file that captures the data records that are not imported for each dimension. If an errop file is specified, the ZIP file is stored in the Outbox where you can download the file using Inbox/Outbox Explorer or tools like EPM Automate or REST APIs, for example, with the Download API.

#### **Required Roles**

Service Administrator

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јоbТуре	Import Data or IMPORT_DATA (both parameters are supported)	Yes	None
jobName	Name of this job.	No	Import Data
	Example: dailydataload		
importFileName	You can specify the name of the ZIP, CSV or TXT (Oracle Essbase format data file) file from which data is to be imported.	Yes	None
	If the parameter passed to import data is in Essbase format, the ZIP file must contain an Essbase format TXT file.		
	For other import jobs, the ZIP file may contain one or more CSV files that identify the import sequence in the file names; for example data1-3.csv, data2-3.csv, and data3-3.csv.		
	The value must use JSON syntax.		
sourceType	Paramter to specify the source of data.	Yes	None
	Allowed value is Planning or Essbase.		

#### Table 8-13 Import Data

### Table 8-13 (Cont.) Import Data

Name	Description	Required	Default
delimiter	Parameter to specify a delimiter. Allowed value is comma or tab.	No	comma
	This is only applicable when the source type is Planning.		
dateFormat	Parameter to specify the data format.	No	MM-DD-YYYY
	Allowed value is one of the following: MM-DD-YYYY, DD-MM-YYYY, or YYYY-MM-DD.		
includeMetaData	Parameter to specify to include metadata from the data file.	No	false
	Allowed value is true or false.		
	This is only applicable when the source type is Planning.		
cube	Parameter to specify the cube name.	Yes	None
	This is only applicable (and becomes mandatory) when the source type is Essbase.		
errorFile	Paramter to specify the errorFile to store the rejected records (maximum 1,000).	No	No error files are created
	The error file is zipped with the name of this parameter. The ZIP file is stored in the Outbox. You can download it with the Download API. This API overrides any existing error file with the same name.		
	Example: ImportDataErrorFile.zip		
stopOnError	Parameter to stop the import process if an intermediate error is encountered during the import, for example, if data load finds an unknown member or invalid data value. This setting can only be used when sourceType is Essbase.	No	true
	When using this option, if you specified an error file, you can then review the rejected data record that has the error. The record is included in a ZIP file that is stored in the outbox where you can download it for review, for example, with the Download API. Allowed value is true or false.		

For a sample URL, see Sample URL and Payload in Execute a Job.

#### Sample Payloads

Example 1: Executes the import data job ImportJob and overrides the importFileName parameter.

```
{"jobType":"IMPORT_DATA","jobName":"ImportJob",
"parameters":{
    "importFileName":"myImportfile123.zip"
    }
}
```

Example 2: Executes the import data job ImportJob and overrides the delimiter, dateFormat, and includeMetaData parameters.

```
{"jobType":"IMPORT_DATA","jobName":"ImportJob",
"parameters":{
    "delimiter":"comma",
    "dateFormat":"MM-DD-YYYY",
    "includeMetaData":"false"
    }
}
```

Example 3: Executes the import data job ImportJob defined with sourceType as Essbase and overrides the sourceType and cube parameters.

```
{"jobType":"IMPORT_DATA","jobName":"ImportJob",
"parameters":{
    "sourceType":"Essbase",
    "cube":"Plan1"
    }
}
```

Example 4: Executes the ImportData job ImportDataJob and overrides the errorFile parameter with a value ImportDataErrorFile.zip. If error records are found during the Import Data operation, a ZIP file called ImportDataErrorFile.zip is created in the Planning repository. The generated error file can be downloaded from the Outbox from the job status page or using the Download REST API or EPM Automate downloadfile command.

```
{"jobType": "IMPORT_DATA",
    "jobName": "ImportDataJob",
    "parameters": {
        "errorFile":"ImportDataErrorFile.zip"
    }
}
```

Example 5: Executes the ImportData job ImportDataJob\_Sample defined with sourceType as Essbase, and overrides the stopOnError parameter with the value as true. The data load will stop loading in case of an intermediate error.

```
{
    "jobType": "IMPORT_DATA",
    "jobName": "ImportDataJob_Sample",
    "parameters": {
        "importFileName":"importDataFile_Essabse.txt",
        "cube":"Plan1",
        "stopOnError":"true"
    }
}
```

Example 6: Executes the import data job with all the mandatory parameters.

```
{
  "jobType": "IMPORT_DATA",
  "parameters":{
```

```
"sourceType": "Planning",
   "importFileName": "myImportfile123.zip",
   "delimiter": "comma"
}
```

Example 7: Executes the import data job with all the mandatory parameters. The sourceType parameter is specified as Essbase, and cube provides the cube name. Default values are assumed for other non-mandatory parameters.

```
"jobType": "Import Data",
   "parameters":{
      "sourceType": "Essbase",
      "cube": "Plan1",
      "importFileName": "EssbasePlan1 data.zip"
   }
}
```

## Export Data

}

{

Use this REST API to export application data into a file using the export data settings, including file name, specified in a job of type export data. The file containing the exported data is stored in the repository.

You can override some of the parameters of the job definition while executing this job with a REST API.

You can also export application data into a file using the parameter values provided, without an explicit predefined Export Data job definition.

Exporting data supports substitution variables. You can use substitution variables while providing the rowMembers, columnMembers, and povMembers definitions. See Exporting Data and Creating and Assigning Values to Substitution Variables in Administering Planning.

#### **Required Roles**

Service Administrator

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### Request

Supported Media Types: application/json

#### **Parameters**

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

#### Table 8-14 Export Data

Name	Description	Required	Default
јор⊥λЪ	Export Data or EXPORT_DATA (both parameters are supported)	Yes	None

#### Table 8-14 (Cont.) Export Data

Name	Description	Required	Default
jobName	The name of this job.	No	Export Data
	Example: dailydataexport		
exportFileName	The file name for the exported data. Data is exported as a ZIP file only. The exported file is stored in the Planning repository. The value must use JSON syntax.	No	The file name for the exported data will be the same as jobName.
delimiter	Parameter to specify a delimiter.	No	comma
	Allowed value is comma or tab.		
exportSmartListAs	Parameter to specify how Smart Lists are exported. Allowed value is label or name.	No	label, which signifies that Smart View labels will be exported.
includeDynamicMemb ers	Parameter to include or exclude dynamic members. Allowed value is true or false.	No	true, which signifies that dynamic members will be exported.
cube	Parameter to specify the cube from which to export data.	Yes	None
rowMembers	Parameter to specify the row members. Example: "Name,Price,Discount %"	Yes	None
columnMembers	Parameter to specify the column members. <b>Example</b> : "Name,Price,Discount %"	Yes	None
povMembers	Parameter to specify the POV members. <b>Example</b> : "Name,Price,Discount %"	Yes	None
exportDataDecim alScale	Parameter to specify the number of decimal positions (0-16) that will be returned when exporting data from Essbase. If the default None is selected, the data that is returned will not be formatted and will return as Essbase returns it. Selecting a numeric value will result in the exported data displaying that number of digits to the right of the decimal point, wherever applicable. For example, specifying 3 in the Decimals field will result in the exported data to display three digits to the right of the decimal point. Selecting 0 formats the data to display a whole number. <b>Example</b> : A value 27.07000001 can be formatted and written as 27.07 in the export data file if the value for this parameter is set to 2.	No	None

For a sample URL, see Sample URL and Payload in Execute a Job.

#### Sample Payloads

Example 1: Executes the export data job ExportJobDaily and overrides the exportFileName parameter.

```
{"jobType":"EXPORT_DATA","jobName":"ExportJobDaily",
    "parameters":{
        "exportFileName":"myExportfile.zip"
        }
}
```

Example 2: Executes the export data job ExportJobDaily and overrides the delimiter, exportSmartListAs, and includeDynamicMembers parameters.

```
{"jobType":"EXPORT_DATA","jobName":"ExportJobDaily",
"parameters":{
    "delimiter":"tab",
    "exportSmartListAs":"name",
    "includeDynamicMembers":"true"
    }
```

Example 3: Executes the export data job ExportJobDaily and overrides the cube parameter only. This job will now execute for the cube Vis1ASO.

```
{"jobType":"EXPORT_DATA","jobName":"ExportJobDaily",
"parameters":{
    "cube":"Vis1ASO
    }
}
```

Example 4: Executes the export data job ExportJobDaily and overrides the cube name along with the rowMembers, columnMembers, and povMembers parameters. This job will now execute for the cube Vis1ASO.

```
{"jobType":"EXPORT_DATA","jobName":"ExportJobDaily",
"parameters":{
    "cube":"Vis1ASO",
    "rowMembers":"Current,Variance,Actual,Scenario",
    "columnMembers":"Statistics,Account",
    "povMembers":"Period,Year,Version,Entity,Product,Channel"
    }
}
```

Example 5: Executes the export data job ExportJobDaily and overrides the cube name along with the parameters rowMembers, columnMembers, and povMembers. We use substitution variables while overriding the rowMembers, columnMembers, and povMembers definition. This job executes for the cube VislASO.

```
{"jobType":"EXPORT_DATA","jobName":"ExportJobDaily",
    "parameters":{
        "cube":"Vis1ASO",
        "rowMembers":"ILv10Descendants(&Param1)",
        "columnMembers":"ILv10Descendants(&Param2)",
        "povMembers":"Period,Year,Version,&Param3,Product,Channel"
        }
}
```

Example 6: Executes the export data job ExportJobDaily and overrides the cube name along with the parameters exportDataDecimalScale, rowMembers, and columnMembers. We use

substitution variables while overriding the rowMembers, columnMembers, and povMembers definition. This job executes for the cube Vis1ASO.

```
{"jobType":"EXPORT_DATA","jobName":"ExportJobDaily",
"parameters":{
    "cube":"Vis1ASO",
    "rowMembers":"ILv10Descendants(&Param1)",
    "columnMembers":"ILv10Descendants(&Param2)",
    "povMembers":"Period,Year,Version,&Param3,Product,Channel",
    "exportDataDecimalScale":"2"
    }
}
```

Example 7: Executes the export data job with all the mandatory parameters, cube, rowMembers, columnMembers, and povMembers. Default values are assumed for other non-mandatory parameters.

```
{"jobType": "EXPORT_DATA",
"parameters": {
    "cube": "Vis1ASO",
    "rowMembers": "ILv10Descendants(&Param1)",
    "columnMembers": "ILv10Descendants(&Param2)",
    "povMembers": "Period,Year,Version,&Param3,Product,Channel"
    }
}
```

Example 8: Executes the export data job with all the mandatory parameters, cube, rowMembers, columnMembers, and povMembers. Decimal precision is set to 3. Default values are assumed for other non-mandatory parameters.

```
{"jobType": "EXPORT_DATA",
"parameters":{
    "cube": "Plan1",
    "rowMembers": "ILvl0Descendants(&Param1)",
    "columnMembers": "ILvl0Descendants(&Param2)",
    "povMembers": "Period,Year,Version,&Param3,Product,Channel",
    "exportDataDecimalScale": 3
    }
}
```

Example 9: Executes the export data job with all the mandatory parameters, cube, rowMembers, columnMembers, and povMembers. Decimal precision is set to 3. Dynamic members are not exported. Default values are assumed for all other non-mandatory parameters.

```
{"jobType": "EXPORT_DATA",
"parameters":{
    "cube": "Plan1",
    "rowMembers": "ILvl0Descendants(&Param1)",
    "columnMembers": "ILvl0Descendants(&Param2)",
    "povMembers": "Period,Year,Version,&Param3,Product,Channel",
    "exportDataDecimalScale": 3,
    "includeDynamicMembers": false
```

}

}

### Import Metadata

Imports metadata from a file in the Planning repository into the application using the import metadata settings specified in a Planning job of type import metadata.

You can also override some of the parameters of the job definition while executing this job from a REST API.

For Planning, Financial Consolidation and Close, and Tax Reporting, you can specify an error file that captures the metadata records that are not imported for each dimension. If an error file is specified, a separate error file is created for each dimension. The error files are then zipped together and the zip file is stored in the Outbox where you can download the file using Inbox/ Outbox Explorer or tools like EPM Automate or REST APIs, for example, with the Download API.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Require d	Default
јоbТуре	Import Metadata or IMPORT_METADATA (both parameters are supported)	Yes	None
jobName	The name of a job of type <b>import metadata</b> exactly as it is already defined in the Planning application.	Yes	None
	Example: importAccount		

#### Table 8-15 Import Metadata

Table 8-15	(Cont.)	Import	Metadata
------------	---------	--------	----------

Name	Description	Require d	Default
importZipFileName	Optionally, you can specify the name of the ZIP file from which metadata is to be imported. The contents of the ZIP file that you specify take precedence over the file names defined in the job. The ZIP file may contain one or more CSV files.	No	The import file name defined in the job definition.
	The file names containing metadata for dimensions should match the import file names defined in the job or end with _DIMENSIONNAME.csv, for example, metadata_Entity.csv, metadata_HSP_SmartLists.csv, and metadata_Exchange Rates.csv.		
	Only metadata for the dimensions for which metadata import is set up in the job is imported. Metadata for other dimensions, if contained in the ZIP file, is ignored.		
	Example: {importZipFileName:importAccount.zip}		
refreshCube	You can override the option to perform a refresh cube action defined in the job.	No	"Refresh Database if Import Metadata is
	Allowed values are either true or false.		successful" parameter of the job definition.
errorFile	Optionally, create a separate error file for each dimension. The error files are zipped with the name of this parameter. The ZIP file is stored in the Outbox. You can download it with the Download API. This API overrides any existing error file with the same name <b>Example</b> : ImportMetaDataErrorFile.zip	No	No error files are created.

For a sample URL, see Sample URL and Payload in Execute a Job.

```
Sample Payload
```

Example: Executes the job ImportMetaDataJob and overrides only the importZipFileName parameter.

```
{
  "jobType": "IMPORT_METADATA",
  "jobName": "ImportMetaDataJob",
  "parameters": {
      "importZipFileName": "myMetaDataDailyJob.zip"
  }
}
```

Example: Executes the job ImportMetaDataJob and overrides the errorFile parameter with a value ImportMetaDataErrorFile.zip. If there are error records found during the Import Metadata operation for one or more dimensions, a ZIP file called

ImportMetaDataErrorFile.zip is created in the repository that contains one error CSV file for each failed dimension. The generated error file can be downloaded from the Outbox from the job status page or using the Download REST API or EPM Automate downloadfile command.

{
 "jobType": "IMPORT\_METADATA",

```
"jobName": "ImportMetaDataJob",
"parameters": {
        "errorFile":"ImportMetaDataErrorFile.zip"
}
```

## Export Metadata

}

Use this REST API to export metadata into a file using the settings specified in a Planning job of type export metadata. The file containing the exported metadata is stored in the Planning repository.

You can also override some of the parameters of the job definition while executing this job from a REST API.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

**Parameters** 

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Require d	Default
јоbТуре	Export Metadata or EXPORT_METADATA (both parameters are supported)	Yes	None
jobName	The name of a job of type <b>export metadata</b> exactly as it is already defined in the Planning application.	Yes	None
	Example: dailyAccountExport		
exportZipFileName	Optionally, you can specify a file name for the exported metadata. Metadata is exported as a ZIP file only.	No The file name for exported metada	
	The value must use JSON syntax.		be the same as Job Name
	<b>Example</b> : {exportZipFileName:Accountexport.zip}		

#### Table 8-16 Export Metadata

**Example Payload** 

Example: Executes the export metadata job "ExportMetadataDaily" and overrides the exportZipFileName parameter.

```
{
    "jobType": "EXPORT METADATA",
    "jobName": "ExportMetadataDaily",
    "parameters": {
```

```
"exportZipFileName": "dailyMetaData.zip"
}
```

## Cube Refresh

}

Use this REST API to refresh the Planning application cube. Typically, you refresh the cube after importing metadata into the application.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
jobType	Cube Refresh or CUBE_REFRESH (both parameters are supported)	Yes	None
jobName	Name of the job to run. You must use the exact name of a job that is already defined in the application.	Yes	None
	Example: refreshcube		
allowedUsersDuri ngCubeRefresh	<b>Possible values:</b> Administrators <b>or</b> All Users	No	None
terminateActiveR equestsBeforeCub eRefresh	Possible values: true or false	No	None
logOffAllUsersBe foreCubeRefresh	<b>Possible values</b> : true <b>or</b> false	No	None
allowedUsersAfte rCubeRefresh	Possible values: Administrators or All Users	No	None

#### Table 8-17 Cube Refresh

For a sample URL, see Sample URL and Payload in Execute a Job.

#### Sample Payload

{"jobType":"CUBE\_REFRESH","jobName":"CubeRefresh"}

Sample Payload overriding parameters:

```
{"jobType":"CUBE_REFRESH","jobName":"MyRefreshCube","parameters":
{"allowedUsersDuringCubeRefresh":" All Users",
"terminateActiveRequestsBeforeCubeRefresh":"false","logOffAllUsersBeforeCubeRe
fresh":"true","allowedUsersAfterCubeRefresh":"Administrators"}}
```

## Clear Cube

Use this REST API to clear specific data within input and reporting cubes.

You can clear the data using member selection or a valid MDX query. Using member selection, you can also optionally clear related supporting details, comments, and attachments. You can also elect to do a physical or logical clear of data. This gives you more flexibility and granularity when clearing the cube.

**NOTE:** The Clear Cube job deletes the data you specify within input and reporting cubes, but it does not delete the application definition in the application's relational tables.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
jobType	Clear Cube or CLEAR_CUBE (both parameters are supported)	Yes	None
jobName	Name of the job to run. Important: You must use the exact name of a job that is already defined in the application.	Yes	None
	<b>Example</b> : ClearPlan1		
cube	Valid ASO cube name	No	As per the job definition

#### Table 8-18 Clear Cube

Name	Description	Required	Default
members	Valid member selection that is comma separated. Applicable only for Partial Clear Job, for an ASO cube, defined with member selection. <b>Example:</b> "ILv10Descendants (E xchange Rates), Total	No	As per the job definition
	Expense"		
mdxQuery	Valid MDX query. Applicable only for Partial Clear Job, for an ASO cube, defined with MDX query support. <b>Example:</b> "Crossjoin({[Apr], [May],[Jun]}, {[Expense1]})"	No	As per the job definition
clearSupportingDeta ils	Specify if supporting details should be cleared. Allowed values: true or false. Applicable only for Partial Clear Job, for an ASO cube, defined with member selection.	No	As per the job definition
clearComments	Specify if comments should be cleared. Allowed values: true or false. Applicable only for Partial Clear Job, for an ASO cube, defined with member selection.	No	As per the job definition
clearAttachments	Specify if attachments should be cleared. Allowed values: true or false. Applicable only for Partial Clear Job, for an ASO cube, defined with member selection.	No	As per the job definition
clearPhysicalOnEssb ase	Specify if this is a physical clear on Essbase. Allowed values: true or false. Applicable only for Partial Clear Job, for an ASO cube, defined with member selection or MDX query support.	No	As per the job definition

### Table 8-18 (Cont.) Clear Cube

For a sample URL, see Sample URL and Payload in Execute a Job.

#### Sample Payload

{"jobType":"CLEAR CUBE", "jobName":"ClearPlan1"}

Example: Executes the clear job Clear\_Partial\_Basic, which is defined with member selection, and overrides the cube and members parameters.

```
{
   "jobType": "Clear Cube",
   "jobName": "Clear_Partial_Basic",
   "parameters": {
        "cube": "HP1_ASO",
        "members": "ILv10Descendants(Exchange Rates),Siblings(Total Expense)"
   }
}
```

Example: Executes the clear job Clear\_Partial\_Basic, which is defined with member selection, and overrides the cube, clearSupportingDetails, clearComments, and other parameters.

```
{
    "jobType": "Clear Cube",
    "jobName": "Clear_Partial_Basic",
    "parameters": {
        "cube":"HP1_ASO",
        "members":"ILv10Descendants(Exchange Rates),Siblings(Total Expense)",
        "clearSupportingDetails":"false",
        "clearComments":false,
        "clearAttachments":false,
        "clearPhysicalOnEssbase":false
    }
}
```

Example: Executes the clear job Clear\_Partial\_Advanced, which is defined with the MDX query, and overrides the mdxQuery parameter.

```
{
   "jobType": "Clear Cube",
   "jobName": "Clear_Partial_Advanced",
   "parameters": {
        "mdxQuery":"Crossjoin({[Apr],[May],[Jun]},{[Expense1]})"
   }
}
```

Example: Executes the clear job Clear\_Partial\_Advanced, which is defined with the MDX query, and overrides the cube, mdxQuery, and clearPhysicalOnEssbase parameters.

```
{
   "jobType": "Clear Cube",
   "jobName": "Clear_Partial_Advanced",
   "parameters": {
        "cube":"HP1_ASO",
        "mdxQuery":"Crossjoin({[Apr],[May],[Jun]},{[Expense1]})",
        "clearPhysicalOnEssbase":false
```

}

## Administration Mode

Changes the login level for a Planning application. If you set login level to Administrators, all Interactive Users and Planners will be logged off of the application upon completion of the job. For details on administration mode, see Scheduling Jobs.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јоbТуре	Administration Mode	Yes	None
jobName	The job name to be used for this job execution. <b>Example:</b> AppAdminJob	No	Administration Mode
loginLevel	Specify the login level for users using loginLevel. Possible values are Administrators or All Users	Yes	None

#### Table 8-19 Parameters

For a sample URL, see Sample URL and Payload in Execute a Job.

#### Sample Payload

Example: This request will change the login level of the application to "Administrators" level.

```
{
   "jobType": "Administration Mode",
   "jobName": "AppAdminJob",
   "parameters": {
        "loginLevel": "Administrators"
   }
}
```

### **Compact Cube**

Use this REST API to compact the outline file of an ASO cube.

Compaction helps keep the outline file at an optimal size. Compacting the outline does not clear the data. For more information, see Scheduling Jobs.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

#### Table 8-20 Parameters

Name	Description	Required	Default
јоbТуре	Compact Cube	Yes	None
jobName	The job name to be used for this job execution.	No	Compact Outline
	<b>Example:</b> CompactCube		
cubeName	Name of the ASO cube	Yes	None

For a sample URL, see Sample URL and Payload in Execute a Job.

#### Sample Payload

Example: This request will compact the outline of Vis1ASO ASO cube.

```
{
   "jobType": "Compact Cube",
   "jobName": "CompactCube",
   "parameters": {
        "cubeName": "Vis1Aso"
   }
}
```

### **Restructure Cube**

Performs a full restructure of a BSO cube to eliminate or reduce fragmentation. For more information, see Scheduling Jobs.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

**REST Resource** 

## Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорДуре	Restructure Cube	Yes	None
jobName	The job name to be used for this job execution. <b>Example:</b> RestructureCube	No	Restructure Cube
cubeName	Name of the BSO cube	Yes	None

For a sample URL, see Sample URL and Payload in Execute a Job.

Sample Payload

Example: This request will restructure Plan1 BSO

```
{
   "jobType": "Restructure Cube",
   "jobName": "RestructureCube",
   "parameters": {
        "cubeName": "Plan1"
   }
}
```

# Merge Data Slices

Merges incremental data slices of an ASO cube. Fewer slices improve a cube's performance. You can merge all incremental data slices into the main database slice or merge all incremental data slices into a single data slice without changing the main database slice. You can optionally remove cells that have a value of zero. For more information, see Scheduling Jobs.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

### Request

Supported Media Types: application/json

## Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорТуре	Merge Data Slices	Yes	None
jobName	The job name to be used for this job execution. <b>Example:</b> MergeDataSlice	No	Merge Data Slices
cubeName	Name of the ASO cube	Yes	None
keepZeroCells	Possible values are <b>true</b> or <b>false</b>	Yes	None
mergeSliceType	Possible values are <i>allIncrementalSlicesI</i> <i>nMain</i> (Merge all into the main slice)	Yes	None
	Or allIncrementalSlicesI nOneIncremental (Merge all incremental into a single incremental slice)		

Table 8-22 Parameters

For a sample URL, see Sample URL and Payload in Execute a Job.

## Sample Payload

Example: This request will merge all incremental data slices in the main data slice and keep zero value cells.

```
{
  "jobType": "Merge Data Slices",
  "jobName": "MergeDataSlice",
  "parameters": {
      "cubeName": "VisASO",
      "mergeSliceType": "allIncrementalSlicesInMain",
      "keepZeroCells": "true"
}
```

# **Optimize Aggregation**

}

Improves the performance of ASO cubes. This job has two actions: Enable query tracking and Execute aggregation process. It performs an aggregation, optionally specifying the maximum disk space for the resulting files, and optionally basing the view selection on user querying patterns. This API is only applicable to aggregate storage databases. For information about scheduling jobs, see Scheduling Jobs.

Before using this API, you must first enable query tracking to capture tracking statistics on the aggregate storage cube. Then, after you enable query tracking, you must allow sufficient time to collect user data-retrieval patterns before you execute the aggregation process based on

query data. The execute aggregation process deletes existing aggregated views and generates optimized views based on the collected query tracking data.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/jobs/
{jobId}
```

### Request

Supported Media Types: application/json

## Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

## Table 8-23 Parameters

Name	Description	Required	Default
jobType	Optimize Aggregation	Yes	None
jobName	The job name to be used for this job execution	No	Optimize Aggregation
parameters	Parameters required for the job	Yes	None
cubeName	Name of the ASO cube	Yes	None
type	Can take one of these values: enableQueryTracking or executeAggregationP rocess	Yes	None
useQueryData	Aggregate the views the server selects based on collected user querying patterns. This option is only available if query tracking is turned on. Permissible values: <b>true</b> or <b>false</b> . Default: false. Applicable only if type is <b>executeAggregationP</b> <b>rocess</b> .		None

Name	Description	Required	Default
includeAlternateRol lups	Include secondary hierarchies (with default level usage) in the view selection. Permissible values: <b>disable</b> or <b>enable</b> . Default: disable (no secondary hierarchies are considered). Applicable only if type is <b>executeAggregationP</b> <b>rocess</b> .	No	None
growthSizeRatio	Aggregates the views the server selects until the maximum growth of the aggregated database exceeds the limits you specify. The value can be a real number such as 1.01. Default is that the database will grow without any growth ratio limit. Applicable only if type is <b>executeAggregationP</b> <b>rocess</b> .	No	None

For a sample URL, see Sample URL and Payload in Execute a Job.

Sample Payload

Example 1: This request will enable query tracking on the Vis1ASO cube.

```
{
   "jobType": "Optimize Aggregation",
   "jobName": "CubeOptimizeAggr",
   "parameters": {
        "cubeName": "Vis1ASO",
        "type": "enableQueryTracking"
   }
}
```

Example 2: This request will execute the aggregation process on the Vis1ASO cube.

```
{
   "jobType": "Optimize Aggregation",
   "jobName": "CubeOptimizeAggr",
   "parameters": {
        "cubeName": "Vis1ASO",
        "type": "executeAggregationProcess"
    }
}
```

}

}

Example 3: This request will execute aggregation process on the Vis1ASO cube. Aggregation process will use the query tracking data, will not include alternate roll ups, and use growth size ratio as 1.01.

```
{
   "jobType": "Optimize Aggregation",
   "jobName": "CubeOptimizeAggr",
   "parameters": {
        "cubeName": "Vis1ASO",
        "type": "executeAggregationProcess",
        "useQueryData": "true",
        "includeAlternateRollups": "disable",
        "growthSizeRatio": "1.01"
   }
}
```

# Import Security

Imports the security records or access control list (ACL) records from a Comma Separated Values (CSV) file. For information about access permissions to application artifacts, see Setting Up Access Permissions.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

# **Excel File Format**

- Object Name: The name of the object for which the ACL is defined
- Name: The name of the user or group for which the ACL is defined
- Parent: The name of the parent of the object
- Is User: The flag (Y or N) that determines if the ACL is defined for a user or for a group
- Object Type: The type of object, for example, Forms folder
- Access Type: The type of privilege, such as READ or READWRITE
- · Access Mode: Additional information, such as if the ACL is applicable on the descendants
- Remove: To remove a particular ACL, set this to Y

## All possible values:

Object Type:

- SL\_FORM Form
- SL\_COMPOSITE Composite Form
- SL\_TASKLIST Tasklist
- SL\_CALCRULE Rule
- SL\_FORMFOLDER Form Folder
- SL\_CALCFOLDER Rule Folder
- SL\_DIMENSION Dimension

- SL\_CALCTEMPLATE Template
- SL\_REPORT Management Report

• SL\_REPORTSSHOT - Management Report Snapshot

Access Type:

- NONE None
- READ Read
- WRITE Write
- READWRITE Read Write
- LAUNCH Launch

Access Mode:

- MEMBER
- CHILDREN
- @ICHILDREN
- @DESCENDANTS
- @IDESCENDANTS

## CSV File Example:

Object Name, Name, Parent, Is User, Object Type, Access Type, Access Mode, Remove "Exchange Rates to USD", "ats\_user3", "Y", "SL\_FORM", "READWRITE", "MEMBER", "N" "Exchange Rates to USD", "ats\_user4", "Y", "SL\_FORM", "READWRITE", "MEMBER", "N" "Exchange Rates to USD", "ats\_user15", "Y", "SL\_FORM", "READ", "MEMBER", "N" "Exchange Rates to USD", "ats\_user10", "Y", "SL\_FORM", "READ", "MEMBER", "N" "Calculate Benefits", "group\_1", "N", "SL\_COMPOSITE", "READWRITE", "MEMBER", "N"

# **Required Roles**

Service Administrator

### Request

Supported Media Types: application/json

### Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
jobType	Import Security	Yes	None
jobName	The job name to be used for this job execution. <b>Example:</b> ImportSecurity	No	Import Security

## Table 8-24 Parameters

Name	Description	Required	Default
fileName	The input CSV file for import. The file containing the ACL records should be present in the Planning Cloud repository.	Yes	None
clearAll	Clear existing access permissions when importing new access permissions. Possible values are true or false	No	False
errorFile	Optionally, create a separate error file for recording any errors that occur during the import process. The file containing the error messages is stored in the Outbox. You can download it with theDownload API. This API overrides any existing error file with the same name.	No	None

# Table 8-24 (Cont.) Parameters

For a sample URL, see Sample URL and Payload in Execute a Job.

Sample Payload

**Example 1: Imports security records from the input file** ImportSecurityRecordsFile.csv. **Existing security records are retained**.

```
{
   "jobType": "Import Security",
   "jobName": "ImportSecurity",
   "parameters": {
        "fileName": "ImportSecurityRecordsFile.csv"
   }
}
```

Example 2: Imports security records from the input file ImportSecurityRecordsFile.csv. Clears existing security records before importing.

```
{
   "jobType": "Import Security",
   "jobName": "ImportSecurity",
   "parameters": {
        "fileName": "ImportSecurityRecordsFile.csv"
        "clearAll": "true"
```

}

Example 3: Imports security records from the input file ImportSecurityRecordsFile.csv and exports the error messages to the file SecurityImportErrors.txt. Existing security records are retained.

```
{
  "jobType": "Import Security",
  "jobName": "ImportSecurity",
  "parameters": {
     "fileName": "ImportSecurityRecordsFile.csv"
     "clearAll": "true"
     "errorFile": "SecurityImportErrors.txt"
  }
}
```

# **Export Security**

Exports the security records or access control list (ACL) records for specified users or groups to a Comma Separated Values (CSV) file. For information about access permissions to application artifacts, see Setting Up Access Permissions.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

# **Required Roles**

Service Administrator

## Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

# Table 8-25 Parameters

Name	Description	Required	Default
јорДуре	Export Security	Yes	None
jobName	The name of this job. <b>Example:</b> ExportSecurity	No	Export Security

Name	Description	Required	Default
fileName	The name of the file to which records should be exported. The file containing the exported data is stored in the Planning repository. If fileName is not specified, a file is auto-generated with a name containing the user name, current date, and time stamp. For example, test_admin_Security Records_2019-02-26- 04-34-45-420.csv.	No	The file name is auto- generated
exportUsers	Comma separated user names. Only ACL records related to the specified users are exported.	No	None
exportGroups	Comma separated user names. Only ACL records related to the specified groups are exported.	No	None

# Table 8-25 (Cont.) Parameters

# Notes:

- This job can take only exportGroups or exportUsers at one time. If you need to export groups and users, you must run the job twice, once with each parameter.
- If a user name or group name contains a comma, escape the comma in the request. For example, if a user name is test, User, the request should contain test\\,User.
- For the file format, see the definition in Import Security Records.

For a sample URL, see Sample URL and Payload in Execute a Job.

### Sample Payload

Example 1: Exports all security records to the ExportSecurityRecordsFile.csv file.

```
{
   "jobType": "Export Security",
   "jobName": "ExportSecurity",
   "parameters": {
        "fileName": "ExportSecurityRecordsFile.csv"
   }
}
```

Example 2: Exports security records of two groups, group1 and group2, to the ExportSecurityRecordsFile.cv file.

```
{
    "jobType": "Export Security",
    "jobName": "ExportSecurity",
    "parameters": {
        "exportGroups": "group1, group2"
        "fileName": "ExportSecurityRecordsFile.csv"
    }
}
```

Example 3: Exports security records of two users, test1 and test, User2 to the ExportSecurityRecordsFile.csv file. Note that one user name contains a comma in it.

```
{
    "jobType": "Export Security",
    "jobName": "ExportSecurity",
    "parameters": {
        "exportUsers": "test1, test\\,User2"
        "fileName": "ExportSecurityRecordsFile.csv"
    }
```

# Export Audit

}

This REST API exports the audit records for a number of days.

The audit records are exported to a Comma Separated Values (CSV) file. The output CSV file contains the first character as a Byte Order Mark (BOM) character \ufeff. The API writes an encrypted application identifier following the BOM character. This application identifier is written between double-quotes. Headers for the CSV file follow the application identifier. For more information, see Auditing Tasks and Data.

You can use an optional excludeApplicationId parameter to not write the application identifier in the export file. Exported audit reports without the application identifier cannot be imported back into the application.

The generated CSV file is compressed and the output is a ZIP file. The file can be downloaded using the Download REST API.

## **Required Roles**

Service Administrator

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

### Request

Supported Media Types: application/json

### Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јоbТуре	Export Audit	Yes	None
jobName	The job name to be used for this job execution. Example: ExportAudit	No	Export Audit
userNames	Comma separated user names. Audit records created by only the specified users are exported. If not specified, audit records created by all users are exported.	No	None
fileName	The name of the file to which records should be exported. The file containing the exported data is stored in the Oracle Planning and Budgeting Cloud repository. If fileName is not specified, a file is auto- generated with a name containing the user name, current date, and time stamp. For example, test_admin_AuditRec ords_2019-02-26-04- 34-45-420.zip	No	The file name is auto- generated

# Table 8-26 Parameters

Name	Description	Required	Default
nDays	<ul> <li>Number of days for which audit records should be exported.</li> <li>Possible values are: <ul> <li>1: Export audit records for the last 24 hours</li> <li>2: Export audit records for the last two days</li> <li>7: Export audit records for the last seven days</li> </ul> </li> <li>30: Export audit records for the last 30 days</li> <li>60: Export audit records for the last 60 days</li> <li>180: Export all existing audit records for the last 180 days</li> <li>All: Export all audit records Note: Audit information is maintained for up to 365 days from the current system date.</li> </ul>	No	7
excludeApplication d	Optionally, you can specify if the application identifier should be written in the export file. Possible values: true or false	No	false
	This parameter can benefit those customers who do not want the application identifier to be included in the export file to help import into their own systems. This export file cannot be used to import into an EPM Cloud environment.		

# Table 8-26 (Cont.) Parameters

# Notes:

• This job does not export records based on group names.

• If a user name contains a comma, escape the comma in the request. For example, if a user name is test, User then add test\\,User to the request.

For a sample URL, see Sample URL and Payload in Execute a Job.

Sample Payload

Example 1: Exports the last 180 days of audit records to the ExportAuditLast180Days.zip file.

```
{
  "jobType": "Export Audit",
  "jobName": "Export180DaysAudit",
  "parameters": {
    "fileName": "ExportAuditLast180Days.zip",
        "ndays": "180"
  }
}
```

Example 2: Exports the last seven days of audit records created by planner1 and planner2. Records are exported to a zip file with an auto-generated file name.

```
{
  "jobType": "Export Audit",
  "jobName": "AllAuditRecordsOfPlanners",
  "parameters": {
        "userNames": "planner1, planner2"
   }
}
```

Example 3: Exports the last 180 days of audit records to the ExportAuditLast180Days.zip file. The application identifier will be not written in the generated file. This export file cannot be used to import into an EPM Cloud environment.

```
{
  "jobType": "Export Audit",
  "jobName": "Export180DaysAudit",
  "parameters": {
     "fileName": "ExportAuditLast180Days.zip",
     "ndays": "180",
     "excludeApplicationId": "true"
  }
}
```

# Export Job Console

Use this REST API to export the job console records to a Comma Separated Values (CSV) file.

The output CSV file contains the first character as a Byte Order Mark (BOM) character, \ufeff. The API writes an encrypted application identifier following the BOM character. This application identifier is written between double-quotes. Headers for the CSV file follow the application identifier.

You can use an optional excludeApplicationId parameter to not write the application identifier in the export file. Exported job console data files without the application identifier cannot be imported back into the application.

The generated CSV file is compressed and the output is a ZIP file. The file can be downloaded using the Download REST API.

To view pending jobs, see Viewing Pending Jobs and Recent Activity.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорТуре	Export Job Console	Yes	None
jobName	The job name to be used for this job execution. Example: ExportWeeklyJobStat usRecords	No	Export Job Console
userNames	Comma separated user names. Job console records created by only the specified users are exported. If not specified, job console records created by all users are exported.	No	None

#### Table 8-27 Parameters

Name	Description	Required	Default
fileName	The name of the file to which records should be exported. The file containing the exported data is stored in the Planning repository. If fileName is not specified, a file is auto- generated with a name containing the user name, current date, and time stamp. For example, test_admin_JobConso leRecords 2019-02-2	No	The file name is auto- generated
	6-04-34-45-420.zip		
ndays	<ul> <li>Number of days for which audit records should be exported. Possible values are.</li> <li>1: Export job console records for the last 24 hours</li> <li>2: Export job console records for the last two days</li> <li>7: Export job console records for the last seven days</li> <li>30: Export job console records for the last 30 days</li> <li>60: Export job console records for the last 40 days</li> <li>All: Export all job console records</li> </ul>	No	7
jobNames	Comma-separated job names for which job console records should be exported.	No	None

# Table 8-27(Cont.) Parameters

Name
Name jobTypes

# Table 8-27 (Cont.) Parameters

Name	Description	Required	Default
name	Description MERGE_DATA_SLI CES Optimize Aggregation or OPTIMIZE_AGGRE GATION Import Security or SECURITY_IMPORT Export Security or SECURITY_EXPORT Export Audit or AUDIT_EXPORT Export Job Console or JOBCONSOLE_EXP ORT Sort Members or SORT_MEMBERS Smart Push or SMART_PUSH Import Exchange Rates or IMPORT_EXCHAN GE_RATES Execute Bursting Definition or EXECUTE_MR_BUR ST		
jobStatusCodes	Comma-separated status code of the jobs for which job records are exported. Possible values are: 1 - Processing 2 - Completed successfully 3 - Failed with errors 4 - Completed with unknown status 5 - Completed with threshold violation status 6 - Pending cancellation 7 - Cancelled 8 - Completed with errors 9 - Completed with warnings all - All jobs with any status	No	2

# Table 8-27 (Cont.) Parameters

Name	Description	Required	Default
exportErrorDetails	If true, exports the details of failed/error jobs as separate error log file in the final output file. Job status details of jobs having one of the status listed below are exported in separate files. • Error • Unknown • Completed with Threshold Exception • Completed with Errors • Completed with Warnings	No	true
topCountDuration	Filters the top <i>n</i> job status records by completion time. This is useful for finding the longest running jobs. For example, enter 10 for this parameter to review the top 10 longest running jobs, as in this example: "topCountDuration ":"10"	No	0 Represents all records
excludeApplicationI d	Optionally, you can specify if the application identifier should be written in the export file. Possible values: true or false	No	false
	This parameter can benefit those customers who do not want the application identifier to be included in the export file to help import into their own systems. This export file cannot be used to import into an EPM Cloud environment.		

# Table 8-27 (Cont.) Parameters

For a sample URL, see Sample URL and Payload in Execute a Job.

## Sample Payload

Example 1: Exports the job console records for all default parameters into the NewFile.csv file. Exports status of all Rule jobs completed in the last seven days.

```
{
    "jobType":"JOBCONSOLE_EXPORT",
    "jobName":"AllJobConsoleExports",
    "parameters":{"fileName":"NewFile.csv"}
}
```

Example 2: Exports the job console records for Rule and Export Data jobs that completed normally or with an error status over the last month into the exportFile.csv file. Job details of the failed jobs are exported in separate files in the final compressed file.

```
{
    "jobType":"JOBCONSOLE_EXPORT",
    "parameters":{"fileName":"exportFile.csv", "jobTypes": "Rules,
EXPORT_DATA", "jobStatusCodes": "2,3", "ndays":"30"}
}
```

Example 3: Exports the job console records for the jobs named Daily Consolidation and Smart Push to a Reporting Cube. Includes jobs that completed normally or with an error status over the last month into the exportFile.csv file. Job details of the failed jobs are not exported in separate files because exportErrorDetails is false.

```
{
    "jobType":"JOBCONSOLE_EXPORT",
    "parameters":{"fileName":"exportFile.csv", "jobNames":"Daily
Consolidation, Smart Push to Reporting Cube", "jobStatusCodes": "2,3",
"ndays":"30", "exportErrorDetails":"false"}
}
```

Example 4: Exports the top 10 longest running jobs:

```
{
    "jobType":"JOBCONSOLE_EXPORT",
    "parameters":{"fileName":"exportFile.csv", "jobStatusCodes": "all",
"ndays":"all", "jobTypes":"all", "exportErrorDetails":"false",
"topCountDuration":"10"}
}
```

Example 5: Exports the job console records for all default parameters into to the NewFile.csv file. This exports status of all Rule jobs completed in the last seven days. The application identifier will be not written in the generated file. This export file cannot be used to import into an EPM Cloud environment.

```
{
    "jobType":"JOBCONSOLE_EXPORT",
    "jobName":"AllJobConsoleExports",
    "parameters":{
    "fileName":"NewFile.csv",
```

```
"excludeApplicationId": "true"
}
```

# Sort Members

Sorts the dimension members of a business process.

You can sort Entity, Account, Scenario, Version, and user-defined custom dimension members. You cannot sort Period, Years, or Currency dimension members. This feature is only supported for the Planning, Module, and Free Form business processes. For more information, see Sorting Members.

For Planning Module applications, you cannot sort these dimensions:

- Any dense dimension
- The "Plan Element" dimension, even if it is renamed, from Financials
- The "Project Element" dimension, even if it is renamed, from Projects

After sorting members, administrators must perform a cube refresh.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

# **Required Roles**

Service Administrator

### Request

Supported Media Types: application/json

### Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорТуре	Sort Members	Yes	None
jobName	The job name to be used for this job execution. <b>Example:</b> SortEntity	No	Sort Members
member	Parent member whose children or descendants are being sorted.	Yes	None
order	Order of sorting. Possible values are:	No	ascending
	• ascending		
	• descending		

## Table 8-28 Parameters

Name	Description	Required	Default
type	Sort children or descendants. Possible values are:	No	children
	<ul> <li>children - sorting by children affects only members in the level immediately below the specified member</li> <li>descendants - sorting by descendants affects all descendants of the specified member.</li> </ul>		

Table 8-28	(Cont.)	Parameters
------------	---------	------------

For a sample URL, see Sample URL and Payload in Execute a Job.

# Sample Payload

Example 1: Sorts the child members of the Account dimension in ascending order.

```
{
  "jobType": "Sort Members",
  "jobName": "SortAccount",
  "parameters":
  {
   "member":"Account"
  }
}
```

Example 2: Sorts the child members of the Account dimension in descending order.

```
{
   "jobType": "Sort Members",
   "jobName": "SortAccountDesc",
   "parameters":
   {
    "member":"Account", "order":"descending"
   }
}
```

Example 3: Sorts the descendants of member account200 in descending order.

```
{
   "jobType": "Sort Members",
   "jobName": "SortAccount200Desc",
   "parameters":
```

```
{
"member":"account200", "order":"descending", "type":"descendants"
}
```

# Import Exchange Rates

}

Export the Exchange Rates template in the Planning repository and change the rates if required. You can then import the rates into the application using the Import Exchange Rates settings specified in a Planning job of type import exchange rates. For more information, see Job Types.

You can also override some of the parameters of the job definition while executing this job from a REST API.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default	
јоbТуре	Import Exchange Rates or IMPORT_EXCHANGE_RAT ES (both parameters are supported)	Yes	None	
jobName	The name of the job to be used for this job execution. <b>Important</b> : You must use the exact name of a job that is already defined in Planning as described in Managing Jobs.	Yes	None	
	<b>Example:</b> importNewExchangeRa te			

Table 8-29 Import Exchange Rates

Name	Description	Required	Default
importFileName	Optionally, you can specify the name of the CSV file from which exchange rates are to be imported.	No	The source file of the job definition
	If you specify a file name, the Import Exchange Rate file name in the job is ignored.		
includeMetaData	You can override the option to include metadata. Allowed value is true or false.	No	Include Metadata parameter of the job definition

# Table 8-29 (Cont.) Import Exchange Rates

For a sample URL, see Sample URL and Payload in Execute a Job.

## Sample Payload

Example 1: Executes the import exchange rates job MyExchangeRates and overrides the importFileName parameter.

```
{"jobType":"Import Exchange Rates","jobName":"MyExchangeRates",
"parameters":{
    "importFileName":"ExportExchangeRatesTemplate.csv"
    }
}
```

**Example 2:** Executes the import exchange rates job MyExchangeRates and overrides the importFileName and includeMetaData parameters.

```
{"jobType":"Import Exchange Rates","jobName":"MyExchangeRates",
"parameters":{
    "importFileName":"ExchangeRateTemplate2.csv",
    "includeMetaData":"false"
    }
}
```

# Auto Predict

Schedule predictions using the Auto Predict job. With Auto Predict, administrators can define a prediction to predict future performance based on historical data and schedule a job to run that prediction definition, automating the prediction process. For details about Auto Predict, see Setting Up Predictions to Run Automatically in *Administering Planning*.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Job Types.

# **Required Roles**

Service Administrator

# Request

Supported Media Types: application/json

# Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорТуре	Auto Predict	Yes	None
jobName	The name used to define Auto Predict in the user interface in Overview, then Actions, and then Auto Predict. This name will be used for the job execution. <b>Important</b> : You must use the exact name of a job that is already defined in Planning as described in Managing Jobs.	Yes	None
	<b>Example:</b> Prediction1		
forceRun	If this is set to true, the job will always execute. If not, the job executes only for the first time. In subsequent attempts, if there is no change in the job definition, this message displays: "Auto Prediction definition hasn't changed since the last time the Auto Predict job ran; the job will not execute. If you want to run the Auto Predict definition, for example if there are new actual values, you can run the Auto Predict definition from the Auto Predict page. From the Actions menu, click Actions and then click Run."		False

Table 8-30 Import Exchange Rates

Name	Description	Required	Default
paginatedDim	Speeds up an Auto Predict job by running predictions in parallel in separate prediction threads. For the parallel jobs to be efficient, choose a dimension that will result in evenly spread data for each prediction thread. Example: Entity	No	False

Table 8-30 (Cont.) Import Exchange Rates

For a sample URL, see Sample URL and Payload in Execute a Job.

# Sample Payload

Example 1: Executes the Auto Predict job ASO->BSO.

```
{
  "jobType": "Auto Predict",
  "jobName": "ASO->BSO",
  "parameters": {
      "forceRun": true,
      "paginatedDim": "Entity"
  }
}
```

# Import Cell-Level Security

This REST API imports cell-level security settings from a ZIP file that contains an Excel file with cell-level security definitions into Planning or Tax Reporting business processes. Cell-level security enables Service Administrators to restrict who can view data in the application by defining rules that remove read or write access to cells that a user would normally have access to due to their regular security.

The file must be present in the Inbox. You can use the Upload REST API to upload the file. Any rejected records are generated in an Excel file that is zipped and copied to the Outbox.

The best method to get the import file format template is to export cell-level security from the application.

The following is a general explanation of the Excel file. The file contains two Excel worksheets:

- Rules contains cell-level security definitions, dimensions included, properties such as Unspecified Valid, and Additional Dims Required
- 2. Sub Rules contains member selections and exclusions

The Rules worksheet has the following column headings:

- Name
- Position

- Description
- Enabled
- Valid Cubes This column can contain either All or a list of comma-separate names of cubes, such as Plan1, Plan2
- Anchor Dim Name
- Anchor Dimension Apply to Unselected Members
- Dim1
- Dim1 Required
- Dim2
- Dim2 Required
- DimX
- DimX Required

The Sub Rules worksheet has the following column headings:

- Name This column must contain the name of the Rules from the first worksheet
- Users
- User Groups
- Restriction This column can contain Deny Read or Deny Write
- Anchor Members
- Anchor Exclusion
- Dim1 Members
- Dim1 Exclusion
- Dim2 Members
- Dim2 Exclusion
- DimX Members
- DimX Exclusion

## **Required Roles**

Service Administrator

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

### **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/
jobs

### Request

Supported Media Types: application/json

## Parameters

The following table summarizes the client request parameters specific to this job. For parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорТуре	Import Cell-Level Security or IMPORT_CELL_LEVEL_SECURITY	Yes	None
jobName	The name of the job to be used. This job name appears on the job console.	No	Import Cell-Level Security Definitions
	<b>Example</b> : ImportCLSPlan1		
fileName	The name of the ZIP file containing the input Excel file. The file must be present in the Inbox.	Yes	None
	Before using this REST API, you can use the Upload REST API to upload the file.		
errorFile	Optionally, create a separate error file for recording any errors that occur during the import process. If this is not specified, an error file is auto- generated with a name containing the user name, current date, and time stamp. For example, admin_ImportError_2020- 02-26-04-34-45-420.txt. The file containing the error messages is stored in the Outbox. You can download it using the Download API. This API overrides any existing error file with the same name.	No	The file is auto-generated

# Table 8-31 Import Cell-Level Security

For a sample URL, see the sample URL and payload in Execute a Job

Example 1: Imports cell-level security records from the input file ImportCLSRecordsFile.zip.

```
{
   "jobType": "Import Cell-Level Security",
   "jobName": "ImportCLSJob",
   "parameters": {
        "fileName": "ImportCLSRecordsFile.zip"
   }
}
```

Example 2: Imports cell-level security records from the input file ImportCLSRecordsFile.zip and exports the error messages to the file ImportCLSFileLog.txt.

```
{
    "jobType": "Import Cell-Level Security",
    "jobName": "ImportCLSJob",
    "parameters": {
        "fileName": "ImportCLSRecordsFile.zip",
        "errorFile": "ImportCLSRecordsFileLog.txt"
    }
}
```

# Export Cell-Level Security

This REST API exports cell-level security settings from Planning or Tax Reporting into a ZIP file that contains an Excel file. Cell-level security enables Service Administrators to restrict who can view data in the application by defining rules that remove read or write access to cells that a user would normally have access to due to their regular security.

The generated file is compressed, and the output is a ZIP file that is added to the Outbox. You can download the file using the Download REST API.

Note the following requirements for the format of the Excel file used with this REST API.

The exported Excel file contains two worksheets with these names:

- 1. Rules
- 2. Sub Rules

The Rules worksheet has the following column headings:

- Name
- Position
- Description
- Enabled
- Valid Cubes This column contains either All or a list of comma-separate names of cubes, such as Plan1, Plan2
- Anchor Dim Name
- Anchor Dimension Apply to Unselected Members
- Dim1
- Dim1 Required
- Dim2
- Dim2 Required
- DimX Members
- DimX Required

The Sub Rules worksheet has the following column headings:

- Name This column contains the names of the Rules from the first sheet
- Users
- User Groups
- Restriction This column can contain Deny Read or Deny Write
- Anchor Members
- Anchor Exclusion
- Dim1 Members
- Dim1 Exclusion
- Dim2 Members
- Dim2 Exclusion

- DimX Members
- DimX Exclusion

# **Required Roles**

Service Administrator

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/
jobs

## Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For parameters that are common to all jobs, see Execute a Job.

## Table 8-32 Export Cell Level Security

Name	Description	Required	Default
јоbТуре	Export Cell-Level Security or EXPORT_CELL_LEVEL_SECURITY	Yes	None
jobName	The name of the job to be used. This job name appears on the job console.	No	Export Cell-Level Security Definitions
	<b>Example</b> : ExportCLSDPlan1		
fileName	The name of the ZIP file that will be created to hold the Excel file containing cell-level security information. The file containing the exported data is stored in the Outbox.	Yes	None
names	Optionally, include a comma-separated list of cell-level security definitions in the application. Information from each definition is exported to a separate Excel file and then zipped. For example, the list could contain CLSDAccountPeriod, CLSDEntityPe riod, CLSDProductPeriod.	No	All records are exported
	If this parameter is not provided, all cell-level security records are exported.		

For a sample URL, see the sample URL and payload in Execute a Job

Example 1: Exports all cell-level security records to the file ExportCLSDRecordsFile.zip.

# Sample Payload

```
{
   "jobType": "Export Cell-Level Security",
   "jobName": "ExportCellLevelSecurityJob",
   "parameters": {
        "fileName": "ExportCLSDRecordsFile.zip"
   }
}
```

**Example 2: Exports three cell-level security records with names** CLSDAccountPeriod, CLSDEntityPeriod, and CLSDProductPeriod to the file Export3CLSDRecordsFile.zip.

```
{
    "jobType": "Export Cell-Level Security",
    "jobName": "ExportCellLevelSecurityJob",
    "parameters": {
        "fileName": "Export3CLSDRecordsFile.zip",
        "names": "CLSDAccountPeriod, CLSDEntityPeriod, CLSDProductPeriod"
    }
}
```

# Import Valid Intersections

This REST API imports valid intersections groups from a ZIP file that contains an Excel file with valid intersection definitions into a Financial Consolidation and Close, Planning, or Tax Reporting business process.

The Excel file must be present in the Inbox. You can use the Upload REST API to upload the file. Any rejected records are generated in an Excel file that is zipped and copied to the Outbox.

The following is a general explanation of the Excel file. The file contains two Excel worksheets:

- 1. Rules defines the intersection group, dimensions included, and properties such as Unspecified Valid and Additional Dims Required
- 2. Sub Rules provides member selections and exclusions

The Rules worksheet has the following column headings.

- Name
- Position
- Description
- Enabled
- Valid Cubes This column can contain either All or a list of comma-separate names of cubes, such as Plan1, Plan2
- Anchor Dim Name
- Anchor Dimension Apply to Unselected Members
- Dim1
- Dim1 Required
- Dim2

- Dim2 Required
- DimX
- DimX Required

The Sub Rules worksheet must have the following column headings:

- Name This column must contain the name of the Rule from the first worksheet
- Users
- User Groups
- Restriction This column can contain Deny Read or Deny Write
- Anchor Members
- Anchor Exclusion
- Dim1 Members
- Dim1 Exclusion
- Dim2 Members
- Dim2 Exclusion
- DimX Exclusion

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## **REST Resource**

POST	<pre>/HyperionPlanning/rest/{api_version}/applications/{application}/</pre>
jobs	

### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For parameters that are common to all jobs, see Execute a Job.

### Table 8-33 Import Valid Intersections

Name	Description	Required	Default
јорТуре	Import Valid Intersections <b>or</b> IMPORT_VALID_INTERSECTIONS	Yes	None
jobName	The name of the job to be used for this job execution, exactly as it is defined in the application.	No	Import Valid Intersections
	Example: ImportVIAccountPeriod		

Name	Description	Required	Default
fileName	The name of the ZIP file containing the input Excel file. The file must be present in the Outbox.	Yes	None
	Before using this REST API, you can use the Upload REST API to upload the file.		
errorFile	Optionally, identify the name of a text file for recording any errors that occur during the import process. If this is not specified, an error file is auto- generated with a name containing the user name, current date, and time stamp. For example, admin_ImportError_2020-02-26- 04-34-45-420.txt.	No	The file name is auto- generated
	The file containing the error messages is stored in the Outbox. You can download it using the Download REST API.		

# Table 8-33 (Cont.) Import Valid Intersections

For a sample URL, see the sample URL and payload in Execute a Job

Example 1: Imports valid intersections records from the input file ImportVIRecordsFile.zip.

```
{
   "jobType": "Import Valid Intersections",
   "jobName": "ImportVIJob",
   "parameters": {
        "fileName": "ImportVIRecordsFile.zip"
   }
}
```

Example 2: Imports valid intersections records from the input file ImportVIRecordsFile.zip and exports the error messages to the file ImportVIRecordsFileLog.txt.

```
{
   "jobType": "Import Valid Intersections",
   "jobName": "ImportVIJob",
   "parameters": {
        "fileName": "ImportVIRecordsFile.zip",
        "errorFile": "ImportVIRecordsFileLog.txt"
   }
}
```

# **Export Valid Intersections**

This REST API exports valid intersection groups (certain cell intersections filtered by rules when users enter data or select runtime prompts) from Financial Consolidation and Close, Planning, or Tax Reporting business processes.

The output is a ZIP file that is added to the Outbox. You can download the file using the Download REST API.

Note the following requirements for the format of the Excel file used with this REST API.

The exported Excel file contains two worksheets with these names:

- 1. Rules
- 2. Sub Rules

The Rules worksheet has the following column headings:

- Name
- Position
- Description
- Enabled
- Anchor Dim Name
- Anchor Dimension Apply to Unselected Members
- Dim1
- Dim1 Required
- Dim2
- Dim2 Required
- DimX
- DimX Required

The Sub Rules worksheet has the following column headings:

- Name This column contains the names of the Rules from the first worksheet
- Anchor Members
- Anchor Exclusion
- Dim1 Members
- Dim1 Exclusion
- Dim2 Members
- Dim2 Exclusion
- DimX Members
- DimX Exclusion

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/
jobs

### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For parameters that are common to all jobs, see Execute a Job.

Table 8-34	Export Valid	Intersections
------------	--------------	---------------

Name	Description	Required	Default
јорТуре	Export Valid Intersections or EXPORT_VALID_INTERSECTIONS	Yes	None
jobName	The name of the job to be used. This job name appears on the job console.	No	Export Valid Intersections
	<b>Example</b> : ExportVIRecords		
fileName	The name of the ZIP file that will be created to hold the Excel file containing valid intersection records. The file containing the exported data is stored in the Outbox.	Yes	None
names	If provided, exports some of the records using the names in a comma- separated list of valid intersection record names. For example, the list could contain VIAccountPeriod, VIEntityPeriod , VIProductPeriod.	No	All records are exported
	If this parameter is not provided, all valid intersection records are exported.		

For a sample URL, see the sample URL and payload in Execute a Job

## Sample Payload

Example 1: Exports all valid intersections records to the file ExportVIRecordsFile.zip.

```
{
   "jobType": "Export Valid Intersections",
   "jobName": "ExportVIJob",
   "parameters": {
        "fileName": "ExportVIRecordsFile.zip"
   }
}
```

**Example 2:** Exports three valid intersection records with names VIAccountPeriod, VIEntityPeriod, and VIProductPeriod to the file Export3VIRecordsFile.zip.

```
{
   "jobType": "Export Valid Intersections",
   "jobName": "ExportVIJob",
   "parameters": {
        "fileName": "Export3VIRecordsFile.zip",
        "names": "VIAccountPeriod, VIEntityPeriod, VIProductPeriod"
   }
}
```

# Execute a Report Bursting Definition

You can execute bursting for a single report or book for more than one member of a single dimension, and publish a PDF or Excel output for each member.

The bursting definition must be present in the folder that you specify with the burstingDefinitionName parameter.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/
jobs

## Request

Supported Media Types: application/json

# Parameters

The following table summarizes the client request parameters specific to this job. For parameters that are common to all jobs, see Execute a Job.

## Table 8-35 Execute a Report Bursting Definition

Name	Description	Required	Default
јоbТуре	Execute Bursting Definition or EXECUTE_MR_BURST (both parameters are supported)	Yes	None
jobName	The name of the job to be used. This job name appears on the job console.	No	Execute Bursting Definition
	<b>Example</b> : MonthlySalesBurstDev		
burstingDefinitionN ame	Bursting definition name with the complete path to where the bursting definition is stored.	Yes	None
	<b>Example</b> :/Library/Jan/ MonthlySalesBurstDef		

For a sample URL, see the sample URL and payload in Execute a Job

Sample Payload

Example 1: Executes the bursting definition named MonthlySalesBurstDev that is present in the Library folder.

```
{
  "jobType":"Execute Bursting Definition",
  "jobName":"Execute MonthlySalesBurstDef",
  "parameters": {
    "burstingDefinitionName":"Library/MonthlySalesBurstDef"
}
```

Example 2: Executes the bursting definition named MonthlySalesBurstDev that is present in the Reports subfolder under the Library folder.

```
{
  "jobType":"Execute Bursting Definition",
  "jobName":"Execute MonthlySalesBurstDef",
  "parameters": {
    "burstingDefinitionName":"Library/Reports/MonthlySalesBurstDef"
```

# Export Library Documents

}

Creates a job to copy a document from the library. The Copy Artifact from Library (Export Library Document) job copies the content of a library document to the default download location, where you can download it to your local computer. Using REST APIs allows you to automate the tasks of exporting documents and downloading them.

You can use the Inbox/Outbox Explorer to view the details of the copied file. Use the Download REST API to download the file.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. For additional details, see Job Types.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs.

## **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јоbТуре	Copy Artifact From Library or Export Library Document or COPY_ARTIFACT_FRO M_LIBRARY (all values are supported)	Yes	None
jobName	The name of this job. <b>Example:</b> Copy_Quarterly_Sales	No	Export Library Document
idOrFullyQualifiedN ame	The name of the document. This can be the document name with a fully qualified path or UUID.	Yes	None
saveAsFile	The output file name, in the default download location, to which the document should be copied. If you don't provide the extension in saveAsFile, the file	No	Name of the document
	will take the extension from the document being copied. If a file with the same name exists, the job will error out unless the overwrite flag is passed as true.		
	The default output file name is the name of the document. The extension of the document is used as the extension of the output file name.		
overwrite	If a file with the same name exists in the default download location, the file will not be overwritten by default unless the overwrite flag is passed as true.	No	false

## Table 8-36 Parameters

Name	Description	Required	Default
errorFile	The error file name, in the default download location, which contains the details (including errors) of the operation. Any existing error file with the same name is overwritten. If you don't provide the extension in errorFile, the file will use .log as the default extension. Use the Inbox/Outbox Explorer to view the details of the error file. Use the Download REST API to download the		None
exportFormat	file. The format of the copied document. Allowed values are file and zip.	No	file
	<ul> <li>file - copies the document in its original binary format. For example, if the document is a PDF or Microsoft Word document, it is copied as a PDF or a Microsoft Word document.</li> <li>zip - copies the document in its original binary format and zips it.</li> </ul>		

Table 8-36	(Cont.) Parameters
------------	--------------------

For a sample URL, see Sample URL and Payload in Execute a Job.

## Sample Payload Example

Copies a document called WeeklySales.txt, identified with the complete path of the document, to the default download location and compresses it. The output file name will be WeeklySales.zip. If a file with the same name exists in the Inbox/Outbox, the existing file will be overwritten. An error file with the name WeeklySalesErrorLog.log will be created with the details of the activity.

```
"jobType": "COPY_ARTIFACT_FROM_LIBRARY",
"jobName": "Copy Invalid SKU Q1 List",
```

{

```
"parameters":
    {
        "artifactName": "Library/folder1/WeeklySales.txt",
        "saveAsFile": "WeeklySales.txt",
        "overwrite": "true",
        "errorFile": "WeeklySalesErrorLog.log",
        "exportFormat": "zip"
    }
}
```

## Import Library Documents

Creates a job to import documents from the library. The Import Document to Library job imports the content from a local source to the library in the specified upload location. Using REST APIs allows you to automate the tasks of uploading library artifacts.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. For additional details, see Job Types.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs.

## **Required Roles**

Service Administrator

## Request

Supported Media Types: application/json

## Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Name	Description	Required	Default
јорТуре	Import Document to Library or IMPORT_DOCUMENT_ TO_LIBRARY	Yes	None
jobName	The name of this job. <b>Example:</b> Import_Annual_Report	No	Import Document to Library
name	The name of the document or ZIP file containing documents being imported.	Yes	
description	Brief description of the document being imported. For ZIP files, this description applies to all documents within it.		None

## Table 8-37Parameters

Name	Description	Required	Default
idOrFullyQualifiedD estinationPath	The library destination path where the document(s) will be imported. This can be a path with folders or UUID of the folder.	Yes	None
overwrite	If a file with the same name exists in the default download location, the file will not be overwritten by default unless the overwrite flag is	No	false
deleteAfterImport	passed as true. Determines whether the file should be deleted from the local source after import.	No	false
	For imports using a ZIP file, the source file will be deleted only if all contained documents are imported successfully.		
errorFile	The error file name, in the default download location, which contains the details (including errors) of the operation. Any existing error file with the same name is overwritten.	No	None
	If you don't provide the extension in errorFile, the file will use .log as the default extension.		
	Use the Inbox/Outbox Explorer to view the details of the error file. Use the Download REST API to download the file.		

## Table 8-37 (Cont.) Parameters

For a sample URL, see Sample URL and Payload in Execute a Job.

## Sample Payload Example

Imports a document called FinancialReport2022.xlsx into a folder called Insights with a description. If a file with the same name exists, it will be overwritten. An error file named FinancialReport2022ImportLog.log will be created with details of the activity.

```
{
    "jobType": "IMPORT_DOCUMENT_TO_LIBRARY",
    "jobName": "ImportSingleDocument",
    "parameters": {
        "name": "FinancialReport2022.xlsx",
        "description": "Annual Financial Report for 2022",
        "idOrFullyQualifiedDestinationPath": "Library/Insights",
        "overwrite": true,
        "deleteAfterImport": false,
        "errorFile": "FinancialReport2022ImportLog.log"
    }
}
```

## Sample Payload Example: Importing a ZIP File

Imports a ZIP file named Reports2022.zip into the folder Reports. The import process generates a common log file, Reports2022ImportLog.log, which aggregates the details and outcomes of all child jobs associated with the documents contained within the Reports2022.zip file.

```
{
    "jobType": "IMPORT_DOCUMENT_TO_LIBRARY",
    "jobName": "ImportMultipleDocuments",
    "parameters": {
        "name": "Reports2022.zip",
        "description": "Collection of Financial Reports for 2022",
        "idOrFullyQualifiedDestinationPath": "Library/Reports",
        "overwrite": true,
        "deleteAfterImport": false,
        "errorFile": "Reports2022ImportLog.log"
    }
}
```

## Execute Job Code Samples

Example 8-1 Java Sample – executeJob.java

```
//
// BEGIN - Execute a Job (EXPORT_DATA, EXPORT_METADATA, IMPORT_DATA,
IMPORT_METADATA, CUBE_REFRESH, ...)
//
public void executeJob(String jobType, String jobName, String parameters)
throws Exception {
    String urlString = String.format("%s/HyperionPlanning/rest/%s/
applications/%s/jobs", serverUrl, apiVersion, applicationName);
    JSONObject payload = new JSONObject();
    payload.put("jobName",jobName);
    payload.put("jobType",jobType);
    payload.put("parameters",new JSONObject(parameters));
```

```
String response = executeRequest(urlString, "POST", payload.toString());
System.out.println("Job started successfully");
getJobStatus(fetchPingUrlFromResponse(response, "self"), "GET");
//
// END - Execute a Job (EXPORT_DATA, EXPORT_METADATA, IMPORT_DATA,
IMPORT_METADATA, CUBE_REFRESH, ...)
//
```

## Example 8-2 cURL Sample – ExecuteJob.sh

```
funcExecuteJob() {
    url="$SERVER URL/HyperionPlanning/rest/$API VERSION/
applications/$APP NAME/jobs"
    encodedJobName=$(echo $2 | sed -f urlencode.sed)
    if [ ! -z "$3" ]; then
param="{\"jobType\":\"$1\", \"jobName\":\"$encodedJobName\", \"parameters\":$3}"
    else
            param="{\"jobType\":\"$1\",\"jobName\":\"$encodedJobName\"}"
    fi
    funcExecuteRequest "POST" $url $param
   output=`cat response.txt`
   status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started executing job successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Example 8-3 Groovy Sample – ExecuteJob.groovy

```
else {
                                             params.put(param[0], param[1]);
                                     }
                             }
                    }
                    payload.put("jobName",jobName);
                    payload.put("jobType", jobType);
                    payload.put("parameters", params);
            1
            else {
                    payload.put("jobName",jobName);
                    payload.put("jobType",jobType);
    } catch (MalformedURLException e) {
        println "Malformed URL. Please pass valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", payload);
    if (response != null) {
        getJobStatus(fetchPingUrlFromResponse(response, "self"), "GET");
    }
}
```

## **Retrieve Job Status**

Use this REST API to poll the server to get the processing state for a job with a specified ID.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## **REST Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/jobs/
{jobIdentifier}
```

## Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

## Table 8-38 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
applicationName	The name of the application	Path	Yes	None
jobIdentifier	The ID of the job	Path	Yes	None

## Response

Parameters

The following table summarizes the response parameters.

## Table 8-39 Parameters

Name	Description
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 = cancel pending; 3 = cancelled; 4 = invalid parameter; Integer.MAX_VALUE = unknown
details	Details about the job status, such as "Metadata import was successful" for metadata import
jobID	The ID of the job, such as 224
jobName	The name of the job, such as Refresh Database
descriptiveStatus	The status of the job, such as Completed or Error

Supported Media Types: application/json

Example of Response Body

The following shows an example of the response body for metadata import:

```
{
   "status": 0,
   "details": "Metadata import was successful",
   "jobId": 224,
   "jobName": "Import Account Metadata",
    "descriptiveStatus": "Completed",
   "links": [{
        "rel": "self",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/test2/jobs/224",
        "action": "GET"
    }, {
        "rel": "job-details",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/test2/jobs/224/details",
        "action": "GET"
    }]
}
The following shows an example of the response body when an error occurs
during cube refresh:
{
   "status": 1,
   "details": "An error occurred while updating the relational database.",
    "jobStatus": "Error",
   "jobId": 145,
    "jobName": "Refresh Database",
    "links": [{
        "rel": "self",
        "href": "https://<SERVICE NAME>-
```

```
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/PS4app1/jobs/145",
    "action": "GET"
    }}, {
        "rel": "job-details",
        "href": "https://<SERVICE_NAME>-
```

The following shows an example of the response body when an error occurs during cube refresh:

```
{
   "status": 1,
   "details": "An error occurred while updating the relational database.",
    "jobStatus": "Error",
   "jobId": 145,
    "jobName": "Refresh Database",
    "links": [{
        "rel": "self",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/PS4app1/jobs/145",
        "action": "GET"
   }}, {
        "rel": "job-details",
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/test2/jobs/145/details",
        "action": "GET"
    }]
}
```

## Retrieve Job Status Details

Use this REST API to poll the server to get execution details for a Job with the specified Job ID.

The job types for which details are returned by this service are: IMPORT\_DATA, EXPORT\_DATA, EXPORT\_DATA, EXPORT METADATA, and IMPORT METADATA.

Supports paging for jobs of type IMPORT\_DATA, IMPORT\_METADATA, EXPORT\_DATA, and EXPORT METADATA using the offset and limit query parameters shown in the table.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/jobs/ {jobIdentifier}/details

### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-40 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
jobIdentifier	The ID of the job, such as 224	Path	Yes	None
q				
msgType	Optionally, return messages for a particular message type. If no messageType is provided, returns messages of types ERROR, WARNING, and INFO.	Query	No	None
offset	For paging of jobs. Indicates the actual index from which the records are returned. It is 0 based.	Query	No	0
limit	For paging for jobs. Controls how many items to return. Defaults to 25 if not specified.	Query	No	25

### **Example Requests**

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs/145/details

## Optionally specifying messageType:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs/145/
details?q={"messageType":"ERROR"}

Optionally specifying paging for jobs of type IMPORT\_DATA and EXPORT\_DATA with the offset and limit:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs/145/
details?q={"messageType":"ERROR"}&offset=0&limit=5}

### Response

The following table summarizes the response parameters.

Name	Description
items	Version of the API you are developing with
recordsRead	The name of the application
recordsRejected	The ID of the job for records rejected
recordsProcessed	The ID of the job for records processed

## Table 8-41 Parameters

## Table 8-41 (Cont.) Parameters

Name	Description
dimensionName	For paging of jobs. Indicates the actual index from which the records are returned. It is 0 based.
loadType	For paging for jobs. Controls how many items to return. Defaults to 25 if not specified.

Supported Media Types: application/json

## Example of Response Body

The following shows an example of the response body for metadata import with messageType = ERROR:

```
{
   "items": [{
        "links": [{
            "rel": "child-job-details",
            "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
test2/jobs/224/childjobs/12/details?
limit=10&q=%7BmessageType:ERROR%7D&offset=10",
            "action": "GET"
        }],
        "recordsRead": 8,
        "recordsRejected": 0,
        "recordsProcessed": 8,
        "dimensionName": "Entity",
        "loadType": "Metadata Import"
    }, {
        "links": [{
            "rel": "child-job-details",
            "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
test2/jobs/224/childjobs/13/details?
limit=10&q=%7BmessageType:ERROR%7D&offset=10",
            "action": "GET"
        }],
        "recordsRead": 2,
        "recordsRejected": 0,
        "recordsProcessed": 2,
        "dimensionName": "Job",
        "loadType": "Metadata Import"
    }],
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
test2/jobs/224/details?limit=10&q=%7BmessageType:ERROR%7D&offset=10",
        "action": "GET"
    }],
}
```

## Retrieve Child Job Status Details

Use this REST API to get the execution details for the child Job with the specified ID.

Certain types of jobs, such as metadata import and export, create child jobs for each dimension being exported or imported.

The job types for which child details are returned by this service are IMPORT\_METADATA and EXPORT\_METADATA. Supports paging for jobs of type IMPORT\_DATA and EXPORT\_DATA using the offset and limit query parameters shown in the table.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

## **Required Roles**

Service Administrator

## **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/jobs/ {jobIdentifier}/childjobs/{childJobIdentifier}/details

## Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-42 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
applicationName	The name of the application	Path	Yes	None
jobIdentifier	The ID of the job, such as 224	Path	Yes	None
childJobIdentifier	The ID of the child job	Path	Yes	None
childJobID	The ID of the child job, such as 8	Path	Yes	None
q				
messageType	Optionally, return messages for a particular message type. If no messageType is provided, returns messages of types ERROR, WARNING, and INFO.	Query	Yes	None
offset	For paging of jobs. Indicates the actual index from which the records are returned. It is 0 based.	Query	No	0
limit	For paging of jobs. Controls how many items to return. Defaults to 25 if not specified.	Query	No	25

### **Example Requests**

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs/145/ childjobs/123/details

Optionally specifying messageType:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs/145/ childjobs/123/details?q={"messageType":"ERROR"}

Optionally specifying paging for jobs of type IMPORT\_METADATA and EXPORT\_METADATA with an offset and limit:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/jobs/145/ childjobs/123/details?q={"messageType":"ERROR"}&offset=0&limit=5

## Response

The following table summarizes the response parameters.

### Table 8-43 Parameters

Name	Description
items	The number of records read, such as 8
msgType	Message type, such as INFO
msgCategory	Message category, such as Argument parsing
msgText	Message text

Supported Media Types: application/json

#### Example of Response Body

The following example shows a response body with messageType = INFO, offset=5, limit=5. Notice the prev and next links.

```
{
    "items": [{
        "msgType": "INFO",
        "msgCategory": "Argument parsing",
        "msgText": "The column alias mapping list specified with the /C2A
switch did not match a key in the Command Properties file \"null\" so it will
be used as the mapping directly: \"(<ignoreUndefined>,@Plan*)\"."
    }, {
        "msqType": "INFO",
        "msgCategory": "Unclassified",
        "msgText": "Header record fields: Entity, Parent, Alias: Default,
Alias: SLAliases, Valid For Consolidations, Data Storage, Two Pass
Calculation, Description, Formula, UDA, Smart List, Data Type, Hierarchy
Type, Enable for Dynamic Children, Number of Possible Dyn..."
    }, {
        "msqType": "INFO",
        "msgCategory": "Dimension, member, or cube retrieval",
        "msgText": "Located and using \"Entity\" dimension for loading data
in \"Test2\" application."
    }, {
        "msqType": "INFO",
        "msgCategory": "Unclassified",
        "msgText": "HspOutlineLoad::dateFormatSpecified is true,
SessionHalDateFormat stored on session: M/d/yy, sessionId: 759992870"
    }, {
        "msqType": "INFO",
        "msgCategory": "Dimension, member, or cube retrieval",
        "msgText": "Load dimension \"Entity\" has been unlocked successfully."
```

```
}],
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
test2/jobs/224/childjobs/12/details?limit=5&offset=5",
        "action": "GET"
    }, {
        "rel": "prev",
        "href": "https:<BASE-URL>/HyperionPlanning/rest/v3/applications/test2/
jobs/224/childjobs/12/details?offset=0&limit=5",
        "action": "GET"
    }, {
        "rel": "next",
        "href": "https:/<BASE-URL>/HyperionPlanning/rest/v3/applications/
test2/jobs/224/childjobs/12/details?offset=10&limit=5",
        "action": "GET"
    }],
}
```

# Working with Members

You can get and add members using a set of REST resources, as summarized below.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Add Member	POST	<pre>/HyperionPlanning/rest/{api_version}/applications/ {application}/dimensions/{dimensionname}/members</pre>
Get Member	GET	/HyperionPlanning/rest/{api_version}/applications/ {application}/dimensions/{dimension}/members/{member}

Table 8-44 Working with Members

## Add Member

Use this REST API to add a new member to the application outline in the specified dimension and plan type and under the specified parent member.

## Note:

**Prerequisite**: The parent member must be enabled for dynamic children and a cube refresh must have happened after the parent was enabled.

## **Required Roles**

Service Administrator

## **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/dimensions/ {dimname}/members

## Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-45 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application to which to add a member	Path	Yes	None
dimname	Name of the dimension to which to add a member	Path	Yes	None

## Example URL and Payload

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/dimensions/ Entity/members

{"memberName":"North America","parentName":"Enterprise Global"}

## Response

Payload Parameters:

The following table summarizes the payload parameters.

Name	Description
name	Name of the member, such as North America
children	Whether the member has children
description	Description of the member
parentName	Name of the parent, such as Enterprise Global
dataType	Data type, if available
objectType	Type of object
dataStorage	Storage attribute for the member, such as STOREDATA
dimName	Dimension name
twoPass	Boolean value to indicate whether the member has the Two-Pass Calculation associated attribute
instance	Information about the instance
type	Type of member
detail	Detailed information in case of error
status	Request status, such as 400
errorPath	Path of the error, if available

### Table 8-46 Parameters

Name	Description
title	Error title, if available
errorCode	Error code, if available
errorDetails	Error details, if available
message	Message text
localizedMessage	Localized message, if available

## Table 8-46 (Cont.) Parameters

### Example of Response Body

Sample response body where the member is added successfully

```
{
    "name": "North America",
    "children": null,
    "description": null,
    "parentName": "Enterprise Global",
    "dataType": "UNSPECIFIED",
    "objectType": 33,
    "dataStorage": "STOREDATA",
    "dimName": "Entity",
    "twoPass": false,
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
Vision/dimensions/Entity/members/North%20America",
        "action": "GET"
    }]
}
```

## Sample response when an error occurs when adding the member:

```
{
    "detail": "Error occurred adding member. Unable to find parent
<Enterprise GlobalX> defined for a dynamic member.",
    "status": 400,
    "message": "com.hyperion.planning.HspRuntimeException: Error occurred
adding member. Unable to find parent <Enterprise GlobalX> defined for a
dynamic member.",
    "localizedMessage": "com.hyperion.planning.HspRuntimeException: Error
occurred adding member. Unable to find parent <Enterprise GlobalX> defined
for a dynamic member."
}
```

## Get Member

Gets the specified member's properties.

## **Required Roles**

Service Administrator

## **REST Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/dimensions/
{dimname}/members/{member}
```

## Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-47 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to get member properties	Path	Yes	None
dimname	Name of the dimension for which to get member properties	Path	Yes	None
member	Name of the member for which to get member properties	Path	Yes	None

## Request Payload:

The following table summarizes the payload parameters.

Name	Description
name	Name of the member, such as North America
children	Whether the member has children
description	Description of the member
parentName	Name of the parent, such as Enterprise Global
dataType	Data type, if available
objectType	Type of object
dataStorage	Storage attribute for the member, such as STOREDATA
dimName	Dimension name
twoPass	Boolean value to indicate whether the member has the Two-Pass Calculation associated attribute

## Table 8-48 Parameters

### Example URL and Payload

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/dimensions/ Entity/North America

{"memberName":"North America","parentName":"Enterprise Global"}

### Example of Response Body

Sample response body where the member is added successfully

```
{
    "name": "North America",
    "children": null,
    "description": null,
    "parentName": "Enterprise Global",
    "dataType": "UNSPECIFIED",
    "objectType": 33,
    "dataStorage": "STOREDATA",
    "dimName": "Entity",
    "twoPass": false,
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
Vision/dimensions/Entity/members/North%20America",
        "action": "GET"
    }]
}
```

# **Get Applications**

This REST API returns a list of applications to which the specified user is assigned. It also provides certain key information about the application.

## **Required Roles**

Service Administrator

### **REST Resource**

GET /HyperionPlanning/rest/{api version}/applications

## Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-49 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

### Response

Supported Media Types: application/json

Parameters:

Name	Description
Items	A list of applications
name	Application name
type	Product type. Possible values: HFM, HP
adminMode	Indicates if the application's login level is set to Administrators. Returns a Boolean value where true indicates that the login level for the application is set to Administrators and false indicates that the login level is set to All Users.
theme	Current theme of the application. Possible values:
	<ul> <li>REDWOOD_ORACLE_R13</li> <li>REDWOOD_LIGHT_R13</li> <li>REDWOOD_DARK_R13</li> </ul>
webBotDetails	Web bot details of the application
webBotAppId	Web bot application ID register for the application
dpEnabled	Indicates if decision package is enabled in the application. Returns a Boolean value true when enabled.
unicode	Indicates if the application is Unicode enabled. Returns a Boolean value where true indicates that the application is Unicode enabled.
appStorage	Returns the storage type of the application, such as Default, Multidim, or ASO.
аррТуре	Business process type. Possible values are PBCS, EPBCS, and so on.
hybrid	Indicates if the hybrid configuration is enabled in the application. Returns a Boolean value true when enabled.

```

# Manage Planning Units

You can manage planning units using a set of REST resources, as summarized here.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

For detailed information on managing planning units, see Managing Approvals.

**Note:** The manage planning unit resources use the parameters puldentifier and puhldentifier:

- puIdentifier: Planning unit identifier
- puhIdentifier: Planning unit hierarchy identifier

Use the following format for these parameters:

puIdentifier:

"scenarioName"::"versionName"::"pmMember"

• pmMember:

"Entity: SecondaryMember"

• puhIdentifier

"scenarioName"::"versionName"

## Table 8-51 Managing Planning Units

Task	Reque st	REST Resource
List All Planning Units	POST	<pre>/HyperionPlanning/rest/{version}/applications/ {application}/planningunits? q={"scenario":"scenarioName","version":"versionName"}&amp;of fset=10&amp;limit=10</pre>
Get Planning Unit History and Annotations	GET	<pre>/HyperionPlanning/rest/{api_version}/applications/ {application}/planningunits?q={"scenario": {"scenario"},"version": {"version"}}&amp;offset={offset}&amp;limit={limit}</pre>
Get a Planning Unit Owner Photo	GET	/HyperionPlanning/rest/{api_version}/applications/ {application}/users/{userId}/photo
Get Planning Unit Promotional Path	GET	<pre>/HyperionPlanning/rest/{api_version}/applications/ {application}/planningunits/{puIdentifier}/promotionpath</pre>

## Table 8-51 (Cont.) Managing Planning Units

Task	Reque st	REST Resource
Get Available Planning Unit Actions	GET	<pre>/HyperionPlanning/rest/{api_version}/applications/ {applicationName}/planningunits{puhIdentifier}/ availableactions</pre>
Get Filters with All Possible Values	GET	/HyperionPlanning/rest/{api_version}/applications/ {application}/pufilters
Change Planning Unit Status	POST	/HyperionPlanning/rest/{api_version}/applications/ {application}/planningunits/{puhIdentifier}/actions

## List All Planning Units

You can use REST APIs to return a list of planning units for the specified application and owned by the user initiating the REST API. (Note that this does not return all planning units for all applications and users.)

Paging is supported if the optional offset and limit parameters are provided.

## **Required Roles**

Service Administrator

## **REST Resource**

POST

```
/HyperionPlanning/rest/{version}/applications/{application}/planningunits?
q={"scenario":"scenarioName","version":"versionName"}&offset=10&limit=10
```

## Request

Supported Media Types: application/x-www-form-urlencoded

Parameters:

The following table summarizes the client request.

## Table 8-52 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
q	Paging options for planning units. Possible values are described in the following rows.	Query	No	Limit = 25
scenario	Scenario for the application; required	Query	No	None
version	Version for the application; required	Query	No	None
offset	Indicates the actual index from which the records are returned; 0 based.	Query	No	1
limit	Controls how many items to return; defaults to 25 if not specified.	Query	No	25

**Request Payload:** 

The following table summarizes the payload parameters.

Name	Description	Туре	Required
filter	Name, type, and values to filter on. Example:	Payload	No
	<pre>filter={name:"SubStatus",type: values:[0,4]}</pre>	3,	

## Table 8-53 Parameters

## Example URL and Payload

```
https://<BASE-URL>/HyperionPlanning/rest/{version}/applications/{application}/
planningunits?
```

```
q={"scenario":"scenarioName","version":"versionName"}&offset=10&limit=10
```

### Example without filters:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/planningunits? q={"scenario":"Forecast","version":"BU Version 1"}

## Example with two filters, multiple values provided:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/planningunits? q={"scenario":"Forecast","version":"BU Version 1"}

## Payload:

```
filter={name:"Status",type:4,values:
[2,5]}&filter={name:"SubStatus",type:3,values:[0,4]}
```

## Response

Supported Media Types: application/json

Parameters:

Name	Description
name	Planning unit name, such as Marketing
value	Planning unit value
owner	Planning unit owner, such as Admin
version	Planning unit version, such as BU Version_1
entity	Planning unit entity, such as Marketing
status	Planning unit status, such as Under Review
scenario	Planning unit scenario, such as Forecast
Formatted value	Formatted value, if any
puName	Planning unit name, such as Marketing
subStatus	Planning unit substatus
secMember	Secondary dimension member, if any
puAlias	Planning unit alias, such as Marketing
versionAlias	Version alias, if any

## Table 8-54 Parameters

## Example of Response Body

```
{
    "items": [{
        "name": null,
        "value": -1.0,
        "owner": "admin",

            }]
        }
    }],
    "type": "HP"
}
```

## Get Planning Unit History and Annotations

You can use REST APIs to return a merged list of history and annotations for the planning unit that the requesting user owns for the specified Scenario, Version, and PM Member.

If both annotSeq and logSeq are < 0, parent level nodes are returned. If annotSeq or logSeq is provided, the replies to that annotation or history are returned respectively.

If both annotSeq and logSeq are < 0, parent level nodes are returned. If annotSeq or logSeq is provided, the replies to that annotation or history are returned respectively.

## **Required Roles**

Service Administrator

### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/
planningunits/{puIdentifier}/historyandannotations?
q={annotSeq=-1,logSeq=-1}&offset=10&limit=10
```

### Request

Supported Media Types: application/x-www-form-urlencoded

Parameters:

The following table summarizes the client request.

### Table 8-55 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
scenario	Scenario for the application; required	Path	Yes	None

## Table 8-55 (Cont.) Parameters

Name	Description	Туре	Required	Default
version	Version for the application; required	Path	Yes	None
pmMember	Entity; secondary member	Path	Yes	None
offset	Indicates the actual index from which the records are returned; 0 based.	Query	No	1
limit	Controls how many items to return; defaults to 25 if not specified.	Query	No	25

## Example URL and Payload

```
https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/planningunits/
Forecast::"BU Version_1"::Marketing::/historyandannotations?
q={annotSeq:-1,logSeq:-1}
```

Filter can include name, type, and values to filter on. For example: filter={name:"SubStatus", type:3, values:[0,4]}

## Response

Supported Media Types: application/x-www-form-urlencoded

Parameters:

Name	Description
comment	Comment entered by the planning unit owner when performing an action
hasHistory	True if the planning unit has history
logSeq	Sequence of the action performed on the planning unit
staticImage	Whether a static image exists for this note
authorImagePath	The path to the user image for the user who performed the action
commentTitle	The author name and the action the author performed
commentDate	The date when the action was performed or the annotation was added
commentSubTitle	Processing state of the planning unit when the action was performed
parentAnntSeq	Sequence of the annotation or the parent annotation added to the planning unit
isChildNode	true if this is a reply to an annotation

## Table 8-56 Parameters

## Example of Response Body

```
{
    "items": [{
        "comment": "Enough justification provided, Approving it.",
```

```
"hasHistory": false,
        "logSeq": -1,
        "staticImage": true,
        "authorImagePath": "/Images/GhostUser.png",
        "commentTitle": "admin",
        "commentDate": "8/22/14 3:41 PM",
        "commentSubTitle": "",
        "parentAnntSeq": 1,
        "isChildNode": false,
        "links": [{

    "type": "HP",
}
```

## Get a Planning Unit Owner Photo

You can use REST APIs to get an image for the requested planning unit owner if a photo is uploaded for the owner.

## **Required Roles**

Service Administrator

### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/users/ {userId}/photo

## Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-57 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
userID	The identifier of the user for whom to retrieve a photo	Path	Yes	

## Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/users/5000100/
photo

### Response

Supported Media Types: In case of success, returns application/octet-stream. In case of error, returns application/json.

Error Response:

Name	Description
detail	Detail about the status of the planning unit photo for this user. For example: PU photo not available, make sure that a valid user identifier is provided.
status	HTTP status, such as 400.
message	Informational message about the status of the photo for this user.
localizedMessage	A localized informational message about the status.

### Table 8-58 Parameters

## Example of Error Response Body

The following shows an example of the response body in JSON format.

```
{
    "detail": "PU photo not available, make sure the a valid user identifier
is provided.",
    "status": 400,
    "message": "java.lang.RuntimeException: PU photo not available, make sure
the a valid user identifier is provided.",
    "localizedMessage": "java.lang.RuntimeException: PU photo not available,
make sure the a valid user identifier is provided."
}
```

## Get Planning Unit Promotional Path

You can use REST APIs to get a list of promotion path nodes for a given application, user, and planning unit. The planning unit is identified by the provided scenario, version, and PM member.

The list can have up to three nodes: the node before the current location, the node at the current location, and the one after the current location. If the planning unit is at the starting location or the last location in the path, only two nodes are returned.

### **Required Roles**

Service Administrator

### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/
planningunits{puIdentifier}/promotionpath

### Request

Parameters:

The following table summarizes the client request.

## Table 8-59 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

## Table 8-59 (Cont.) Parameters

Name	Description	Туре	Required	Default
application	The name of the application	Path	Yes	None
puIdentifier	The name of the planning unit, such as Sales	Path	Yes	None

## Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/planningunits/ Forecast::"BU Version 1"::Dev/promotionpath

## Response

Supported Media Types: application/json

Parameters:

## Table 8-60 Parameters

Name	Description
Items	Planning unit promotional path information
name	Name of the planning unit
ownerType	Planning unit owner type
group	Returns whether the owner is a group of users or an individual users, true or false
staticImage	Returns whether the image is a static manage, true or false
nodeImagePath	Path to the planning unit owner photo
ownerName	Name of the planning unit owner
currentLoc	Returns if this is the current location of the planning unit, true or false

## Example of Response Body

```
{
    "items": [{
        "name": "ent_111: Regular Coke",
        "ownerType": 0,
        "group": false,
        "staticImage": true,
        "nodeImagePath": "../ui themes/tadpole/images product/pm/75X89/
PUOwner.png",
        "ownerName": "Planner1",
        "currentLoc": true
    }, {
        "name": "Total Entity",
        "ownerType": 0,
        "group": false,
        "staticImage": false,
        "nodeImagePath": "v3/applications/PS4app1/puphoto?app0wner=50001",
```

```
"ownerName": "admin",
    "currentLoc": false
}],
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
PS4app1/planningunits/Forecast::%22BU%20Version_1%22::Dev/promotionpath",
        "action": "GET"
    }],
}
```

## Get Available Planning Unit Actions

You can use REST APIs to return a list of the next set of applicable actions available for the planning units, consisting of the specified scenario, version, and PM Members (Entity: Secondary member) that are owned by the requesting user.

## **Required Roles**

Service Administrator

### **REST Resource**

POST

```
/HyperionPlanning/rest/{api_version}/applications/{application}/
planningunits{puhIdentifier}/availableactions
```

#### Request

Parameters:

The following table summarizes the client request.

## Table 8-61 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
puIdentifier	The name of the planning unit, such as Sales	Path	Yes	None
q	Optionally, return limited or full approvals functionality. Options are listed here.	Query	No	None
0	Returns limited approvals functionality - useful for mobile clients	Query	No	None
1	Returns full approvals functionality; default is 1.	Query	No	None

### URL and Payload Examples

https://<BASE-URL>/rest/v3/applications/PS4app1/planningunits/Forecast::"BU
Version 1"/availableactions?q={"options":1}

### Payload examples:

pmMembers=pmMemberNames

pmMembers=Dev, Marketing

### Response

Supported Media Types: application/json

Parameters:

## Table 8-62 Parameters

Name	Description
Items	Planning unit available actions
actionId	ID of the action
Name	Name of the action

## Example of Response Body

```
{
    "items": [{
        "actionId": 6,
        "name": "Promote"
    }, {
        "actionId": 3,
        "name": "Sign Off"
    }, {
        "actionId": 1,
        "name": "Reject"
    }, {
        "actionId": 7,
        "name": "Delegate"
    }, {
        "actionId": 8,
        "name": "Take Ownership"
    }, {
        "actionId": 9,
        "name": "Originate"
    }, {
        "actionId": 10,
        "name": "Freeze"
    }],
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
PS4 HP2/planningunits/Current::%22BU%20Version 1%22/availableactions?
q=%7Boptions:1%7D",
        "action": "GET",
        "data": {
            "pmMembers": "ent 111: Regular Coke"
        }
    }],
}
```

## Get Filters with All Possible Values

Returns all filter types with all possible values by which users can filter planning units for a given application. For every value, there is a label (in the client locale) representation and an integer value. The labels are shown to end users to pick from, but whenever possible, the client should submit the integer value that is unique to the server. Every application supports several types of filters that are indicated by the type field.

Name is optional. The defIndex is the index in the value array for the default selection value.

## **Required Roles**

Service Administrator

## **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/pufilters

## Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

## Table 8-63 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
d	Optionally, return filters for limited or full functionality. Options are listed here.	Query	No	None
0	Returns filters for limited Approvals functionality - useful for mobile clients.	Query	No	None
1	Returns filters for full Approvals functionality; default is 1.	Query	No	None

### Example URL

https://<BASE-URL>-/HyperionPlanning/rest/v3/applications/PS4app1/pufilters?
q={"options":"0"}

## Response

Supported Media Types: application/json

Parameters:

Name	Description	
Names	Planning unit available actions	
aliases	Aliases for values to be displayed instead of labels if user preference is defined as such	
name	Name for the filter	

Name	Description
type	Type of the filter
values	Integer values; usually the client will submit this value to indicate the selected filter
labels	Labels for values to be displayed in the client for the filter
defIndex	Index of the value to be displayed as the default value

## Table 8-64 (Cont.) Parameters

## Example of Response Body

```
{
    "items": [{
        "aliases": ["Forecast"],
        "name": "Scenarios",
        "type": 1,
        "values": [50218],
        "labels": ["Forecast"],
        "defIndex": 0
    }, {

    }],
}
```

## Change Planning Unit Status

You can use REST APIs to change the status of the planning units consisting of the specified scenario, version, and PM Members (Entity: Secondary member) that are owned by the requesting user.

An error will display if the planning units belong to same hierarchy but different levels, or if the statuses for the planning units are not the same.

Supported actions for limited approvals functionality are: "PROMOTE" (6), "SIGN\_OFF" (3), "APPROVE" (2), "DELEGATE" (7), "TAKE\_OWNERSHIP" (8), "ORIGINATE" (9), "FREEZE" (10)

## **Required Roles**

Service Administrator

## **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/
planningunits/{puhIdentifier}/actions
```

## Request

Supported Media Types: application/x-www-form-urlencoded

Parameters:

The following table summarizes the client request.

## Table 8-65 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None

### Example URL and Payload

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/planningunits/
Forecast::"BU Version 1"/actions

## Payload

actionId=actionId&pmMembers=pmMemberNames&comments=comments

## Response

Supported Media Types: application/json

Example of Response Body

```
{
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
PS4app1/planningunits/Forecast::%22BU%20Version_1%22/actions",
```

```
"action": "POST",
   "data": {
        "pmMembers": "\"Dev\"",
        "action": "PROMOTE",
        "comments": "\"Promoting the PU\""
   }
}]
```

# **Get User Preferences**

}

Returns the requesting user's display preferences.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### **Required Roles**

Service Administrator

#### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}/applications/{application}/
userpreferences

#### Request

Parameters:

The following table summarizes the client request.

## Table 8-66 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
userpreferences	The requesting user's display preferences	path	Yes	None

## Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/PS4app1/userpreferences

## Response

Supported Media Types: application/json

## Table 8-67 Parameters

ame Description	
decimal separator	Preference for decimal separator
scale	Preference for scale
thousandsSeparator	Preference for the thousands separator

Name	Description
thousandsSeparator	Preference for the style of negative numbers
negativeStyle	Preference for the minimum precision
minPrecision	Preference for the minimum precision
maxPrecision	Preference for the maximum precision
showPUAlias	Preference for showing the planning unit alias
currSymbol	Preference for the currency symbol
type	The type of application, such as HP

## Table 8-67 (Cont.) Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "decimalSeparator": "",
    "scale": 0,
    "thousandsSeparator": "",
    "negativeStyle": 255,
    "minPrecision": 0,
    "maxPrecision": 0,
    "showPUAlias": false,
    "currSymbol": "",
    "links": [{
        "rel": "self",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
PS4app1/userpreferences",
        "action": "GET"
    }]
}
```

# Working with Data Slices

You can import, export, and clear data slices, as summarized here. Note that attribute dimensions are not supported in the payload.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Import Data Slice	POST	<pre>/HyperionPlanning/rest/{api_version}/applications/ {application}/plantypes/{plantype}/importdataslice</pre>
Export Data Slice	POST	<pre>/HyperionPlanning/rest/{api_version}/applications/ {application}/plantypes/{plantype}/exportdataslice</pre>
Clear Data Slice	POST	/HyperionPlanning/rest/{api_version}/applications/ {application}/plantypes/{plantype}/cleardataslice

## Table 8-68Working with Data Slices

# Import Data Slices

Can be used to import data given a JSON data grid with a point of view, columns, and one or more data rows. Data will be imported only for cells that the user has read-write access to. Imports data of types Text, Date and Smart List along with numeric data. Returns JSON with details on the number of cells that were accepted, the number of cells that were rejected, and the first 100 cells that were rejected. You can set custom parameters to view rejected cells to understand the reason for the rejection.

# **Required roles**

Service Administrator

# **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/plantypes/
{plantype}/importdataslice

# Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

# Table 8-69 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to import the data slice	Path	Yes	None
plantype	Name of the plan type for which to import the data slice	Path	Yes	None

# Example URL and Payload:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/plantypes/plan1/
importdataslice
Payload Parameters

The Payload is JSON with the following parameters.

# Table 8-70 Parameters

Name	Description
dataGrid	JSON data grid

Name	Description		
aggregateEssbaseData	True or false.		
	If true, the values being saved will be added to the existing values. Only numeric values can be aggregated. Cells with Smart list, Text and Date data types will be rejected.		
	If false, the data values will be overwritten. A value of "#missing" will clear the cell value as shown in the example. The default is false.		
	<b>Note</b> : Values provided in the "data" section of the JSON payload will be used even for cells with supporting details provided. For cells with supporting details, make sure the total calculated for the incoming supporting details matches the value provided in the row "data" section.		
	See the following table for examples.		
cellNotesOption	Possible values are: "Overwrite", "Append", and "Skip".		
-	<ul> <li>"Overwrite": The existing cell notes will be overwritten. An empty array for cell notes [] will indicate deletion of existing cell notes. A value of "null" will leave the existing cell notes intact.</li> <li>"Append": New cell notes will be appended to existing cell notes.</li> <li>"Skip": Cell notes will not be processed.</li> </ul>		
dateFormat	Date format used in the input data grid. Valid formats are: "MM-DD- YYYY", "DD-MM-YYYY", "YYYY-MM-DD", "MM/DD/YYYY", "DD/MM/ YYYY", "YYYY/MM/DD"		
strictDateValidation	Optionally, influence how Date cell values are validated. When set to true, date values are validated against the dateFormat specified in the payload and are rejected if the format for the value does not conform to the dateFormat. If set to false, date values are interpreted more leniently. Default is true.		
customParams			
PostDataImportRuleNames	Optionally, provide the post data import rule names. This is primarily used by Data Management for planners. Default is false.		
includeRejectedCells	Optionally, indicate if the response should include the first 100 rejected cells. Default is true.		
includeRejectedCellsWith Details	Optionally, indicate if the response should include the reasons why cells are rejected. Default is false.		

# Table 8-70 (Cont.) Parameters

# Table 8-71 Import Data Slice Examples

Source Cell	Target Cell	Resulting Target Cell
Supporting Detail (SD)	#missing	SD
SD	Value	Add SD value to the existing value, do not add SD
Value	SD	Delete SD, add Value to the existing value
SD1	SD2	Delete SD2, add SD value to the existing value, do not add SD1

# Sample payload:

```
{
```

"aggregateEssbaseData":true,
"cellNotesOption":"Overwrite",

```
"dateFormat":"DD/MM/YYYY",
   "strictDateValidation":true,
    "dryRun": true,
    "customParams":{
        "PostDataImportRuleNames":"Post data rule 1, \"post, data rule
2\"",
        "IncludeRejectedCells":true,
        "IncludeRejectedCellsWithDetails":true
    },
```

Supported Media Types: application/json

#### **JSON** Output

The rejected cells consist of cells that the user does not have read-write access to; cells where row or column member names are invalid and do not exist; cells where the data is invalid (for example, an invalid Smart List value); and cells that are non-numeric (Smart List, Text, or Date type) with data when <code>aggregateEssbaseData</code> is set to true.

{

"numAcceptedCells": 3,

"numRejectedCells": 9,

```
"rejectedCells": ["[BaseData, FY15, Plan, Working, 410, P_160, Jan, Project
Number]", "[BaseData, FY15, Plan, Working, 410, P_160, Feb, Project Number]",
"[BaseData, FY15, Plan, Working, 410, P_160, Mar, Project Number]", "[BaseData,
FY15, Plan, Working, 410, P_160, Jan, Request Date]", "[BaseData, FY15, Plan,
Working, 410, P_160, Feb, Request Date]", "[BaseData, FY15, Plan, Working, 410,
P_160, Mar, Request Date]", "[BaseData, FY15, Plan, Working, 410,
P_160, Mar, Request Date]", "[BaseData, FY15, Plan, Working, 410,
Project Type]", "[BaseData, FY15, Plan, Working, 410, P_160, Feb, Project Type]",
"[BaseData, FY15, Plan, Working, 410, P_160, Mar, Project Type]"],
```

# **Export Data Slices**

Use this REST API to export data for a specified region.

The exported data will be in the form of a JSON grid with pov, columns, and 0 or more data rows. Data will be exported only for cells for which the user has read-write access.

# **Required Roles**

Service Administrator

#### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/plantypes/
{plantype}/exportdataslice
```

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

# Table 8-72 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to export the data slice	Path	Yes	None
plantype	Name of the plan type for which to export the data slice	Path	Yes	None

#### Example URL and payload:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/plantypes/plan1/
exportdataslice
Payload Parameters

The Payload is JSON with the following parameters.

Name	Description
gridDefinition	JSON grid definition to define the region
exportPlanningData	True or false. Optionally, you can provide the parameter exportPlanningData, which, when set to true, will export supporting details and cell notes along with Essbase numeric data. Default is false.
suppressMissingBlocks	True or false. Optionally, you can set suppressMissingBlocks to true to suppress blocks with missing data.
suppressMissingRows	True or false. Optionally, you can set suppressMissingRows to true to suppress rows with missing data.
suppressMissingColumns	True or false. Optionally, you can set suppressMissingColumns to true to suppress rows with missing data.

# Table 8-73 Parameters

Supported Media Type: application

#### Sample Payload

Example 1: Providing dimension names as follows in the gridDefinition is recommended and is more efficient.

```
{
    "exportPlanningData": false,
    "gridDefinition": {
        "suppressMissingBlocks": true,
        "pov": {
            "dimensions": [
              "HSP_View",
              "Year",
              "Scenario",
              "Version",
              "Entity",
              "Product"
        ],
```

```
"members": [
      [
         "BaseData"
      ],
      [
         "FY15"
      ],
      [
         "Plan"
      ],
      [
         "Working"
      ],
      [
         "410"
      ],
      [
         "P_160"
      ]
   ]
},
"columns": [
   {
      "dimensions": [
       "Period"
      ],
      "members": [
       [
           "IDescendants(Q1)"
         1
      ]
   },
   {
      "dimensions": [
         "Period"
      ],
      "members": [
        [
            "IDescendants(Q2)"
         ]
      ]
   }
],
"rows": [
   {
      "dimensions": [
        "Account"
      ],
      "members": [
         [
            "Project Number",
            "Request Date",
            "Project Type",
            "Project Investment"
         ]
      ]
```

} ] }

# OR

No dimension names provided is less efficient:

```
{
   "exportPlanningData": true,
   "gridDefinition": {
     "suppressMissingBlocks": true,
      "pov": {
         "members": [
            ["BaseData"], ["FY15"], ["Plan"], ["Working"], ["410"],
["P_160" ]
         ]
      },
      "columns": [
         {
            "members": [
               [
                  "IDescendants(Q1)"
               ]
            ]
         },
         {
            "members": [
               [ "IDescendants(Q2)" ]
            ]
         }
     ],
      "rows": [
         {
            "members": [
               [
                  "Project Number",
                  "Request Date",
                  "Project Type",
                  "Project Investment"
               ]
            ]
         }
     ]
   }
}
```

JSON Output

The following shows an example of the response body with exportPlanningData : true.

```
"pov": [
   "BaseData",
   "FY15",
   "Plan",
   "Working",
   "410",
   "P 160"
],

         null,
         null
      ]
   }
]
```

Example 2: Suppress missing blocks, rows, and columns when exporting a data slice:

```
{
    "exportPlanningData": false,
    "gridDefinition": {
        "suppressMissingBlocks": true,
        "suppressMissingColumns": true,
        "pov": {
            "dimensions": [
               "HSP_View",
               "Year",
               "Scenario",
               "Version",
               "Entity",
               "Product"
               "Product"
               "Start and start and star
```

}

```
],
   "members": [
     [
        "BaseData"
      ],
      [
         "FY15"
      ],
      [
         "Plan"
      ],
      [
         "Working"
      ],
      [
         "410"
      ],
      [
         "P_160"
      ]
   ]
},
"columns": [
   {
      "dimensions": [
       "Period"
      ],
      "members": [
        [
         "IDescendants(Q1)"
         ]
      ]
   },
   {
      "dimensions": [
         "Period"
      ],
      "members": [
       [
           "IDescendants(Q2)"
         ]
      ]
   }
],
"rows": [
  {
      "dimensions": [
        "Account"
      ],
      "members": [
         [
            "Project Number",
            "Request Date",
            "Project Type",
            "Project Investment"
         ]
```

```
]
         }
     ]
   }
}
JSON Output:
{
   "pov": [
      "BaseData",
      "FY15",
      "Plan",
      "Working",
      "410",
      "P 160"
  ],
   "columns": [
      [
         "Jan",
         "Feb",
         "Mar",
         "Q1",
         "Apr",
         "May",
         "Jun",
         "Q2"
      ]
  ],
   "rows": [
      {
         "headers": [
            "Project Number"
         ],
         "data": [
            "1",
            "2",
            "3",
            ]
      },
      {
         "headers": [
           "Project Type"
         ],
         "data": [
            "Other",
            "IT",
            "Construction",
            ....
         ]
      },
```

Example payload with multiple dimensions:

```
{
   "exportPlanningData": false,
   "gridDefinition": {
      "suppressMissingBlocks": true,
      "pov": {
         "dimensions": [
            "HSP View",
            "Scenario",
            "Version",
            "Product"
         ],
         "members": [
            [
               "BaseData"
            ],
            [
               "Plan"
            ],
            [
                "Working"
            ],
            [
                "P 160"
            ]
         ]
      },
      "columns": [
         {
            "dimensions": [
               "Year", "Period"
            ],
            "members": [
                [
                   "FY19"
               ],
                [
                   "IDescendants(Q1)"
```

```
]
            ]
         },
         {

            "members": [
               [
                  "410",
                  "420"
               ],
               [
                  "Project Number",
                  "Request Date",
                  "Project Type",
                  "Project Investment"
               ]
            ]
         },
         {
            "dimensions": [
              "Entity", "Account"
            ],
            "members": [
                [
                  "430"
               ],
               [
                  "Project Investment"
               ]
            ]
        }
     ]
  }
}
```

# **Clear Data Slices**

Use this REST API to clear Planning and Essbase data for a specified region. In order to run this operation, the user must be an administrator.

# **Required Roles**

Service Administrator

#### **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/plantypes/
{plantype}/cleardataslice

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

# Table 8-74 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to export the data slice	Path	Yes	None
plantype	Name of the plan type for which to export the data slice	Path	Yes	None

# Example URL and Payload:

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/plantypes/plan1/ cleardataslice

# Payload Parameters

The Payload is JSON with the following parameters.

# Table 8-75 Parameters

Name	Description
gridDefinition	JSON grid definition to define the region
clearEssbaseData	True or false. If true, will clear Essbase numeric data. Default is true.
clearPlanningData	True or false. If true, will delete the cell notes, attachments, and supporting details. Default is false.

#### Sample Payload

Providing dimension names as follows in the gridDefinition is recommended and is more efficient.

# {

"clearEssbaseData":true,

```
"clearPlanningData":false,
"gridDefinition" : {
"suppressMissingBlocks" : true,
"pov" : {
"dimensions" : [ "HSP_View", "Year", "Scenario", "Version", "Entity", "Product" ],
"members" : [["BaseData"], ["FY15"], ["Plan"], ["Working"], ["410"], ["P_160"]]
},
"columns" : [ {
"dimensions" : [ "Period" ],
"members" : [["IDescendants(Q1)"]]
}, {
"dimensions" : [ "Period" ],
"members" : [["IDescendants(Q2)"]]
}],
"rows" : [ {
"dimensions" : [ "Account" ],
"members" : [[ "Project Number", "Request Date", "Project Type", "Project Investment" ]]
}]
}
}
OR
No dimension names provided is less efficient:
{
"clearEssbaseData":true,
"clearPlanningData":false,
"gridDefinition" : {
"suppressMissingBlocks" : true,
"pov" : {
"members" : [["BaseData"], ["FY15"], ["Plan"], ["Working"], ["410"], ["P_160"]]
},
"columns" : [ {
"members" : [["IDescendants(Q1)"]]
}, {
"members" : [["IDescendants(Q2)"]]
```

# }],

"rows" : [ {

"members" : [["Project Number", "Request Date", "Project Type", "Project Investment"]]

}]

}

}

# Response

Supported Media Types: application/json

JSON Output

The following shows an example of the response body with clearEssbaseData true and clearPlanningData false. There is one rejected cell due to the presence of supporting details because clearPlanningData is false:

{

"numClearedCells": 31,

"numRejectedCells": 1

"rejectedCells": ["Project Investment, Feb, BaseData, FY15, Plan, Working, 410, P\_160"],

}

# **Getting and Setting Substitution Variables**

You can use REST APIs to get and set substitution variables at the plan level and application level, as summarized here.

You can also use REST APIs to delete substitution variables. See Deleting Substitution Variables.

# **Required Roles**

Service Administrator, Power User (with Rule Launch access)

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 8-76 Getting and Setting Substitution Variables

Task	Request	REST Resource
Get All Substitution Variables Defined for the Application	GET	<pre>/HyperionPlanning/rest/ {api_version}/applications/ {application}/ substitutionvariables</pre>
Get a Substitution Variable Defined for the Application	GET	/HyperionPlanning/rest/ {api_version}/applications/ {application}/ substitutionvariables/MyPeriod

Task	Request	REST Resource
Create or Update All Substitution Variables Defined for the Application	POST	/HyperionPlanning/rest/ {api_version}/applications/ {application}/ substitutionvariables
Get Substitution Variables Defined at the Plan Type Level	GET	/HyperionPlanning/rest/ {api_version}/applications/ {application}/plantypes/ {plantype}/substitutionvariables
Get Derived Substitution Variables at the Plan Type Level	GET	<pre>/HyperionPlanning/rest/ {api_version}/applications/ {application}/plantypes/ {plantype}/substitutionvariables? q={"derivedValues":true}</pre>

Get a Derived Substitution Variable Defined at the Plan Type Level	GET	HyperionPlanning/rest/ {api_version}/applications/ {application}/plantypes/ {plantype}/substitutionvariables/ MyPeriod?q={"derivedValues":true}
Create and Update Substitution Variables at the Plan Type Level	POST	/HyperionPlanning/rest/ {api_version}/applications/ {application}/plantypes/ {plantype}/substitutionvariables

#### Table 8-76 (Cont.) Getting and Setting Substitution Variables

# Get All Substitution Variables Defined for the Application

You can use REST APIs to retrieve all substitution variables defined for the application (all plan types).

# **Required Roles**

Service Administrator, Power User (with Rule Launch access)

#### **REST Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/
substitutionvariables
```

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

# Table 8-77 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None

#### Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/ substitutionvariables

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

# Table 8-78 Parameters

Name Description		
items	Collection of information about the resource	
name	Name of the substitution variable, such as CurrYear	
value	Value of the substitution variable, such as FY16	
planType	Plan type, such as Plan1, or ALL for all plan types	

# Example of Response Body

The following shows an example of the response body.

```
{
    "items": [{
        "name": "CurrYear",
        "value": "FY16",
        "planType": "ALL"
    }, {
        "name": "CurrYear",
        "value": "FY17",
        "planType": "Plan2"
    },{
        "name": "CurrPeriod",
        "value": "Jan",
        "planType": "Plan1"
    }, {
        "name": "CurrPeriod",
        "value": "Feb",
        "planType": "ALL"
    }]
}
```

# Get a Substitution Variable Defined for the Application

You can use REST APIs to retrieve a substitution variable defined for the application.

# **Required Roles**

Service Administrator, Power User (with Rule Launch access)

#### **REST Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/
substitutionvariables/CurrPeriod
```

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

# Table 8-79 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None

#### Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/ substitutionvariables/CurrPeriod

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

# Table 8-80 Parameters

Name	Description
name	Name of the substitution variable, such as CurrPeriod
value	Value of the substitution variable, such as Jan
planType	Plan type, such as Plan1, or ALL for all plan types

# Example of Response Body

The following shows an example of the response body.

```
{
    "name": "CurrPeriod",
    "value": "Jan",
```

```
"planType": "ALL",
"links": [{
    "rel": "self",
    "href": "https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
vision/substitutionvariables/CurrPeriod",
    "action": "GET"
  }]
}
```

# Create or Update All Substitution Variables Defined for the Application

Can be used to create or update substitution variables for the application.

Variables in the payload that exit in the application at the defined scope will be updated; new variables will be created at the defined scope.

#### **Required Roles**

Service Administrator

#### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/
substitutionvariables
```

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

# Table 8-81 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None

#### Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/ substitutionvariables

#### **Example Payload**

With the following payload, CurrYear at the application level will be updated, and CurrPeriod will be created at the Plan3 level.

```
{
    "items": [{
        "name": "CurrYear",
        "value": "FY18",
        "planType": "ALL"
    }, {
        "name": "CurrPeriod",
        "
}
```

```
"value": "Dec",
"planType": "Plan3"
}]
```

}

Supported Media Types: application/json

Example of a successful response

```
Http status code: 204 (No content)
```

# Example of an error response

Http status: 400

To confirm the results, you can go to the application to see the updates.

# Get Substitution Variables Defined at the Plan Type Level

You can use REST APIs to retrieve a list of retrieve a list of substitution variables defined at the plan type level.

# **Required Roles**

Service Administrator, Power User (with Rule Launch access)

# **Rest Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/
plantypes/{plantype}/substitutionvariables
```

# Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

# Table 8-82 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
plantype	The plan type for which to get substitution variables	Path	Yes	None

#### Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/plantypes/Plan1/
substitutionvariables

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

# Table 8-83 Parameters

Name	Description
items	Collection of information for the resource
name	Name of the substitution variable, such as CurrPeriod
value	Value of the substitution variable, such as Jan
planType	Name of the plan type, such as Plan1

# **Example of Response Body**

The following shows an example of the response body.

```
{
    "items": [{
        "name": "CurrPeriod",
        "value": "Jan",
        "planType": "Plan1"
    }]
}
```

# Get Derived Substitution Variables at the Plan Type Level

You can use REST APIs to retrieve a list of derived substitution variables at the plan type level.

# **Required Roles**

Service Administrator, Power User (with Rule Launch access)

# **Rest Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/
plantypes/{plan}/substitutionvariables?q={"derivedValues":true}
```

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
plantype	Name of the plan type for which to get substitution variables	Path	Yes	None
d	Options for returning derived values, as described in the following row	Query	No	
derivedValues	If set to true, the derived list shows all variables available at run time to be used against the plan type. This includes variables defined at the application level and at the plan type level.	Query	No	derivedValues = true when getting derived substitution
	If a substitution variable with the same name is defined both at the plan type level and at the application level, the plan type level is returned.			variables

# Table 8-84 Parameters

Parameters

The following table summarizes the client request.

#### Table 8-94 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, v3	Path	Yes	None
plantype	The name of the plan type for which to delete the substitution variables	Path	Yes	None

#### Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/plantypes/Plan1/
substitutionvariables:delete

#### Example Payload

{

The following payload will delete CurrYear and CurrPeriod at the Plan1 level.

```
"items": [{
"name": "CurrYear",
"value": "FY23",
"planType": "Plan1"
```

```
}, {
    "name": "CurrPeriod",
    "value": "Jan",
    "planType": "Plan1"
}]
```

1

Supported Media Types: application/json

Example of a successful response

Http status code: 204 (No content)

Example of an error response

Http status: 400

# Delete Substitution Variables for the Application

Use this REST API to delete substitution variables defined for the application (for all plan types). Variables that exist at the plan type level or application level are deleted.

Before deleting substitution variables, you can use REST APIs to get information on what substitution variables are defined for the application or plan type. See Getting and Setting Substitution Variables.

#### **Required Roles**

Service Administrator

#### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/
substitutionvariables:delete
```

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

# Table 8-95 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, v3	Path	Yes	None

#### Example URL

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/Vision/ substitutionvariables:delete

# Example Payload

The following payload will delete CurrPeriod at the application level and CurrYear at Plan1.

```
{
    "items": [{
        "name": "CurrPeriod",
        "value": "Jan",
        "planType": "ALL"
    }, {
        "name": "CurrYear",
        "value": "FY23",
        "planType": "Plan1"
    }]
}
```

#### Response

Supported Media Types: application/json

Example of a successful response

Http status code: 204 (No content)

#### Example of an error response

Http status: 400

# Example of Response Body

The following shows an example of the response body.

```
{
    "items": [{
        "name": "CurrYear",
        "value": "FY16",
        "planType": "ALL"
    }, {
        "name": "CurrYear",
        "value": "FY17",
        "planType": "Plan2"
    },{
        "name": "CurrPeriod",
        "value": "Jan",
        "planType": "Plan1"
    }, {
        "name": "CurrPeriod",
        "value": "Feb",
        "planType": "ALL"
    }]
}
```

# Working with Connections

Use these REST APIs to work with connections.

With multiple environments, using REST APIs saves you time and effort by automating the process of logging in and configuring connections. For information about accessing environments, see Accessing EPM Cloud.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using these REST APIs requires prerequisites. See Prerequisites.

Task	Request	REST Resource
View a Connection	GET	<pre>/HyperionPlanning/rest/epm/{api_version}/ applications/{application}/connections/ {connectionRef}</pre>
View all Connections	GET	/HyperionPlanning/rest/epm/{api_version}/ applications/{application}/connections
Update a Connection	POST	/HyperionPlanning/rest/epm/{api_version}/ applications/{application}/connections/ {connectionRef}

# Table 8-96 Working with Connections

# View a Connection

Use this REST API to view details for a connection that is saved in an application.

# **Required Roles**

Service Administrator

# **REST Resource**

```
GET /HyperionPlanning/rest/epm/{api_version}/applications/{application}/
connections/{connectionRef}
```

# Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

# Table 8-97 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to view the connection	Path	Yes	None
connectionRef	The connection to view. The value can be either a connection name or ID.	Path	Yes	None

Supported Media Types: application/json

**Payload Parameters:** 

The following table summarizes the parameters.

#### Table 8-98 Parameters

Parameters	Description
items	Collection of information about the resource
id	Unique identifier for the connection, such as 1c89922d-92ba-46c1-850f- e2a8a416ddf2
name	Name of the connection, such as Connection29
description	Description of the connection, such as Planning
url	The URL of the connection, such as https:// <service_name>- <tenant_name>.<service_type>.<dcx>.oraclecloud.com/ HyperionPlanning</dcx></service_type></tenant_name></service_name>
username	The username for the connection, such as admin
domain	The domain name for the connection
modified	The time stamp of the last modification to the connection details, such as 2021-01-18 12:23:49.0
modifiedBy	The last service administrator to modify the connection details, such as admin

#### **Example Response**

The identity domain information as shown as part of the response.

```
{
    "id": "f83b3da2-9505-415e-b7f7-3cf113cc94e4",
    "name": "Connection1",
    "description": "Test Connection",
    "url": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning",
    "username": "admin",
    "domain": "<DOMAIN NAME>",
    "modified": "2021-02-02 09:16:02.0",
    "modifiedBy": "admin",
    "links": [
        {
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/
rest/epm/v1/applications/epbcs1/connections/f83b3da2-9505-415e-
b7f7-3cf113cc94e4",
            "action": "GET",
            "rel": "self",
            "data": null
        }
    ]
}
```

# **View All Connections**

Use this REST API to view details for all of the connections saved in an application.

This API supports paging, so you can filter the number of connections you see in the output using the offset and limit parameters shown in the table.

# **Required Roles**

Service Administrator

# **REST Resource**

GET /HyperionPlanning/rest/epm/{api\_version}/applications/{application}/
connections

# Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

# Table 8-99 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to view connections	Path	Yes	None
offset	For paging of jobs. Indicates the actual index from which the records are returned. It is 0 based.	Query	No	0
limit	For paging for jobs. Controls how many items to return. Defaults to 25 if not specified.	Query	No	25

# Example URL

https://<BASE-URL>/HyperionPlanning/rest/epm/v1/applications/epbcs1/connections?
offset=2&limit=2

# Response

The following table summarizes the parameters.

# Table 8-100 Parameters

Parameters	Description
items	Collection of information about the resource
id	Unique identifier for the connection, such as 1c89922d-92ba-46c1-850f- e2a8a416ddf2
name	Name of the connection, such as Connection29
description	Description of the connection, such as Planning
url	The URL of the connection, such as https://< <i>BASE-URL</i> >/ HyperionPlanning

Parameters	Description
username	The username for the connection, such as admin
domain	The domain name for the connection
modified	The time stamp of the last modification to the connection details, such as 2021-01-18 12:23:49.0
modifiedBy	The last service administrator to modify the connection details, such as admin

# Table 8-100 (Cont.) Parameters

#### Example Response

The identity domain information as shown as part of the response.

```

# Update a Connection

Use this REST API to update a specific connection that is saved in an application.

You can update the values using either a plain text password or encrypted password. The response returns the updated connection details.

#### **Required Roles**

Service Administrator

#### **REST Resource**

GET /HyperionPlanning/rest/epm/{api\_version}/applications/{application}/
connections/{connectionRef}

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

#### Table 8-101 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application for which to update a connection	Path	Yes	None
connectionRef	The connection to refer to. The value can be either a connection name or ID.	Path	Yes	None

Name	Description
name	Name of the connection, such as Connection29
description	Description of the connection, such as Planning
url	The URL of the connection, such as https:// <base-url>/HyperionPlanning</base-url>
username	The username for the connection, such as admin
password	The password of the connection
encryptedPassword	The password of the connection in the encrypted format using the EPM Automate encrypt command. See encrypt.

#### Table 8-102 Parameters for Connection Information that Can Be Modified

## Example Body

Example 1:

```
{
    "name": "<NEW_CONNECTION_NAME>",
    "description": "<NEW_DESCRIPTION>",
    "url": "https://<BASE-URL>/HyperionPlanning",
    "username": "<NEW_USERNAME>",
    "password": "<NEW_PASSWORD>"
}
```

Example 2:

```
{
    "name": "<NEW_CONNECTION_NAME>",
    "description": "<NEW_DESCRIPTION>",
    "url": "https://<BASE-URL>/HyperionPlanning",
    "username": "<NEW_USERNAME>",
    "encryptedPassword": "<ENCRYPTED_PASSWORD>"
}
```

#### Response

Supported Media Type: application/json

Table 8-103	Parameters	

Parameters		
items		
id	Unique identifier for the connection, such as 1c89922d-92ba-46c1-850f- e2a8a416ddf2	
name	Name of the connection, such as Connection29	
description	Description of the connection, such as Planning	
url	The URL of the connection, such as https://< <i>BASE-URL</i> >/ HyperionPlanning	
domain	The domain name for the connection	
username	The username for the connection, such as admin	

Parameters	Description
modified	The time stamp of the last modification to the connection details, such as 2021-01-18 12:23:49.0
modifiedBy	The last service administrator to modify the connection details, such as admin

#### Table 8-103 (Cont.) Parameters

#### Example Response

The identity domain information as shown as part of the response.

```
{
    "id": "<ID>",
   "name": "<NEW CONNECTION NAME>",
    "description": "<NEW DESCRIPTION>",
   "url": "https://<BASE-URL>/HyperionPlanning",
    "domain": "<DOMAIN NAME>",
    "username": "<NEW USERNAME>",
    "modified": "2021-02-02 09:16:02.0",
    "modifiedBy": "admin",
    "links": [
        {
            "href": "https://<BASE-URL>/HyperionPlanning/rest/epm/v1/
applications/epbcs1/connections/f83b3da2-9505-415e-b7f7-3cf113cc94e4",
            "action": "GET",
            "rel": "self",
            "data": null
        }
   1
}
```

# 9 Migration REST APIs

Use the Migration REST APIs to get API versions, work with files, manage services and application snapshots, work with users, and skip updates.

Some Migration REST APIs are version 11.1.2.3.600 and others are version v1 or v2. Passing the incorrect version will result in 404 errors when the API is invoked. Be sure to use the correct version for the API. Be sure to use the correct version for the API. Migration REST API versions are as follows.

These Migration APIs are version 11.1.2.3.600:

- Delete Files (v11.1.2.3.600)
- Download
- Get Information About All Application Snapshots
- Get Information About All Services
- Get Information About a Specific Application Snapshot
- List Files (v11.1.2.3.600)
- Provide Feedback (v11.1.2.3.600)
- Run Recreate on a Service (11.1.2.3.600)
- Upload

These Migration APIs are version v1:

- Clone an Environment
- Copy a File Between Instances (v1)
- Copy Application Snapshot (v1)
- Copy from Object Store (v1)
- Copy to Object Store (v1)
- Download Application Snapshot (v1)
- Get Essbase Query Governor Execution Time
- Get the Build Version and Daily Maintenance Window Time (v1)
- LCM Import (v1)
- LCM Export (v1)
- Manage Permission for Manual Access to Database (v1)
- Rename Application Snapshot (v1)
- Restart the Service Instance (v1)
- Running Daily Maintenance While Skipping the Scheduled Daily Maintenance (v1)
- Send Email (v1)
- Set Encryption Key (v1)

- Set Essbase Query Governor Execution Time
- Setting the Daily Maintenance Time (v1)
- Skip Updates (v1)
- Upload Application Snapshot (v1)

These Migration APIs are version v2:

- Copy a File Between Instances (v2)
- Copy Application Snapshot (v2)
- Copy from Object Store (v2)
- Copy to Object Store (v2)
- Delete Files (v2)
- Download Application Snapshot (v2)
- Export Essbase Data (v2)
- Get Essbase Query Governor Execution Time
- Get Idle Session Timeout
- Get the Build Version and Daily Maintenance Window Time (v2)
- Get Virus Scan on File Upload
- LCM Import (v2)
- LCM Export (v2)
- List Backups Only for OCI (Gen 2) Environments (v2)
- List Files (v2)
- Manage Permission for Manual Access to Database (v2)
- Provide Feedback (v2)
- Rename Application Snapshot (v2)
- Restore Backup Only for OCI (Gen 2) Environments (v2)
- Restart the Service Instance (v2)
- Run Recreate on a Service (v2)
- Running Daily Maintenance While Skipping the Scheduled Daily Maintenance (v2)
- Send Email (v2)
- Set Encryption Key (v2)
- Set Essbase Query Governor Execution Time
- Set Idle Session Timeout
- Set Virus Scan on File Upload
- Setting the Daily Maintenance Time (v2)
- Skip Updates (v2)
- Update the IP Allowlist Only for OCI (Gen 2) Environments
- Upload Application Snapshot (v2)
- View the IP Allowlist Only for OCI (Gen 2) Environments

This Migration API is version v3:

Delete Files (v3)

# **URL Structure for Migration**

This topic shows the general URL structure for the Migration REST APIs.

Some Migration REST APIs are version 11.1.2.3.600 and others are version v1 or v2. Be sure to use the correct version for the API. Passing the incorrect version will result in 404 errors when the API is invoked.

You can find an API version using REST APIs as described here: Getting API Versions for Migration APIs. For a list of all of the Migration APIs and their version numbers, see Migration REST APIs.

Use this URL structure to access the Migration REST resources:

https://<BASE-URL>/interop/rest/{api version}/{path}

#### Where:

• <BASE-URL>: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- {*api* version}: API version you are developing with.
- {path}: Identifies the resource.

## Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ <code>internal/"</code> in the URL.

# **Migration Status Codes**

The status code returned in the response of REST API calls identifies the status of the operation.

Status Code	Description
0	Operation success
-1	Operation in progress
+ve	Operation failed, with the status signifying an error

#### Table 9-1 Status Code

# **Getting API Versions for Migration APIs**

You can manage versions using the set of REST resources summarized in the following table.

**Important**: The version number is case-sensitive. For example, if the version number is listed as v1 with a lowercase v, you cannot enter the version number with a capital v as in this incorrect example, V1, which would result in an error. Instead, you must enter the version number with a lowercase v as in this correct example: v1.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 9-2 Manage Versions of Migration APIs

Task	Request	REST Resource
Get REST API Versions for Migration	GET	/interop/rest/
Get Information About a Specific REST API Version for Migration	GET	<pre>/interop/rest/{apiVersion}</pre>

# Get REST API Versions for Migration

Returns information about which REST APIs are available and supported. Multiple versions may be supported simultaneously.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

GET /interop/rest/

#### Request

Supported Media Types: application/json

#### Table 9-3 Parameters

Name	Description	
Details	In case of errors, details are published with the error string	
Status	See Migration Status Codes	
Items	Detailed information about the API	
Version	The version	
Lifecycle	Possible values: active, deprecated	
Latest	Whether this version is the latest	
Links	Detailed information about the link	
Href	Links to API call	
Action	The HTTP call type	
Rel	Possible values: self	
Data	Parameters as key value pairs passed in the request	

Name	Description
lifecycle	The stage in the lifecycle, such as active
version	The version, such as 11.1.2.3.600, v1, and v2, for example, "version": "11.1.2.3.600", "v1", v2"
serviceType	The service type, such as PCMCS
serverVersion	The server version, such as 21.05.70
buildVersion	The build version, such as 21.05.52

#### Table 9-3 (Cont.) Parameters

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "links": [
        {
            "href": "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/interop/rest/11.1.2.3.600",
            "rel": "self",
            "data": null,
            "action": "GET"
        }
    ],
    "details": null,
    "status": 0,
    "items": [
        {
            "latest": true,
            "links": [
                {
                    "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/interop/rest/11.1.2.3.600",
                    "rel": "version",
                    "data": null,
                    "action": "GET"
               }
            ],
            "lifecycle": "active",
            "version": "11.1.2.3.600",
            "serviceType": "PCMCS",
            "serverVersion": "21.05.70",
            "buildVersion": "21.05.52"
        }
    ],
}
```

**Getting API Versions of Migration APIs Sample Code** 

Prerequisites: json.jar

Common functions: See Common Helper Functions for Java

```
Example 9-1 Java Sample – getVersionsOfLCM.java
```

```
//
//
// BEGIN - List all the versions in PBCS
11
public void getLCMVersions() throws Exception {
    String urlString = String.format("%s/interop/rest", serverUrl);
    String response = executeRequest(urlString, "GET", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        JSONArray fileList = json.getJSONArray("items");
        System.out.println("List of files are :");
        JSONObject jObj = null;
        for(int i=0; i<fileList.length();i++) {</pre>
     System.out.println("Version :" + jObj.getString("version"));
          System.out.println("Lifecycle :" + jObj.getString("lifecycle"));
          System.out.println("Latest :" + jObj.getString("latest"));
          System.out.println("Link :" + ((JSONObject) ((JSONArray)
jObj.getJSONArray("links")).get(0)).getString("href") + "\n");
        }
    }
}
11
// END - List all the versions in PBCS
11
```

#### Example 9-2 cURL Sample – GetVersionsOfLCM.sh

#### Prerequisites: jq

Common functions: See Common Helper Functions for cURL

```
funcGetLCMVersions() {
   url=$SERVER URL/interop/rest
    funcExecuteRequest "GET" $url
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == 0 ]; then
        echo "List of versions :"
        count=`echo $output | jg '.items | length'`
        i=0
        while [ $i -lt $count ]; do
            echo "Version : " `echo $output | jq '.items['$i'].version'`
            echo "Lifecycle :" `echo $output | jq '.items['$i'].lifecycle'`
            echo "Latest :" `echo $output | jq '.items['$i'].latest'`

# Get Information About a Specific REST API Version for Migration

Returns information about a specific version.

Some Migration REST APIs are version 11.1.2.3.600, and others are other versions, such as v1 or v3. Passing the incorrect version will result in 404 errors when the API is invoked. Be sure to use the correct version for the API; api\_version could be 11.1.2.3.600, v1, or v2.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

GET /interop/rest/{api version}

#### Request

Parameters:

The following table summarizes the client request.

#### Table 9-4 Parameters

Name	Description	Туре	Default
api_version	Specific API version	Path	Yes

#### Response

Supported Media Types: application/json

#### Table 9-5 Parameters

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible values: self, recreate service
data	Parameters as key value pairs passed in the request

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
   "status":0,
    "details":null,
    "links":[{
        "data":null,
        "action":"GET",
        "href":"https://<BASE-URL/interop/rest/11.1.2.3.600",
        "rel":"self"
        },{
        "data":null,
        "action":"GET",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/services",
        "rel": "recreate service"
        },{
        "data":null,
        "action":"GET",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/applications",
        "rel":"application service"
        },{
```

```
"data":null,
    "action":"GET", "href":"https://<BASE-URL>/interop/rest/
11.1.2.3.600/applicationsnapshots "rel":"application snapshot service"
    },{
    "data":null,
    "action":"POST",
    "rel":"feedback services",
    "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/feedback"
}]
}
```

#### Get Information about a Specific Version of Migration Sample Code

#### Example 9-4 Java Sample – getInfoAboutSpecificVersion.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN - List version details
11
public void getLCMVersionDetails() throws Exception {
   String urlString = String.format("%s/interop/rest/%s", serverUrl,
apiVersion);
    String response = executeRequest(urlString, "GET", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        JSONArray linksArray = json.getJSONArray("links");
        System.out.println("Version " + apiVersion + " details :");
        JSONObject jObj = null;
        for(int i=0; i < linksArray.length(); i++) {</pre>
            jObj = (JSONObject)linksArray.get(i);
            System.out.println("Service :" + jObj.getString("rel"));
            System.out.println("URL :" + jObj.getString("href"));
            System.out.println("Action :" + jObj.getString("action") + "\n");
        }
    }
}
11
// END - List version details
11
```

#### Example 9-5 cURL Sample – GetInfoAboutSpecificVersion.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcGetLCMVersionDetails() {
    url=$SERVER_URL/interop/rest/$API_VERSION
    funcExecuteRequest "GET" $url
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
```

```
if [ $status == 0 ]; then
   echo "Version $API VERSION details :"
   count=`echo $output | jq '.links | length'`
   i=0
   while [ $i -lt $count ]; do
        echo "Service : " `echo $output | jq '.links['$i'].rel'`
        echo "URL :" `echo $output | jq '.links['$i'].href'`
        echo "Action :" `echo $output | jq '.links['$i'].action'`
        echo ""
        i=`expr $i + 1`
   done
else
   error=`echo $output | jq '.details'`
   echo "Error occurred. " $error
fi
funcRemoveTempFiles "respHeader.txt" "response.txt"
```

#### Example 9-6 Groovy Sample – GetInfoAboutSpecificVersion.groovy

#### Prerequisites: json.jar

}

Common Functions: See CSS Common Helper Functions for Groovy

```
def getLCMVersionDetails() {
   def url;
    try {
            url = new URL(serverUrl + "/interop/rest/" + apiVersion)
    } catch (MalformedURLException e) {
           println "Malformed URL. Please pass valid URL"
            System.exit(0);
    }
    response = executeRequest(url, "GET", null);
    def object = new JsonSlurper().parseText(response)
    def status = object.status
    if (status == 0) {
        def links = object.links
        println "Version " + apiVersion + " details :"
        links.each{
           println "Service : " + it.rel
           println "URL : " + it.href
           println "Action : " + it.action + "\n"
        }
    } else {
        println "Error occurred while fetching version details"
        if (object.details != null)
                println "Error details: " + object.details
    }
}
```

# Import and Export Files

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-6Import and Export Files

Task	Request	REST Resource
LCM Import (v1)	POST	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration?q={type:"import"}</pre>
LCM Import (v2)	POST	/interop/rest/v2/snapshots/import
LCM Export (v1)	POST	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration?q={type:"export"}</pre>
LCM Export (v2)	POST	/interop/rest/v2/snapshots/export

# LCM Import (v1)

Initiates import of a Migration snapshot so that the contents of the application snapshot are imported into the application. You can complete these tasks for imported users: set a specific password for all users in the snapshot, set a unique temporary password for each user in the snapshot, and force password reset at first login.

The presence of status -1 in the response indicates that the import is in progress. You should use the job status URI to determine whether the import is complete.

If the Job completes with status 1, the task details will be mentioned in the items from which the source, destination, and URL to fetch the first set of errors is available. All issues for a particular task can be fetched in the manner of pagination. Acceptable values for msgtype are: error/warn/info; limit represents the number of issues requested per request, and offset marks the beginning number to fetch the issues.

This API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

Identity Domain Administrator role is required to import user and predefined roles

#### **REST Resource**

POST /interop/rest/{api\_version}/applicationsnapshots/{applicationSnapshotName}/
migration?q={type:"import"}

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-7 Tasks for LCM Import

Task	Request	REST Resource
LCM Import	POST	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration?q={type:"import"}</pre>
Import Status; the 9 in the resource is used as an example here	GET	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration/9</pre>
Details	GET	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration/9/0/details? limit=25&amp;msgtype=error&amp;offset=0</pre>

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

#### Table 9-8 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
applicationSnapsho tName	Application snapshot that is to be imported	Path	Yes	None
type	Type of migration being performed, import	Query	Yes	None
importUsers	Whether to import users; true imports users and their predefined role assignments. The import fails if the user does not have the Identity Domain Administrator role.	Query	No	false
userPassword	The default password for the imported users.	Query	No	A unique temporary password is assigned to each user
resetPassword	Whether to force reset password for the imported users on first login, true or false	Query	No	true

#### Response

Supported Media Types: application/json

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request
items	Details about the resource
source	From where the navigation is being performed
destination	To where the navigation is being performed
name	Name of the task, usually "Task Information"
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

#### Table 9-9 Parameters

#### **Examples of Response Body**

The following are examples of the response body in JSON format.

#### Example 1: Job is in Progress

```
{
    "details":null,
    "status":-1,
    "links":[{
        "data":null,
        "action":"POST",
        "rel":"self",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migrationq={type:"import"}"
        },{
        "data":null,
        "action":"POST",
        "rel":"Job Status",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/2"
    }]
}
```

#### **Example 2: Job Completes with Errors**

```
{"status":1,
"items":[{
    "source":"/Nasdaq/HSS-Shared Services",
    "name":"Task Information",
    "destination":"Shared Services",
    "links":[{
        "data":null,
        "action":"GET",
    "
```

```
"rel":"Job Details",
      "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1/0/details?
limit=25&offset=0&msqtype=error"}]
  },
   {"source":"/Artifact Snapshot/HP-SS2",
  "name":"Task Information",

/interop/rest/11.1.2.3.600/applicationsnapshots/<APPLICATION-SNAPSHOT-NAME>/
migration?
q={type:"import",importUsers:"true"}'
```

#### Sample cURL Command OAuth 2.0

```
curl -X POST --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/x-www-form-urlencoded' 'https://<BASE-URL>
/interop/rest/11.1.2.3.600/applicationsnapshots/<APPLICATION-SNAPSHOT-NAME>/
migration?
q={type:"import",importUsers:"true"}'
```

# LCM Import (v2)

The LCM Import (v2) REST API initiates import of a Migration snapshot so that the contents of the application snapshot are imported into the application. You can complete these tasks for imported users: set a specific password for all users in the snapshot, set a unique temporary password for each user in the snapshot, and force password reset at first login.

The presence of status -1 in the response indicates that the import is in progress. You should use the job status URI to determine whether the import is complete.

If the Job completes with status 1, the task details will be mentioned in the items from which the source, destination, and URL to fetch the first set of errors is available. All issues for a

particular task can be fetched in the manner of pagination. Acceptable values for msgtype are: error/warn/info; limit represents the number of issues requested per request, and offset marks the beginning number to fetch the issues.

This API is version v2.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

Identity Domain Administrator role is required to import user and predefined roles.

#### **REST Resource**

**POST** /interop/rest/v2/snapshots/import

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 9-10 Tasks for LCM Import

Task	Request	REST Resource
LCM Import	POST	/interop/rest/v2/snapshots/import
Import Status	GET	/interop/rest/v2/status/migration/22
Details	GET	/interop/rest/v2/status/migration/22/0/details? limit=25&offset=0&msgtype=info

#### Request

Support Media Types: application/json

The following table summarizes the request parameters.

#### Table 9-11 Parameters

Name	Description	Туре	Required	Default
snapshotName	Application snapshot that is to be imported	Payload	Yes	None
importUsers	Whether to import users; true imports users and their predefined role assignments. The import fails if the user issuing the request does not have the Identity Domain Administrator role.	Payload	No	false

### Table 9-11 (Cont.) Parameters

Name	Description	Туре	Required	Default
userPassword	The default password for the imported users.	Payload	No	A unique temporar y password is assigned to each user
resetPassword	Whether to force reset password for the imported users on first login, true or false	Payload	No	true

#### **Example URL and Payload**

https://<BASE-URL>/interop/rest/v2/snapshots/import

```
{
    "snapshotName": "Artifact Snapshot",
    "parameters": {
        "importUsers": true,
        "userPassword": "epm_cloud",
        "resetPassword": false
    }
}
```

### Response

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request
items	Details about the resource
source	From where the navigation is being performed
destination	To where the navigation is being performed
name	Name of the task, usually "Task Information"
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

#### **Examples of Response Body**

The following are examples of the response body in JSON format.

#### Example 1: Import is in Progress

```
{
    "details": null,
    "status": -1,
    "links": [
        {
            "href": "https://<BASE-URL>/interop/rest/v2/snapshots/import",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": "https://<BASE-URL>/interop/rest/v2/status/migration/24",
            "action": "POST",
            "rel": "Job Status",
            "data": null
        }
    1
}
```

**Example 2: Import Completes** 

```
{
    "details": null,
    "status": 0,
    "items": [
        {
            "name": "Task Information",
            "source": "/Artifact Snapshot/HSS-Shared Services",
            "destination": "Shared Services",

            "rel": "self",
            "data": null
        }
    ]
}
```

#### Sample cURL Command Basic Auth

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -H
'Content-Type: application/json' -d '{"snapshotName":"<SNAPSHOT-
NAME>","parameters":
{"importUsers":<TRUE/FALSE>,"userPassword":"<PASSWORD>","resetPassword":<TRUE/
FALSE>}}'
'https://<BASE-URL>/interop/rest/v2/snapshots/import'
```

#### Sample cURL Command OAuth 2.0

```
curl -X POST --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/json' -d '{"snapshotName":"<SNAPSHOT-
NAME>","parameters":
{"importUsers":<TRUE/FALSE>,"userPassword":"<PASSWORD>","resetPassword":<TRUE/
FALSE>}}'
'https://<BASE-URL>/interop/rest/v2/snapshots/import'
```

# LCM Export (v1)

Initiates a repeat export of a Migration artifact based on the settings that were used to export artifacts using the Migration artifact export screen. This REST API is version 11.1.2.3.600.

You can also use EPM Automate to automate the repeat export of artifacts.

The presence of status -1 in the response indicates that the reexport is in progress. You should use the job status URI to determine whether the reexport is complete.

If the Job completes with status 1, the task details will be mentioned in the items from which the source, destination, and URL to fetch the first set of errors is available. All issues for a particular task can be fetched in the manner of pagination. Acceptable values for msgtype are: error/warn/info; limit represents the number of issues requested per request, and offset marks the beginning number to fetch the issues.

This API is version v1.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

POST /interop/rest/{api\_version}/applicationsnapshots/{applicationSnapshotName}/
migration?q={type:"export}

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
LCM Export	POST	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration?q={type:"export"}</pre>
Export Status	GET	/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration/8
Details	GET	<pre>/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/migration/8/0/details? limit=25&amp;msgtype=error&amp;offset=0</pre>

#### Table 9-13 Tasks for LCM Export

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 9-14 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
applicationSnapsho tName	Application snapshot that has to be exported	Path	Yes	None
type	Type of migration being performed, can be export or import	Query	Yes	None

#### Response

Supported Media Types: application/json

#### Table 9-15 Parameters

Attribute	Description
details	In case of errors, details are published with the error string
status	See Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible values. Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the re-export operation
data	Parameters as key value pairs passed in the request
items	Details about the resource
source	From where the navigation is being performed
destination	To where the navigation is being performed
name	Name of the task, usually "Task Information"
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

## Examples of Response Body

The following are examples of the response body in JSON format.

#### Example 1: Export is in Progress

```
{
   "status":-1,
  "links":[{
     "data":null,
      "action":"POST",
      "rel":"self",
   "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migrationg={type:"export"}"
      },{
      "data":null,
      "action":"POST",
      "rel":"Job Status",
   "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/8"
   }],
   "details":null
```

#### **Example 2: Export Completes with Errors**

```
{"status":1,
"items":[{
   "source":"/Nasdaq/HSS-Shared Services",
   "name": "Task Information",
   "destination": "Shared Services",
   "links":[{
     "data":null,
     "action":"GET",
      "rel":"Job Details",
      "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1/0/details?
limit=25&offset=0&msgtype=error"}]
   },
   {"source":"/Artifact Snapshot/HP-NASDAQ",
  "name": "Task Information",
   "destination":"",
   "links":[{
     "data":null,
      "action":"GET",
      "rel":"Job Details",
      "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1/1/details?
limit=25&offse=0&msgtype=error"}]
   }],
   "details":null,
   "links":[{
      "data":null,
      "action":"POST",
      "rel":"self",
      "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1"}
1}
```

#### **Example 3: Information on Each Task is Requested**

```
{"status":0,
"items":[{
     "msgType":"error",
     "artifact": "/Native Directory/Groups",
     "msgText":"EPMIE-00069: Failed to find user during group children
import. User user0026 not found. Please ensure that a user exists in the
system.",
          "msgCategory":"14000: Error reported.",
     "msgCategory":"14000: Error reported."
     },{
     "msgType":"error",
     "artifact":"/Native Directory/Groups",
     "msqText":"EPMIE-00069: Failed to find user during group children
import. User user0025 not found. Please ensure that a user exists in the
system.",
     "msgCategory":"14000: Error reported." }
     ],
"details":null,
"links":[{
     "data":null,
     "action":"GET",
     "rel":"self",
     "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1/0/details?
limit=2&msqType=error&offset=25"},
     {"data":null,
     "action":"GET",
     "rel":"next",
     "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1/0/details?
limit=2&offset=27&msqType=error"},
     {"data":null,
     "action":"GET",
     "rel":"prev",
     "href":https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2/migration/1/0/details?limit=2&offset=23&msgType=error
     }]
          }
```

#### Java Sample - LcmExport.java

#### Prerequisites: json.jar

Common functions: See Appendix A, Common Helper Functions for Java.

```
//
// BEGIN - Export an application snapshot
//
public void exportSnapshot(String applicationSnapshotName) throws Exception
{
    JSONObject params = new JSONObject();
    params.put("type","export");
    String urlString = String.format("%s/interop/rest/%s/
applicationsnapshots/%s/migration?q=%s", serverUrl, apiVersion,
```

```
URLEncoder.encode(applicationSnapshotName, "UTF-8"), params.toString());
String response = executeRequest(urlString, "POST", null);
System.out.println("Export started successfully");
getMigrationJobStatus(fetchPingUrlFromResponse(response, "Job Status"),
"POST");
}
//
// END - Export an application snapshot
//
```

#### cURL Sample – LcmExport.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcExportSnapshot() {
   param=$(echo "{type:export}" | sed -f urlencode.sed)
    encodedFileName=$(echo $1 | sed -f urlencode.sed)
url=$SERVER URL/interop/rest/$API VERSION/
applicationsnapshots/$encodedFileName/migration?q=$param
    funcExecuteRequest "POST" $url
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started exporting successfully"
        funcGetMigrationStatus "POST"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

#### Groovy Sample – LcmExport.groovy

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Groovy

```
def exportSnapshot(applicationSnapshotName) {
    def url;
    try {
        String snapshotName = URLEncoder.encode(applicationSnapshotName,
    "UTF-8");
        JSONObject params = new JSONObject();
        params.put("type","export");
        url = new URL(serverUrl + "/interop/rest/" + apiVersion + "/
        applicationsnapshots/" + snapshotName + "/migration?q=" + params.toString());
        } catch (MalformedURLException e) {
            println "Malformed URL. Please pass valid URL"
               System.exit(0);
        }
        response = executeRequest(url, "POST", null, "application/x-www-form-
urlencoded");
```

```
if (response != null) {
    getMigrationJobStatus(fetchPingUrlFromResponse(response, "Job
Status"), "POST");
    }
}
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# LCM Export (v2)

The LCM Export (v2) REST API initiates a repeat export of a Migration artifact based on the settings that were used to export artifacts using the Migration artifact export screen.

The presence of status -1 in the response indicates that the reexport is in progress. You should use the job status URI to determine whether the reexport is complete.

If the job completes with status 1, the task details will be mentioned in the items from which the source, destination, and URL to fetch the first set of errors is available. All issues for a particular task can be fetched in the manner of pagination. Acceptable values for msgtype are: error/warn/info; limit represents the number of issues requested per request, and offset marks the beginning number to fetch the issues.

This API is version v2.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

```
POST /interop/rest/v2/snapshots/export
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-16	Tasls LCM	Export
------------	-----------	--------

Task	Request	REST Resource
LCM Export	POST	/interop/rest/v2/snapshots/export
Export Status	GET	/interop/rest/v2/status/migration/28
Details	GET	/interop/rest/v2/status/migration/28/1/details? limit=25&offset=0&msgtype=info

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

#### Table 9-17 Parameters

Name	Description	Туре	Required	Default
SnapshotName	Application snapshot that has to be exported	Payload	Yes	None

#### Example URL and Payload

https://<BASE-URL>/interop/rest/v2/snapshots/export

```
{
    "snapshotName": "Artifact Snapshot"
}
```

#### Response

Supported Media Types: application/json

#### Table 9-18 Parameters

Attribute	Description
details	In case of errors, details are published with the error string
status	See Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible values. Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the re-export operation
data	Parameters as key value pairs passed in the request
items	Details about the resource
source	From where the navigation is being performed
destination	To where the navigation is being performed
name	Name of the task, usually "Task Information"
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

### Examples of Response Body

The following are examples of the response body in JSON format.

### Example 1: Export is in Progress

```
{
    "details": null,
```

```
"status": -1,
    "links": [
        {
            "href": "https://<BASE-URL>/interop/rest/v2/snapshots/export",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": "https://<BASE-URL>/interop/rest/v2/status/migration/28",
            "action": "POST",
            "rel": "Job Status",
            "data": null
        }
    ]
}
```

**Example 2: Export Completes** 

```
{
    "details": null,
    "status": 0,
    "items": [
        {
            "name": "Task Information",
            "source": "Shared Services",
            "destination": "/Artifact Snapshot1/HSS-Shared Services",

                    "action": "GET",
                    "rel": "Job Details",
                    "data": null
                }
            1
        },
        {
            "name": "Task Information",
            "source": "Document Repository",
            "destination": "/Artifact Snapshot1/DOCREP-Document Repository",
```

```
"links": [
                {
                    "href": "https://<BASE-URL>/interop/rest/v2/status/
migration/28/2/details?limit=25&offset=0&msgtype=info",
                    "action": "GET",
                    "rel": "Job Details",
                    "data": null
                }
            ]
        },
        {
            "name": "Task Information",
            "source": "Calculation Manager",
            "destination": "/Artifact Snapshot1/CALC-Calculation Manager",
            "links": [
                {
                     "href": "https://<BASE-URL>/interop/rest/v2/status/
migration/28/3/details?limit=25&offset=0&msgtype=info",
                    "action": "GET",
                    "rel": "Job Details",
                    "data": null
                }
            ]
        },
        {
            "name": "Task Information",
            "source": "FDM Enterprise Edition",
            "destination": "/Artifact Snapshot1/FDMEE-FDM Enterprise Edition",
            "links": [
                {
                     "href": "https://<BASE-URL>/interop/rest/v2/status/
migration/28/4/details?limit=25&offset=0&msgtype=info",
                    "action": "GET",
                    "rel": "Job Details",
                    "data": null
                }
            1
        }
    ],
    "links": [
        {
            "href": "https://<BASE-URL>/interop/rest/v2/status/migration/28",
            "action": "GET",
            "rel": "self",
            "data": null
        }
    ]
}
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H'Content-Type: application/json' -d
'{"snapshotName":"Artifact Snapshot"}''https://<BASE-URL>/interop/rest/v2/
snapshots/export'
```

# Upload and Download Files

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-19 Upload and Download Files

Task	Request	REST Resource
Upload	POST	<pre>/interop/rest/11.1.2.3.600/applicationsnapshots/ {applicationSnapshotName}/contents</pre>
Download	GET	/interop/rest/{api_version}/applicationsnapshots/ {applicationSnapshotName}/contents

# Upload

Uploads a file from the current directory on the local machine to the repository. Files on the repository cannot be accessed directly.

If a file already exists, the API gives an error and does not overwrite it. Use this command to upload data, metadata, and back up snapshots to a service instance. See About EPM Automate in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud*.

If a -1 status is returned and it is the last chunk to be uploaded, this means that an LCM artifact snapshot has been uploaded and zip extraction is in progress. The client pings the URL until the status is a positive integer. This job is done asynchronously.

Note: The entire path to the file must be encoded, for example, changing / to 2F and spaces to 20.

For example, change this path to an .HTML file in the apr directory:

apr/2020-03-04 23 07 20/2020-03-04 23 07 20.html

to this:

apr%2F2020-03-04%2023\_07\_20%2F2020-03-04%2023\_07\_20.html

This REST API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

POST /interop/rest/11.1.2.3.600/applicationsnapshots/{applicationSnapshotName}/
contents

#### Note:

For Data Management uploads, use the following JSON format for the query parameter:

/interop/rest/11.1.2.3.600/applicationsnapshots/
{applicationSnapshotName}/contents?extDirPath=inbox

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/octet-stream

The following table summarizes the client request.

#### Table 9-20 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
applicationSnapsho tName	Name of the application snapshot or file name to be uploaded (for example, "Artifact Snapshot.zip" or s112.csv). A file with this name is created in the repository. If a file or folder with this name exists in the repository, an error indicates that a file or folder exists	Path	Yes	None

Name	Description	Туре	Required	Default
Name extDirPath	Used to support upload of Data Management files. Supported values include:	Query	No	None
	<ul> <li>inbox - Upload files into the inbox; except for Profitability and Cost Management, Oracle Enterprise Performance Management Cloud business processes look in this location for files to process</li> <li>profitinbox - Upload files to be processed by Profitability and Cost Management</li> <li>to_be_imported - Upload a Narrative Reporting snapshot that is to be imported during the next daily maintenance of the environment</li> <li>outbox - Upload files to the outbox for all EPM Cloud business processes except for Profitability and Cost Management</li> <li><i>profitoutbox</i> - Upload files to the outbox for Profitability and Cost Management</li> <li>You can also use a directory under inbox, outbox, profitinbox, and profitoutbox, for example, inbox/ <i>directory_name</i></li> <li>Example: "extDirPath= inbox/<i>directory_name</i>" to</li> </ul>			
	upload files to a directory within the inbox for processing by Data Management.			
	<b>Upload</b> : /interop/rest/11.1.2.3.600/ applicationsnapshots/applicationSnapshotName/ contents?extDirPath=inbox%2Fdm_folder			
	Example: "extDirPath=inbox" where inbox is the folder where the Data Management file is to be uploaded Example of query parameters in JSON format for Data Management Upload: /interop/rest/11.1.2.3.600/ applicationsnapshots/{applicationSnapshotName}/ contents?extDirPath=inbox			

## Table 9-20 (Cont.) Parameters

## Response

Supported Media Types: application/json

#### Table 9-21 Parameters

Name	Description		
details	In case of errors, details are published with the error string		
status	See Migration Status Codes		
links	Detailed information about the link		
href	Links to API call		
action	The HTTP call type		
rel	Possible values: self, recreate service		
data	Parameters as key value pairs passed in the request		

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "status":0,
    "details":null,
    "links":[{
        "data":null,
        "action":"POST",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/applicationsnapshots/
{applicationSnapshotName}/contents
```

#### **REST API Examples with Postman**

See REST API Examples with Postman.

#### **Upload Sample Code**

```
Example 9-7 Java Sample – 11.1.2.3.600
```

Prerequisites: json.jar

```
/**
 *
 * Simple Implementation class to execute Upload functionality for API
version 11.1.2.3.600
 */
public class UploadFile
{

            if (connection != null)
                connection.disconnect();
        }
    }
/**
* Method to retrieve the error message
 * @param response
 * @return String details
 * @throws Exception
*/
    private String getDetails (String response) throws Exception {
        JSONObject json = new JSONObject(response);
        if (!JSONObject.NULL.equals(json.get("details")))
            return json.getString("details");
        else
            return "NA";
    }
}
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Download

Downloads a file from the repository to the current directory in the local environment.

If the content type of the response is application/JSON, then an error with details is displayed on the server. Otherwise, the content of the file is streamed through the response.

**Note**: The entire path to the file must be encoded, for example, changing / to %2F and spaces to %20. This API can be used to download files up to 1GB in a single request.

For example, change this path to an .HTML file in the apr directory:

apr/2020-03-04 23 07 20/2020-03-04 23 07 20.html

to this:

apr%2F2020-03-04%2023 07 20%2F2020-03-04%2023 07 20.html

This REST API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

## **REST Resource**

GET /interop/rest/{api\_version}/applicationsnapshots/{applicationSnapshotName}/
contents

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

The following table summarizes the GET request parameters.

Name	Description	Туре	Required	Default
applicationSnapsho tName	Application snapshot name or file name to download (for example, "Artifact Snapshot" or s112.csv).	Path	Yes	None
	The entire applicationSnapshotName must be encoded before sending the request.			
	To download a particular file, provide the path to that file as the value of applicationSnapshotName. For example, to download a Data Management file called s112.csv in the inbox, refer to the file as "inbox\s112.csv" in the path parameter.			
	To download the Activity Reports or access log, use the fully qualified file name as shown in the output of List Files.			
	For example, to download a specific file from the apr directory, use the following format: pr%2F2020-03-04%0A23_07_20%2F2020-03-04%0A23_07 _20.html apr%2F%0A2020-03-04%2023_07_20%2F%0Aaccess_log. zip apr%2F%0A2020-03-04%2023_07_20%2F%0Aactivityrep ort.json.			

## Table 9-22 (Cont.) Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None

#### **Example of Request**

https://<BASE-URL>/interop/rest/11.1.2.3.600/applicationsnapshots/Vision.zip/
contents

#### Table 9-23 Parameters

Name	Description
Details	In case of errors, details are published with the error string
Status	See Migration Status Codes
Links	Detailed information about the link
Href	Links to API call
Action	The HTTP call type
Rel	Possibly value: self
Data	Parameters as key value pairs passed in the request

#### Response

Supported Media Types: application/json or application/octet-stream

#### Example of Response Body

The following shows an example of the response body in JSON format in case there is an error during download.

```
{
   "details": "Invalid file : Vision.zip",
   "status":1,
   "links":[{
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/Vision.zip/contents",
        "action":"GET",
        "rel":"self",
        "data":null
    }]
}
```

#### **Download Sample Code**

Example 9-8 Java Sample – downloadFile.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java.

        byte[] buffer = new byte[5 * 1024 * 1024];
        while ((bytesRead = inputStream.read(buffer)) != -1)
            outputStream.write(buffer, 0, bytesRead);
        System.out.println("File download completed.");
        return outputStream;
    }
}
```

# View and Delete Files

This table shows the REST APIs to view and delete files. These REST APIs are version 11.1.2.3.600 and v2.

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-24 View and Delete	Files
----------------------------	-------

Task	Request	REST Resource	_
List Files (v11.1.2.3.600)	GET	/applicationsnapshots	
List Files (v2)	GET	/interop/rest/v2/files/list	

Task	Request	REST Resource
Delete Files (v11.1.2.3.600)	DELETE	/applicationsnapshots/ {applicationSnapshotName}
Delete Files (v2)	DELETE	/interop/rest/v2/files/delete
Delete Files (v3)	POST	/interop/rest/v3/files/delete

# List Files (v11.1.2.3.600)

This API (v11.1.2.3.600) lists the files in the Planning repository and returns information about the available file and application snapshots.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

This API provides details such as name, type, size and last modified time. Size and last modified are not available for LCM snapshots. See About EPM Automate in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud*.

This REST API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

## **REST Resource**

GET /interop/rest/{api version}/applicationsnapshots

Supported Media Types: application/json

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Response

#### Table 9-25 Parameters

Name	Description
Details	Will be published in case of error with the error string
Status	See Migration Status Codes
Items	

Name	Description
Name	Name of the application snapshot
Туре	Can be LCM or EXTERNAL
	Type signifies if this snapshot is for LCM or EXTERNAL. LCM indicates that the file is an LCM snapshot. EXTERNAL indicates that files are not LCM, such as Planning files.
Size	Size of the application snapshot in bytes. Available only for type EXTERNAL
Lastmodifiedtim e	Time in Long value as per the last modified time of the file. Available only for type EXTERNAL
Links	Detailed information about the link
Href	Link to API call/ status API
Action	The HTTP call type
Rel	Will be self
Data	Parameters as key value pairs passed in the request

## Table 9-25 (Cont.) Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "status":0,
    "items":[{
        "name":"sample.csv",
        "type":"EXTERNAL",
        "size":"18",
        "lastmodifiedtime":"1422534438000"
        },{
        "name":"snapshot1",
        "type":"LCM",
        "size":null,
        "lastmodifiedtime":null
    }],
    "details":null,
    "links":[{
        "data":null,
        "action":"GET",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots",
        "rel":"self"
    }]
}
```

```
List Files Sample Code
```

Example 9-9 Java Sample – listFiles.java

Prerequisites: json.jar

```
Common Functions: See Common Helper Functions for Java
```

```
11
// BEGIN - List all the files in PBCS
11
public void listFiles() throws Exception {
    String urlString = String.format("%s/interop/rest/%s/
applicationsnapshots", serverUrl, apiVersion);
    String response = executeRequest(urlString, "GET", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        if (json.get("items").equals(JSONObject.NULL))
            System.out.println("No files found");
        else {
            System.out.println("List of files :");
            JSONArray itemsArray = json.getJSONArray("items");
            JSONObject jObj = null;
            for (int i=0; i < itemsArray.length(); i++) {</pre>
                jObj = (JSONObject)itemsArray.get(i);
                System.out.println(jObj.getString("name"));
            }
        }
    }
}
11
// END - List all the files in PBCS
11
```

#### Example 9-10 cURL Sample- ListFiles.sh

Prerequisites: json.jar

Common Functions: See Common Helper Functions for cURL

```
funcListFiles() {
    url=$SERVER_URL/interop/rest/$API_VERSION/applicationsnapshots
    funcExecuteRequest "GET" $url
    list=`cat response.txt | jq 'select(.items != null) | .items[].name'`
    if [[ ! -z $list ]]; then
        echo $list
    else
        echo "No files found"
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)
```

#### Example 9-11 Groovy Sample- ListFiles.groovy

Prerequisites: json.jar

See CSS Common Helper Functions for Groovy

```
def listFiles() {
   def url;
    try {
            url = new URL(serverUrl + "/interop/rest/" + apiVersion + "/
applicationsnapshots")
    } catch (MalformedURLException e) {
            println "Malformed URL. Please pass valid URL"
            System.exit(0);
    }
    response = executeRequest(url, "GET", null);
    def object = new JsonSlurper().parseText(response)
    def status = object.status
    if (status == 0 ) {
        def items = object.items
        if (items == null) {
            println "No files found"
        }
        else {
            println "List of files :"
            items.each{
                println it.name
            }
        }
    } else {
        println "Error occurred while listing files"
        if (object.details != null)
                println "Error details: " + object.details
    }
}
```

#### **Common Functions**

- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# List Files (v2)

This REST API (v2) lists the files in the repository and returns information about the available file and application snapshots.

This API provides details such as name, type, size and last modified time. Size and modified time are not available for LCM snapshots. See About EPM Automate in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud*.

This REST API is version v2.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

GET /interop/rest/v2/files/list

Supported Media Types: application/json

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

### Example URL

https://<BASE-URL>/interop/rest/v2/files/list

#### Response

## Table 9-26 Parameters

Name	Description
Details	Will be published in case of error with the error string
Status	See Migration Status Codes
Items	
Name	Name of the file or application snapshot
Туре	Can be LCM or EXTERNAL
	Type signifies if this is an LCM snapshot or not. LCM indicates that the file is an LCM snapshot. EXTERNAL indicates that the file is not an LCM snapshot, such as a Planning file.
Size	Size of the file in bytes. Available only for type EXTERNAL
Lastmodifiedtim e	Last modified time of the file in milliseconds since 1970-01-01. Available only for type EXTERNAL
Links	Detailed information about the link
Href	Link to API call/ status API
Action	The HTTP call type
Rel	Will be self
Data	null

## Example of Response Body

The following shows an example of the response body in JSON format.

```
"status":0,
"items":[{
"name":"sample.csv",
"type":"EXTERNAL",
```

{

```
"size":"18",
"lastmodifiedtime":"1422534438000"
},{
"name":"Artifact Snapshot",
"type":"LCM",
"size":null,
"lastmodifiedtime":null
}],
"details":null,
"links":[{
"data":null,
"action":"GET",
"href": "https://<BASE-URL>/interop/rest/v2/files/list",

}]
```

#### List Files Sample Code

#### Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H
'Content-Type: application/json' 'https://<BASE-URL>/interop/rest/v2/files/
list'
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Delete Files (v11.1.2.3.600)

1

Use the Delete Files (v11.1.2.3.600) REST API to delete a file from the Planning repository.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

Specify the filename with path separators in percent-encoding format, for example, using %5C as the encoded value for \ (file separator). For a file named inbox/file1.csv, pass it as inbox%5Cfile1.csv. If you are calling the cURL command to trigger the REST API, you can use a backslash \ for the path separator without URL encoding. See About EPM Automate in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.

This REST API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

DELETE /interop/rest/{api\_version}/applicationsnapshots/
{applicationSnapshotName

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 9-27 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
applicationSnapsho	Application snapshot name that needs to be deleted	Path	Yes	None
tName				

#### Response

Supported Media Types: application/json

## Table 9-28 Parameters

Parameters	Description	
Details	Published if there is an error with the error string	
Status	See Migration Status Codes	
Links	Detailed information about the link	
Href	Links to the API call	
Action	The HTTP call type	
Rel	Possible value: self	
Data	Parameters as key value pair passed in the request	

## Example of Response Body

```
{
    "status":0,
    "links":[{
        "data":null,
        "action":"DELETE",
        "rel":"self",
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/ss2"
    }],
```

```
"details":null
```

}

**Delete Files Sample Code** 

#### Example 9-12 Java Sample – deleteFile.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN - Delete a file in PBCS
11
public void deleteFile(String fileName) throws Exception {
   String urlString = String.format("%s/interop/rest/%s/applicationsnapshots/
%s", serverUrl, apiVersion, fileName);
   String response = executeRequest(urlString, "DELETE", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0)
        System.out.println("File deleted successfully");
    else
        System.out.println("Error deleting file : " +
json.getString("details"));
}
//
// END - Delete a file in PBCS
11
```

## Example 9-13 cURL Sample – DeleteFile.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcDeleteFile() {
    encodedFileName=$(echo $1 | sed -f urlencode.sed)
    url=$SERVER_URL/interop/rest/$API_VERSION/
applicationsnapshots/$encodedFileName
    funcExecuteRequest "DELETE" $url
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == 0 ]; then
        echo "Deleted successfully"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

## Example 9-14 Groovy Sample – DeleteFile.groovy

Prerequisites: json.jar

Common Functions: CSS Common Helper Functions for Groovy

```
def deleteFile(filename) {
    def url;
    try {
        String encodedFileName = URLEncoder.encode(filename, "UTF-8");
        url = new URL(serverUrl + "/interop/rest/" + apiVersion + "/
applicationsnapshots/" + encodedFileName)
    } catch (MalformedURLException e) {
        println "Malformed URL. Please pass valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "DELETE", null);
    def object = new JsonSlurper().parseText(response)
    def status = object.status
    if (status == 0)
       println "File deleted successfully"
    else {
        println "Error occurred while deleting file"
        if (object.details != null)
           println "Error details: " + object.details
    }
}
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Delete Files (v2)

The Delete Files (v2) REST API deletes a file from the repository. This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. This API is backwards compatible.

Filenames that use a backslash \ as path separators must be handled using escape characters, for example, using \\ as the value for \ (the file separator). For a file named inbox\file1.csv, pass it as inbox\\file1.csv.

For more information on deleting files, see EPM Automate Commands in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.

**Note**: To delete files using EPM Groovy rules, use the v11.2.3.600 version of the same API instead of the v2 version.

This REST API is v2.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

DELETE /interop/rest/v2/files/delete

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

#### Table 9-29 Parameters

Name	Description	Туре	Required	Default
fileName	Application snapshot name that needs to be deleted	Payload	Yes	None

## **Example URL and Payload**

https://<BASE-URL>/interop/rest/v2/files/delete

```
{
"fileName": "inbox/file1.csv",
}
```

#### Response

Supported Media Types: application/json

#### Table 9-30 Parameters

Parameters	Description	
Details	Published if there is an error with the error string	
Status	See Migration Status Codes	
Links	Detailed information about the link	
Href	Links to the API call	
Action	The HTTP call type	
Rel	Possible value: self	
Data	Parameters as key value pair passed in the request	

## Example of Response Body

```
{
```

"status":0,

```
"links":[{
    "data":null,
    "action":"DELETE",
    "rel":"self",
    "href":"https://<BASE-URL>/interop/rest/v2/files/delete"
}],
"details":null
```

#### Sample cURL command

}

```
curl -X DELETE -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D
respHeader.txt -H 'Content-Type: application/json' -d
'{"fileName":"FILE_TO_BE_DELETED"}' 'https://<BASE-URL>/interop/rest/v2/files/
delete'
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Delete Files (v3)

The Delete Files (v3) REST API deletes a file from the repository. This topic describes the simplified v3 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v3 API easier to use. This API is backwards compatible.

Filenames that use a backslash \ as path separators must be handled using escape characters; for example, using \\ as the value for \ (the file separator). For a file named inbox\file1.csv, pass it as inbox\\file1.csv.

For more information on deleting files, see EPM Automate Commands in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.

This API is v3.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

**POST** /interop/rest/v3/files/delete

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 9-31 Parameters

Name	Description	Туре	Required	Default
fileName	File name to delete	Payload	Yes	None

### Example URL and Payload

https://<BASE-URL>/interop/rest/v3/files/delete

```
{
"fileName": "inbox/file1.csv",
}
```

#### Response

Supported Media Types: application/json

#### Table 9-32 Parameters

Parameters	Description	
Details	Published if there is an error with the error string	
Status	See Migration Status Codes	
Links	Detailed information about the link	
Href	Links to the API call	
Action	The HTTP call type	
Rel	Possible value: self	
Data	Parameters as key value pair passed in the request	

## **Example Response Body**

```
{
   "status":0,
   "links":[{
        "data":null,
        "action": "POST",
        "rel":"self",
        "href":"https://<EPM-CLOUD-BASE-URL>/interop/rest/v3/files/delete"
   }],
   "details":null
}
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"fileName":"FILE_TO_BE_DELETED"}' 'https://<BASE-URL>/interop/rest/v3/files/
delete'
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# Manage Services

You can manage all available services using the following REST resources.

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-33	Manage	Services
------------	--------	----------

Task	Request	REST Resource
Get Information About All Services	GET	<pre>/interop/rest/{api_version}/services</pre>
Get Idle Session Timeout	GET	/interop/rest/{api_version}/config/ services/idlesessiontimeout
Set Idle Session Timeout	PUT	/interop/rest/{api_version}/config/ services/idlesessiontimeout
Restart the Service Instance (v1)	POST	/interop/rest/{api_version}/services/ {service_type}/resetservice
Restart the Service Instance (v2)	POST	/interop/rest/v2/config/services/reset
Run Recreate on a Service (11.1.2.3.600)	GET	/interop/rest/{api_version}/services/ {servicename}/recreate
Run Recreate on a Service (v2)	POST	/interop/rest/v2/config/services/ recreate

# Get Information About All Services

Returns information about all services that you can perform in a Planning environment.

This API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

#### **REST Resource**

GET /interop/rest/{api\_version}/services

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Response

Supported Media Types: application/json

Name	Description
api_version	Specific API version
details	In case of errors, details are published with the error string
status	See Migration Status Codes
details	In case of error, details are published with the error string
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	<b>Possible values:</b> self, PBCS recreate service, PBCS reset service - <b>details are for</b> PBCS recreate service
data	Parameters as key value pair passed in the request

#### Table 9-34 Parameters

## Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "details":null,
    "status":0,
    "links":[{
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/services",
        "rel":"self",
        "data":null,
        "action":"GET"
        },{
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/services/PBCS/
recreate",
        "rel":"PBCS recreate service",
        "data":null,
        "action":"POST"
        },{
    }
}
```

```
"href":"https://<EPM-CLOUD-BASE-URL>/interop/rest/11.1.2.3.600/
services/PBCS/resetservice",
    "rel":"PBCS reset service",
    "data":null,
    "action":"POST"
    }]
}
```

Get Information About All Services Sample Code

#### Java Sample – getInfoAboutAllServices.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN - Get services
11
public void getServices() throws Exception {
    String urlString = String.format("%s/interop/rest/%s/services",
serverUrl, apiVersion);
    String response = executeRequest(urlString, "GET", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        JSONArray linksArray = json.getJSONArray("links");
        System.out.println("Services list :");
        JSONObject jObj = null;
        for(int i=0; i < linksArray.length(); i++) {</pre>
            jObj = (JSONObject)linksArray.get(i);
            System.out.println("Service :" + jObj.getString("rel"));
            System.out.println("URL :" + jObj.getString("href"));
            System.out.println("Action :" + jObj.getString("action") + "\n");
        }
    }
}
11
// END - Get services
11
```

#### cURL Sample - GetInfoAboutAllServices.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcGetServices() {
    url=$SERVER_URL/interop/rest/$API_VERSION/services
    funcExecuteRequest "GET" $url
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == 0 ]; then
        echo "Services list :"
        count=`echo $output | jq '.links | length'`
```

```
i=0
        while [ $i -lt $count ]; do
            rel=`echo $output | jq '.links['$i'].rel'`
            rel=`echo "$rel" | tr -d "\""`
            if [ "$rel" != "self" ]; then
                echo "Service : " `echo $output | jq '.links['$i'].rel'`
                echo "URL :" `echo $output | jq '.links['$i'].href'`
                echo "Action :" `echo $output | jq '.links['$i'].action'`
                echo ""
            fi
            i=`expr $i + 1`
        done
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

#### Groovy Sample – GetInfoAboutAllServices.groovy

#### Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Groovy

```
def getServices() {
   def url;
    try {
       url = new URL(serverUrl + "/interop/rest/" + apiVersion + "/services")
    } catch (MalformedURLException e) {
        println "Malformed URL. Please pass valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "GET", null);
    def object = new JsonSlurper().parseText(response)
    def status = object.status
    if (status == 0) {
        def links = object.links
        println "Services list :"
        links.each{
            if(!it.rel.equals("self")) {
                println "Service : " + it.rel
                println "URL : " + it.href
                println "Action : " + it.action + "\n"
            }
        }
    } else {
        println "Error occurred while fetching services list"
        if (object.details != null)
            println "Error details: " + object.details
    }
}
```

## Get Idle Session Timeout

Returns the session timeout (in minutes) of the Oracle Enterprise Performance Management Cloud environment. After a session is idle for this duration, users are redirected to the Login page.

This API is version v2.

#### **Required Roles**

Service Administrator

## **REST Resource**

```
GET /interop/rest/{api_version}/config/services/idlesessiontimeout
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

Supported Media Types: application/json

#### Table 9-35 Parameters

Name	Description	Туре	Require d	Default
api_version	Specific API version (v2)	Path	Yes	None

#### Response

Supported Media Types: application/json

#### Table 9-36 Parameters

Name	Description	
details	In case of errors, details are published with the error string	
status	<ul> <li>0 - Operation success</li> <li>+ve - Operation failed, with the status signifying an error</li> </ul>	
timeout	Session Timeout value in minutes	
href	Link to API call	
action	HTTP call type	
rel	Possible value: self	
data	null	

#### **Example of Response Body**

```
{
    "details": null,
    "links": [{
        "rel": "self",
        "href": "<uri>/interop/rest/v2/config/services/
idlesessiontimeout",
        "data": "null",
        "action": "GET"
    }],
    "status": "0",
    "items": [{
        "timeout": "30"
    }]
}
```

### Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -H
'Content-Type: application/json' 'https://<BASE-URL>/interop/rest/v2/config/
services/idlesessiontimeout '
```

## Set Idle Session Timeout

Changes the session timeout (in minutes) of the Oracle Enterprise Performance Management Cloud environment. The new session timeout becomes active after the next daily maintenance of the environment.

Use this API to change the default session timeout (75 minutes) to a different value. After a session is idle for the duration specified using this API, the user is redirected to the Login page.

This API is version v2.

#### **Required Roles**

Service Administrator

#### **REST Resource**

PUT /interop/rest/{api version}/config/services/idlesessiontimeout

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

## Table 9-37 Parameters

Name	Description	Туре	Require d	Default
api_version	Specific API version (v2)	Path	Yes	None
timeout	Session timeout value	Payload	Yes	None

## **Example of Request Body**

```
{
    "timeout": "30"
}
```

## Response

Supported Media Types: application/json

Table 9-38 Parameters

Name	Description	
details	In case of errors, details are published with the error string	
status	<ul> <li>0 - Operation success</li> <li>+ve - Operation failed, with the status signifying an error</li> </ul>	
href	Link to API call	
action	HTTP call type	
rel	Possible value: self	
data	null	

## **Example of Response Body**

```
{
    "links": [{
        "rel": "self",
        "href": "<uri>/interop/rest/v2/config/services/
idlesessiontimeout",

}
```

#### Sample cURL command

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"timeout":"30"}' 'https://<BASE-URL>/interop/rest/v2/config/services/
idlesessiontimeout
```

# Restart the Service Instance (v1)

Use the Restart the Service Instance (v1) REST API to restart the service instance with a REST API.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

You can also use an optional AutoTune parameter to auto-tune the environment before restarting it to ensure that Essbase index caches for Block Storage Option (BSO) cubes are optimized for your application.

This API is version v1.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/{api version}/services/{service type}/resetservice

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

Payload: JSON

Name	Description	Туре	Require d	Default
api_version	Specific API version	Path	Yes	None
service_type	Value for the service type. Service type can be one of the following: PBCS for Planning and Budgeting, EPBCS for Enterprise Planning and Budgeting, FCCS for Financial Consolidation and Close, TRCS for Tax Reporting, EDMCS for Enterprise Data Management, PCMCS for Profitability and Cost Management, or ARCS for Account Reconciliation.	Path	Yes	None
comment	Comment about executing the restart	Payload	Yes	None
autotune	If set to true, runs the auto tune algorithm before the restart. This ensures that Essbase index caches for BSO cubes are optimized for your application.	Payload	No	false

### **Example of Request Body**

```
{
   "comment": "Reset requested by Administrator",
   "autotune": "true"
}
```

## Response

## Table 9-40 Parameters

Name	Description	
Details	In case of errors, details are published with the error string	
Status	See Migration Status Codes	
Links	Detailed information about the link	
Href	Links to API call or status API	
Action	The HTTP call type	
Rel	Possible values: self and/or Job Status.	
	If the value is set to Job Status, you can use the href to get the status of the reset service	
Data	Parameters as key value pairs passed in the request	

## Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "details":null,
    "status":0,
    "links":[{
        "href":"https://<BASE-URL>/interop/rest/v1/services/PBCS/
resetservice",
        "rel":"self",
        "data":null,
        "action":"POST"
        },{
        "href":"https://<BASE-URL>/interop/rest/v1/services/PBCS/resetservice/
777",
        "rel":"Job Status",
        "data":null,
        "action":"GET"
    }]
}
```

## **Restart the Service Sample Code**

### Example 9-15 Java Sample – ResetServices.java

Prerequisites: json.jar

#### Common Functions: See Common Helper Functions for Java

```
11
// BEGIN - Reset services
11
public void hardReset(String comment) throws Exception {
    Scanner in = new Scanner(System.in);
    System.out.println("Are you sure you want to restart the service instance
(yes/no): no ?[Press Enter]");
    String s = in.nextLine();
    if (!s.equals("yes")) {
        System.out.println("User cancelled the reset command");
        System.exit(0);
    }
    JSONObject params = new JSONObject();
    params.put("comment", java.net.URLEncoder.encode(comment));
      params.put("autotune", "true");
    String urlString = String.format("%s/interop/rest/%s/services/PBCS/
resetservice", serverUrl, lcmVersion);
   String response = executeRequest(urlString, "POST", params.toString(),
"application/json");
    getJobStatus(fetchPingUrlFromResponse(response, "Job Status"),"GET");
}
11
// END - Reset services
11
```

#### Example 9-16 cURL Sample – ResetServices.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcHardReset() {
   echo "Are you sure you want to restart the service instance (yes/no): no ?
[Press Enter] "
   read toCreate
    if [ $toCreate != "yes" ]; then
        echo "User cancelled the reset command"
        exit 0
    fi
    url=$SERVER URL/interop/rest/$LCM VERSION/services/PBCS/resetservice
    comment=$(echo $1 | sed -f urlencode.sed)
    param="{\"comment\":\"$comment\", \"autotune\":\"true\"}"
    funcExecuteRequest "POST" $url $param "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started hard reset succesfully"
        funcGetStatus "GET"

- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Restart the Service Instance (v2)

Use the Restart the Service Instance (v2) REST API to restart the service instance.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. This API is backwards compatible.

You can also use an optional AutoTune parameter to auto-tune the environment before restarting it to ensure that Essbase index caches for Block Storage Option (BSO) cubes are optimized for your application.

This REST API is version v2.

#### **Required Roles**

Service Administrator

### **REST Resource**

**POST** /interop/rest/v2/config/services/reset

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

Payload: JSON

## Table 9-41Parameters

Name	Description	Туре	Require d	Default
api_version	Specific API version	Path	Yes	None
comment	Comment about executing the restart	Payload	Yes	None
autotune	If set to true, runs the auto tune algorithm before the restart. This ensures that Essbase index caches for BSO cubes are optimized for your application.	Payload	No	false

#### **Example of Request Body**

```
{
   "comment": "Reset requested by Administrator",
   "parameters": {
        "autotune": "false"
    }
}
```

#### Response

#### Table 9-42 Parameters

Name	Description	
Details	In case of errors, details are published with the error string	
Status	See Migration Status Codes	
Links	Detailed information about the link	
Href	Links to API call or status API	

Name	Description
Action	The HTTP call type
Rel	Possible values: self and/or Job Status.
	If the value is set to Job Status, you can use the href to get the status of the reset service
Data	Parameters as key value pairs passed in the request

## Table 9-42 (Cont.) Parameters

### Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "details": null,
    "status": 0,
    "links": [{
        "href": "https://<URL>/interop/rest/v2/config/services/reset",
        "rel": "self",
        "data": null,
        "action": "POST"
    },
    {
        "href": "https://<URL>/interop/rest/v2/config/status/service/
hardreset/1",
        "rel": "Job Status",
        "data": null,
        "action": "GET"
    }]
}
```

#### Sample cURL Command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d ' {"comment":"<COMMENT>","parameters":
{"autotune":"false"}}' 'https://<BASE-URL>/interop/rest/v2/config/services/
reset'

# Run Recreate on a Service (11.1.2.3.600)

The Run Recreate on a Service (v11.1.2.3.600) REST API restores an environment to a clean state by recreating the deployment.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

You re-create the deployment to complete these tasks:

- Clean up an environment before importing a full snapshot.
- Change the business process that can be deployed in an environment.
- Change the Essbase version in use in Oracle Enterprise Performance Management Cloud environments other than Narrative Reporting, Oracle Enterprise Data Management Cloud, and Account Reconciliation, which do not use Essbase.
   By default, EPM Standard Cloud Service and EPM Enterprise Cloud Service environments are deployed with Hybrid-enabled Essbase, while legacy environments are deployed with Non-Hybrid Essbase. Downgrading the deployment of Hybrid-enabled Essbase in EPM Standard Cloud Service and EPM Enterprise Cloud Service environments is required, if you are importing a snapshot from an environment that has a Non-Hybrid Essbase version. Upgrading the deployment of Non-Hybrid Essbase in Epd to:
  - Support the extended dimensionality in existing legacy Financial Consolidation and Close environments
  - Enable hybrid block storage (BSO) applications in legacy Enterprise Planning and Planning Modules environments

For detailed information about Hybrid Essbase and the considerations for upgrading to Hybrid Essbase, see About Essbase in EPM Cloud in Getting Started with Oracle Enterprise Performance Management Cloud for Administrators.

#### Caution:

- This API deletes the existing application and, optionally, all user defined artifacts from the environment. Additionally, it re-creates the database and removes all existing data. After recreating the service, you can create a new business process or import one using REST APIs, Migration, or EPM Automate.
- This API deletes migration history. As a result, the Migration Status Report available in Migration will not contain historic information.
- Before using this API, perform a complete backup of the environment. You can create a backup snapshot by executing runDailyMaintenance.

This API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/{api version}/services/{servicename}/recreate

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/x-www-form-urlencoded

Table 9-43 P	arameters
--------------	-----------

Name	Description	Туре	Require d	Default
api_version	Specific API version	Path	Yes	None
servicename	Name of the service for which recreate needs to be run, such as PBCS	Path	Yes	None
tempServiceType	Optionally, convert an environment to a different service environment. The business processes that you can deploy in an environment is governed by the type of subscription that you have. For example, if you have an EPM Standard Cloud Service subscription, you cannot create a FreeForm application after converting the environment from Account Reconciliation to Planning. If you have an EPM Enterprise Cloud Service subscription, you can create any business process in your environment after changing the service type appropriately. See "About the New EPM Cloud Services" in Getting Started with Oracle Enterprise Performance Management Cloud for Administrators.	Payload	No	None
	The behavior of this parameter is dependent on your subscription. For details and examples, see Recreate in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.			
	Acceptable tempServiceType values:			
	<ul> <li>ARCS to convert an environment to an Account Reconciliation environment</li> </ul>			
	<ul> <li>EDMCS to convert an environment to an Oracle Enterprise Data Management Cloud environment</li> </ul>			
	<ul> <li>EPRCS to convert an environment to a Narrative Reporting environment</li> </ul>			
	<ul> <li>PCMCS to convert an environment to a Profitability and Cost Management Cloud environment</li> </ul>			
	<ul> <li>PBCS to convert a Profitability and Cost Management environment to a Planning, Enterprise Planning, or Enterprise Profitability and Cost Management environment</li> </ul>			
	<b>Note</b> : You can create a Tax Reporting or Financial Consolidation and Close application in a new Planning environment. You do not need to change the service type of the environment.			
	When you run this REST API with tempserviceType, the serviceType change can be verified by making a REST call to /interop/ rest.			
removeAll	If set to true, deletes all the snapshots and the content of the Inbox and Outbox folders	Payload	No	None

Name	Description	Туре	Require d	Default
essbaseChange	Optionally, upgrade or downgrade the current Essbase version. The REST API retains the current Essbase version if you do not specify this option. Permissible values are:	Payload	No	None
	<ul> <li>upgrade to change from Non-Hybrid Essbase to Hybrid Essbase</li> <li>downgrade to change from Hybrid Essbase to Non-Hybrid Essbase</li> </ul>			
	<b>Caution</b> : Before using this option, read and understand the information available in About Essbase in EPM Cloud in Getting Started with Oracle Enterprise Performance Management Cloud for Administrators.			

# Table 9-43 (Cont.) Parameters

#### Response

# Table 9-44 Parameters

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self and/or Job Status.
	If the value is set to Job Status, you can use the href to get the status of the recreate service
data	Parameters as key value pairs passed in the request

# **Example of Response Body**

The following is an example of the response body in JSON format.

```
{
   "details":null,
   "status":0,
   "links":[{
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/services/PBCS/
recreate",
        "rel":"self",
        "data":null,
        "action":"POST"
        },{
        "href":"https://<BASE-URL>/interop/rest/11.1.2.3.600/services/PBCS/
recreate/777",
        "rel":"Job Status",
        "data":null,
        "action":"GET"
```

```
}]
```

}

Run Recreate on a Service Sample Code

```
Example 9-18 Java Sample – runRecreateOnAService.java
```

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
//
// BEGIN - Recreate services
//
public void recreateService(String serviceName, String serviceType, String
removeAll, String essbaseChange) throws Exception {
    Scanner in = new Scanner(System.in);
    System.out.println("Are you sure you want to recreate the EPM environment
(yes/no): no ?[Press Enter]");
    String s = in.nextLine();
    if (!s.equals("yes")) {
        System.out.println("User cancelled the recreate command");
        System.exit(0);
    }
```

```
JSONObject params = new JSONObject();
//params.put("tempServiceType", serviceType);
params.put("removeAll", removeAll);
params.put("essbaseChange", essbaseChange);
    String parameters = "parameters="+ URLEncoder.encode(params.toString(),
"UTF-8");
    String urlString = String.format(
                                                      "%s/interop/rest/%s/
services/%s/recreate", serverUrl, apiVersion, serviceName);
    String response = executeRequest(urlString, "POST", parameters,
"application/x-www-form-urlencoded");
    getJobStatus(fetchPingUrlFromResponse(response, "Job Status"),"GET");
}
11
// END - Recreate services
11
```

#### Example 9-19 cURL Sample – RunRecreateOnAService.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcRecreateService() {
    echo "Are you sure you want to recreate the EPM environment (yes/no):
    no ?[Press Enter]"
        read toCreate
        if [ $toCreate != "yes" ]; then
            echo "User cancelled the recreate command"
```

```
exit 0
        fi
        url=$SERVER URL/interop/rest/$API VERSION/services/EPM/recreate
        json=$(echo "{\"removeAll\":\"true\",\"essbaseChange\":\"upgrade\"}"
| sed -f urlencode.sed)
        param="parameters=$json"
        funcExecuteRequest "POST" $url $param "application/x-www-form-
urlencoded"
        output=`cat response.txt`
        status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started recreating the environment successfully"
                funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
        funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

# Example 9-20 Groovy Sample – RunRecreateOnAService.groovy

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Groovy

```
def recreateService(serviceName) {
   def toCreate = System.console().readLine 'Are you sure you want to
recreate the EPM environment (yes/no): no ?[Press Enter]'
    if (!toCreate.equals("yes")) {

# Run Recreate on a Service (v2)

•

Use the Run Recreate on a Service (v2) REST API to restore an environment to a clean state by recreating the deployment.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. This API is backwards compatible.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See About the REST APIs. Using this REST API requires prerequisites. See Prerequisites.

You re-create the deployment to complete these tasks:

- Clean up an environment before importing a full snapshot.
- Change the business process that can be deployed in an environment.
- Change the Essbase version in use in Oracle Enterprise Performance Management Cloud environments other than Narrative Reporting, Oracle Enterprise Data Management Cloud, and Account Reconciliation, which do not use Essbase.
  By default, EPM Standard Cloud Service and EPM Enterprise Cloud Service environments are deployed with Hybrid-enabled Essbase, while legacy environments are deployed with Non-Hybrid Essbase. Downgrading the deployment of Hybrid-enabled Essbase in EPM Standard Cloud Service and EPM Enterprise Cloud Service environments is required, if you are importing a snapshot from an environment that has a Non-Hybrid Essbase version. Upgrading the deployment of Non-Hybrid Essbase in legacy environments is required to:
  - Support the extended dimensionality in existing legacy Financial Consolidation and Close environments
  - Enable hybrid block storage (BSO) applications in legacy Enterprise Planning and Planning Modules environments

For detailed information about Hybrid Essbase and the considerations for upgrading to Hybrid Essbase, see About Essbase in EPM Cloud in Getting Started with Oracle Enterprise Performance Management Cloud for Administrators.

#### Caution:

- This API deletes the existing application and, optionally, all user defined artifacts from the environment. Additionally, it re-creates the database and removes all existing data. After recreating the service, you can create a new business process or import one using REST APIs, Migration, or EPM Automate.
- This API deletes migration history. As a result, the Migration Status Report available in Migration will not contain historic information.
- Before using this API, perform a complete backup of the environment. You can create a backup snapshot by executing runDailyMaintenance.

This API is version v2.

# **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# Manage Application Snapshots

You can manage the file system artifacts or application snapshots using the following REST resources.

**Note**: The password of the source EPM Cloud environment must have already been encrypted using EPM Automate. The encrypted password must then be passed as one of the parameters for the copysnapshot REST API. See the *encrypt* command in Command Reference in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud*.

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Get Information About All Application Snapshots	GET	<pre>/interop/rest/{api_version}/ applicationsnapshots</pre>
Get Information About a Specific Application Snapshot	GET	/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}
Upload Application Snapshot (v1)	POST	/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName
Upload Application Snapshot (v2)	POST	/interop/rest/v2/files/upload
Download Application Snapshot (v1)	GET	/interop/rest/{api_version}/ applicationsnapshots/ {applicationSnapshotName}
Download Application Snapshot (v2)	POST	/interop/rest/v2/files/download
Copy Application Snapshot (v1)	POST	/interop/rest/v1/services/ {servicename}/copysnapshot
Copy Application Snapshot (v2)	POST	/interop/rest/v2/snapshots/ copyfrominstance
Rename Application Snapshot (v1)	PUT	/interop/rest/{api_version}/ renamesnapshot
Rename Application Snapshot (v2)	PUT	/interop/rest/v2/snapshots/rename

#### Table 9-47 Manage Application Snapshots

# Get Information About All Application Snapshots

This API returns information about all application snapshots that are available in an Planning instance. It provides details such as name, type, size, and last modified time. Type signifies whether it is a Migration snapshot or an external snapshot. Size and last modified time are not available for Migration type snapshots.

This API is version 11.1.2.3.600.

# **Required Roles**

Service Administrator

#### **REST Resource**

GET /interop/rest/{api\_version}/applicationsnapshots

# Response

Supported Media Types: application/json

# Table 9-48 Parameters

Name	Description	
api_version	Specific API version	

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
items	Detailed information about the API
name	Name of the application snapshot
type	Possible values: LCM, EXTERNAL
size	Size of the application snapshot in bytes. Available only for type EXTERNAL
lastmodifiedtim e	Time in Long value as per the last modified time of the file. Will be available only for type ${\tt EXTERNAL}$
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible value: self
data	Parameters as key value pairs passed in the request

# Table 9-48 (Cont.) Parameters

# **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
    "status":0,
    "items":[{
        "name":"sample.csv",
        "type":"EXTERNAL",
        "size":"18",
        "lastmodififedtime":"1422534438000"
        },{
        "name":"snapshot1",
        "type":"LCM",
        "size":null,
        "lastmodififedtime":null
    }],
    "details":null,
    "links":[{
        "data":null,
        "action":"GET",
        "href":"https://<BASE URL>/interop/rest/11.1.2.3.600/
applicationsnapshots",
        "rel":"self"
    }]
}
```

# **Common Functions**

- See CSS Common Helper Functions for Groovy

# Get Information About a Specific Application Snapshot

Returns information about all the operations that can be performed on a particular application snapshot. It provides details on operations such as Migration import and export, upload, download, and delete.

This API is version 11.1.2.3.600.

# **Required Roles**

Service Administrator

# **REST Resource**

GET /interop/rest/{api\_version}/applicationsnapshots/{applicationSnapshotName}

#### Request

The following table summarizes the GET request parameters.

# Table 9-49 Parameters

Name	Description	Туре	Required	Default
applicationSnapsho tName	Application snapshot name to retrieve the details	Path	Yes	N/A

#### Response

Supported Media Types: application/json

#### Table 9-50 Parameters

Name	Description
details	In the case of an error, details are published with the error string
status	See Migration Status Codes
items	Detailed information about the API
name	Name of the application snapshot
type	Possible values: LCM, EXTERNAL
canexport	Identifies whether this application snapshot can be exported using Migration. Applicable only to Migration application artifacts
canimport	Identifies whether this application snapshot can be imported using Migration. Applicable only to Migration application artifacts
canupload	Identifies whether the application snapshot can be uploaded
candownload	Identifies whether the application snapshot can be downloaded
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible values: self, import, export, upload, download, or delete depending on the operation permitted on an application snapshot
data	Parameters as key value pairs passed in the request

# **Example of Response Body**

The following is an example of the response body in JSON format.

```
{
    "status":0,
    "items":[{
        "name": "snapshot1",
        "type":"LCM",
        "canexport":true,
        "canimport":true,
        "canupload":true,
        "candownload":true
    }],
    "details":null,
    "links":[{
        "data":null,
        "action":"GET",
        "href":"https://<BASE URL>/interop/rest/11.1.2.3.600/

# Upload Application Snapshot (v1)

This API uploads an application snapshot to the Planning repository. The client needs to call upload API multiple times based on the size of file to upload. The client needs to break the existing stream into a number of chunks depending on the logic that each chunk size is not greater than 50 \* 1024 \* 1024 bytes.

This API is version v1.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

**POST** /interop/rest/{api\_version}/applicationsnapshots

Supported Media Types: application/octet-stream

The following table summarizes the client request.

# Table 9-51 Parameters

Name	e Description		Default
api_version	Specific API version	Path	N/A
applicationSnapsho tName	Name of the application snapshot to be uploaded. A file with this name is created in the Planning repository. If a file or folder with this name exists in the repository, an error is thrown indicating that a file or folder exists.		N/A
isLast	If the chunk being passed is the last one then set to true	Query	N/A
chunkSize	Size of the chunk being passed in bytes	Query	N/A
isFirst	If the chunk being passed is the first one and there will be subsequent requests for upload then set as true	Query	N/A
fileSize	The size of the file being uploaded	Query	N/A

# Response

Supported Media Types: application/json

Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Is self, which denotes the URL of this REST API.	
data	Parameters as key value pairs passed in the request	

# **Example of Response Body**

```
{
   "status":0,
   "details":null,
   "links":[{
        "data":null,
        "action":"POST",
        "href":"https://<BASE URL>/interop/rest/v1/applicationsnapshots/
ss2.zip/contents,
        "rel":"self"
   }]
}
```

#### **Examples of Uploading with Postman**

To upload a file named snapshot.zip of size 12606 bytes, select request method as POST and Basic Authorization header for all the requests.

**Example Request 1: Create a File** 

Parameters

```
https://<BASE URL>//interop/rest/v1/applicationsnapshots/snapshot.zip/contents?
q=PARAMETERS ->
{"isFirst":true,"chunkSize":14,"fileSize":"12606","isLast":false} // utf-8
encoded value of it
```

```
{"isFirst":true,"chunkSize":14,"fileSize":"12606","isLast":false} // utf-8
encoded value of it
```

#### **URL and Response**

```
https://<BASE URL>/interop/rest/v1/applicationsnapshots/snapshot.zip/contents?
q=%7B%22isFirst%22%3Atrue%2C%22chunkSize%22%3A14%2C%22fileSize%22%3A%223318004
%22%2C%22isLast%22%3Afalse%7D
```

```
{
    "links": [
        {
            "rel": "self", {
                "href": "https://<BASE URL>/interop/rest/v1/applicationsnapshots/
snapshot.zip/contents?
q=%7B%22isFirst%22:true,%22chunkSize%22:14,%22fileSize%22:%223318004%22,%22isL
ast%22:false%7D",
            "data": null,
                "action": "POST"
        }
    ],
    "details": null,
    "status": 0
}
```

## **Example Request 2: Upload the Content**

#### Parameters

https://<BASE URL>/interop/rest/v1/applicationsnapshots/snapshot.zip/contents?q=

{"startRange":"0","isFirst":false,"chunkSize":12606,"isLast":false,"fileSize":"12
606","endRange":"12605","chunkNo":1} // encoded value of it (Ensure the value of
the parameters chunkSize and fileSize is equivalent to the total size of the file
and endRange is set to fileSize - 1.)

# **URL and Response**

```
https://<BASE URL>/interop/rest/v1/applicationsnapshots/snapshot.zip/contents?
q=%7B%22startRange%22%3A%220%22%2C%22isFirst%22%3Afalse%2C%22chunkSize%22%3A12
606%2C%22isLast%3A%22false%22%7D
```

To select the file, select tab Body, radio button Binary, and select File, Send.

# Example Request 3: Extract the Content Out of the Zip File

## Parameters

https://<<BASE URL>/interop/rest/v1/applicationsnapshots/snapshot.zip/contents?q=

```
{"isFirst":false,"chunkSize":14,"fileSize":"12606","isLast":true} // utf-8
encoded value of it
```

## **URL and Response**

```
https://<BASE URL>/interop/rest/v1/applicationsnapshots/snapshot.zip/contents?
q=%7B%22isFirst%22%3Afalse%2C%22chunkSize%22%3A14%2C%22fileSize%22%3A%2212606%
22%2C%22isLast%22%3Atrue%7D
```

To select the file:, select tab Body, radio button Binary, select File, Send.

# Upload Application Snapshot (v2)

The Upload Application Snapshot (v2) REST API uploads an application snapshot to Oracle Enterprise Performance Management Cloud. The client needs to call upload API multiple times based on the size of the file to upload. The client needs to break the existing stream into a number of chunks depending on the logic that each chunk size is not greater than 50 \* 1024 \* 1024 bytes.

This API is version v2.

# **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

## **REST Resource**

**POST** /interop/rest/v2/files/upload

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

 Table 9-53
 Tasks for Upload Application Snapshot

Task	Reques t	REST Resource
Create file	POST	/interop/rest/v2/files/upload
Upload content	PATCH	/interop/rest/v2/files/upload/7224986735511603
Extract the content out of zip file	POST	/interop/rest/v2/files/upload/7224986735511603/complete
Extraction status	GET	/interop/rest/v2/status/jobs/7224986735511603

# Request

Supported Media Types: application/json

The following table summarizes the client request.

# Table 9-54 Parameters

Name	Description	Туре	Required	Default
fileName	Name of the application snapshot to upload. A file with this name is created in EPM Cloud. If a file or folder with this name already exists, an error is thrown indicating that a file or folder exists.	Payload	Yes	None
fileSize	The size of the file to upload	Payload	Yes	None

# Response

Supported Media Types: application/json

Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Is self, which denotes the URL of this REST API.	
data	Parameters as key value pairs passed in the request	

# Table 9-55 Parameters

## **Examples of Uploading with Postman**

To upload a file named snapshot.zip of size 12606 bytes, select Basic Authorization header for all the requests.

# Example URL and Payload to Create the File

Request Method: POST

Supported Media Types: application/json

https://<BASE URL>/interop/rest/v2/files/upload

```
{
   "fileName": "snapshot.zip",
   "fileSize": "2468889"
}
```

# Example Response 1

```
{
    "status":0,
    "details":null,
    "links":[{
        "data":null,
        "action":"POST",
        "href":"https://<BASE URL>/interop/rest/v2/interop/rest/v2/files/
upload,
        "rel":"self"
    }]
}
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"fileName": "snapshot.zip", "fileSize":"2468889"}' 'https://<BASE URL>/
interop/rest/v2/files/upload'
```

# Example URL and Payload to Upload the Content

Request Method: PATCH

Supported Media Types: application/octet-stream

Chunk-Range has to be passed as a Header parameter (0-2468889)

# Note:

Ensure the value of the fileSize is equivalent to the total size of the file and end Range is set to fileSize -1.

https://<BASE URL>/interop/rest/v2/files/upload/7224986735511603

To select the file: Select tab Body, radio button Binary, and choose File to upload.

# **Example Response 2**

```
{
   "details": null,
   "status": 0,
   "links": [
        {
            "href": " https://<BASE URL>/interop/rest/v2/files/upload/
7224986735511603",
            "action": "PATCH",
                "rel": "self",
                "data": null
            }
        ]
}
```

#### Sample cURL command

```
curl -X PATCH -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt
-H 'Content-Type: application/octet-stream' -H
'Chunk-Range: 0-2468888' --data-binary '@snapshot.zip' 'https://<BASE URL>/
interop/rest/v2/files/upload/7232824317092320'
```

#### Example URL and Payload to Extract the Content Out of the Zip File

Request method: POST

Supported Media Types: application/json

https://<BASE URL>/interop/rest/v2/files/upload/7224986735511603/complete

### **Example Response 3**

```
{
    "details": null,
```

```
"status": -1,
    "links": [
        {
            "href": "http://slcar282.usdv1.oraclecloud.com:13017/interop/
rest/v2/files/upload/7224986735511603/complete",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": "http://slcar282.usdv1.oraclecloud.com:13017/interop/
rest/v2/status/jobs/7293659723083015",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    ]
}
```

# Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json'
'https://<BASE URL>/interop/rest/ v2/files/upload/7232824317092320/complete'
```

#### **Example URL and Payload Extraction Status**

Request method: POST

Supported Media Types: application/json

This API request needs to be requested when the status code received in the example 3 response is -1.

https://<BASE URL>/interop/rest/v2/status/jobs/7293659723083015

#### Example Response 4

## Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json'
'https://<BASE URL>/interop/rest/ v2/status/jobs/7293659723083015'
```

# Download Application Snapshot (v1)

Downloads the application snapshot from EPM repository to the local location from where client is being run. After receiving the response, if the content type is application/json then there would be an error on server and refer to details. Else, if it's application/octet-stream, then the content to be downloaded is part of the response and can read from the response body.

# Note:

The entire path to the file must be encoded; for example, changing / to \$2F.

For example, change this path to an .HTML file in the apr directory:

apr/2020-03-04 23 07 20/2020-03-04 23 07 20.html

to this:

apr%2F2020-03-04%2023 07 20%2F2020-03-04%2023 07 20.html

This API is version v1.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

# **REST Resource**

GET /interop/rest/{api\_version}/applicationsnapshots/{applicationSnapshotName}/
contents

Supported Media Types: application/x-www-form-urlencoded

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Request

The following table summarizes the GET request parameters.

# Table 9-56 Parameters

Name	Description	Туре	Required	Default
applicationSnapsho tName	Application snapshot name or file name to download (for example, "Artifact Snapshot" or s112.csv).	Path	Yes	None
	The entire applicationSnapshotName must be encoded before sending the request.			
	To download a particular file, provide the path to that file as the value of applicationSnapshotName. For example, to download a Data Management file called s112.csv in the inbox, refer to the file as "inbox\s112.csv" in the path parameter.			
	To download the Activity Reports or access log, use the fully qualified file name as shown in the output of List Files.			
	For example, to download a specific file from the apr directory, use the following format:			
	pr%2F2020-03-04%0A23_07_20%2F2020-03-04%0A23_ 07_20.html			
	apr%2F%0A2020-03-04%2023_07_20%2F%0Aaccess_lo g.zip			
	apr%2F%0A2020-03-04%2023_07_20%2F%0Aactivityr eport.json.			
api_version	Specific API version	Path	Yes	None

# **Example of Request**

https://<BASE URL>/interop/rest/v1/applicationsnapshots/Vision.zip/contents

## Response

Supported Media Types: application/json

## **Response Header**

fileExtension: This will have the file extension that can be used to create a file locally. Can contain values such as zip or csv.

## Table 9-57 Parameters

Attribute	Description	
details	Published in case of errors with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Possible value: self	
data	Parameters as key value pairs passed in the request	

# **Example of Response Body**

The following shows an example of the response body in JSON format in case there is an error during download.

```
{
   "details":"Not a valid file.",
   "status":8,
   "links":[{
        "href":"https://<BASE URL>/interop/rest/v1/applicationsnapshots/
s112.csv/contents",
        "action":"GET",
        "rel":"self",
        "data":null
    }]
}
```

**Download Sample Code** 

#### Java Sample - downloadFile.java

```

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 9-58 Tasks for Download Application Snapshot

Task	Request	REST Resource
Initiate download	POST	/interop/rest/v2/files/download
Status of compression of file	GET	/interop/rest/v2/status/download/7234359469022936
Download link	GET	/interop/rest/v2/files/download/7234359469022936
Deletion of temporary file (Applicable to snapshots)	DELETE	/interop/rest/v2/files/download/7234359469022936

# Request

Supported Media Types: application/json

The following table summarizes the GET request parameters.

# Table 9-59 Parameters

Name	Description Type	Required	Default
fileName	Application snapshot name or to download (for example, Payload "Artifact Snapshot").	Yes	None

# Response

Supported Media Types: application/json

# **Response Header**

fileExtension:This will have the file extension that can be used to create a file locally. Can contain values such as zip or csv.

# Table 9-60 Parameters

Attribute	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible value: self
data	Parameters as key value pairs passed in the request

# Example of Downloading with Postman

To download a file named snapshot.zip, select Basic Authorization header for all the requests.

# Example URL and Payload to Initiate Download

Request Method: POST

## Supported Media Types: application/json

```
https://<BASE URL>/interop/rest/v2/files/download
{
    "fileName": "snapshot.zip"
```

# Example Response 1

}

```
{
    "details": null,
    "status": -1,
    "links": [
        {
            "href": " https://<BASE URL>/interop/rest/v2/files/download",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": " https://<BASE URL>/interop/rest/v2/status/download/
7236073834203988",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    1
}
```

## Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"fileName":"snapshot.zip"}' 'https://interop/rest/v2/files/download'
```

# Example URL for Status of Compression File

Request Method: GET

Supported Media Types: application/json

https://<BASE URL>/interop/rest/v2/status/download/7236073834203988

## Example Response 2

```
"action": "GET",
    "rel": "self",
    "data": null
},
{
    "href": "https://<BASE URL>/v2/files/download/7236073834203988",
    "action": "GET",
    "rel": "Download link",
    "data": null
    }
]
```

## Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json'
'https://<BASE URL>/interop/rest/v2/status/download/7237042873146169'
```

## Example URL and Payload for Download Link

Request method: POST

Supported Media Types: application/json

https://<BASE URL>/interop/rest/v2/files/download/7236073834203988

#### **Example Response 3**

After receiving the response, if the content type is application/json, then there would be an error on the server and refer to details. Otherwise, if it's application/octet-stream, then the content to be downloaded is part of the response and can read from the response body.

#### Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o snapshot.zip -D respHeader.txt -
H 'Content-Type: application/json'
'https://<BASE URL>/interop/rest/v2/files/download/7237042873146169'
```

#### Example URL and Payload for Deletion of Temporary File

Request method: DELETE

Supported Media Types: application/json

https://<BASE URL>/interop/rest/v2/files/download/7236073834203988

## **Example Response 4**

## Sample cURL command

```
curl -X DELETE -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D
respHeader.txt -H 'Content-Type: application/json'
'https://<BASE URL>/interop/rest/v2/files/download/7237042873146169'
```

# Copy Application Snapshot (v1)

Use this API (v1) to copy a snapshot from one environment (source) to another environment (target).

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

This API is executed on the target environment after details are provided for the source environment from which the snapshot is to be copied.

**Prerequisites**: The password of the source EPM Cloud environment must have already been encrypted using EPM Automate. The encrypted password must then be passed as one of the parameters for the copysnapshot REST API. See the *encrypt* command in Command Reference in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.

This REST API is version v1.

## **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

**POST** /interop/rest/v1/services/{servicename}/copysnapshot

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Trigger copysnapshot	POST	/interop/rest/{api_version}/services/{servicename}/copysnapshot
Retrieve copysnapshot status	GET	/interop/rest/{api_version}/services/{servicename}/ copysnapshot/777
Request		
Supported Media Types: application/x-www-form-urlencoded		

# Table 9-61 Tasks for Copy Application Snapshot

# Response

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the POST request parameters.

# Table 9-62 Parameters

Name	Description		Required	Default	
api_version	Specific API version, such as v1		Yes	None	
serviceName	Name of the service, such as PBCS	Path	Yes	None	
snapshotName	Name of the snapshot to be copied	Form	Yes	None	
userName	User with access to the source instance	Form	Yes	None	
fpwd	The encrypted password for the source user to be passed as a string. The encrypted password must then be passed as one of the parameters for the REST API.	Form	Yes	None	
	For information on encrypting and generating the password.epw password file with EPM Automate, see the encrypt command in Command Reference in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.				
sourceURL	The URL of the source instance	Form	Yes	None	
	<b>Note:</b> This API also supports the previous name of this parameter, targetURL.				

#### Table 9-63 Parameters

Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status of the copy snapshot	
data	Parameters as key value pairs passed in the request	

# **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{"status":-1, "items": null, "links":[{"rel":"self", "href":"https://<BASE
URL>/interop/rest/v1/services/PBCS/copysnapshot","data":null,"action":"POST"},
{"rel":"Job Status","href":"https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/interop/rest/v1/services/
PBCS/copysnapshot/1502357937045","data":null,"action":"GET"}],"details":null
```

#### Java Sample – CopySnapshot.java

```
11
// BEGIN - copysnapshotfrominstance
11
public void copysnapshot() throws Exception {
String snapshotName = "SNAPSHOT NAME";
String srcUserName = "USER NAME";
String targetURL = "https://<BASE URL>";
String srcEPWfilePath = "C:\\logs\\pwd.epw";
String srcDomain = null;
String urlString = String.format("%s/interop/rest/v1/services/PBCS/
copysnapshot", serverUrl);
String fpwd = fetchPwdFromFile(srcEPWfilePath);
String params = null;
if (null == srcDomain) {

# Copy Application Snapshot (v2)

}

Use this REST API (v2) to copy a snapshot from one environment (source) to another environment (target).

This API is executed on the target environment after details are provided for the source environment from which the snapshot is to be copied.

**Prerequisites**: The password of the source EPM Cloud environment must have already been encrypted using EPM Automate. The encrypted password must then be passed as one of the parameters for the copyfrominstance REST API. See the *encrypt* command in Command Reference in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.

This REST API is version v2.

# **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

## **REST Resource**

```
POST /interop/rest/v2/snapshots/copyfrominstance
```

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Trigger copysnapshot	POST	/interop/rest/v2/snapshots/copyfrominstance
Retrieve copysnapshot status	GET	/interop/rest/v2/status/jobs/777

# Table 9-64 Tasks for Copy Application Snapshot

#### Request

Supported Media Types: application/json

The following table summarizes the POST request parameters.

# Table 9-65 Parameters

Name	Description	Туре	Required	Default
snapshotName	Name of the snapshot to be copied	Payload	Yes	None
userName	User with the Service Administrator predefined role in the source instance	Payload	Yes	None
fpwd	The encrypted password for the source user to be passed as a string.	Payload	Yes	None
	For information on encrypting and generating the password.epw password file with EPM Automate, see the encrypt command in Command Reference in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.			
sourceURL	The URL of the source instance	Payload	Yes	None

# **Example URL and Payload**

https://<BASE URL>/interop/rest/snapshots/copyfrominstance

```
{
   "snapshotName": "<NAME>",
   "userName": "<USERNAME>",

```

# Copy to and from the Object Store

This table table shows the REST APIs to copy a file or a backup snapshot from the outbox of the current cloud environment (the source) to the Oracle Object Storage Cloud (the target). It also shows the REST APIs to copy a file or a backup snapshot from the Oracle Object Storage Cloud (the source) to the cloud environment (the target). These REST APIs are version v1 and v2.

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-71 Application Snapshot Service

Task	Request	REST Resource
Copy to Object Store (v1)	POST	/interop/rest/v1/services/copytoobjectstore
Copy to Object Store (v2)	POST	/interop/rest/v2/objectstorage/copyto
Copy from Object Store (v1)	POST	/interop/rest/v1/services/copyfromobjectstore
Copy from Object Store (v2)	POST	/interop/rest/v2/objectstorage/copyfrom

# Copy from Object Store (v1)

Use the Copy from Object Store (v1) REST API to copy a file or a backup snapshot from the Oracle Object Storage Cloud (the source) to the cloud environment (the target). If you are copying a backup snapshot, this API copies it from the Object Storage bucket and extracts its contents in Oracle Enterprise Performance Management Cloud.

This topic describes the v1 version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 9-72 Tasks for Copy from Object Store

Task	Request	REST Resource
Trigger copyfromobjectstor e	POST	/interop/rest/v1/services/copyfromobjectstore
Retrieve copyfromobjectstor e status	GET	/interop/rest/v1/services/jobs/777

### Request

Supported Media Types: application/json

# Table 9-73 Parameters

Name	Description	Туре	Required	Default
url	The URL of the Object Store, appended with the bucket name and the name of the object to be copied. The URL format:	Form	Yes	None
	<pre>https:// swiftobjectstorage.region_identifier.oracleclou d.com/v1/namespace/bucket name/object name</pre>			
	Components of this URL:			
	<ul> <li>region_identifier is a Oracle Cloud Infrastructure hosting region.</li> </ul>			
	<ul> <li>namespace is the top-level container for all buckets and objects. Each Oracle Cloud Infrastructure tenant is assigned a unique system-generated and immutable Object Storage namespace name at account creation time. Your tenancy's namespace name, for example, axaxnpcrorw5, is effective across all regions.</li> <li>bucket_name is the name of a logical container where you store your data and files. Buckets are organized and maintained under compartments. A system generated bucket name, for example, bucket-20210301-1359 reflects the current year, month, day, and time.</li> </ul>			
	<ul> <li>object_name is the name of the snapshot or file that you want to copy from Oracle Object Storage Cloud.</li> <li>For more information, see these topics in Oracle Cloud Infrastructure Documentation:</li> </ul>			
	<ul> <li>Regions and Availability Domains</li> <li>Understanding Object Storage Namespaces</li> <li>Managing Buckets</li> </ul>			
username	The ID of a user who has the required access rights to write to Oracle Object Storage Cloud.	Form	Yes	None
	For users created in a federated identity provider, specify the fully-qualified name of the user (for example, exampleIdP/jdoe or exampleIdP/john.doe@example.com, where exampleIdP is the name of the federated identity provider). For other users, provide the User ID.			
password	The Swift password or auth token associated with the user. This password is not the same as the password that you use to sign into the Object Storage Console. Auth token is an Oracle-generated token that you use to authenticate with third-party APIs, for example to authenticate with a Swift client. For instructions to create this token, see To create an auth token in Oracle Cloud Infrastructure Documentation.	Form	Yes	None
targetfile	Name of the target filename (with path) of the downloaded artifact. When copying snapshots, do not specify the ZIP extension.	Form	Yes	None
	Examples: Artifact Snapshot_24_Sept_2020, inbox/ File_new.txt			

# Response

- See CSS Common Helper Functions for Groovy

## Copy from Object Store (v2)

Use the Copy from Object Store (v2) REST API to copy a file or a backup snapshot from the Oracle Object Storage Cloud (the source) to the cloud environment (the target). If you are copying a backup snapshot, this API copies it from the Object Storage bucket and extracts its contents in Oracle Enterprise Performance Management Cloud.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. This API is backwards compatible.

## Note:

The Object Storage requires an *Other Web Services Provider* type. Ensure that you have access to the Web service you are connecting. You must also have URLs for the Web service and an login details if required. For information see, Connecting to External Web Services in *Administering Planning*.

This REST API is version v2.

#### **Required Roles**

Service Administrator

## **REST Resource**

**POST** /interop/rest/v2/objectstorage/copyfrom

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 9-75 Tasks

Task	Request	REST Resource
Trigger copyfromobjectstor e	POST	/interop/rest/v2/objectstorage/copyfrom
Retrieve copyfromobjectstor e status	GET	/interop/rest/v2/status/jobs/777

## Request

Supported Media Types: application/json

## Table 9-76 Parameters

Name	Description	Туре	Required	Default
url	The URL for Oracle Cloud Object Storage, appended with the bucket name and an optional object name.	Payload	Yes	None
	This is the URL format: :			
	https://			
	swiftobjectstorage.region_identifier.oracleclou			
	d.com/v1/namespace/bucket_name/object_name			
	Components of this URL:			
	<ul> <li>region_identifier is a Oracle Cloud Infrastructure hosting region.</li> </ul>			
	• <b>namespace</b> is the top-level container for all buckets and objects. Each Oracle Cloud Infrastructure tenant is assigned a unique system-generated and immutable Object Storage namespace name at account creation time. Your tenancy's namespace name, for example, axaxnpcrorw5, is effective across all regions.			
	<ul> <li>bucket_name is the name of a logical container where you store your data and files. Buckets are organized and maintained under compartments. A system-generated bucket name, for example, bucket-20210301-1359 reflects the current year, month, day, and time.</li> </ul>			
	<ul> <li>object_name is the name of the snapshot or file that you want to copy from Oracle Object Storage Cloud.</li> </ul>			
	For more information, see these topics in Oracle Cloud Infrastructure Documentation:			
	Regions and Availability Domains			
	Understanding Object Storage Namespaces			
	Managing Buckets			
userName	The ID of a user who has the required access rights to write to Oracle Object Storage Cloud.	Payload	Yes	None
	For users created in a federated identity provider, specify the fully-qualified name of the user (for example, exampleIdP/jdoe or exampleIdP/john.doe@example.com, where exampleIdP is the name of the federated identity provider). For other users, provide the User ID.			
password	The Swift password or auth token associated with the user. This password is not the same as the password that you use to sign into the Object Storage Console. Auth token is an Oracle-generated token that you use to authenticate with third-party APIs, for example to authenticate with a Swift client. For instructions to create this token, see To create an auth token in Oracle Cloud Infrastructure Documentation.	Payload	Yes	None
targetFile	Name of the target filename (with path) of the downloaded artifact. When copying snapshots, do not specify the ZIP extension.	Payload	Yes	None
	Examples: Artifact Snapshot_24_Sept_2020, inbox/ File_new.txt			

### **Example URL and Payload**

```
{
    "url":"https://swiftobjectstorage.<region_identifier>.oraclecloud.com/v1/
namespace/bucket_name/object_name",
    "userName": "epm_user",
    "password": "epm_password",
    "targetFile": "Artifact snapshot"
}
```

https://<BASE URL>/interop/rest/v2/objectstorage/copyfrom

### Response

Supported Media Types: application/json

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request

#### Table 9-77 Parameters

## **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
    "details": null,
    "status": -1,
    "items": null,
    "links": [
        {
            "href": " https://<BASE URL>/interop/rest/v2/objectstorage/
copyfrom",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": " https://<BASE URL>/interop/rest/v2/status/jobs/
4003051833546274",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
```

```
]
```

}

#### Sample cURL Command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H
'Content-Type: application/json' -d
'{"url":"OBJECT_STORAGE_URL","userName":"USER_NAME","password":"PASSWORD",
"targetFile":"FILEPATH/FILENAME"}' 'https://<BASE_URL>/interop/rest/v2/
objectstorage/copyfrom'
```

#### **Common Functions**

- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Copy to Object Store (v1)

Use the Copy to Object Store (v1) REST API to copy a file or a backup snapshot from the current cloud environment (the source) to the Oracle Object Storage Cloud (the target). You can copy any file or snapshot available in the EPM Cloud. For example, if you export data to a file, the exported file is stored in the Outbox. You can then use this API to copy the file directly to Oracle Object Storage, assuming you have an account.

This topic describes the v1 version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

## Note:

The Object Storage requires an *Other Web Services Provider* type. Ensure that you have access to the Web service you are connecting. You must also have URLs for the Web service and an login details if required. For information see, Connecting to External Web Services in *Administering Planning*.

This REST API is version v1.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/v1/services/copytoobjectstore

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 9-78 Tasks for Copy to Object Store

Task	Request	REST Resource
<b>Trigger</b> copytoobjectstore	POST	/interop/rest/v1/services/copytoobjectstore
Retrieve copytoobjectstore status	GET	/interop/rest/v1/services/jobs/777

## Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

## Table 9-79 Parameters

Name	Description	Туре	Required	Default
url	Oracle Object Storage Cloud bucket with an optional object name appended. The URL format without object name: https:// swiftobjectstorage.region_identifier.oracleclou d.com/v1/namespace/bucket_name	Form	Yes	None
	The URL format with object name:			
	<pre>https:// swiftobjectstorage.region_identifier.oracleclou d.com/v1/namespace/bucket_name/object_name</pre>			
	Components of this URL:			
	<ul> <li>region_identifier is an Oracle Cloud Infrastructure hosting region.</li> <li>namespace is the top-level container for all buckets and objects. Each Oracle Cloud Infrastructure tenant is assigned a unique system-generated and immutable Object Storage namespace name at account creation time. Your tenancy's namespace name, for example, axaxnpcrorw5, is effective across all regions.</li> <li>bucket_name is the name of a logical container where you store your data and files. Buckets are organized and maintained under compartments. A system generated bucket name, for example, bucket-20210301-1359 reflects the current year, month, day, and time.</li> <li>object_name, optionally, is name that you want to use for the file on Oracle Object Storage Cloud. If an object name is not specified, the file will be copied with its original name.</li> <li>For more information, see these topics in Oracle Cloud Infrastructure Documentation:</li> <li>Regions and Availability Domains</li> <li>Understanding Object Storage Namespaces</li> </ul>			
username	Managing Buckets The ID of a user who has the required access rights to write	Form	Yes	None
	to Oracle Object Storage Cloud. For users created in a federated identity provider, specify the fully-qualified name of the user (for example, exampleIdP/ jdoe or exampleIdP/john.doe@example.com, where exampleIdP is the name of the federated identity provider). For other users, provide the User ID.			
password	The Swift password or auth token associated with the user. This password is not the same as the password that you use to sign into the Object Storage Console. Auth token is an Oracle-generated token that you use to authenticate with third-party APIs, for example to authenticate with a Swift client. For instructions to create this token, see To create an auth token in Oracle Cloud Infrastructure Documentation.	Form	Yes	None
filepath	Name of the file (with path) to be copied to the Store. If you are copying a snapshot, do not specify the ZIP extension. Examples: Artifact Snapshot, inbox/File.txt	Form	Yes	None

#### Sample Request Payload

```
url: https://swiftobjectstorage.<region_identifier>.oraclecloud.com/v1/
epmclouddev/epm_artifact_snapshot
username: <username>
password: <password>
filepath: Artifact Snapshot
```

#### Response

Supported Media Types: application/json

Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	<b>Possible values:</b> self or Job Status. If the value is set to Job Status, you can use the href to get the status	
data	Parameters as key value pairs passed in the request	

#### Table 9-80 Parameters

### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
    "status": -1,
    "items": null,
    "links": [{
        "rel": "self",
        "href": "https://<BASE URL>/interop/rest/v1/services/
copytoobjectstore",
        "data": null,
        "action": "POST"
    }, {
        "rel": "Job Status",
        "href": "https://<BASE URL>/interop/rest/v1/services/jobs/
1502357937045",
        "data": null,
        "action": "GET"
    }],
    "details": null
}
```

The password parameter value is clear text.

```
copyToObjectStore Sample code:
public void copyToObjectStore() throws Exception {
```

```
String filepath = "FILE NAME/FILE PATH";
String username = "USER NAME";
String url = "https://
swiftobjectstorage.<region_identifier>.oraclecloud.com/v1/<namespace>/
<bucket_name>";
String password = "PASSWORD";
String urlString = String.format("%s/interop/rest/v1/services/
copytoobjectstore", serverUrl);
String params = "url=" + url + "&userName=" + username + "&password=" +
password + "&filepath=" +filepath;
String response = executeRequest(urlString, "POST", params,
"application/x-www-form-urlencoded");
getJobStatus(fetchPingUrlFromResponse(response, "Job Status"), "GET");
}
```

## Copy to Object Store (v2)

Use the Copy to Object Store (v2) REST API to copy a file or a backup snapshot from the current cloud environment (the source) to the Oracle Object Storage Cloud (the target). You can copy any file or snapshot available in the EPM Cloud. For example, if you export data to a file, the exported file is stored in the Outbox. You can then use this API to copy the directly to Oracle Object Storage, assuming you have an account.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. This API is backwards compatible.

## Note:

The Object Storage requires an *Other Web Services Provider* type. Ensure that you have access to the Web service you are connecting. You must also have URLs for the Web service and an login details if required. For information see, Connecting to External Web Services in *Administering Planning*.

This REST API is version v2.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/v2/objectstorage/copyto

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 9-81 Tasks

Task	Request	REST Resource
<b>Trigger</b> copytoobjectstore	POST	/interop/rest/v2/objectstorage/copyto
Retrieve copytoobjectstore status	GET	/interop/rest/v2/status/jobs/777

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 9-82 Parameters

Name	Description	Туре	Required	Default
url	The URL for Oracle Cloud Object Storage, appended with the bucket name and an optional object name.	Payload	Yes	None
	This is the URL format without the object name:			
	<pre>https:// swiftobjectstorage.region_identifier.oraclecl oud.com/v1/namespace/bucket_name</pre>			
	This is the URL format with the object name: https:// swiftobjectstorage.region_identifier.oracleclou d.com/v1/namespace/bucket name/object name			
	Components of this URL:			
	<ul> <li>region_identifier is a Oracle Cloud Infrastructure hosting region.</li> </ul>			
	<ul> <li>namespace is the top-level container for all buckets and objects. Each Oracle Cloud Infrastructure tenant is assigned a unique system-generated and immutable Object Storage namespace name at account creation time. Your tenancy's namespace name, for example, axaxnpcrorw5, is effective across all regions.</li> </ul>			
	<ul> <li>bucket_name is the name of a logical container where you store your data and files. Buckets are organized and maintained under compartments. A system-generated bucket name, for example, bucket-20210301-1359 reflects the current year, month, day, and time.</li> </ul>			
	<ul> <li>object_name, optionally, is a name that you want to use for the file on Oracle Object Storage Cloud. If an object name is not specified, the file will be copied with its original name.</li> </ul>			
	For more information, see these topics in Oracle Cloud Infrastructure documentation:			
	Regions and Availability Domains			
	<ul> <li>Understanding Object Storage Namespaces</li> <li>Managing Buckets</li> </ul>			
userName	The ID of a user who has the required access rights to write to Oracle Object Storage Cloud.	Payload	Yes	None
	For users created in a federated identity provider, specify the fully-qualified name of the user (for example, exampleIdP/jdoe or exampleIdP/john.doe@example.com, where exampleIdP is the name of the federated identity provider). For other users, provide the User ID.			
password	The Swift password or auth token associated with the user. This password is not the same as the password that you use to sign into the Object Storage Console. Auth token is an Oracle-generated token that you use to authenticate with third-party APIs, for example to authenticate with a Swift client. For instructions to create this token, see To create an auth token in Oracle Cloud Infrastructure Documentation.	Payload	Yes	None

Name	Description	Туре	Required	Default
filePath	Name of the file (with path) to be copied to the Object Store. If you are copying a snapshot, do not specify the ZIP extension.	Payload	Yes	None
	Examples: Artifact Snapshot, inbox/File.txt			

## Table 9-82 (Cont.) Parameters

#### **Example URL and Payload**

# Working with Essbase

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 9-84 Working with Essbase

Task	Request	REST Resource
Export Essbase Data (v2)	POST	/interop/rest/v2/essbase/export
Essbase Block Analysis Report	POST	/interop/rest/diag/v1/services/essbaseblockanalysisreport
Get Essbase Query Governor Execution Time	GET	/interop/rest/{api_version}/config/services/ essbaseqrygovexectime
Set Essbase Query Governor Execution Time	PUT	/interop/rest/{api_version}/config/services/ essbaseqrygovexectime

## Export Essbase Data (v2)

The Export Oracle Essbase (v2) REST API exports level 0 or all data for the specified cube. Export data files are written to the Outbox directory as a zip file. You can download it using the EPM Automate downloadFile command or the Download REST API. Running an export places

the cube into read-only mode and prevents any write activity during the period of the execution of the export.

This API is version v2.

**Required Roles** 

Service Administrator

**REST Resource** 

POST /interop/rest/v2/essbase/export

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

#### Table 9-85 Parameters

Name	Description	Туре	Required	Default
cubeName	Name of the BSO or ASO cube	Payload	Yes	None
fileName	Name of a zip file in which the Essbase data will be exported. This file will be available in the outbox from where it can be downloaded.	Payload	Yes	None
level	The value is 0 or ALL, Level 0 and ALL are valid for BSO cubes. Only level 0 is valid for ASO cubes.	Payload	Yes	level=0

#### **Example URL and Payload**

https://<BASE URL>V/interop/rest/v2/ essbase/export

```
{
   "cubeName": "Plan1",
   "fileName": "Plan1Export.zip",
   "parameters": {
        "level": "0"
   }
}
```

#### Response

Supported Media Types: application/json

Attribute	Description
details	In case of errors, details are published with the error string
status	See Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible values. Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the re-export operation
data	Parameters as key value pairs passed in the request

### Table 9-86Parameters

#### **Examples of Response Body**

The following are examples of the response body in JSON format.

#### Example 1: Export is in Progress

```
{
    "details": "Essbase Database Export",
    "status": -1,
    "items": null,
    "links": [
        {
            "href": "https://<BASE URL>/interop/rest/v2/essbase/export",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": "https://<BASE URL>/interop/rest/v2/status/jobs/
19974850954170405",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    ]
}
```

#### Example 2: Export Completes Successfully

```
"data": null
}
]
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"cubeName": "Plan1","fileName": "Plan1Export.zip","parameters":{"level":
"0" }}' 'https://<BASE URL>/interop/rest/v2/essbase/export'
```

## Essbase Block Analysis Report

}

Use this REST API to create an Oracle Essbase Block Analysis Report that helps you analyze Oracle Essbase data to support the tuning of Block Storage Option (BSO) cubes (generally, used for calculations) in your application. The Essbase Block Analysis report is helpful to resolve performance issues resulting from patterns of data; for example, repeated numbers in Essbase BSO cubes.

The Essbase Block Analysis report provides information in these areas:

- **Percentage of blocks with only Zero:** Shows the blocks that contain only zeros as a percentage of all the blocks contained in the export file.
- Top 10 Repeated Numerical Cell Values By Percentage of Numerical Cells: Shows the top 10 repeated values as a percentage of all the values in the export file.
- **Top 100 Dense Member Combinations with Repeated Values:** Shows the top 100 dense combinations with repeated values in the cube. The "Cell Value" column shows a value for each member, in the order it appears in the hierarchy, as a different column. For example, if Period is across the column, there will be a different column for January, February, and so on. Other dense dimension(s) appear in the rows. This should help you identify the locations of the repeated values.

Before executing this API, use the Export Essbase Data (v2) API to export the data from the cube for which you want to create the Block Analysis report to a zip file. You may export levelo or all data as needed. Execute this API to create the Block Analysis report for this zip file. The report is created in the outbox; you can use the Download API to download it to a local computer or the Send Email (v1) or Send Email (v2) API to email it.

This API is version v1.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/diag/v1/services/essbaseblockanalysisreport

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the POST request parameters:

## Table 9-87 Parameters

Name	Description	Туре	Required	Default
exportDataFile	Name of the zip file that contains the Essbase data that was previously exported from a BSO cube	Payload	Yes	None
reportFile	Name for the HTML formatted Block Analysis Report file	Payload	Yes	None

#### Sample URL and Payload

https//<BASE URL>/interop/rest/diag/v1/services/essbaseblockanalysisreport

{"zipFilename":"essbaseexport.zip","outputFileName":"Essbase.html"}

#### Response

Supported Media Types: application/json

Name	Description
details	Detailed status of the operation performed.
status	See Migration Status Codes
links	Detailed information about the link and HTTP call type
items	Detailed information about the API
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you
	can use the href to get the status
data	Parameters as key value pairs passed in the request

#### Table 9-88 Parameters

#### Example of Response Body

```
phoenix223599.appsdev1.fusionappsdphx1.oraclevcn.com:9380/interop/rest/
diag/v1/services/essbaseblockanalysisreport,
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": http://
phoenix223599.appsdev1.fusionappsdphx1.oraclevcn.com:9380/interop/rest/
diag/v1/services/jobs/537707435156101,
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    ]
}
```

## Get Essbase Query Governor Execution Time

This API returns the Oracle Essbase Query Governor Execution Time (maximum number of seconds that a query can run before Essbase Server terminates it) of all the Essbase cubes.

This API is version v2.

#### **Required Roles**

Service Administrator

#### **REST Resource**

GET /interop/rest/{api version}/config/services/essbaseqrygovexectime

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

#### Table 9-89 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None

#### Response

Supported Media Types: application/json

Parameters	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Can be self and/or Job Status. If set to Job Status, you can use the href	
	to get the status of the import operation	
data	Parameters as key value pairs passed in the request	

#### Table 9-90 Parameters

#### Example of Response Body

```
{
    "details": null,
    "status": 0,
    "items": [
        {
             "qryexectime": "600"
        }
    ],
    "links": [
        {
            "href": "<uri>/interop/rest/v2/config/services/
essbaseqrygovexectime",
            "action": "GET",
            "rel": "self",
            "data": null

    ]
}
```

## Set Essbase Query Governor Execution Time

This API sets the Oracle Essbase Query Governor Execution Time (maximum number of seconds that a query can run before the Essbase Server terminates it) for all the Essbase cubes.

The governor value can be set to any value from 0 to 70000.

This API is version v2.

#### **Required Roles**

Service Administrator

#### **REST Resource**

PUT /interop/rest/{api\_version}/config/services/essbaseqrygovexectime

### Request

Supported Media Types: application/json

#### Table 9-91 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
qryexectime	Query Governor Execution Time Value	Payload	Yes	None

#### **Example of Request Body**

```
{
    "qryexectime": "600"
}
```

#### Response

Supported Media Types: application/json

#### Table 9-92 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href
	to get the status of the import operation
data	Parameters as key value pairs passed in the request

### Example of Response Body

```
{
    "links": [{
        "rel": "self",
        "href": "<uri>/interop/rest/v2/config/services/
essbaseqrygovexectime",
        "data": null,
        "action": "PUT"
    }],
    "details": "null",
```

"status": 0, "items": null

# Copy a File Between Instances (v1)

}

Use this API (v1) to copy a file from one environment (source) to another environment (target).

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

This API is executed on the target environment after details are provided for the source environment from which the file is to be copied. This feature gives you flexibility in copying files from one cloud environment to another.

**Prerequisites**: The password of the source EPM Cloud environment must have already been encrypted using EPM Automate. The encrypted password must then be passed as one of the parameters for the Copy File REST API. See the encrypt command in Command Reference in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud.* 

This REST API is version v1.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

**POST** /interop/rest/v1/services/copyfile

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the POST request parameters.

#### Table 9-93 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version, such as v1	Path	Yes	None
sourceFileName	Name of the file to be copied	Form	Yes	None
userName	User with access to the source instance	Form	Yes	None

## Table 9-93(Cont.) Parameters

Name	Description	Туре	Required	Default
pwd	The location and name of the file containing the encrypted password for the user. The encrypted password must then be passed as one of the parameters for the Copy File REST API. For information on encrypting and generating the password.epw file with EPM Automate, see the encrypt command in Command Reference in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.	Form	Yes	None
sourceURL	The URL of the source instance	Form	Yes	None
targetFileName	Name of the file to be copied to the target environment	Form	Yes	None

#### Response

Supported Media Types: application/json

#### Table 9-94 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{"status":-1, "items": null, "links":[{"rel":"self", "href":"https://<<BASE
URL>/interop/rest/v1/services/copyfile","data":null,"action":"POST"},
{"rel":"Job Status","href":"https://<BASE URL>/interop/rest/v1/services/jobs/
1502357937045","data":null,"action":"GET"}],"details":null
```

# Copy a File Between Instances (v2)

Use this REST API (v2) to copy a file from one environment (source) to another environment (target).

This API is executed on the target environment after details are provided for the source environment from which the file is to be copied. This feature gives you flexibility in copying files from one cloud environment to another.

**Prerequisites**: The password of the source EPM Cloud environment must have already been encrypted using EPM Automate. The encrypted password must then be passed as one of the parameters for the Copy File REST API. See the encrypt command in Command Reference in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud*.

This REST API is version v2.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

**POST** /interop/rest/v2/files/copyfrominstance

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the POST request parameters.

### Table 9-95 Parameters

Name	Description	Type Require		d Default	
sourceFileName	Name of the file to copy	Payload	Yes	None	
userName	User with the Service Administrator predefined role in the source instance	Payload	Yes	None	
pwd	The location and name of the file containing the encrypted password for the user. For information on encrypting and generating the password.epw file with EPM Automate, see the encrypt command in Command Reference in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.	Payload	Yes	None	
sourceURL	The URL of the source instance	Payload	Yes	None	

## Table 9-95(Cont.) Parameters

Name	Description	Туре	Required	Default
targetFileName	Name of the file to be copied to the target environment	Payload	Yes	None

### **Example URL and Payload**

https://<BASE URL>/interop/rest/files/copyfrominstance

```
{
   "sourceFileName": "<NAME>",
   "userName": "<USERNAME>",
   "pwd": "<PASSWORDFILE>",
   "sourceURL": "https://<BASE URL>,"
   "targetFileName": "<NAME>"
}
```

#### Response

Supported Media Types: application/json

Table 9-96	Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	null

### Example of Response Body

The following shows an example of the response body in JSON format.

```
"status": -1,
"items": null,
"links": [{
    "rel": "self",
    "href": "https://<BASE URL>/interop/rest/v2/files/copyfrominstance",
    "data": null,
    "action": "POST"
    }, {
        "rel": "Job Status",
        "href": "https://<BASE URL>/interop/rest/v2/status/jobs/
1502357937045",
        "data": null,
        "action": "GET"
```

```
}],
"details": null
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d '{"sourceFileName":"FILE_TO_BE_COPIED",
"sourceURL":"SOURCE_URL","userName":"USER_NAME","targetFileName":"TARGET_FILEN
AME","pwd":"ENCRYPTED_PASSWORD"}' 'https://<BASE_URL>/interop/rest/v2/files/
copyfrominstance'
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Clone an Environment

}

Use this REST API to clone the current environment and, optionally, identify domain artifacts (users and predefined roles), Data Management records, audit records, Job Console records, contents of the inbox and outbox, and stored snapshots.

This API is executed on the source environment after details are provided for the target environment to be cloned. It is an alternative to using the Clone Environment feature in a browser or the EPM Automate cloneEnvironment command.

**Prerequisites**: The password of the target EPM Cloud environment must have already been encrypted using EPM Automate. The encrypted password string must then be passed as one of the parameters for the Clone Environment REST API. See the encrypt command in *Working with EPM Automate for Oracle Enterprise Performance Management Cloud*.

For considerations with cloning an environment, see Cloning EPM Cloud Environments in Administering Migration for Oracle Enterprise Performance Management Cloud.

This REST API is version v1.

#### **Required Roles**

Service Administrator

Identity Domain Administrator role is required to clone users and predefined roles.

#### **REST Resource**

```
POST /interop/rest/v1/services/clone
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

Supported Media Types: <code>application/json</code>

The following table summarizes the POST request parameters.

## Table 9-97 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version, such as v1	Path	Yes	None
targetUsername	sername The ID of a Service Administrator in the target environment. If you plan to clone user and role assignments in the target environment, this user must also have the Identity Domain Administrator role.		Yes	None
targetEncryptPassw ord	The encrypted password of the user identified by targetUsername to be passed as a string.	Payload	Yes	None
	For information on encrypting and generating the password.epw file with EPM Automate, see encrypt in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.			
targetURL	The URL of the environment that will become the cloned environment	Payload	Yes	None
snapshotName	Optionally, the name of a snapshot that should be used for cloning. This snapshot must be present in the source environment.	Payload	No	Last maintena nce snapshot
migrateUsers	Whether to clone users and their predefined and application role assignments, True or False. For this option to work, the user identified by targetUsername must have the Identity Domain Administrator role in the target environment.	Payload	No	False
maintenanceStartTi me	Whether to reset the maintenance start time of the cloned environment to that of the source environment. To keep the current maintenance start time of the target environment, set this value to False.	Payload	No	True
dataManagement	Whether to clone the Data Management records of the source to the target environment for all environments other than Oracle Enterprise Data Management Cloud and Narrative Reporting, True or False.	Payload	No	True
applicationAudit	Whether to clone the application audit data in the source to the target environment for FreeForm, Planning, Planning Modules, Financial Consolidation and Close, and Tax Reporting environments, True or False. Including application audit data while cloning an environment makes the target environment keep the application audit history.	Payload	No	True
jobConsole	Whether to clone the job console data in the source to the target environment for FreeForm, Planning, Planning Modules, Financial Consolidation and Close, and Tax Reporting environments, True or False. Including job console data while cloning an environment makes the target environment keep the job console history.	Payload	No	True

## Table 9-97 (Cont.) Parameters

Name	Description	Туре	Required	Default
storedSnapshotsAnd Files	Whether to clone the contents of the inbox, outbox, and stored snapshots in the source to the target environment for all environments, True or False. Including stored snapshots and files while cloning an environment makes sure that the stored snapshots and files are not lost. This is useful especially while cloning a Classic environment to an OCI (Gen 2) environment.		No	False

#### **Example URL and Payload**

```
{
    "targetURL":"https://<BASE URL>,targetUserName":"cloneUser@oracle.com",
    "targetEncryptPassword":"<targetUserEncryptedPasswordString>",
    "parameters":{"snapshotName":"Artifact Snapshot"
    "migrateUsers":"true", "maintenanceStartTime":"true", "dataManagement":"true",
    "jobConsole":"true", "applicationAudit":"true",
    "storedSnapshotsAndFiles":"false"}
}
```

#### Response

Supported Media Types: application/json

Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status	
intermittentSta tus	Status of each step performed; can be polled regularly from the job status URL	

#### Table 9-98 Parameters

#### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{"intermittentStatus":null, "links":[{"rel":"Job Status","href":"https://
<<BASE URL>/interop/rest/v1/services/
status","data":null,"action":"GET"}],"details":null,"status":-1"items":null)
```

Java Sample - CloneEnvironment.java

Prerequisites: json.jar

Common functions: See Appendix A, Common Helper Functions for Java.

```
11
    // BEGIN - Clone Environment
    11
    public void cloneEnvironment() throws Exception {
        String targetUrl = "https://<BASE URL>";
        String targetUsername = "<Target User name>";
        String encryptedPwdString =
fetchPwdFromFile("epw file Path") ; //"<Target system encrypted password>";
        String snapshotToClone = "Artifact Snapshot";
        JSONObject params = new JSONObject();
        JSONObject payload = new JSONObject();
         //Optional parameters if not passed default values will be picked
         /*
         params.put("snapshotName", snapshotToClone);
         params.put("migrateUsers", Boolean.TRUE.toString());
         params.put("maintenanceStartTime", Boolean.TRUE.toString());
         params.put("dataManagement", Boolean.TRUE.toString());
         */
         //Mandatory parameters
         payload.put("targetURL", targetUrl);
         payload.put("targetUserName", targetUsername);
         payload.put("targetEncryptPassword", encryptedPwdString);
         payload.put("parameters", params);
     String urlString = String.format("%s/interop/rest/v1/services/clone",
serverUrl);
     String response = executeRequest(urlString, "POST", payload.toString(),
"application/json");
     getMigrationJobStatus(fetchPingUrlFromResponse(response, "Job
Status"), "GET");
private String fetchPwdFromFile(String filePath) {
        BufferedReader br = null;
        try {
           br = new BufferedReader(new FileReader(filePath));
            String line = null;
            String pwdString = null;
            while ((line = br.readLine()) != null) {
                pwdString = line;
            }
            return pwdString;
        } catch (Exception e) {
        } finally {
            if (null != br)
                try {
                    br.close();
                } catch (IOException e) {
                    // TODO Auto-generated catch block
                    e.printStackTrace();
                }
```

```
}
return null;
}
//
// END - Clone Environment
//
```

### cURL Sample - cloneEnvironment.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcCloneEnvironment() {
    url="$SERVER URL/interop/rest/v1/services/clone"
    local targetUrl="<TargetSystemURL>"
    local targetUserName="<TargetSystemUsername>"
    local targetEncryptedPassword= $(cat $EPWfilePath)
#"<TargetSystemEncryptedPasswordString>"
    #optionalParams="{\"snapshotName\":\"Artifact
Snapshot\", \"migrateUsers\":\"true\", \"maintenanceStartTime\":\"true\", \"dataM
anagement\":\"true\"}"
param="{\"targetURL\":\"$targetUrl\",\"targetUserName\":\"$targetUserName\",\"
targetEncryptPassword\":\"$targetEncryptedPassword\"}"
#, \"parameters\":\"$optionalParams\"}"
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=$(cat response.txt)
    status=$(echo $output | jq '.status')

FALSE>","dataManagement":
"<TRUE/FALSE>","jobConsole":"<TRUE/FALSE>","applicationAudit":"<TRUE/
FALSE>","storedSnapshotSAndFiles":"<TRUE/FALSE>"}'
'https://<EPM-CLOUD-BASE-URL>/interop/rest/v1/services/clone'
```

## Provide Feedback (v11.1.2.3.600)

This feedback service sends feedback or reports an issue to Oracle.

This API is version 11.1.2.3.600.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

POST /interop/rest/{api\_version}/feedback

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 9-99 Parameters

Name	Description	
details	Published in case of errors with the error string	
status	See Migration Status Codes	
items	Details about the resource	
issueRef	Feedback reference to contact Oracle support	

Name	Description
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible value: self
data	Parameters as key value pairs passed in the request

#### Table 9-99 (Cont.) Parameters

### **Example of Response Body**

Supported Media Types: application/json

The following shows an example of the response body in JSON format.

```
{
   "details":null,
   "status":0,
   "items":[{"issueRef":"UDR_default_fin_superuser_2015_09_14_11_10_18"}],
   "links":[{
        "data":null,
        "action":"POST",
        "rel":"self",
        "href":"https://<BASE_URL>/interop/rest/{api_version}/feedback"
   }]
}
```

#### Java Sample - ProvideFeedback.java

#### Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN - Provide Feedback
11
public void provideFeedback(String description) throws Exception {
   JSONObject params = new JSONObject();
   JSONObject config = new JSONObject();
    config.put("URL", serverUrl);
   params.put("configuration", config);
   params.put("description", description);
    String urlString = String.format("%s/interop/rest/%s/feedback",
serverUrl, lcmVersion);
   String response = executeRequest(urlString, "POST", params.toString(),
"application/json");
   JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        System.out.println("Feedback successful");
    } else {
        System.out.println("Error occurred: " + json.getString("details"));
    }
```

```
}
//
// END - Provide Feedback
//
```

#### cURL Sample – ProvideFeedback.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

```
Common Functions: See Common Helper Functions for cURL
```

```
funcProvideFeedback() {
    url=$SERVER URL/interop/rest/$LCM VERSION/feedback
    description=$(echo $1 | sed -f urlencode.sed)
   param="{\"configuration\":
{\"URL\":\"$SERVER URL\"},\"description\":\"$description\"}"
    funcExecuteRequest "POST" $url $param "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == 0 ]; then
        echo "Feedback successful"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

#### Groovy Sample – ProvideFeedback.groovy

#### Prerequisites: json.jar

See CSS Common Helper Functions for Groovy

```
def provideFeedback(description) {
   def url;
    JSONObject params = new JSONObject();
    try {
        JSONObject config = new JSONObject();
        config.put("URL", serverUrl)
        params.put("configuration", config);
        params.put("description", description);
        url = new URL(serverUrl + "/interop/rest/" + lcmVersion + "/
feedback");
    } catch (MalformedURLException e) {
        println "Malformed URL. Please pass valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", params.toString(), "application/
json");
    def object = new JsonSlurper().parseText(response)
    def status = object.status
    if (status == 0) {
        println "Feedback successful"
```

```
} else {
    println "Error occurred while listing files"
    if (object.details != null)
        println "Error details: " + object.details
}
```

# Provide Feedback (v2)

}

The Provide Feedback (v2) feedback service sends feedback or reports an issue to Oracle.

This API is version v2.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

**POST** /interop/rest/v2/services/feedback

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: multipart/form-data

Name	Description	Туре	Require d	Default
fileName	The name of the zip file that you want Oracle support to use to resolve the current issue.	Multipa rt	Yes	None
file	Multiple files like EPM Automate scripts or Fiddler traces required to be submitted to Oracle can be zipped altogether and uploaded.	Multipa rt	Yes	None
configuration	Details of the client, OS, URL, and description of the issue.	Multipa rt	Yes	None

### **Example URL and Payload**

```
https://<BASE URL>/interop/rest/v2/services/feedback
```

```
configuration:{"Configuration":{"Operating_System": "Windows
10","EPMAutomate_Version":"22.11.12","Java_Vendor":"Oracle Corporation",
"Java_Version":"1.8.0_341","URL":"http://
slcar287.usdv1.oraclecloud.com:12847"},"description":"Issue description"}
```

#### Response

Supported Media Types: application/json

Name	Description	
details	Published in case of errors with the error string	
status	See Migration Status Codes	
items	Details about the resource	
issueRef	Feedback reference to contact Oracle support	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Possible value: self	
data	Parameters as key value pairs passed in the request	

#### Table 9-100 Parameters

#### **Example of Response Body**

```
"details": null,
    "status": 0,
    "items": [
        {
            "issueRef":
"UDR default epm default cloud admin 2022 10 11 01 47 10"
        }
    ],
    "links": [
        {
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcx>.oraclecloud.com/interop/rest/v2/services/
feedback",
            "action": "POST",
            "rel": "self",
            "data": null
        }
    ]
}
```

#### Sample cURL Command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: multipart/form-data' -F 'fileName=abc.zip' -
F'configuration={"configuration":{"Operating_System": "Windows 10",
"EPMAutomate_Version":"22.11.12","Java_Vendor":"Oracle
Corporation","Java_Version":"1.8.0_341","URL":"https://<BASE
URL>","description":"abc"}}' -F 'file=@/
C:/Users/abc/Sample.zip' 'https://<BASE URL>/interop/rest/v2/services/
feedback'
```

# Send Email (v1)

Use the Send Mail (v1) REST API to send an email to specified recipients, optionally attaching files from EPM Cloud. You can attach any file up to 10 MB in size, other than a snapshot, that is available in EPM Cloud environments. This API can be incorporated into REST API programs and scripts to notify users of various conditions or to send reports.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the process is complete. The presence of status -1 in the response indicates that the process is in progress. Any non-zero status except -1 indicates failure.

This REST API is version v1.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/<api version>/services/sendmail

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 9-101 Tasks

Task	Request	REST Resource
Trigger sendmail	POST	/interop/rest/ <api_version>/services/sendmail</api_version>
Retrieve sendmail status	GET	/interop/rest/ <api_version>/services/jobs/777</api_version>

## Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

## Table 9-102 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
to	The recipient email addresses separated by semi-colons	Form	Yes	None
subject	The subject for the email	Form	Yes	None
body	The body of the email providing details.	Form	Yes	None
attachments	One or more file names separated by commas to be added as attachments to the email, for example, outbox/ Errorfile.txt or inbox/Errorfile2.txt You can attach any file up to 10 MB in size, other than a snapshot, that is available in EPM Cloud environments.	Form	No	None

## Sample Request Payload

```
to:abc@oracle.com
subject:EPM
body:EPM weekly email
attachments:apr/2021-08-10 11_30_25/2021-08-10 11_30_25.html
```

## Response

Table 9-103	Parameters
-------------	------------

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

## Example of Response Body

```
{
    "status": -1,
    "items": null,
    "links": [{
        "rel": "self",
        "href": "https://<BASE URL>/interop/rest/v1/services/sendmail",
```

```
"data": null,
    "action": "POST"
}, {
    "rel": "Job Status",
    "href": "https://<BASE URL>/interop/rest/v1/services/jobs/
1502357937045",
    "data": null,
    "action": "GET"
    }],
    "details": null
}
```

JobID is appended only to the API used to fetch the status of the progress.

#### Sample code:

```
public void sendMail() throws Exception {
    String to = "RECIPIENT EMAIL ADDRESS";
    String subject = "SUBJECT OF THE MAIL";
    String body = "BODY OF THE MAIL";
    String attachments = "NAME OF THE FILE TO BE ATTACHED";
    String urlString = String.format("%s/interop/rest/v1/services/sendmail",
    serverUrl);
    String params = "to=" + to + "&subject=" + subject + "&body=" + body +
    "&attachments=" +attachments;
    String response = executeRequest(urlString, "POST", params,
    "application/x-www-form-urlencoded");
    getJobStatus(fetchPingUrlFromResponse(response, "Job Status"), "GET");
}
```

## **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Send Email (v2)

Use the Send Mail (v2) REST API to send an email to specified recipients, optionally attaching files from EPM Cloud. You can attach any file up to 10 MB in size, other than a snapshot, that is available in EPM Cloud environments. This API can be incorporated into REST API programs and scripts to notify users of various conditions or to send reports.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. This API is backwards compatible.

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the process is complete. The presence of status -1 in the response indicates that the process is in progress. Any non-zero status except -1 indicates failure.

This REST API is version v2.

**Required Roles** 

**Required Roles** 

Service Administrator

**REST Resource** 

**POST** /interop/rest/v2/mails/send

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 9-104 Tasks

Task	Request	REST Resource
Trigger sendmail	POST	/interop/rest/v2/mails/send
Retrieve sendmail status	GET	/interop/rest/v2/status/jobs/777

## Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 9-105 Parameters

Name	Description	Туре	Required	Default
to	The recipient email addresses separated by semi-colons	Payload	Yes	None
subject	The subject for the email	Payload	Yes	None
body	The body of the email providing details.	Payload	Yes	None
parameters	Parameters for this REST API	Payload	No	None
attachments	One or more file names separated by commas to be added as attachments to the email, for example, outbox/ Errorfile.txt or inbox/Errorfile2.txt You can attach any file up to 10 MB in size, other than a snapshot, that is available in EPM Cloud environments.	Payload	No	None

#### Sample URL and Payload

https://<BASE URL>/interop/rest/v2/mails/send

```
{
    "to": "<EMAIL_ADDRESS>",
    "subject": "EPM",
    "body": "EPM weekly email",
```

```
"parameters": {
    "attachments":"apr/Feedback 2022-03-01 07_42_04/access_log.zip"
}
```

## Response

}

Table 9-106	Parameters
-------------	------------

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

## Example of Response Body

```
{
    "status": -1,
    "items": null,
    "links": [{
        "rel": "self",
        "href": "https://<BASE URL>/interop/rest/v2/mails/send",
        "data": null,
        "action": "POST"
    }, {
        "rel": "Job Status",
        "href": "https://<BASE URL>/interop/rest/v2/status/jobs/
1502357937045",
        "data": null,
        "action": "GET"
    }1,
    "details": null
}
```

### Sample cURL Command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d '{"subject":"SUBJECT_OF_THE_MAIL",
"to":"RECIPIENT_EMAIL_ADDRESS","body":"BODY_OF_THE_MAIL","parameters":
{"attachments":"NAME_OF_THE_FILE_TO_BE_ATTACHED"}}' 'https://<BASE_URL>/
interop/rest/v2/mails/send'
```

## **Common Functions**

See Common Helper Functions for Java

- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Skip Updates (v1)

Use the Skip Updates (v1) API to add, list, or remove a skip update request. Using this API, you can ask Oracle to skip applying a monthly update to an environment, or remove all previous skip update requests so that the environment is updated to the main code line. This allows you to skip updates to an EPM Cloud production environment at times when you need to complete time-sensitive tasks, for example, closing a quarter, without creating a service request.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

You can also list the skip update requests currently specified for an environment. You can set skip update requests for a maximum of two update cycles. You cannot skip updates for an environment that is on a one-off patch. Additionally, you cannot skip monthly updates that are more than two months apart from the update that the environment is currently on. For example, if the environment is currently on 20.12, you can skip 21.01 and 21.02 updates, but not 21.03. This gives you better control over monthly and weekly updates.

This REST API is version v1.

#### **Required Roles**

Service Administrator

#### **REST Resource**

**POST** /interop/rest/v1/services/skipupdate

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 9-107 Parameters

Name	Description	Туре	Required	Default
type	The desired action to be performed (Add, List, or Remove)	Form	Yes	None

## Table 9-107 (Cont.) Parameters

Name	Description	Туре	Required	Default
version	The version to be skipped from update, for example, 20.12	Form	No (Yes, only when the type is Add)	None
comment	The business reason for skipping an update, such as Year End	Form	No (Yes, only when the type is Add)	None

## Response

Supported Media Types: application/json

### Table 9-108 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request

## **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
   "links":[{
   "https://<BASE URL>/interop/rest/v1/services/skipupdate",
        "rel":"self",
        "data":null,
        "action":"POST"
    }
  ],
   "details":null,
   "status":0
}
```

## **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Skip Updates (v2)

Use the Skip Updates (v2) REST API to add, list, or remove a skip update request. Using this API, you can ask Oracle to skip applying a monthly update to an environment, or remove all previous skip update requests so that the environment is updated to the main code line. This allows you to skip updates to an EPM Cloud production environment at times when you need to complete time-sensitive tasks, for example, closing a quarter, without creating a service request.

You can also list the skip update requests currently specified for an environment. You can set skip update requests for a maximum of two update cycles. You cannot skip updates for an environment that is on a one-off patch. Additionally, you cannot skip monthly updates that are more than two months apart from the update that the environment is currently on. For example, if the environment is currently on 22.10, you can skip 22.11 and 22.12 updates, but not 23.01. This gives you better control over monthly and weekly updates.

This REST API is version v2.

### **Required Roles**

Service Administrator

### **REST Resource**

**POST** /interop/rest/v2/services/skipupdate

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 9-109 Parameters

Name	Description	Туре	Required	Default
type	The desired action to be performed (Add, List, or Remove)	Payload	Yes	None
version	The version to be skipped from update, for example, 22.12	Payload	No (Yes, only when the type is Add)	None
comment	The business reason for skipping an update, such as Year End	Payload	No (Yes, only when the type is Add)	None

## **Example URL and Payload**

```
https://<BASE URL>/interop/rest/v2/services/skipupdate
{
    "type":"Add",
    "parameters": {
        "version": "22.12",
        "comment": "Year end"
    }
}
```

## Response

Supported Media Types: application/json

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	null

#### Table 9-110 Parameters

## **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
   "status": 0,
   "items": null,
   "links": [{
        "rel": "self",
        "href": "https://<BASE URL>/interop/rest/v2/services/skipupdate",
        "data": null,
        "action": "POST"
   }
   "details": null
}
```

## Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d '{"type":"Add","parameters":
{"version":"22.10","comment":"Year End"}}' 'https://<BASE URL>/interop/
rest/v2/services/skipupdate'
```

## **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## List or Restore Backups - Only for OCI (Gen2) Environments

In OCI (Gen 2) environments, you can use a REST APIs to list available backup snapshots archived by Oracle in the Oracle Object Storage Cloud, or to restore an available backup snapshot archived by Oracle in the Oracle Object Storage Cloud (that is, copy it to the environment).

### Table 9-111 List or Restore Backups

Task	Request	REST Resource
List Backups - Only for OCI (Gen 2) Environments	GET	/interop/rest/v2/backups/list
Restore Backup - Only for OCI (Gen 2) Environments	POST	/interop/rest/v2/backups/restore

## List Backups - Only for OCI (Gen 2) Environments

In OCI (Gen 2) environments, you can list available backup snapshots archived by Oracle in the Oracle Object storage Cloud.

You can then restore available backup snapshots (copy them to the environment), To restore backup snapshots in OCI (Gen 2) environments, see Restore Backup. After copying the backup, you can archive it or use it to restore the current environment by yourself. With the List Backups and Restore Backup APIs, you no longer have to create a service request to request a backup from an OCI environment.

This API is version v2.

#### **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

#### **REST Resource**

GET /interop/rest/v2/backups/list

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Response

Supported Media Types: application/json

Attribute	Description
details	Published in case of errors with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible value: self
intermittentSta	Stats of each step perormed; can be polled regularly from the job status URL
tus	

## Table 9-112 Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
   "details": null,
   "links": [{
        "href": "https://<BASE URL>/interop/rest/v2/backups/list",
        "rel": "self",
        "data": null,
        "action": "GET"
   }],
   "status": 0,
   "items": ["2022-02-16T05:49:15/Artifact_Snapshot.zip",
   "2022-02-18T05:44:54/Artifact_Snapshot.zip"]
}
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

## Restore Backup - Only for OCI (Gen 2) Environments

In OCI (Gen 2) environments, you can restore an available backup snapshot archived by Oracle in Oracle Object Storage (that is, copy it to the environment).

To view available backup snapshots, see List Backups. If a backup snapshot is available, you can copy it to the current environment using the Restore Backup API.

After copying the backup, you can archive it or use it to restore the current environment by yourself. With the List Backups and Restore Backup APIs, you no longer have to create a service request to request a backup from an OCI environment.

This REST API is version v2.

## **Required Roles**

## **Required Roles**

Service Administrator

Power User assigned to the Migration Administrator Profitability and Cost Management application role

## **REST Resource**

**POST** /interop/rest/v2/backups/restore

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

Supported Media Types: application/json

The following table summarizes the POST request parameters.

## Table 9-113 Parameters

Name	Description	Туре	Required	Default
backupName	The name of the backup snapshot, as listed in the response for List Backups	Payload	Yes	None

Name	Description	Туре	Required	Default
targetName	The name of the backup snapshot, without an extension, in the target environment	Payload	No	If you do not specify this parameter, the backup snapshot is restored to the target environme nt pre- pended with the current timestamp, for example, 2022-03- 10T06:37 :48_Arti fact_Sna pshot.zi p or 2022-03- 30T06:22 :35_EPRC S_Backup .tar.gz.
				. car . 92.

## Table 9-113 (Cont.) Parameters

## **Example of Request Body**

```
{
    "backupName": "2022-02-16T21:00:02/Artifact_Snapshot_2021-12-16T21:00:02",
    "parameters": {
        "targetName": "Backup_16Dec"
    }
}
```

## Response

Supported Media Types: application/json

## Table 9-114Parameters

		المعمد
Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	

Table 9-114	(Cont.) Parameters	

Name	Description
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status of the copy snapshot
	Status of each step performed; can be polled regularly from the job status URL
tus	

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "http://<BASE URL>/interop/rest/v2/backups/restore",
            "data": null,
            "action": "POST"
        },
        {
            "rel": "Job Status",

# 10 Security REST APIs

This section describes the REST APIs to manage security features in Oracle Enterprise Performance Management Cloud.

Task	Request	REST Resource
Get Restricted Data Access	GET	/interop/rest/{api_version}/config/ services/restricteddataaccess
Set Restricted Data Access	PUT	/interop/rest/{api_version}/config/ services/restricteddataaccess
Get Virus Scan on File Upload	GET	/interop/rest/{api_version}/config/ services/virusscanonfileupload
Set Virus Scan on File Upload	PUT	/interop/rest/{api_version}/config/ services/virusscanonfileupload
Manage Permission for Manual Access to Database (v1)	PUT	<pre>/interop/rest/{api_version}/ services/dataaccess? accessType={allow  revoke}&amp;disableEmergencyAccess={tru e false}</pre>
Manage Permission for Manual Access to Database (v2)	PUT	/interop/rest/v2/services/ setmanualdataaccess
Set Encryption Key (v1)	PUT	/interop/rest/{api_version}/ services/encryptionkey
Set Encryption Key (v2)	PUT	interop/rest/v2/services/ setencryptionkey
View the IP Allowlist - Only for OCI (Gen 2) Environments	GET	/interop/rest/epmociservice/v2/ ipallowlist
Update the IP Allowlist - Only for OCI (Gen 2) Environments	POST	/interop/rest/epmociservice/v2/ ipallowlist

## Table 10-1 Security

## **Get Restricted Data Access**

The Get Restricted Data Access REST API returns *true* if the environment is configured so that "Submit Application Snapshot" cannot be selected by a Service Administrator while submitting Provide Feedback; otherwise, returns *false*.

This REST API is version v2.

### **Required Roles**

Service Administrator

### **REST Resource**

GET /interop/rest/{api\_version}/config/services/restricteddataaccess

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the GET request parameters:

### Table 10-2 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None

## Response

Supported Media Types: application/json

## Table 10-3 Parameters

Name	Description
details	Detailed status of the operation performed.
status	See Migration Status Codes
links	Detailed information about the link and HTTP call type
items	Detailed information about the API
dataAccessRestr iction	Whether the restricted data access is enabled
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request

## Example of Response Body

```
],
   "links": [
        {
            "href": "<uri>/interop/rest/v2/config/services/
restricteddataaccess",
            "action": "GET",
            "rel": "self",
            "data": null
        }
    ]
}
```

## Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -H
'Content-Type: application/json' 'https://<BASE-URL>/interop/rest/v2/config/
services/restricteddataaccess'
```

## Set Restricted Data Access

The Set Restricted Data Access REST API enables/disables the selection of "Submit Application Snapshot" by the Service Administrator while submitting Provide Feedback.

This REST API is version v2.

## **Required Roles**

Service Administrator

#### **REST Resource**

PUT /interop/rest/{api\_version}/config/services/restricteddataaccess

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the PUT request parameters:

## Table 10-4 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
dataAccessRestrict ion	Enable/Disable restricted data access; possible values are <i>true</i> and <i>false</i>	Payload	Yes	None

## **Example of Request Body**

```
{
    "dataAccessRestriction": "true"
}
```

## Response

Supported Media Types: application/json

Name	Description
details	Detailed status of the operation performed.
status	See Migration Status Codes
links	Detailed information about the link and HTTP call type
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
error	Detailed information about the error
data	Parameters as key value pairs passed in the request

## Example of Response Body

```
{
   "details": null,
   "status": 0,
   "items": null,
   "links": [
        {
            "href": "<uri>/interop/rest/v2/config/services/
restricteddataaccess",
            "action": "PUT",
            "rel": "self",
            "data": null
        }
   ]
}
```

#### Sample cURL command

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H
'Content-Type: application/json' -d '{"dataAccessRestriction":"true"}'
'https://<BASE-URL>/interop/rest/v2/config/services/restricteddataaccess'
```

## Get Virus Scan on File Upload

The Get Virus Scan on File Upload REST API returns *true* if virus scan on file upload is enabled; otherise, it returns *false*.

This API is version v2.

## **Required Roles**

Service Administrator

### **REST Resource**

GET /interop/rest/{api\_version}/config/services/virusscanonfileupload

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

## Table 10-6Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None

## Response

Supported Media Types: application/json

## Table 10-7 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
items	Detailed information about the API
scanfiles	Indicates whether the virus scan is enabled
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

## **Example of Response Body**

```
{
    "details": null,
    "links": [{
        "rel": "self",
        "href": "<uri>/interop/rest/v2/config/services/
virusscanonfileupload",
        "data": "null",
        "action": "GET"
    }],
    "status": "0",
    "items": [{
        "scanfiles": "true"
    }]
}
```

## Sample cURL command

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -H
'Content-Type: application/json' 'https://<BASE-URL>/interop/rest/v2/config/
services/virusscanonfileupload'
```

## Set Virus Scan on File Upload

The Set Virus Scan on File Upload REST API enables/disables the virus scan on a file upload.

This API is version v2.

#### **Required Roles**

Service Administrator

## **REST Resource**

PUT /interop/rest/{api\_version}/config/services/virusscanonfileupload

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

## Table 10-8 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None

## Table 10-8 (Cont.) Parameters

Name	Description	Туре	Required	Default
scanfiles	Enable/Disable virus scan	Payload	Yes	None

#### Response

Supported Media Types: application/json

#### Table 10-9 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

### Example of Response Body

```
{
    "links": [{
        "rel": "self",
        "href": "<uri>/interop/rest/v2/config/services/
virusscanonfileupload",
        "data": null,
        "action": "PUT"
    }],
    "details": "null",
    "status": 0,
    "items": null
}
```

## Sample cURL command

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"virusscan":"true"}' 'https://<BASE-URL>/interop/rest/v2/config/services/
virusscanonfileupload'
```

## Manage Permission for Manual Access to Database (v1)

Use this API (v1) to manage permission for manual access to database by Oracle.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not

require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

This gives you the ability to allow or disallow Oracle personnel to manually access your database in emergency situations when an environment is unresponsive and you have not yet created a service request to investigate the issue.

In an emergency situation, Oracle follows an internal process whereby a high-level development executive, after an independent verification process, permits manual access to the database without your explicit approval. You can also prohibit Oracle from manually accessing the EPM Cloud database, even if a service request to remedy a database issue is open.

This API is version v1.

### **Required Roles**

Service Administrator

### **REST Resource**

```
PUT /interop/rest/{api_version}/services/dataaccess?accessType={allow|
revoke}&disableEmergencyAccess={true|false}
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 10-10 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
accessType	Allow or revoke the manual access to database by Oracle, where the value can be allow or revoke	Query	Yes	None
disableEmergencyAc cess	Whether to prohibit all manual access to the database. The possible values are true and false. Setting this parameter value to true stops Oracle from manually accessing the database even if a service request is open. Oracle does not recommend setting this parameter value to true because Oracle cannot access the database if access is required to troubleshoot and fix a down environment. If the environment is down, you will not be able to issue this REST API to allow Oracle to manually access the database.	Query	No	False

### Response

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

## Table 10-11 Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
Copy
{
    "links": [1]
    0: {
        "rel":"self", "href":"https://<BASE-URL>/interop/rest/v1/services/
    dataaccess?accessType=allow&disableEmergencyAccess=true"
        "data":"null",
        "action":"PUT,
        }-
        -
        "details":"null",
        "status":"0"
}
```

## **Common Functions**

## Manage Permission for Manual Access to Database (v2)

Use this REST API (v2) to manage permission for manual access to database by Oracle.

This gives you the ability to allow or disallow Oracle personnel to manually access your database in emergency situations when an environment is unresponsive and you have not yet created a service request to investigate the issue.

In an emergency situation, Oracle follows an internal process whereby a high-level development executive, after an independent verification process, permits manual access to the database without your explicit approval. You can also prohibit Oracle from manually accessing the EPM Cloud database, even if a service request to remedy a database issue is open.

This API is version v2

## **Required Roles**

Service Administrator

## **REST Resource**

PUT /interop/rest/v2/services/setmanualdataaccess

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 10-12 Parameters

Name	Description	Туре	Required	Default
accessType	Allow or revoke the manual access to database by Oracle, where the value can be allow or revoke	Payload	Yes	None
parameters				
disableEmergencyAc cess	Whether to prohibit all manual access to the database. The possible values are true and false. Setting this parameter value to true stops Oracle from manually accessing the database even if a service request is open. Oracle does not recommend setting this parameter value to true because Oracle cannot access the database if access is required to troubleshoot and fix a down environment. If the environment is down, you will not be able to issue this REST API to allow Oracle to manually access the database.	Payload	No	False

## **Example URL and Payload**

https://<BASE URL>/interop/rest/v2/services/setmanualdataaccess

```
{
    "accessType": "Revoke",
    "parameters": {
        "disableEmergencyAccess": "False"
    }
}
```

## Response

Supported Media Types: application/json

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	null

## Table 10-13 Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
   "details": null,
   "status": 0,
   "links": [
        {
            "href": "https://<BASE-URL>/interop/rest/v2/services/
setmanualdataaccess",
            "action": "PUT",
            "rel": "self",
            "data": null
        }
   ]
}
```

#### Sample cURL command

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d '{"accessType":"Revoke","parameters":
{"disableEmergencyAccess":"True"}}' 'https://<BASE-URL>/interop/rest/v2/
services/setmanualdataaccess'
```

#### **Common Functions**

## Set Encryption Key (v1)

Provides a Bring Your Own Key (BYOK) solution to include Oracle EPM Cloud in your standard key management rotation.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not

require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

The API can be used to set and remove a user-defined encryption key for access to database used in an Oracle EPM Cloud instance.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

This API is version v1.

#### **Required Roles**

Service Administrator

#### Table 10-14 Set Encryption Key Tasks

Task	Request	REST Resource
Execute a Job	PUT	/interop/rest/{api_version}/services/ encryptionkey
Retrieve Job Status	GET	/interop/rest/v1/services/jobs/{jobID}

## **REST Resource**

PUT /interop/rest/{api\_version}/services/encryptionkey

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 10-15 Parameters

Name	Description	Туре	Required	Default
Кеу	The user-defined encryption key. If empty or no key is passed, encryption is reset.	Form	No	None

#### Response

Supported Media Types: application/json

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

## Table 10-16 Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
  "details":null,
  "status":-1,
  "links":[{
     "href":"https://<BASE-URL>/interop/rest/v1/services/encryptionkey",
     "rel":"self",
     "data":null,
     "action":"PUT"
     },{
     "href":"https://<BASE-URL>/interop/rest/v1/services/jobs/777",
     "rel":"Job Status",
     "data":null,
     "action":"GET"
   }]
}
```

### cURL Sample - setencryptionkey.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcSetEncryptionKey() {
    url=$SERVER_URL/interop/rest/v1/services/encryptionkey
    key="xcfddrerghgArfh" #use a strong key to set the encryption
key
    param="key=$key"
    funcExecuteRequest "PUT" $url $param "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == -1 ]; then
    echo "Setting Encryption Key"
    funcGetStatus "GET"
    else
    error=`echo $output | jq '.details'`
```

```
echo "Error occurred. " $error
        fi
        funcRemoveTempFiles "respHeader.txt" "response.txt"
}
funcResetEncryptionKey() {
        url=$SERVER URL/interop/rest/v1/services/encryptionkey
        param=""
        funcExecuteRequest "PUT" $url $param "application/json"
        output=`cat response.txt`
        status=`echo $output | jq '.status'`
        if [ \$ status == -1 ]; then
        echo "Resetting Encryption Key"
        funcGetStatus "GET"
        else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
        fi
        funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

```
}
```

## Set Encryption Key (v2)

The Set Encryption Key (v2) REST API provides a Bring Your Own Key (BYOK) solution to include Oracle EPM Cloud in your standard key management rotation.

The API can be used to set and remove a user-defined encryption key for access to database used in an Oracle EPM Cloud instance.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

This API is version v2.

## **Required Roles**

Service Administrator

#### **REST Resource**

PUT interop/rest/v2/services/setencryptionkey

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 10-17 Set Encryption Key Tasks

Task	Request	REST Resource
Execute a Job	PUT	/interop/rest/v2/services/setencryptionkey
Retrieve Job Status	GET	/interop/rest/v2/status/jobs/777

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 10-18 Parameters

Name	Description	Туре	Required	Default
parameters				
key	The user-defined encryption key. If empty or no key is passed, encryption is reset.	Payload	No	None

## Example URL and Payload

https://<BASE URL>/interop/rest/v2/services/setencryptionkey

{"parameters": {"key": "se!m+a2J"}}

## Response

Supported Media Types: application/json

## Table 10-19 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	null

## View or Update the IP Allowlist - Only for OCI (Gen 2) Environments

In OCI (Gen 2) environments, you can use a REST API to update or list the IP allowlist.

- Use the POST method with the action parameter set to add to add the IP addresses and Classless Inter-Domain Routings (CIDRs) to the allowlist of your environment.
- Use the POST method with the action parameter set to remove to remove the IP addresses and CIDRs from the allowlist of your environment.
- Use the GET method to list IP addresses and CIDRs in the allowlist of your environment.

## Table 10-20 IP Allowlist

Task	Request	REST Resource	
View the IP allowlist	GET	/interop/rest/epmociservice/v2/ipallowlist	
Update the IP allowlist	POST	/interop/rest/epmociservice/v2/ipallowlist	

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## View the IP Allowlist - Only for OCI (Gen 2) Environments

In OCI (Gen 2) environments, you can use a REST API to list the IP allowlist.

Use the GET method to list IP addresses and CIDRs in the allowlist of your environment.

This REST API is version v2.

### **Required Roles**

Service Administrator

### **REST Resource**

GET /interop/rest/epmociservice/v2/ipallowlist

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Response

Supported Media Types: application/json

## Table 10-21 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status.
items	List of IP addresses and CIDRs that are set as the allowlist for your environment.

## Example of Response Body

The following shows an example of the response body in JSON format.

"links": [

{

```
{
            "rel": "self",
            "href": "https://<BASE-URL>/interop/rest/epmociservice/v2/
ipallowlist",
             "data": null,
             "action": "GET"
        }
    ],
    "details": null,
    "status": 0,
    "items": [
        "ip address1/24",
        "ip address2",
        "ip address3",
        "ip address4",
        "ip address5"
    ]
}
```

## Update the IP Allowlist - Only for OCI (Gen 2) Environments

In OCI (Gen 2) environments, you can use a REST API to update the IP allowlist.

Use the POST method with the action parameter set to add to add the IP addresses and Classless Inter-Domain Routings (CIDRs) to the allowlist of your environment.

Use the POST method with the action parameter set to remove to remove the IP addresses and CIDRs from the allowlist of your environment.

This REST API is version v2.

#### **Required Roles**

Service Administrator

**REST Resource** 

**POST** /interop/rest/epmociservice/v2/ipallowlist

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the POST request parameters.

Name	Description	Туре	Required	Default
fileName	The path to a filename with a list of IP addresses and CIDRs that you want to add to or remove from the allowlist.	Payload	Yes	None
	If you want the file to be uploaded to the default location, the path is not required and you only need to specify the file name.			
	<b>Example</b> : IPList.txt			
	Each line in the file must be an IP address or CIDR in the following format:			
	xxx.xxx.xxx			
	xxx.xxx.xxx/n			
	Note:			
	<ul> <li>Only IP V4 IP addresses are supported.</li> <li>Use CIDR format, rather than individual IP addresses, to specify a continuous range of IP addresses.</li> </ul>			
action	Use add to add IP addresses and CIDRs to the allowlist of your environment.	Payload	Yes	None
	Use remove to remove IP addresses and CIDRs from the allowlist.			

## Table 10-22 Parameters

## **Examples of Request Body**

Example 1: Add to the IP Allow List

```
{
    "fileName" : "IPList.txt",
    "action" : "add"
}
```

## Example 2: Remove from the IP Allow ILst

```
{
   "fileName" : "IPList.txt",
   "action" : "remove"
}
```

## Response

Supported Media Types: application/json

## Table 10-23 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link

Name	Description
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status of the copy snapshot

## Table 10-23 (Cont.) Parameters

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "http://<BASE-URL>interop/rest/epmociservice/v2/
ipallowlist",
            "data": null,
            "action": "POST"
        },
        {
            "rel": "Job Status",
            "href": "http://<BASE-URL>/interop/rest/epmociservice/v2/status/
jobs/2126145698194859",

```
{
"details":null,
"links":[
{
    "rel":"self","href":"https://<BASE-URL>/interop/rest/v1/services/
dailymaintenance",
"data":"null",
"action":"GET"}],
"status":"0",
"items":[
{
    "amwTime":"19",
    "buildVersion":"16.10.17"}
]
```

Get Build Version and Daily Maintenance Time Sample Code

Example 11-1 Java Sample – GetMaintenanceDetails.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
//
// BEGIN
//
public void getMaintenanceDetails () throws Exception {
   String urlString = String.format("%s/interop/rest/vl/services/
```

```
dailymaintenance", serverUrl);
    String response = executeRequest(urlString, "GET", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        JSONArray fileList = json.getJSONArray("items");
        System.out.println("List of items are :");
        JSONObject jObj = null;
        for(int i=0; i<fileList.length(); i++) {</pre>
            jObj = (JSONObject)fileList.get(i);
            System.out.println("build version :" +
jObj.getString("buildVersion"));
            System.out.println("AMW time :" + jObj.getString("amwTime"));
            System.out.println("Link :" + ((JSONObject))
((JSONArray)json.getJSONArray("links")).get(0)).getString("href") + "\n");
        }
    }
}
//
// END
11
```

# Example 11-2 cURL Sample – GetMaintenanceDetails.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

```
Common Functions: See Common Helper Functions for cURL
```

```
funcGetMaintenanceDetails () {
   url=$SERVER URL/interop/rest/v1/services/dailymaintenance
    funcExecuteRequest "GET" $url
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == 0 ]; then
        echo "List of items :"
        count=`echo $output | jq '.items | length'`
        i=0
        while [ $i -lt $count ]; do
            echo "Build Version : " `echo $output | jq
'.items['$i'].buildVersion'`
            echo "AMW Time :" `echo $output | jq '.items['$i'].amwTime`
            echo "Link :" `echo $output | jq '.links[0].href'`
            echo ""
            i=`expr $i + 1`
        done
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

# Example 11-3 Groovy Sample – GetMaintenanceDetails.groovy

Prerequisites: json.jar

```
Common Functions: See CSS Common Helper Functions for Groovy
```

```
def getMaintenanceDetails () {
    def url;
    try {
            url = new URL(serverUrl + "/interop/rest/v1/services/
dailymaintenance ")
    } catch (MalformedURLException e) {
            println "Malformed URL. Please pass valid URL"
            System.exit(0);
    response = executeRequest(url, "GET", null);
    def object = new JsonSlurper().parseText(response)
    def status = object.status
   if (status == 0 ) {
       def items = object.items
        println "List of items :"
        items.each{
            println "Build Version : " + it.buildVersion
            println "AMW Time : " + it.amwTime
            println "Link : " + it.links[0].href + "\n"
        }
    } else {
        println "Error occurred while listing versions"
        if (object.details != null)
                println "Error details: " + object.details
    }
}
```

- See CSS Common Helper Functions for Groovy

# Get the Build Version and Daily Maintenance Window Time (v2)

This REST API (v2) returns information about the current build version and the scheduled daily maintenance window start time.

This API is version v2

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See About the REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# **Required Roles**

Service Administrator

#### **REST Resource**

GET /interop/rest/v2/maintenance/getdailymaintenancestarttime

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Request

The following table summarizes the request parameters.

# Table 11-4 Parameters

Name	Description	Туре	Require d	Default
showTimeZone	Displays the time in the time zone specified while setting it	Query	No	false

## **Example URL**

https://<BASE URL>/interop/rest/v2/maintenance/getdailymaintenancestarttime? showTimeZone=true

## Response

Supported Media Types: application/json

# Table 11-5 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
items	Detailed information about the API
amwTime	Scheduled start time of the daily maintenance window in 24-hour format in Etc/UTC timezone by default or in the specified time zone when the "showTimeZone" optional parameter is true.
buildVersion	Current build version
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible value: self
data	null

# Example of Response Body

The following shows an example of the response body in JSON format.

```
"details": null,
"status": 0,
"items": [
```

{

```
{
            "buildVersion": "22.09.40",
            "amwTime": "19:00",
            "timeZone": "Etc/UTC"
        }
    ],
    "links": [
        {
            "href": "https://<BASE URL>/interop/rest/v2/maintenance/
getdailymaintenancestarttime",

# Setting the Daily Maintenance Time (v1)

Use this REST API (v1) to set the daily maintenance window start time.

This topic describes the original version of this REST API. You can also use the simplified v2 version of the REST API. The v2 version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use. The v2 version is backwards compatible.

Use this REST API to set the daily maintenance window time.

# Note:

To ensure that the use of this API does not interfere with the Oracle requirement for creating backups, this API will not change the maintenance start time if the daily maintenance process did not run in the last 36 hours.

This API is version v1.

# **Required Roles**

Service Administrator

# **REST Resource**

PUT /interop/rest/{api version}/services/dailymaintenance?StartTime={N}

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See About the REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Request

The following table summarizes the request parameters.

# Table 11-6 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
StartTime	Scheduled Time (in HH:00 format using a 24 hour clock) at which the maintenance process should start and an optional time zone. Acceptable start time value range is 00:00 - 23:00. If the start time is not to be set in UTC, specify a valid standard time zone; for example, "14:00 America/ Los_Angeles" for 2:00 pm Pacific Standard Time.	Query	Yes	None

# Response

Supported Media Types: application/json

# Table 11-7 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Possible value: self
data	Parameters as key value pairs passed in the request

# Example of Response Body

The following shows an example of the response body in JSON format.

```
{
"links": [1]
0: {
"rel":"self",
"href":"https://<BASE-URL>/interop/rest/v1/services/dailymaintenance?
StartTime=23"
```

```
"data":"null",
"action":"PUT,
}-
-
"details":"null",
"status":"0"
}
```

Maintenance Window Time Sample Code

# Example 11-4 Java Sample – SetMaintenanceDetails.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN
11
public void setMaintenanceDetails () throws Exception {
    String urlString = String.format("%s/interop/rest/v1/services/
dailymaintenance?StartTime=23", serverUrl);
    String response = executeRequest(urlString, "PUT", null);
    JSONObject json = new JSONObject(response);
    int resStatus = json.getInt("status");
    if (resStatus == 0) {
        System.out.println("Updated successfully");
    }
}
11
// END
11
```

# Example 11-5 cURL Sample – SetMaintenanceDetails.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
uncSetMaintenanceDetails () {
    rl=$SERVER_URL/interop/rest/v1/services/dailymaintenance?StartTime=23
    funcExecuteRequest "PUT" $url
    output='cat response.txt'
    status='echo $output | jq '.status''
    if [ $status == 0 ]; then
        echo "Updated Successfully"
    else
        error='echo $output | jq '.details''
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

# Example 11-6 Groovy Sample – SetMaintenanceDetails.groovy

```
Prerequisites: json.jar
```

Common Functions: See CSS Common Helper Functions for Groovy

```
def setMaintenanceDetails () {

        Thread.sleep(60000);
     }
}
```

# Example 11-8 cURL Sample – SetMaintenanceDetails.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
#!/bin/sh
SERVER URL=""
USERNAME=""
PASSWORD=""
API VERSION=""
DOMAIN=""
funcSetMaintenancewithSkipNext () {
        url=$SERVER URL/interop/rest/v1/services/maintenancewindow
        skipNext="false"
        param="{\"skipNext\":\"$skipNext\"}"
        funcExecuteRequest "POST" $url $param "application/json"
        output=`cat response.txt`
        status=`echo $output | jq '.status'`
        if [ \$status == -1 ]; then
          echo "Started Daily Maintainence succesfully"
                funcGetStatus "GET"
        else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
        fi
        funcRemoveTempFiles "respHeader.txt" "response.txt"
```

}

#### Example 11-9 Groovy Sample – SetMaintenanceDetails.groovy

Prerequisites: json.jar

```
Common Functions: See CSS Common Helper Functions for Groovy
```

```
class DailyMaintenanceWithSkipNextv1 {
    def userName // PBCS user name
    def password // PBCS user password
    def serverUrl // PBCS server URL
    def lcmVersion = "v1"; // Version of the PBCS API that you are
    void runDailyMaintenanceWithSkipNext() throws Exception {
        def skipNext = "false"; //true or false based on requirement
        JSONObject params = new JSONObject();
        params.put("skipNext", skipNext);
        String urlString = String.format("%s/interop/rest/%s/services/
maintenancewindow", serverUrl, lcmVersion);
        String response = executeRequest(urlString, "POST",
params.toString(), "application/json");
        waitForCompletion(fetchPingUrlFromResponse(response, "Job Status"));
    }
}
```

# Running Daily Maintenance While Skipping the Scheduled Daily Maintenance (v2)

Use this REST API (v2) if you want to run daily maintenance with an option to skip the next scheduled daily maintenance.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See About the REST APIs. Using this REST API requires prerequisites. See Prerequisites.

This API is version v2

#### **Required Roles**

Service Administrator

**REST Resource** 

**POST** /interop/rest/v2/maintenance/rundailymaintenance

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Request

Supported Media Types: application/json

The following table summarizes the request parameters.

# Table 11-12 Parameters

Name	Description	Туре	Required	Default
skipNext	Specifies if the next scheduled daily maintenance time should be skipped, true or false	String	Yes	false

## Example URL and Payload

https://<BASE URL>/interop/rest/v2/maintenance/rundailymaintenance

#### Response

Supported Media Types: application/json

{"skipNext":"true"}

# Table 11-13 Parameters

Parameters	Description		
details	In case of errors, details are published with the error string		
status	See Migration Status Codes		
links	Detailed information about the link

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

This section describes the REST APIs to manage users, groups, and roles.

Task	Request	REST Resource
Add Users to an Identity Domain (v1)	POST	<pre>/interop/rest/security/<api_version>/ users</api_version></pre>
Add Users to an Identity Domain (v2)	POST	/interop/rest/security/v2/users/add
Remove Users from an Identity Domain (v1)	DELETE	/interop/rest/security/ <api_version>/ users?filename=<filename></filename></api_version>
Remove Users from an Identity Domain (v2)	POST	/interop/rest/security/v2/users/remove
Assign Users to a Predefined Role or Application Role (v1)	PUT	/interop/rest/security/< <i>api_version</i> >/ users
Assign Users to a Predefined Role or Application Role (v2)	PUT	/interop/rest/security/v2/role/assign/ user
Remove Users' Role Assignment (v1)	PUT	/interop/rest/security/< <i>api_version</i> >/ users
Remove Users' Role Assignment (v2)	PUT	/interop/rest/security/v2/role/ unassign/user
Add Users to a Group (v1)	PUT	/interop/rest/security/ <api_version>/ groups</api_version>
Add Users to a Group (v2)	PUT	/interop/rest/security/v2/groups/ adduserstogroup
Remove Users from a Group (v1)	PUT	/interop/rest/security/< <i>api_version</i> >/ groups
Remove Users from a Group (v2)	PUT	/interop/rest/security/v2/groups/ removeusersfromgroup
Update Users	PUT	/interop/rest/security/< <i>api_verion</i> >/ users
Add a User to a Batch of Groups	PUT	/interop/rest/security/< <i>api_version</i> >/ groups
Remove a User from a Batch of Groups	PUT	/interop/rest/security/< <i>api_version</i> >/ groups
Add Groups (v1)	POST	/interop/rest/security/< <i>api_version</i> >/ groups
Add Groups (v2)	POST	/interop/rest/security/v2/groups/add
Remove Groups (v1)	DELETE	/interop/rest/security/< <i>api_version</i> >/ groups
Remove Groups (v2)	POST	/interop/rest/security/v2/groups/remove
User Group Report (v1)	POST	/interop/rest/security/ <api_version>/ usergroupreport</api_version>
User Group Report (v2)	GET	/interop/rest/security/v2/report/ usergroupreport

Task	Request	REST Resource
User Access Report (v1)	POST	<pre>/interop/rest/{api_version}/reports? q={type:provisionreport,fileName:provre port.csv,format=simplified,usertype=ser viceusers}</pre>
User Access Report (v2)	POST	/interop/rest/v2/reports/useraccess
User Audit Report (v1)	POST	<pre>/interop/rest/{api_version}/reports? q={type:userauditreport,fileName:userau ditreport.csv,since=2017-12-10,until=20 18-06-10}</pre>
User Audit Report (v2)	POST	/interop/rest/v2/reports/useraudit
Role Assignment Report (v1)	POST	/interop/rest/security/{api_version}/ roleassignmentreport
Role Assignment Report for Users (v2)	GET	<pre>/interop/rest/security/v2/report/ roleassignmentreport/user? userlogin=<userlogin>&amp;rolename=<rolenam e=""></rolenam></userlogin></pre>
Role Assignment Report for Groups (v2)	GET	<pre>/interop/rest/security/v2/report/ roleassignmentreport/group? groupname=<groupname>&amp;rolename=<rolenam e=""></rolenam></groupname></pre>
Get Available Roles	GET	/interop/rest/security/v2/role/ getavailableroles
Role Assignment Audit Report for OCI (Gen 2) Environments	PUT	/interop/rest/security/{api_version}/ roleassignmentauditreport/
Invalid Login Report for OCI (Gen 2) Environments	PUT	/interop/rest/security/{api_version}/ invalidloginreport/
Group Assignment Audit Report	POST	/interop/rest/{api_version}/reports/ groupaudit
Adding Users to a Team for Account Reconciliation	POST	/armARCS/rest/{version}/jobs
Adding Users to a Team for Financial Consolidation and Close and Tax Reporting	POST	/HyperionPlanning/rest/{api_version}/ applications/{application}/fcmjobs
Removing Users from a Team for Account Reconciliation	POST	/armARCS/rest/{version}/jobs
Removing Users from a Team for Financial Consolidation and Close and Tax Reporting	POST	<pre>/HyperionPlanning/rest/{api_version}/ applications/{application}/fcmjobs</pre>

# Table 12-1 (Cont.) Manage Users

# Add Users to an Identity Domain (v1)

Creates a batch of users in an identity domain using an ANSI or UTF-8 encoded Comma Separated Value (CSV) file that was previously uploaded to the environment. The CSV file should not include the account of the user who executes this command. You can use the Upload REST API to upload the file. The file should be deleted after the API executes. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed. The file format is as follows:

```
First Name,Last Name,Email,User Login
Jane,Doe,jane.doe@example.com,jdoe
John,Doe,john.doe@example.com,john.doe@example.com
```

This API sends each new user an email with details about their accounts (user name and password) if resetpassword is set to true. If resetpassword is set to false, the email is not sent. If you set resetpassword to false, you should specify userpassword. Otherwise, a unique temporary password will be assigned to each user, but, because no email is sent, the passwords will not be known to the users so they will not be able to log in.

See Importing a Batch of User Accounts in *Getting Started with Oracle Cloud* for a detailed description of the CSV file format.

If a user definition in the CSV file matches a user account that exists in the identity domain, no changes will be made to the existing user account. This API creates accounts only for new users whose account information is included in the file. Because user accounts are common to all service environments that an identity domain supports, new users are available to all the environments that share the identity domain.

This API should be run only by an Identity Domain Administrator in the identity domain where users are to be created. In addition, the user running the API must also be the Service Administrator of the environment where the API is targeted.

The API is asynchronous and returns the Job ID. The presence of status -1 in the response indicates that the creation of users is in progress. Use the job status URI to determine whether the creation of users is complete. Any non-zero status except -1 indicates failure of adding users.

# Note:

This API assigns one password (value of userpassword) to all the users specified in the CSV file. Assigning the same password to all users may be desirable if you are creating users purely for testing purposes.

If you are creating real EPM Cloud users and want to assign a specific password to each user, use this API for a single user at a time. That is, specify a single user in the CSV file and provide a password for this user in the API. Then, specify the other user in the CSV file and provide a different password for this user in the API.

When you add users using this API, unlike when you add users from My Services, Oracle Cloud does not send automatic emails to each newly added user. You should manually email credentials (login name and password) to each new user. Additionally, you should force new users to change password at first login by specifying resetpassword as true.

This API is version v1.

# **Required Roles**

Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

# **REST Resource**

POST /interop/rest/security/<api\_version>/users

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 12-2 Tasks for Add Users to an Identity Domain

Task	Request	REST Resource
Add users	POST	/interop/rest/security/< <i>api_version</i> >/users
Add users status	GET	/interop/rest/security/< <i>api_version</i> >/jobs/ <jobid></jobid>

Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the POST request parameters.

# Table 12-3 Parameters

Name	Description	Туре	Required	Default
filename	The name of the uploaded ANSI or UTF-8 encoded CSV file containing the users to add, such as addUsers.csv.	Form	Yes	None
userpassword	Optionally, indicates the default password that you want to assign to all the new users who are created in the identify domain. If specified, this password must meet the minimum identity domain password requirements. If specified, the value of the user password parameter is used as the password for all users specified in the CSV file. Assigning the same password to all users may be desirable if you are creating users purely for testing purposes. If you are creating real EPM Cloud users and want to assign a specific password to each user, use this command without specifying a valid for the userpassword optional parameter.	Form	No	None
resetpassword	Optionally, indicates whether new users must change password at the first login. Unless this parameter is set to false, new users will be forced to change the password at the first login. This parameter sends each new user an email with details about their accounts (user name and password) if resetPassword is set to true.	Form	No	true
	If resetPassword is set to false, the email is not sent.			
	Note: If you set resetPassword to false, you should specify userPassword. Otherwise, a unique temporary password will be assigned to each user, but, because no email is sent, the passwords will not be known to the users, so they will not be able to log in.			

# Response

Supported Media Types: application/json

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

# Table 12-4 Parameters

# **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

# Example 1: Job is in Progress

```
{
  "links": [
   {
     "rel": "self",
     "href": "https://<BASE-URL>/interop/rest/security/<api version>/users",
     "data": {
       "jobType": "ADD USERS",
        "filename": "<filename>",
       "resetpassword": "<true|false>"
                                            },
      "action": "POST"
    },
    {
     "rel": "Job Status",
     "href": "https://<BASE-URL>/interop/rest/security/<api version>/users",
     "data": null,
     "action": "GET"
   }
 ],
 "details": null,
 "status": -1,
  "items": null
}
```

# Example 2: Job Completes with Errors

```
{
"links": [
{
```

```
"rel": "self",
    "href": "https://<BASE-URL>/interop/rest/security/<api_version>/jobs/",
    "data": null,
    "action": "GET"
    }
  ],
    "details": "Failed to add users. Input file <fileName> is not found.
Specify a valid file name.",
    "status": 1,
    "items": null
}
```

# Example 3: Job Completes without Errors

```
{
  "links": [
   {
      "rel": "self",
     "href": "https://<BASE-URL>/interop/rest/security/<api version>/jobs/",
     "data": null,
      "action": "GET"
    }
 ],
  "details": "Processed - 3, Succeeded - 2, Failed - 1.",
  "status": 0,
  "items": [
    {
    "UserName":"<USERNAME>","Error Details": "User <USERNAME> already exists.
Please provide a different user name."
    }
   1
)
```

# Java Sample Code

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java

```
public void addUsers(String fileName, String userPassword, boolean
resetPassword) {
    try {
        String url = this.serverUrl + "/interop/rest/security/
<api_version>/users";
        Map<String, String> reqHeaders = new HashMap<String, String>();
        reqHeaders.put("Authorization", "Basic " + DatatypeConverter
            .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
    Map<String, String> reqParams = new HashMap<String, String>();
    reqParams.put("filename", fileName);
    reqParams.put("userpassword", userPassword);
    reqParams.put("resetpassword", resetPassword + "");
    Map<String, String> resetResult = CSSRESTHelper.callRestApi(new
```

# Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcAddUsers() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/users"
    params="filename=$1&userpassword=$2&resetpassword=$3"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
    cssRESTAPI="AddUsers"
    statusMessage=$(funcCSSRESTHelper "POST" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
    echo $statusMessage
}
```

# **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy

```
def addUsers(fileName, resetPassword, userPassword) {
    String scenario = "Creating users in " + fileName;
    String params = "jobtype=ADD USERS&filename="+ fileName
+"&resetpassword="+ resetPassword +"&userpassword="+ userPassword;
    def url = null;
    def response = null;
    trv {
       url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
users");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", params, "application/x-www-form-
urlencoded");
    if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
   }
}
```

# Sample cURL Command Basic Auth

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -H
'Content-Type: application/x-www-form-urlencoded' -d
'filename=<CSV-FILE-NAME>&resetpassword=<TRUE/FALSE>&userpassword=<PASSWORD>'
'https://<BASE-URL>/interop/rest/security/v1/users'
```

## Sample cURL Command OAuth 2.0

```
curl -X POST --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/x-www-form-urlencoded' -d
'filename=<CSV-FILE-NAME>&resetpassword=<VALUE>&userpassword=<PASSWORD>'
'https://<BASE-URL>/interop/rest/security/v1/users'
```

# Add Users to an Identity Domain (v2)

The Add Users to an Identity Domain (v2) REST API adds users that are provided in the request payload. It sends each new user an email with details about their accounts (user name and password) if resetpassword is set to true. If resetpassword is set to false, the email is not sent. If you set resetpassword to false, you should specify userpassword; otherwise, a unique temporary password will be assigned to each user; but, because no email is sent, the users will not know that password and they will not be able to log in. If a user definition in the payload matches a user account that exists in the identity domain, no changes are made to the existing user account. This API creates accounts only for new users whose account information is provided in the payload. Because user accounts are common to all service environments that an identity domain supports, new users are available to all the environments that share the identity domain.

This API should be run only by an Identity Domain Administrator in the identity domain where users will be created. In addition, the user running the API must also be assigned a predefined role in the environment where the API is targeted. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use.

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure of adding users.

This API is version v2.

#### **Required Roles**

Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

#### **REST Resource**

```
POST /interop/rest/security/v2/users/add
```

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 12-5 Tasks for Add Users to an Identity Domain

Task	Request	REST Resource
Add users	POST	/interop/rest/security/v2/users/add

#### Request

Supported Media Types: application/json

The following table summarizes the POST request parameters.

## Table 12-6 Parameters

Name	Description	Туре	Required	Default
users	List of users to add	Payload	Yes	None

# **Example URL and Payload**

https://<BASE-URL>/interop/rest/security/v2/users/add

```
{
    "users":
    [
        {
            "firstname": "Jane",
            "lastname": "Doe",
            "email": "jane.doe@example.com",
            "userlogin": "jdoe",
            "resetpassword": true
        },
        {
            "firstname": "chris",
            "lastname": "west",
            "email": "chris.west@example.com",
            "userlogin": "chris",
            "password": "userPassword",
            "resetpassword": false
            }
    ]
}
```

# Response

Supported Media Types: application/json

Name	Description	
links	Detailed information about the link and HTTP call type	
status	<ul><li>Identifies the status of the operation</li><li>0: Operation succeeded</li><li>1: Operation failed</li></ul>	
error	Detailed information about the error	
details	Detailed status of the operation performed. Total number of records processed, succeeded, and failed and reason why they failed.	

# Table 12-7Parameters

# **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

# Example 1: Job Completes without Errors

```
{
    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/users/add",
        "action": "POST"
    },
    "status": 0,
    "error": null,
    "details": {
        "processed": 3,
        "failed": 0,
        "faileditems": null
    }
}
```

# Example 2: Job Completes with Errors

```
{
    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/users/add",
        "action": "POST"
    },
    "status": 1,
    "error": {
        "errorcode": "EPMCSS-21146",
        "errormessage": "Failed to add users. Invalid or insufficient
parameters specified. Provide all required parameters for the REST API."
    },
    "details": null
}
```

# **Example 3: Job Completes with Partial Errors**

{
 "links": {

```
"href": "https://<BASE-URL>/interop/rest/security/v2/users/add",
            "action": "POST"
    },
    "status": 0,
    "error": null,
    "details": {
        "processed": 5,
        "succeeded": 3,
        "failed": 2,
        "faileditems":
        {
                         "userlogin": "jdoe",
                         "errorcode": "EPMCSS-21150",
                         "errormessage": "Failed to add user. Invalid email
jdoe.com. Please provide a valid email."
               },
                {
                         "userlogin": "chris",
                         "errorcode": "EPMCSS-21151",
                         "errormessage": "Failed to add user. Missing
[firstname]. Please provide value: [firstname]."
                }
        1
    }
}
```

#### Sample cURL Command Basic Auth

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -H
'Content-Type: application/json' -d'{"users":
[{"firstname":"<FIRSTNAME>","lastname":"<LASTNAME>",
"email":"<EMAIL>","userlogin":"<USERLOGIN>","password":"<PASSWORD>","resetpass
word":<TRUE/FALSE>}]}'
'https://<BASE-URL>/interop/rest/security/v2/users/add'
```

# Sample cURL Command OAuth 2.0

```
curl -X POST --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/json' -d '{"users":
  [{"firstname":"<FIRSTNAME>","lastname":"<LASTNAME>",
  "email":"<EMAIL>","userlogin":"<USERLOGIN>","password":"<PASSWORD>","resetpass
word":<TRUE/FALSE>}]}
' 'https://<BASE-URL>/interop/rest/security/v2/users/add'
```

# Remove Users from an Identity Domain (v1)

Deletes the identity domain accounts identified in an ANSI or UTF-8 encoded CSV file that was uploaded to the environment. Before running this command, use the Upload REST API to upload the file. The file format is as follows:

User Login jane.doe@example.com jdoe@example.com

This API should be run only by Service Administrators who are also assigned to the Identity Domain Administrator role in the identity domain from which users are to be removed. The CSV file should not include the account of the user who executes this command. Because user accounts are common to all service environments that an Identity Domain Administrator supports, deleting an account for one environment deletes it for all environments that share the Identity Domain Administrator. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

The API is asynchronous and returns the Job ID. The presence of status -1 in the response indicates that the removal of users is in progress. Use the job status URI to determine whether the removal of users is complete. Any non-zero status except -1 indicates failure of removing users.

This API is version v1.

# **Required Roles**

Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

# **REST Resource**

DELETE /interop/rest/security/<api version>/users?filename=<filename>

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 12-8 Tasks for Remove Users from an Identity Domain

Task	Request	REST Resource
Remove users	DELETE	/interop/rest/security/ <api_version>/users?filename=<filename></filename></api_version>
Remove users status	GET	/interop/rest/security/< <i>api_version</i> >/jobs/

# Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the DELETE request parameters.

Name	Description	Туре	Required	Default
filename	The name of the uploaded ANSI or UTF-8 encoded CSV file name of a CSV file containing the login names of the users to be removed, for example, removeUsers.csv.		Yes	None

# Table 12-9Parameters

#### Response

Supported Media Types: application/json

# Table 12-10 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

# Examples of Response Body

The following examples show the contents of the response body in JSON format:

# Example 1: Job is in Progress

```
{
  "links": [
    {
     "rel": "self",
     "href": "https://<BASE-URL>/interop/rest/security/<api version>/users?
filename=<filename>",
     "data": {
        "jobType": "REMOVE USERS",
        "filename": "<filename>"
     },
      "action": "DELETE"
    },
    {
     "rel": "Job Status",

  "links": [
   {
     "rel": "self",
     "href": "https://<BASE-URL>/interop/rest/security/<api version>/jobs/",
     "data": null,
     "action": "GET"
   }
 ],
  "details": "Processed - 3, Succeeded - 1, Failed - 2.",
 "status": 0,
  "items": [
     {
          "UserName":"<USERNAME>","Error Details": "User <USERNAME> is not
found. Verify that the user exists."
   },
}
```

# Java Sample Code

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java.

```
public void removeUsers(String fileName) {
    try {
        String url = this.serverUrl + "/interop/rest/security/
<api_version>/users";
        Map<String, String> reqHeaders = new HashMap<String, String>();
        reqHeaders.put("Authorization", "Basic " + DatatypeConverter
            .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
```

```
Map<String, String> reqParams = new HashMap<String, String>();
reqParams.put("filename", fileName);
Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
                                 "DELETE");
        String jobStatus =
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, reqHeaders);
        System.out.println(jobStatus);
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
```

# Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL.

```
funcRemoveUsers() {
    url="$SERVER_URL/interop/rest/security/<api_version>/users"
    params="filename=$1"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
    cssRESTAPI="RemoveUsers"
    statusMessage=$(funcCSSRESTHelper "DELETE" "$url" "$header"
    "$USERNAME" "$PASSWORD" "$params" "$cssRESTAPI")
    echo $statusMessage
}
```

# **Groovy Sample Code**

CSS Common Helper Functions for Groovy.

```
def deleteUsers(fileName) {
    String scenario = "Deleting users in " + fileName;
    String params = null;
   def url = null;
   def response = null;
    try {
        url = new URL(serverUrl + "/interop/rest/security/<api version>/users?
filename=" + fileName);
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    response = executeRequest(url, "DELETE", null, "application/x-www-form-
urlencoded");
    if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
   }
}
```

#### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

#### Sample cURL Command Basic Auth

```
curl -X DELETE -s -u '<USERNAME>:<PASSWORD>' -H
'Content-Type: application/x-www-form-urlencoded'
'https://<BASE-URL>/interop/rest/security/v1/users?filename=<CSV-FILE-NAME>'
```

# Sample cURL Command OAuth 2.0

```
curl -X DELETE --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/x-www-form-urlencoded'
'https://<BASE-URL>/interop/rest/security/v1/users?filename=<CSV-FILE-NAME>'
```

# Remove Users from an Identity Domain (v2)

The Remove Users from an Identity Domain (v2) REST API deletes the accounts indentified in an identity domain that are provided in the request payload.

This API should be run only by a user who is assigned to the Identity Domain Administrator role in the identity domain from which users are to be removed. In addition, this user should also have a predefined role in the environment on which the API is run. The payload should not include the account of the user who executes this command. Because user accounts are common to all service environments that an identity domain supports, deleting an account for one environment deletes it for all environments that share the identity domain. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use.

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure of removing users.

This API is version v2.

#### **Required Roles**

Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

#### **REST Resource**

**POST** /interop/rest/security/v2/users/remove

Table 12-11 Tasks for Remove Users from an Identity Domain

Task	Request	REST Resource
Remove users	POST	/interop/rest/security/v2/users/remove

Request

Supported Media Types: application/json

The following table summarizes the POST request parameters.

# Table 12-12 Parameters

Name	Description	Туре	Required	Default
users	List of user login IDs of the users to remove	Payload	Yes	None

# Example URL and Payload

https://<BASE-URL>/interop/rest/security/v2/users/remove

# Response

Supported Media Types: application/json

Table 12-1	L3 Par	ameters
------------	--------	---------

Name	Description
links	Detailed information about the link and HTTP call type
status	Identifies the status of the operation
	O: Operation succeeded
	• 1: Operation failed

# Table 12-13 (Cont.) Parameters

Name	Description
error	Detailed information about the error
details	Detailed status of the operation performed. Total number of records processed, succeeded, and failed and reason for why it failed.

# **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

# Example 1: Job Completes without Errors

```
{
    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/users/
remove",
        "action": "POST"
    },
    "status": 0,
    "error": null,
    "details": {
        "processed": 2,
        "succeeded": 2,
        "failed": 0,
        "faileditems": null
    }
}
```

# **Example 2: Job Completes with Errors**

```
{
    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/users/
remove",
        "action": "POST"
    },
    "status": 1,
        "error": {
            "errorcode": "EPMCSS-21147",
            "errormessage": "Failed to remove users. Invalid or
insufficient parameters specified. Provide all required parameters for the
REST API."
        },
        "details": null
}
```

# Example 3: Job Completes with Partial Errors

```
{
    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/users/
remove",
        "action": "POST"
```

```
},
    "status": 0,
    "error": null,
    "details": {
        "processed": 5,
        "succeeded": 3,
        "failed": 2,
        "faileditems":
        ſ
        {
                         "userlogin": "jdoe",
                         "errorcode": "EPMCSS-21174",
                         "errormessage": "Failed to remove user. User jdoe
does not exist. Provide a valid userlogin."
                },
                 {
                        "userlogin": "chris",
                         "errorcode": "EPMCSS-21174",
                         "errormessage": " Failed to remove user. User chris
does not exist. Provide a valid userlogin."
                }
        ]
    }
}
```

# Sample cURL Command Basic Auth

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -H
'Content-Type: application/json' -d '{"users":[{"userlogin":"<USERLOGIN>"},
{"userlogin":"<USERLOGIN>"}]}'
'https://<BASE-URL>/interop/rest/security/v2/users/remove'
```

#### Sample cURL Command OAuth 2.0

```
curl -X POST --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/json' -d '{"users":[{"userlogin":"<USERLOGIN>"},
{"userlogin":"<USERLOGIN>"}]}'
'https://<BASE-URL>/interop/rest/security/v2/users/remove'
```

# Assign Users to a Predefined Role or Application Role (v1)

This API assigns users included in an ANSI or UTF-8 encoded CSV file to a pre-defined or application role. Use this API to assign users (including the user who invokes this API) to a pre-defined role or to assign a user with application roles.

To assign a user to an application role, that user should already have a pre-defined role assigned to them.

Use double quotation marks to enclose role names that contain space characters in the CSV file. Before using this API, use the Upload REST API to upload files to the environment. The file should be deleted after the API executes.

The file format is as follows:

```
User Login
jane.doe@example.com
jdoe
```

The API is asynchronous and returns the Job ID. The presence of status -1 in the response indicates that assigning users is in progress. Use the job status URI to determine whether the assignment of roles is complete. Any non-zero status except -1 indicates failure of assigning users. With this API, you can see which records failed and the reason why they failed, in addition to how many records passed and failed.

This API is version v1.

# **Required Roles**

# For predefined roles:

Classic environments: Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

OCI environments: Service Administrator, or Identity Domain Administrator and any predefined role (Power User, User, or Viewer)

# For application roles:

Service Administrator or Access Control - Manage

# **REST Resource**

PUT /interop/rest/security/<api version>/users

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 12-14 Tasks for Assign Users to Roles

Task	Request	REST Resource	
Assign role	PUT	/interop/rest/security/ <api_version>/users</api_version>	
Assign role status	GET	/interop/rest/security/< <i>api_version</i> >/jobs/ <jobid></jobid>	

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the PUT request parameters.

Name	Description	Туре	Required	Default	
api_version	Specific API version	Path	Yes	None	
jobtype	ASSIGN_ROLE	Form	Yes	None	
filename	The name of the ANSI or UTF-8 encoded CSV file containing the login IDs of the users whose role assignment is to be modified, such as assignRoles.csv.	Form	Yes	None	

Name	Description	Туре	Required	Default
rolename	The name of a pre-defined or application role applicable to the service. An incorrect role name will result in an error.	Form	Yes	None
	It identifies one of the following:			
	• If you are assigning users to a pre-defined identity domain role, roleName should identify a pre-defined role applicable to the service. See Understanding Predefined Roles in Getting Started with Oracle Enterprise Performance Management Cloud for Administrators.			
	<ul> <li>Acceptable values for services other than Oracle Enterprise Data Management Cloud:</li> <li>Service Administrator</li> </ul>			
	<ul> <li>Power User</li> </ul>

[{"userlogin":"<USERLOGIN>"}, {"userlogin":"<USERLOGIN>"}]}'
'https://<BASE-URL>/interop/rest/security/v2/role/assign/user'
```

# Remove Users' Role Assignment (v1)

Removes one role currently assigned to the users (including the user who invokes this API) whose login IDs are included in the ANSI or UTF-8 encoded CSV file that is used with this command. Before running this API, upload the file to the environment using the Upload REST API. The file should be deleted after the API executes. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

Use double quotation marks to enclose role names that contain the space character.

The API is asynchronous and returns the Job ID. The presence of status -1 in the response indicates that the removal of role assignments is in progress. Use the job status URI to determine whether unassigning roles is complete. Any non-zero status except -1 indicates failure of unassigning roles.

This API is version v1.

#### **Required Roles**

#### For predefined roles:

Classic environments: Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

OCI environments: Service Administrator, or Identity Domain Administrator and any predefined role (Power User, User, or Viewer)

#### For application roles:

Service Administrator or Access Control - Manage

#### **REST Resource**

PUT /interop/rest/security/<api\_version>/users

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Unassign role	PUT	/interop/rest/security/ <api_version>/users</api_version>
Unassign role status	GET	/interop/rest/security/ <api_version>/jobs/<jobid></jobid></api_version>

# Table 12-20 Tasks for Unassign Users to Roles

# Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the PUT request parameters.

# Table 12-21Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
jobtype	UNASSIGN_ROLE	Form	Yes	None
filename	The name of the ANSI or UTF-8 encoded CSV file containing the users whose role assignment is to be revoked, such as unssignRole.csv.	Form	Yes	None
	The CSV file must have been uploaded already using the Upload REST API. The CSV file should not include the account of the user who executes this command.			
	File format example:			
	User Login			
	<email></email>			
	<firstname2.lastname2></firstname2.lastname2>			

rolename	The name of a pre-defined or application role applicable to	Form	Yes	None
	the service. An incorrect role name will result in an error.		100	None
	<ul> <li>the service. An incorrect role name will result in an error.</li> <li>If you are removing users from a pre-defined role, roleName should identify a pre-defined Roles in <i>Getting Started with Oracle Enterprise Performance Management Cloud for Administrators.</i></li> <li>Acceptable values for services other than Oracle Enterprise Data Management Cloud: <ul> <li>Service Administrator</li> <li>Power User</li> <li>User (do not use Planner, which was used in earlier versions of the service)</li> <li>Viewer</li> </ul> </li> <li>Acceptable values for Oracle Enterprise Data Management Cloud: <ul> <li>Service Administrator</li> <li>Power User</li> </ul> </li> <li>User (do not use Planner, which was used in earlier versions of the service)</li> <li>Viewer</li> </ul> <li>Acceptable values for Oracle Enterprise Data Management Cloud: <ul> <li>Service Administrator</li> <li>User</li> </ul> </li> <li>If you are removing users from an application role, roleName should identify an application role listed in the assign roles tab of Access Control. Acceptable values for Oracle Planning, Oracle Planning Modules, Oracle Financial Consolidation and Close, Sales Planning, Strategic Workforce Planning, and Oracle Tax Reporting applications: <ul> <li>Approvals Administrator</li> <li>Approvals Supervisor</li> <li>Ad Hoc Grid Creator</li> <li>Ad Hoc Grid Creator</li> <li>Ad Hoc Creat Integration</li> <li>Drill Through</li> <li>Run Integration</li> <li>Manage Allocation</li> <li>Manage Poriods</li> <li>Manage Proides</li> <li>Manage Proides</li> <li>Manage Proides</li> <li>Manage Proides</li> <li>Manage Proides</li> <li>Manage Periods</li> <li>Manage Proides</li> <li>Manage Proi</li></ul></li>

    url="$SERVER_URL/interop/rest/security/$API_VERSION/users"
    params="filename=$1&jobtype=UNASSIGN_ROLE&rolename=$2"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
    cssRESTAPI="UnassignRole"
    statusMessage=$(funcCSSRESTHelper "PUT" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
    echo $statusMessage
}
```

# **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy.

```
def unassignUsersRoles(fileName, roleName) {
    String scenario = "Un-assigning users in " + fileName + " with role " +
roleName;
   String params = "jobtype=UNASSIGN ROLE&filename="+ fileName
+"&rolename="+ roleName;
    def url = null;
    def response = null;
    trv {
       url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
users");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "PUT", params, "application/x-www-form-
urlencoded");
    if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
    }
}
```

### Sample cURL Command Basic Auth

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -H'Content-Type: application/x-www-
form-urlencoded' -d
' jobtype=UNASSIGN_ROLE&filename=<CSV-FILE-NAME>&rolename=<ROLENAME>'
'https://<BASE-URL>/interop/rest/security/v1/users'
```

### Sample cURL Command OAuth 2.0

```
curl -X PUT --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H 'Content-
Type: application/x-www-form-urlencoded' -d
'jobtype=UNASSIGN_ROLE&filename=<CSV-FILE-NAME>&rolename=<ROLENAME>'
'https://<BASE-URL>/interop/rest/security/v1/users'
```

# Remove Users' Role Assignment (v2)

The Remover Users' Role Assignment (v2) REST API removes a pre-defined or application role from users provided in the REST API payload. To unassign a user from an application role, the user should exist in Oracle Enterprise Performance Management Cloud.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use.

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates that removing users from roles failed. With this API, you can see which records failed and the reason why they failed, in addition to how many records passed and failed.

This API is version v2.

#### **Required Roles**

#### For predefined roles:

Classic environments: Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

OCI environments: Service Administrator, or Identity Domain Administrator and any predefined role (Power User, User, or Viewer)

#### For application roles:

Service Administrator or Access Control - Manage

#### **REST Resource**

PUT /interop/rest/security/v2/role/unassign/user

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

                "errormessage": "Failed to unassign role. User jdoe does not
exist. Provide a valid userlogin."
            },
            {
                "userlogin": "chris",
                "errorcode": "EPMCSS-21010",
                "errormessage": "Failed to unassign role. User chris does not
exist. Provide a valid userlogin."
            }
        1
    }
}
```

# Sample cURL Command Basic Auth

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
-d '{"rolename":"<ROLENAME>","users":
```

```
[{"userlogin":"<USERLOGIN>"}, {"userlogin":"<USERLOGIN>"}]}' 'https://<BASE-
URL>/interop/rest/security/v2/role/unassign/user'
```

# Sample cURL Command OAuth 2.0

```
curl -X PUT --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H 'Content-
Type: application/json' -d '{"rolename":"<ROLENAME>","users":
[{"userlogin":"<USERLOGIN>"}, {"userlogin":"<USERLOGIN>"}]}' 'https://<BASE-
URL>/interop/rest/security/v2/role/unassign/user'
```

# Add Users to a Group (v1)

Adds a batch of users to an existing group in Access Control using an ANSI or UTF-8 encoded CSV file that was uploaded to the environment. Use the Upload REST API to upload the file. The file should be deleted after the API executes. The file format is as follows:

```
User Login
<user name>
<email>
```

# Note:

A user is added to the group only if both these conditions are met:

- User login IDs included in the file exist in the identity domain that services the environment
- The user is assigned to a pre-defined role in the identity domain

This API should be run only by a service administrator in the identity domain where users are to be added to the group.

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the assignment of users to the group is complete. The presence of status -1 in the response indicates that the addition of users to a group is in progress. Any non-zero status except -1 indicates failure of adding users. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

This API is version 1.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

```
PUT /interop/rest/security/<api version>/groups
```

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

# Table 12-26 Tasks for Add Users to Group

Task	Request	REST Resource
Add users to group	PUT	/interop/rest/security/ <api_version>/groups</api_version>
Add users to group status	GET	/interop/rest/security/< <i>api_version</i> >/jobs/ <jobid></jobid>

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

#### Table 12-27 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
jobtype	The string should have the value ADD_USERS_TO_GROUP. This value denotes that the users are being added to the group.	Form	Yes	None
filename	The name of the uploaded ANSI or UTF-8 encoded CSV file containing the users to add, such as addUsersToGroup.csv.	Form	Yes	None
	The file must have been uploaded already using the Upload REST API.			
groupname	The name of group to which the users must be added. This group must be a pre-existing group.	Form	Yes	None

#### Response

Supported Media Types: application/json

#### Table 12-28 Parameters

Name	Description	
details	In the case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status	
data	Parameters as key value pairs passed in the request	
items	Details about the resource	

# Table 12-28 (Cont.) Parameters

Name	Description	
links	Details of the first URL to be requested to get the job details; rel is "Job Details"	

# **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

        "errorcode": "EPMCSS-21022",
        "errormessage": "Failed to remove users from group. Group <groupname>
does not exist. Provide a valid groupname."
    },
    "details": null
}
```

# **Example 3: Job Completes with Partial Errors**

```
{
   "links": {
            "href": "https://<BASE-URL>/interop/rest/security/v2/groups/
removeusersfromgroup",
            "action": "PUT"
   },
    "status": 0,
    "error": null,
    "details": {
        "processed": 5,
        "succeeded": 3,
        "failed": 2,
        "faileditems":
        ſ
            {
                "userlogin": "jdoe",
                "errorcode": "EPMCSS-21032",
                "errormessage": "Failed to remove user from group. User jdoe
does not exist. Provide a valid userlogin."
            },
            {
                "userlogin": "chris",
                "errorcode": "EPMCSS-21032",
                "errormessage": "Failed to remove user from group. User chris
does not exist. Provide a valid userlogin."
           }
```

] }

#### Sample cURL command

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"groupname":"G1","users":[{"userlogin":"jdoe"}, {"userlogin":"chris"}]}'
'https://<BASE-URL>/interop/rest/security/v2/groups/removeusersfromgroup'
```

# **Update Users**

Modifies attributes such as email, first name, and last name of Oracle Enterprise Performance Management Cloud users in an identity domain using the new values identified in an ANSI or UTF-8 encoded comma-separated value (CSV) file that was uploaded to the environment. Before using this API, use the Upload REST API to upload the file. Use double quotation marks to enclose fields that contain space charaters in the CSV file. The file should be deleted after the API executes. The file format is as follows:

Firt Name, Last Name,Email, User Login
Jane,Doe,<emailAddress>,jdoe
John,Doe,<emailAddress>,<emailAddress>

This API should be run only by Service Administrators who are also assigned to the Identity Domain Administrator role in the identity domain in which users are to be updated. The CSV file should not include the account of the user who executes this command. It updates all properties of the user identified by *User Login*. Because user accounts are common to all service environments that an Identity Domain Administrator supports, updating an account for one environment updates it for all environments that share the Identity Domain.

With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

The API is asynchronous and returns the Job ID. The presence of status -1 in the response indicates that the updating of users is in progress. Use the job status URI to determine whether the process is complete. Any non-zero status except -1 indicates failure.

This API is version v1.

#### **Required Roles**

Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

#### **REST Resource**

PUT /interop/rest/security/<api verion>/users

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 12-38 Tasks for Updating Users

Task	Request	REST Resource
Update users	PUT	/interop/rest/security/ <api_verion>/users</api_verion>
Update users status	GET	/interop/rest/security/< <i>api_version</i> >/jobs/ <jobid></jobid>

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

#### Table 12-39 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
jobtype	UPDATE_USERS	Form	Yes	None
filename	The name of the uploaded ANSI or UTF-8 encoded CSV file containing the users to update, such as updateUsers.csv.	Form	Yes	None

#### Response

Supported Media Types: application/json

## Table 12-40 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

#### Examples of Response Body

The following examples show the contents of the response body in JSON format:

#### Example 1: Job is in Progress

```
{
    "links": [
        {
            "rel": "self",
            "href": " https://<BASE-URL>/interop/rest/security/<api version>/
users",
            "data": {
                "jobType": "UPDATE USERS",
                "filename": "<filename>"
            },
            "action": "UPDATE"
        },
        {
            "rel": "Job Status",
            "href": " https://<EPM-CLOUD-BASE-URL>/interop/rest/security/
<api version>/jobs/<jobID>",
            "data": null,
            "action": "GET"
        }
    ],
    "details": null,
    "status": -1,
    "items": null
}
```

#### Example 2: Job Completes with Errors

```
{
"links": [
{
    "rel": "self",
    "href": "https://<BASE-URL>/interop/rest/security/
<api_version>/jobs/",
    "data": null,
    "action": "GET"
}
],
"details": "Failed to update users. Input file <filename> not found. Specify
a valid file name.",
    "status": 1,
    "items": null
}
```

# Example 3: Job Completes without Errors

```
{
"links": [
{
"rel": "self",
"href": "https://<BASE-URL>/interop/rest/security/
<api_version>/jobs/",
"data": null,
"action": "GET"
```

#### Java Sample Code

```
Prerequisites: json.jar
Common Functions: See: CSS Common Helper Functions for Java
    public void updateUsers(String fileName) {
        try {
            String url = this.serverUrl + "/interop/rest/security/" +
apiVersion + "/users";
            Map<String, String> reqHeaders = new HashMap<String, String>();
            reqHeaders.put("Authorization", "Basic " + DatatypeConverter
                    .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
            Map<String, String> reqParams = new HashMap<String, String>();
            reqParams.put("filename", fileName);
            reqParams.put("jobtype", "UPDATE USERS");
            Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
                    "PUT");
            String jobStatus =
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, reqHeaders);
            System.out.println(jobStatus);
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
```

#### Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcUpdateUsers() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/users"
    params="filename=$1&jobtype=UPDATE_USERS"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
    cssRESTAPI="UpdateUsers"
    statusMessage=$(funcCSSRESTHelper "PUT" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
```

```
echo $statusMessage
}
Groovy Sample Code
Common Functions: See CSS Common Helper Functions for Groovy
def updateUsers(fileName) {
    String scenario = "Updating users from " + fileName ;
    String params = "jobtype=UPDATE USERS&filename="+ fileName;
    def url = null;
    def response = null;
    trv {
       url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
users");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "PUT", params, "application/x-www-form-
urlencoded");
   if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
   }
}
```

# Sample cURL Command Basic Auth

```
curl -X PUT -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/x-www-
form-urlencoded' -d
'jobtype=UPDATE_USERS&filename=<CSV-FILE-NAME>' 'https://<BASE-URL>/interop/
rest/security/v1/users'
```

# Sample cURL Command OAuth 2.0

```
curl -X PUT --header "Authorization: Bearer <OAUTH_ACCESS_TOKEN>" -H
'Content-Type: application/x-www-form-urlencoded' -d
'jobtype=UPDATE_USERS&filename=<CSV-FILE-NAME>'
'https://<BASE-URL>/interop/rest/security/v1/users'
```

# Add a User to a Batch of Groups

Adds an existing user to a batch of groups in Access Control using an ANSI or UTF-8 encoded CSV file that was uploaded to the environment. Use the Upload REST API to upload the file. The file should be deleted after the API executes. With this API, you can see which records

failed and the reason why they failed in addition to how many records passed and failed. The file format is as follows:

Group Name GroupA GroupB

The user is added to the groups only if these conditions are met:

- · The user must exist in the identity domain that services the environment
- The user must be assigned to a pre-defined role in the identity domain
- The groups provided must exist in Access Control and must not be pre-defined groups

Additionally, the user running this API must be authorized to perform this action. This API should be run only by a service administrator in the environment where the user is to be added to the groups.

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the assignment of a user to the groups is complete. The presence of status -1 in the response indicates that the addition of a user to groups is in progress. Any non-zero status except -1 indicates failure of adding a user.

This API is version v1.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

PUT /interop/rest/security/<api\_version>/groups

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 12-41 Tasks for Adding a User to a Batch of Groups

Task	Request	REST Resource
Add a user to groups	PUT	/interop/rest/security/ <api_version>/groups</api_version>
Add a user to groups status	GET	/interop/rest/security/ <api_version>/jobs/<jobid></jobid></api_version>

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
jobtype	The string should have the value ADD_USER_TO_GROUPS. This value denotes that the user is being added to the groups.	Form	Yes	None
filename	The name of the uploaded ANSI or UTF-8 encoded CSV file containing the groups to add the user to, such as addUserToGroups.csv.	Form	Yes	None
	The file must have been uploaded already using the Upload REST API.			
	File format example:			
	Group Name GroupA GroupB			
username	The name of the user to add to the provided list of groups. This user must already exist.	Form	Yes	None

## Response

Supported Media Types: application/json

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

# Remove a User from a Batch of Groups

Removes a user from a batch of groups listed in an ANSI or UTF-8 encoded CSV file maintained in Access Control. You can use the Upload REST API to upload the file to the environment. The file format is as follows:

Group Name GroupA GroupB

A user is removed from groups only if these conditions are met:

- The user must exist in the identity domain that services the environment
- The user must be assigned to a pre-defined role in the identity domain
- The groups provided must exist in Access Control and must not be pre-defined groups

Additionally, the user running this API must be authorized to perform this action. This API should be run only by a service administrator in the environment where a user is to be removed from the groups. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

The presence of status -1 in the response indicates that the removal in progress. Use the job status URI to determine whether the removal is complete. Any non-zero status except -1 indicates failure.

This API is version v1.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

PUT /interop/rest/security/<api\_version>/groups

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 12-44 Tasks for Remove a User from a Batch of Groups

Task	Request	REST Resource
Remove a user from groups	PUT	/interop/rest/security/< <i>api_version</i> >/groups
Remove a user from groups status	GET	/interop/rest/security/ <api_version>/jobs/<jobid></jobid></api_version>

# Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

# Table 12-45 Parameters

Name	Description	Туре	Required	Default

# Add Groups (v1)

Adds groups in Access Control using an ANSI or UTF-8 encoded CSV file that was uploaded to the environment. Use the Upload REST API to upload the file. The file should be deleted after the API executes. The file format is as follows:

Group Name, Description GroupA, GroupADescription GroupB, GroupBDescription

The user running this API must be authorized to perform this action. This API should be run only by a service administrator in the environment where groups are to be added. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether adding groups is complete. The presence of status -1 in the response indicates that the addition is in progress. Any non-zero status except -1 indicates failure of adding a group.

This API is version v1.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

**POST** /interop/rest/security/<api version>/groups

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Create groups	POST	/interop/rest/security/ <api_version>/groups</api_version>
Create groups status	GET	/interop/rest/security/< <i>api_version</i> >/jobs/ <jobid></jobid>

#### Table 12-47 Tasks for Adding a Batch of Groups

# Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

#### Table 12-48 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
filename	The name of the uploaded ANSI or UTF-8 encoded CSV file containing the groups to add, such as addGroups.csv.	Form	Yes	None
	The file must have been uploaded already using the Upload REST API.			
	File format example:			
	Group Name, Description			
	GroupA, GroupADescription			
	GroupB, GroupBDescription			

#### Response

Supported Media Types: application/json

# Table 12-49 Parameters

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request
items	Details about the resource
links	Details of the first URL to be requested to get the job details; rel is "Job Details"

#### Examples of Response Body

The following examples show the contents of the response body in JSON format:

### Example 1: Job is in Progress

```
{
    "links": [
        {
            "href": "http://<BASE-URL>/interop/rest/security/<api version>/
groups",
            "rel": "self",
            "data": {
                "jobType": "ADD GROUPS",
                "filename": "<filename>"
            },
            "action": "POST"
        },
        {
            "href": "http://<BASE-URL>/interop/rest/security/<api version>/
jobs/<jobId ",
            "rel": "Job Status",
            "data": null,
            "action": "GET"
        }
    ],
    "status": -1,
    "details": null,
    "items": null
}
```

### **Example 2: Job Completes with Errors**

```
{
    "links": [
        {

groups",
            "rel": "self",
            "data": {
                "jobType": "ADD GROUPS",
                "filename": ""
            },
            "action": "POST"
        }
   ],
    "status": 1,
    "details": "EPMCSS-20671: Failed to create groups. Invalid or
insufficient parameters specified. Provide all required parameters for the
REST API. ",
    "items": null
}
```

# Example 3: Job Completes without Errors

```
"action": "GET",
            "href": " http://<BASE-URL>/interop/rest/security/<api version>/
jobs/<jobId>",
            "rel": "self"
        }
    ],
    "status": 0,
    "details": "Processed - 4, Succeeded - 3, Failed - 1. ",
   "items": [
    {
        "GroupName":"<GROUPNAME>","Error Details": "Failed to create a group
with the name <GROUPNAME>. This group already exists in the system. Provide a
different group name."
     }
   1
}
```

#### Java Sample Code

Prerequisites: json.jar

Common Functions: See: CSS Common Helper Functions for Java

```
public void addGroups(String fileName) {
        try {
            String url = this.serverUrl + "/interop/rest/security/" +
apiVersion + "/groups";
            Map<String, String> reqHeaders = new HashMap<String, String>();
            reqHeaders.put("Authorization", "Basic " + DatatypeConverter
                    .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
            Map<String, String> reqParams = new HashMap<String, String>();
            reqParams.put("filename", fileName);
           Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
                    "POST");
            String jobStatus =
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, reqHeaders);
            System.out.println(jobStatus);
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
```

#### Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcAddGroups() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/groups"
    params="filename=$1"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
```

```
cssRESTAPI="addGroups"
statusMessage=$(funcCSSRESTHelper "POST" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
echo $statusMessage
}
```

#### **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy

```
def addGroups(fileName) {
    String scenario = "Creating Groups in " + fileName;
    String params = "filename="+ fileName;
    def url = null;
    def response = null;
    try {
        url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
groups");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", params, "application/x-www-form-
urlencoded");
    if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
    }
}
```

# Add Groups (v2)

The Add Groups (v2) REST API adds groups that are provided in the request payload. These groups can be viewed in Access Control.

This topic describes the simplified v2 version of this REST API. This version contains all parameters in the payload and does not require URL encoding while calling the REST APIs. This makes the v2 API easier to use.

The user running this API must be authorized to perform this action. This API should be run only by a Service Administrator in the environment where groups are to be added. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure of adding groups.

This API is version v2.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

**POST** /interop/rest/security/v2/groups/add

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 12-50 Tasks for Add Users to Group

Teek	Deguest	
Task	Request	REST Resource
Add groups	POST	/interop/rest/security/v2/groups/add
	Request	
	Supported Mec	lia Types: application/json

The following table summarizes the POST request parameters.

# Table 12-51 Parameters

Name	Description	Туре	Required Default	
groups	List of groups to add.	Payload	Yes	None

#### **Example URL and Payload**

https://<BASE-URL>/interop/rest/security/v2/groups/add

```
{
    "groups":
    [
        {
            "groupname": "GroupA",
            "description": "GroupADescription"
        },
        {
            "groupname": "GroupB",
            "description": "GroupBDescription"
        }
    ]
}
```

#### Response

Supported Media Types: application/json

Name	Description
links	Detailed information about the link and HTTP call type
status	Identifies the status of the operation
	0 - Operation succeeded
	• 1 - Operation failed
error	Detailed information about the error
details	Detailed status of the operation performed. Total number of records processed, succeeded, and failed, and the reason for why they failed.

#### **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

#### Example 1: Job Completes without Errors

```
{
    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/groups/add",
        "action": "POST"
    },
    "status": 0,
    "error": null,
    "details": {
        "processed": 2,
        "failed": 0,
        "faileditems": null
    }
}
```

#### Example 2: Job Completes with Errors

```

    "links": {
        "href": "https://<BASE-URL>/interop/rest/security/v2/groups/add",
        "action": "POST"
    },
    "status": 1,
    "error": {
        "errorcode": "EPMCSS-21119",
        "errormessage": "Failed to add groups. Invalid or insufficient
parameters specified. Provide all required parameters for the REST API."
    },
    "details": null
}
```

#### **Example 3: Job Completes with Partial Errors**

```
{
    "links": {
            "href": "https://<BASE-URL>/interop/rest/security/v2/groups/add",
            "action": "POST"
    },
    "status": 0,
    "error": null,
    "details": {
        "processed": 5,
        "succeeded": 3,
        "failed": 2,
        "faileditems":
        ſ
        {
                         "groupname": "GroupA",
                         "errorcode": "EPMCSS-21140",
                         "errormessage": "Failed to add group. Group already
exists in System. Provide different group name."
               },
                {
                         "groupname": "GroupB",
                         "errorcode": "EPMCSS-21140",
                         "errormessage": "Failed to add group. Group already
exists in System. Provide different group name."
                }
        1
    }
}
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"groups":[{"groupname":"GroupA","description":"GroupADescription"},
{"groupname":"GroupB","description":"GroupBDescription"}]}'
'https://<BASE-URL>/interop/rest/security/v2/groups/add'
```

# Remove Groups (v1)

Removes groups listed in an ANSI or UTF-8 encoded CSV file maintained in Access Control. You can use the Upload REST API to upload the file to the environment. The file format is as follows:

Group Name GroupA GroupB

The user running this API must be authorized to perform this action. This API should be run only by a service administrator in the environment where a group is to be removed.

The presence of status -1 in the response indicates that the removal in progress. Use the job status URI to determine whether the removal is complete. Any non-zero status except -1

indicates failure. With this API, you can see which records failed and the reason why they failed in addition to how many records passed and failed.

This API is version v1.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

DELETE /interop/rest/security/<api\_version>/groups

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 12-53 Tasks for Remove Groups

        ſ
        {
                        "groupname": "GroupA",
                        "errorcode": "EPMCSS-21125",
                        "errormessage": "Failed to remove group. GroupA
does not exist. Provide a valid groupname."
                },
                {
                       "groupname": "GroupB",
                        "errorcode": "EPMCSS-21125",
                        "errormessage": "Failed to remove group. Group GroupB
does not exist. Provide a valid groupname."
                }
        ]
    }
}
```

#### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
```

'{"groups":[{"groupname":"GroupA"},{"groupname":"GroupB"}]}' 'https://<BASE-URL>/interop/rest/security/v2/groups/remove'

# User Group Report (v1)

Generates a User Group Report of users in the system and writes the report to the filename provided. This report lists the direct or indirect membership of users assigned to the group. It can be downloaded using the Download API.

The report indicates whether the user assignment to group is direct (as member of a group) or indirect (as member of a group that is a child of a nested group). The report identifies the user's login name, first name, last name, email address, assigned group, and type of assignment in the following format. It is identical to the CSV version of the report created from the User Group Report tab in Access Control.

For example, assume that user jdoe is a member of group Test1, which is a child of nested group Test2. In this scenario, the report will display the following information for jdoe:

User, First Name, Last Name, Email, Direct, Group

jdoe, John, Doe, jdoe@example.com, Yes, test1

jdoe, John, Doe, jdoe@example.com, No, test2

This is an asynchronous job and returns the Job ID.

This API is version v1.

## **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- · Any predefined role and the Access Control View application role

## **REST Resource**

POST /interop/rest/security/<api version>/usergroupreport

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 12-59 Tasks for User Group Report

Task	Request	REST Resource
User Group Report	POST	
		/interop/rest/security/ <api version="">/usergroupreport</api>

Task	Request	REST Resource
User Group Report Status	GET	/interop/rest/security/ <api_version>/jobs/<jobid></jobid></api_version>

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

## Table 12-60Parameters

Name	Description	Туре	Required	Default
api_version	The specific API version, v1	Path	Yes	None
filename	The name of the file where the report is to be populated, such as userGroupReport.csv.	Form	Yes	None

### Response

Supported Media Types: application/json

### Table 12-61 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

## **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

# Example 1: Job is in Progress

```
{
   "details": null,
   "links": [
      {
        "href": "https://<BASE-URL>/interop/rest/security/<api_version>/
        usergroupreport",
        "rel": "self",
        "data": {
            "jobType": "GENERATE_USER_GROUP_REPORT",
            "intervalue")
```

## **Example 2: Job Completes with Errors**

# Example 3: Job Completes without Errors

```
{
   "details": null,
   "links": [
        {
         "href": "https://<BASE-URL>/interop/rest/security/<api_version>/
        jobs/<jobid>",
                                "rel": "self",
                              "data": null,
                             "action": "GET"
        }
        j,
        "status": 0,
        "items": null
}
```

## Java Sample Code

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN
11
public void generateUserGroupReport(String fileName) {
        try {
            String url = this.serverUrl + "/interop/rest/security/" +
apiVersion + "/usergroupreport";
            Map<String, String> reqHeaders = new HashMap<String, String>();
            reqHeaders.put("Authorization", "Basic " + DatatypeConverter
                    .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
            Map<String, String> reqParams = new HashMap<String, String>();
            regParams.put("filename", fileName);
           Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
                    "POST");
            String jobStatus =
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, regHeaders);
            System.out.println(jobStatus);
        } catch (Exception e) {
            e.printStackTrace();
        }
// END
//
```

### Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcGenerateUserGroupReport() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/usergroupreport"
    params="filename=$1"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
    cssRESTAPI="generateUserGroupReport"
    statusMessage=$(funcCSSRESTHelper "POST" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
    echo $statusMessage
}
```

# Groovy Sample Code

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Groovy

```
def generateUserGroupReport(fileName) {
   String scenario = "Generating User Group Report in " + fileName;
   String params = "jobtype=GENERATE_USER_GROUP_REPORT&filename="+ fileName;
```

```
def url = null;
def response = null;
try {
    url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
usergroupreport");
} catch (MalformedURLException e) {
    println "Please enter a valid URL"
    System.exit(0);
}
response = executeRequest(url, "POST", params, "application/x-www-form-
urlencoded");
if (response != null) {
    getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
}
```

### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# User Group Report (v2)

Generates a User Group Report for users in the system.

This report lists the direct or indirect membership of users assigned to the group. You can create a query for a specific user or a group or a combination of users and groups.

The report indicates whether the user assignment to an EPM group is direct (as member of a group) or indirect (as member of a group that is a child of a nested group). The report identifies the user's login name, first name, last name, email address, assigned group, and type of assignment.

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure in generating a User Group Report.

This API is version v2.

### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

## **REST Resource**

GET /interop/rest/security/v2/report/usergroupreport?
userlogin=<userlogin>&groupname=<groupname>

	Table 12-62	Tasks for User Gro	oup Report
--	-------------	--------------------	------------

Task	Request	REST Resource
User Group	GET	/interop/rest/security/v2/report/usergroupreport?
Report		userlogin=< userlogin>&groupname= <groupname></groupname>

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 12-63 Request Parameters

Name	Description	Туре	Required	Default
userlogin	Generate usergroupreport for the specified user.	Query	No	The report is created for all users.
groupname	Generate usergroupreport for the users belonging to the specified group name.	Query	No	The report is created for all groups.

#### Response

Supported Media Types: application/json

### Table 12-64 Response Parameters

Parameters	Description
links	Detailed information about the link
status	<ul><li>Status of the operation</li><li>0: Operation succeeded</li><li>1: Operation failed</li></ul>
error	Detailed information about the error
details	Records matching the request

## Examples of Response Body

The following show examples of the response body in JSON format.

# Example 1: REST API Issued without userlogin and groupname Query Parameters Completes without Errors

```
{
   "links": {
    "href": " https://<BASE-URL>/interop/rest/security/v2/report/
```

```
usergroupreport",
    "action": "GET"
 },
 "status": 0,
  "error": null,
  "details": [
    {
      "userlogin": "Jade",
      "firstname": "Jade",
      "lastname": "Clark",
      "email": "jade.clark@example.oracle.com",
      "groups": [
        {
          "direct": "Yes",
          "groupname": "Interactive User"
        },
        {
          "direct": "No",
          "groupname": "Strategic Planner"
        }
      ]
    },
    {
      "userlogin": "Jeff",
      "firstname": "Jeff",
      "lastname": "Clark",
      "email": "jeff.clark@discard.oracle.com",
      "groups": [
        {
          "direct": "Yes",
          "groupname": "Analyst"
        },
        {
          "direct": "No",
          "groupname": "Strategic Planner"
        }
      ]
    }
 ]
}
```

## Example 2: REST API Issued with userlogin and groupname Query Parameters Completes without Errors

```
{
   "links": {
    "href": " https://<BASE-URL>/interop/rest/security/v2/report/
usergroupreport? userlogin='Jade'&groupname='Interactive User'",
    "action": "GET"
   },
   "status": 0,
   "error": null,
   "details": [
    {
        "userlogin": "Jade",
        "userlogin": "Jade",
        "
}
```

```
"firstname": "Jade",
"lastname": "Clark",
"email": "jade.clark@example.oracle.com",
"groups": [
        {
            "direct": "Yes",
            "groupname": "Interactive User"
        }
    ]
}
```

}

Example 3: REST API Issued Only with a userlogin Query Parameter Completes without Errors

```
{
  "links": {
    "href": " https://<BASE-URL>/interop/rest/security/v2/report/
usergroupreport?userlogin='Jade'",
    "action": "GET"
 },
 "status": 0,
  "error": null,
  "details": [
    {
      "userlogin": "Jade",
      "firstname": "Jade",
      "lastname": "Clark",
      "email": "jade.clark@example.oracle.com",
      "groups": [
        {
          "direct": "Yes",
          "groupname": "Interactive User"
        },
        {
          "direct": "No",
          "groupname": "Strategic Planner"
        }
      ]
    }
 1
}
```

Example 4: REST API Issued Only with a groupname Query Parameter Completes without Errors

```
{
   "links": {
    "href": " https://<BASE-URL>/interop/rest/security/v2/report/
usergroupreport?groupname='Strategic Planner'",
    "action": "GET"
   },
   "status": 0,
   "error": null,
```

```
"details": [
   {
      "userlogin": "Jade",
      "firstname": "Jade",
      "lastname": "Clark",
      "email": "jade.clark@example.oracle.com",
      "groups": [
         {
          "direct": "No",
          "groupname": "Strategic Planner"
        }
     ]
    },
    {
     "userlogin": "Jeff",
      "firstname": "Jeff",
      "lastname": "Clark",
      "email": "jeff.clark@example.oracle.com",
      "groups": [
        {
          "direct": "No",
          "groupname": "Strategic Planner"
        }
     ]
    }
 ]
}
```

## Example 5: Job Completes with Errors

```
{
   "links": {
    "href": " https://<BASE-URL>/interop/rest/security/v2/report/
usergroupreport",
    "action": "GET"
   },
   "status": 1,
   "error": {
        "error": {
            "errormessage": "Failed to generate User Group Report. Authorization
failed. Please provide valid authorized user."
    },
    "details": null
}
```

### Sample cURL Commands

### Sample cURL command using Basic Auth

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/report/usergroupreport'
```

curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/report/usergroupreport?
userlogin=< userlogin>&groupname=<groupname>

### Sample cURL command using oAuth

```
curl --location --request GET 'https://<BASE-URL>/interop/rest/security/v2/
report
/usergroupreport' --header "Authorization: Bearer <OAUTH_TOKEN>"
```

```
curl --location --request GET 'https://<EPM-CLOUD-BASE-URL>/interop/rest/
security/v2/report
/usergroupreport/?userlogin=< userlogin>&groupname=<groupname>' --header
"Authorization: Bearer <OAUTH TOKEN>"
```

# User Access Report (v1)

Generates an access report of users in the system and writes the report to the filename provided. This report can then be downloaded using the download command.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

This API is version v1.

#### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

#### **REST Resource**

```
POST /interop/rest/{api_version}/reports?
q={type:provisionreport,fileName:provreport.csv,format:simplified,usertype,servic
eusers}
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 12-65	Tasks for	User	Access	Report
-------------	-----------	------	--------	--------

Task	Request	REST Resource
User Access Report	POST	<pre>/interop/rest/{api_version}/reports? q={type:provisionreport,fileName:provreport.csv,format:s implified,usertype:serviceusers}</pre>

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 12-66 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
fileName	File where report is to be populated	Query	Yes	None
type	Type of report being generated: provisionreport	Query	Yes	None
format	The format of the csv file, classic or simplified	Query	No	classic
usertype	Wheter to generate the report only for Identity Domain Administrators, IDAdmins or ServiceUsers	Query	No	ServiceU sers

### Response

Supported Media Types: application/json

### Table 12-67 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

## Example of Response Body

The following shows an example of the response body in JSON format.

## Example 1: Job is in Progress

```
{
    "links": [
        {
            "rel": "self",
            "href": "https://<BASE-URL>/interop/rest/{api_version}/reports?
q={type=provisionreport,fileName=provreport.csv,format=simplified,usertype=ser
```

```
viceusers}",
    "data": null,
    "action": "POST"
    },
    {
        "rel": "Job Status",
        "href": "https://<BASE-URL>/interop/rest/v1/reports/
3180399797144693",
        "data": null,
        "action": "GET"
     }
    ],
    "status": -1,
    "details": null
}
```

### Java Sample – ProvisionReport.java

Prerequisites: json.jar

Common Functions: See Common Helper Functions for Java

```
11
// BEGIN
11
public void provisionReport (String fileName, String type) throws Exception {
    JSONObject params = new JSONObject();
   params.put("fileName",java.net.URLEncoder.encode(fileName));
   params.put("type", java.net.URLEncoder.encode(type));
   params.put("format", "simplified");
    params.put("usertype", "usertype", "serviceusers"));
   String urlString = String.format("%s/interop/rest/%s/reports?q=%s",
serverUrl, lcmVersion, params.toString());
   String response = executeRequest(urlString, "POST", params.toString(),
"application/x-www-form-urlencoded");
   getJobStatus(fetchPingUrlFromResponse(response, "Job Status"), "GET");
}
11
// END
11
```

## cURL Sample - provisionreport.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcProvisionReport () {
    url=$SERVER_URL/interop/rest/$LCM_VERSION/reports/
    param=$ (echo
"q={type:$reporttype,fileName:$fileName,format:$mode,usertype:$usertype}" |
sed -f urlencode.sed)
    url=$url?$param
```

```
funcExecuteRequest "POST" $url $param "application/json"
    output='cat response.txt'
    status='echo $output | jq '.status''
if [ $status == -1 ]; then
    echo "copying snapshot in progress"
    funcGetStatus "GET"
else
    error='echo $output | jq '.details''
    echo "Error occured. " $error
fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
```

### Groovy Sample – provisionreport.groovy

Prerequisites: json.jar

}

Common Functions: See CSS Common Helper Functions for Groovy

```
def provisionReport (fileName, type) {
        def url;
                                   JSONObject param = new
JSONObject();
        try {
            param.put("fileName", fileName);
            param.put("type",type);
            param.put("format",mode);
            param.put("usertype", usertype);
            url = new URL(serverUrl + "/interop/rest/" + lcmVersion + "/
reports?q=" + param.toString());
        } catch (MalformedURLException e) {
            println "Malformed URL. Please pass valid URL"
            System.exit(0);
        }
        response = executeRequest(url, "POST", param.toString(),
"application/x-www-form-urlencoded");
        if (response != null) {
            getJobStatus(fetchPingUrlFromResponse(response, "Job
Status"), "GET");
       }
}
```

### **Common Functions**

- See Common Helper Functions for Java

- See CSS Common Helper Functions for Groovy

# User Access Report (v2)

The User Access Report (v2) REST API generates an access report of users provisioned in the environment and writes the report to the filename provided. This report can then be downloaded using the download command.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

This API is version v2.

### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

### **REST Resource**

**POST** /interop/rest/v2/reports/useraccess

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

	Table 12-68	Tasks for User Access Report
--	-------------	------------------------------

Task	Reques	t REST Resource
User Access Report	POST	/interop/rest/v2/reports/useraccess

### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 12-69 Parameters

Name	Description	Туре	Required	Default
fileName	File where report is to be populated	Payload	Yes	None
format	The format of the csv file, classic or simplified	Payload	No	classic
usertype	Wheter to generate the report only for Identity Domain Administrators, IDAdmins or ServiceUsers	Payload	No	ServiceU sers

## **Example URL and Payload**

```
https://<BASE-URL>/interop/rest/v2/reports/useraccess
{
    "fileName": "provisionreport.csv",
    "parameters": {
        "format": "simplified",
        "usertype": "IDAdmins"
    }
}
```

## Response

Supported Media Types: application/json

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	null

Table 12-70 Parameters

# **Example of Response Body**

The following example show the contents of the response body in JSON format.

```
{
    "details": null,
    "status": -1,
    "links": [
        {
            "href": "https://<BASE-URL>/interop/rest/v2/reports/useraccess",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": "https://<BASE-URL>/interop/rest/v2/status/jobs/
22747066997747363",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    ]
}
```

## Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type: application/json' -d
'{"fileName":"provisionreport.csv","parameters":
{"format":"simplified","usertype":"IDAdmins"}}
' 'https://<BASE-URL>/interop/rest/v2/reports/useraccess'
```

# User Audit Report (v1)

Generates a user audit report in the system and writes the report to the filename provided. The output CSV file contains the first character as a Byte Order Mark(BOM) character \ufeff. The API writes an encrypted application identifier following the BOM character. This application identifier is written between double quotes. Headers for the CSV file follow the application identifier. The report contains the details regarding the users logged into the system in a given time range.

The generated CSV file is compressed and the output is a ZIP file. The file can be downloaded using the Download REST API.

This is an asynchronous command, so use the job status URI to determine whether the operation is complete.

This API is version v1.

### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

### **REST Resource**

```
POST /interop/rest/{api_version}/reports?
q={type:userauditreport,fileName:userauditreport.csv,since:2017-12-10,until:2018
-06-10}
```

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 12-71 Tasks for User Audit Report

Task	Request	REST Resource
User Audit Report	POST	<pre>/interop/rest/{api_version}/reports? q={type:userauditreport,fileName:useraudit report.csv,since:2017-12-10,until:2018-06-10}</pre>

## Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

### Table 12-72 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
fileName	File where report is to be populated	Query	Yes	None
since	Report generation start date	Query	Yes	None
until	Report generation end date	Query	Yes	None
type	<b>Type of report being generated</b> , provisionreport <b>or</b> userauditreport	Query	Yes	None

### Response

Supported Media Types: application/json

Table 12-73	Parameters
-------------	------------

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

# Example of Response Body

The following shows an example of the response body in JSON format.

```
{
   "links": [
      {
         "rel": "self",
         "href": "https://<BASE-URL>/interop/rest/{api version}/reports?
q={type:userauditreport,fileName:useraudit
report.csv, since: 2017-12-10, until: 2018-06-10}",
         "data": null,
         "action": "POST"
     },
      {
         "rel": "Job Status",
         "href": "https://<BASE-URL>/interop/rest/v1/reports/
3180621025673301",
         "data": null,
         "action": "GET"
```

```
}
],
"status": -1,
"details": null
}
```

## User Audit Report Sample Code

## Example 12-1 Java Sample – UserAuditReport.java

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java

```
11
// BEGIN
11
public void userAuditReport (String fileName, String type, String since,
String until) throws Exception {
    JSONObject params = new JSONObject();
    params.put("fileName",java.net.URLEncoder.encode(fileName));
   params.put("type",java.net.URLEncoder.encode(type));
    params.put("since", java.net.URLEncoder.encode(since));
    params.put("until", java.net.URLEncoder.encode(until));
    String urlString = String.format("%s/interop/rest/%s/reports?q=%s",
serverUrl, lcmVersion, params.toString());
   String response = executeRequest(urlString, "POST", params.toString(),
"application/x-www-form-urlencoded");
    waitForCompletion(fetchPingUrlFromResponse(response, "Job Status"));}
11
// END
11
```

# Example 12-2 cURL Sample – userauditreport.sh

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See Common Helper Functions for cURL

```
funcUserAuditReport () {
    url=$SERVER_URL/interop/rest/$LCM_VERSION/reports/
    param=$(echo
"q={type:$reporttype,fileName:$fileName,since:$since,until:$until}" | sed -f
urlencode.sed)
    url=$url?$param
    funcExecuteRequest "POST" $url $param "application/json"
    output='cat response.txt'
    status='echo $output | jq '.status''
    if [ $status == -1 ]; then
        echo "copying snapshot in progress"
        funcGetStatus "GET"
```

```
else
    error='echo $output | jq '.details''
    echo "Error occured. " $error
fi
funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

## Example 12-3 Groovy Sample – userauditreport.groovy

### Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Groovy

```
def userAuditReport (fileName, type, since, until) {
        def url;
        JSONObject param = new JSONObject();
        try {
            param.put("fileName", fileName);
            param.put("type",type);
            param.put("since", since);
            param.put("until", until);
            url = new URL(serverUrl + "/interop/rest/" + lcmVersion + "/
reports?g=" + param.toString());
        } catch (MalformedURLException e) {
            println "Malformed URL. Please pass valid URL"
            System.exit(0);
        }
        response = executeRequest(url, "POST", param.toString(),
"application/x-www-form-urlencoded");
        if (response != null) {
            waitForCompletion(fetchPingUrlFromResponse(response, "Job
Status"));
        }
1
```

### **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# User Audit Report (v2)

The User Audit Report (v2) REST API generates a user audit report in the environment and writes the report to the filename provided. The output CSV file contains the first character as a Byte Order Mark(BOM) character \ufeff. The API writes an encrypted application identifier following the BOM character. This application identifier is written between double quotes. Headers for the CSV file follow the application identifier. The report contains the details regarding the users logged into the environment in a given time range.

The generated CSV file is compressed and the output is a ZIP file. The file can be downloaded using the Download REST API.

This is an asynchronous command, so use the job status URI to determine whether the operation is complete.

This API is version v2.

#### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

### **REST Resource**

```
POST /interop/rest/v2/reports/useraudit
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 12-74 Task for User Audit Report

Task	Request	REST Resource
User Audit Report	POST	/interop/rest/v2/reports/useraudit

#### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

## Table 12-75 Parameters

Name	Description	Туре	Required	Default
fileName	File where report is to be populated	Payload	Yes	None
since	Report generation start date	Payload	Yes	None
until	Report generation end date	Payload	Yes	None

### **Example URL and Payload**

https://<BASE-URL>/interop/rest/v2/reports/useraudit

```
{
    "fileName": "userauditreport.csv",
    "since": "2022-10-01",
    "until":"2022-11-01"
}
```

## Response

Supported Media Types: application/json

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "details": null,
    "status": -1,
    "links": [
        {
            "href": "https://<BASE-URL>/interop/rest/v2/reports/useraudit",
            "action": "POST",
            "rel": "self",
            "data": null
        },
        {
            "href": "https://<BASE-URL>/interop/rest/v2/status/jobs/
22747152577657842",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    ]
}
```

### Sample cURL command

```
curl -X POST -s -u '<USERNAME>:<PASSWORD>' -o response.txt -D respHeader.txt -
H 'Content-Type:application/json' -d
'{"fileName":"userauditreport.csv","until":"2022-11-01",
"since":"2022-10-01"}''https://<BASE-URL>/interop/rest/v2/reports/useraudit'
```

# Role Assignment Report (v1)

Generates a Role Assignment Report (.CSV). This report lists the predefined roles (for example, Service Administrator) and application roles (for example, Approvals Ownership

Assigner, Approvals Supervisor, Approvals Administrator, and Approvals Process Designer, which are Planning application roles) assigned to users. This report matches the CSV version of the Role Assignment Report generated from Access Control. Additionally, it can generate reports containing Identity Domain Administrator on the system by specifying the user type. The API writes the report to the filename provided, and the report can then be downloaded using the Download REST API.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

The presence of status -1 in the response indicates that the generation of Role Assignment Report is in progress. Use the job status URI to determine whether the generation of Role Assignment Report is complete. Any non-zero status except -1 indicates failure of generating Role Assignment Report.

This API is version v1.

## **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

### **REST Resource**

**POST** /interop/rest/security/{api version}/roleassignmentreport

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Table 12-77 Tasks for User Assignment Report

Task	Request	REST Resource
Role Assignment Report	POST	/interop/rest/security/{api_version}/ roleassignmentreport/
Role Assignment Report Status	GET	<pre>/interop/rest/security/{api_version}/jobs/{jobId}</pre>

### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

## Table 12-78 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None

## Table 12-78 (Cont.) Parameters

Name	Description	Туре	Required	Default
filename	File name for the file where the report is to be populated, such as roleAssignmentReport.csv	Form	Yes	None
usertype	User type for which to generate the report. This paramenter is optional. If provided values can be either ServiceUsers or IDAdmins.	Form	No	ServiceUs ers

### Response

Supported Media Types: application/json

## Table 12-79 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	Parameters as key value pairs passed in the request

## **Examples of Response Body**

The following show examples of the response body in JSON format.

## Example 1: Job is in Progress

```
{
    "links": [
         {
             "data": {
                  "jobType": "GENERATE_ROLE_ASSIGNMENT_REPORT",
"filename": "<filename>"
                  "usertype": "<USER TYPE>"
             },
             "action": "POST",
             "href": "https://<BASE-URL>/interop/rest/security/<api version>/
jobs/<jobId>",
             "rel": "Job Status"
         }
    ],
    "status": -1,
    "details": null,
    "items": null
}
```

## **Example 2: Job Completes with Errors**

```
{
    "links": [
        {
            "data": {
                "jobType": "GENERATE ROLE ASSIGNMENT REPORT",
                "filename": "<filename>"
                "usertype": "<USER TYPE>"
            },
            "action": "POST",
            "href": "https://<BASE-URL>/interop/rest/security/{api version}/
roleassignmentreport",
            "rel": "self"
        }
   ],
    "status": 1,
    "details": "EPMCSS-20665: Failed to generate Role Assignment Report.
Invalid or insufficient parameters are specified. Provide all required
parameters for the REST API. ",
    "items": null
}
```

## Example 3: Job Completes without Errors

## Java Sample Code

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java

```
public void generateRoleAssignmentReport(String filename, String userType) {
    try {
        String url = this.serverUrl + "/interop/rest/security/" +
    apiVersion + "/roleassignmentreport";
        Map<String, String> reqHeaders = new HashMap<String, String>();
        reqHeaders.put("Authorization", "Basic " + DatatypeConverter
                      .printBase64Binary((this.userName + ":" +
    this.password).getBytes(Charset.defaultCharset())));
```

```
Map<String, String> reqParams = new HashMap<String, String>();
reqParams.put("filename", filename);
reqParams.put("usertype", userType);
Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
"POST");
String jobStatus =
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, reqHeaders);
System.out.println(jobStatus);
} catch (Exception e) {
e.printStackTrace();
}
```

## Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcGenerateRoleAssignmentReport() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/
roleassignmentreport"
    params="filename=$1&usertype=$2"
    header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
    cssRESTAPI="generateRoleAssignmentReport"
    statusMessage=$(funcCSSRESTHelper "POST" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
    echo $statusMessage
}
```

## **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy

```
def generateRoleAssignmentReport(filename, userType) {
    String scenario = "Generating Role assignment report in " + filename + "
with usertype as " + userType;
    String params = "jobtype=GENERATE ROLE ASSIGNMENT REPORT&filename="+
filename "&usertype=" + userType;
    def url = null;
    def response = null;
    try {
       url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
roleassignmentreport");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", params, "application/x-www-form-
urlencoded");
    if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
```

```
}
```

## **Common Functions**

- See Common Helper Functions for Java
- See Common Helper Functions for cURL
- See CSS Common Helper Functions for Groovy

# Role Assignment Report for Users (v2)

Generates a Role Assignment Report of users in the environment. The report lists the roles assigned to users. It identifies the user's login name, first name, last name, email address and assigned roles. The report can be created for a specific user or a role or a combination of users and roles.

The report includes:

- Predefined roles (such as Service Administrator)
- Application roles (such as Approvals Assign Ownerships, Approvals Supervise, Approvals Administer, and Approvals Design Process).

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure of getting Role Assignment Report for users.

This API is version v2.

### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

### **REST Resource**

```
GET /interop/rest/security/v2/report/roleassignmentreport/user?
userlogin=<userlogin>&rolename=<rolename>
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Role Assignment Report for Users	GET	/interop/rest/security/v2/report/roleassignmentreport/
Report for Osers		user?userlogin= <userlogin>&amp;rolename=<rolename></rolename></userlogin>

### Request

Supported Media Types: application/json

The following table summarizes the request parameters.

### Table 12-81 Parameters

Name	Description	Туре	Required	Default
userlogin	Generates roleassignmentreport for the specified user only. If a user login is not specified, the report is generated for all the users.	Query	No	All Users
rolename	Generates roleassignmentreport for the specified role only. If a role name is not specified, the report is generated for all the roles.	Query	No	All Roles
	The Role name can be either Predefined or Application Role (for example, Power User or Access Control - Manage).			

### Response

Supported Media Types: application/json

## Table 12-82 Parameters

Parameters	Description
links	Detailed information about the link and HTTP call type
status	See Migration Status Codes
error	Detailed information about the error
details	Lists records matching the request

# Example of Respose Body

The following show examples of the response body in JSON format.

# Response 1: REST API Issued without userlogin or rolename Query Parameters Completes without Errors

```

}
```

### Sample cURL Commands

### Sample cURL command using Basic Auth

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/report/roleassignmentreport/user'
```

curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/report/roleassignmentreport/user?
userlogin=<userlogin>&rolename=<rolename>'

### Sample cURL command using oAuth

```
curl --location --request GET 'https://<BASE-URL>/interop/rest/security/v2/
report
/roleassignmentreport/user' --header "Authorization: Bearer <OAUTH_TOKEN>"
```

```
curl --location --request GET 'https://<BASE-URL>/interop/rest/security/v2/
report
/roleassignmentreport/user?userlogin=<userlogin>&rolename=<rolename>' --
header "Authorization: Bearer <OAUTH TOKEN>"
```

# Role Assignment Report for Groups (v2)

Generates a Role Assignment report of groups in the environment. The report lists the roles assigned to groups. It identifies the group's name, description, type and assigned roles. The report can be created for a specific group or a role or a combination of groups and roles.

The report includes:

- Predefined roles (such as Service Administrator)
- Application roles (such as Approvals Assign Ownerships, Approvals Supervise, Approvals Administer, and Approvals Design Process)

The API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure of getting Role Assignment Report for groups.

This API is version v2.

### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

### **REST Resource**

GET /interop/rest/security/v2/report/roleassignmentreport/group?
groupname=<groupname>&rolename>

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Authorization failed. Please provide valid authorized user."
   },
   "details": null
}
```

### Sample cURL Commands

### Sample cURL command using Basic Auth

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/report/roleassignmentreport/group
```

curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/report/roleassignmentreport/
group?groupname=<groupname>&rolename=<rolename>'

#### Sample cURL command using oAuth

```
curl --location --request GET 'https://<BASE-URL>/interop/rest/security/v2/
report
/roleassignmentreport/group' --header "Authorization: Bearer <OAUTH_TOKEN>"
curl --location --request GET 'https://<BASE-URL>/interop/rest/security/v2/
report
/roleassignmentreport/group?groupname=<groupname>&rolename=<rolename>' --
header "Authorization: Bearer <OAUTH_TOKEN>"
```

## Get Available Roles

Returns all the application roles that are visible along with predefined roles that are available for an Oracle Enterprise Performance Management Cloud service.

This API is synchronous and returns the outcome of the operation in the response. Any nonzero status indicates failure of getting available roles.

This REST API is version v2.

#### **Required Roles**

Service Administrator or Access Control - Manage

#### **REST Resource**

GET /interop/rest/security/v2/role/getavailableroles

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Table 12-86 Tasks for Getting Available Roles

Task	Request	REST Resource
Get Available Roles	GET	/interop/rest/security/v2/role/getavailableroles

## Request

Supported Media Types: application/json

#### Response

Supported Media Types: application/json

Parameters	Description
links	Detailed information about the link
status	<ul> <li>Status of the operation</li> <li>0: Operation succeeded</li> <li>1: Operation failed</li> </ul>
error	Detailed information about the error
details	Records matching the request

## Table 12-87Parameters

## Examples of Response Body

The following show examples of the response body in JSON format.

## Example 1: Job Completes without Errors

```
{
 "links": {
    "href": " https://<BASE URL>/interop/rest/security/v2/role/
getavailableroles",
    "action": "GET"
 },
 "status": 0,
 "error": null,
  "details": [
    {
      "name": "Ad Hoc - Create",
      "id": "HP:0016"
    },
    {
      "name": "Ad Hoc - Read Only User",
      "id": "HP:0017"
    },
    {
      "name": "Ad Hoc - User",
      "id": "HP:0015"
    },
    {
      "name": "Announcements - Manage",
      "id": "HP:0021"
    },
    {
      "name": "User",
      "id": "HUB:003"
    },
    {
      "name": "Viewer",
      "id": "HUB:004"
   },
    . . .
 ]
}
```

#### **Example 2: Job Completes with Errors**

```
{
   "links": {
    "href": " https://<BASE-URL>/interop/rest/security/v2/role/
getavailableroles",
    "action": "GET"
   },
   "status": 1,
   "error": {
        "error": {
            "errormessage": "Failed to get available roles. Authorization failed.
Please provide valid authorized user."
    },
    "details": null
}
```

#### Sample cURL Commands

#### Sample cURL command using Basic Auth

```
curl -X GET -s -u '<USERNAME>:<PASSWORD>' -H 'Content-Type: application/json'
'https://<BASE-URL>/interop/rest/security/v2/role/getavailableroles'
```

## Sample cURL command using oAuth

```
curl --location --request GET 'https://<BASE-URL>/interop/rest/security/v2/
role/getavailableroles'
--header "Authorization: Bearer <OAUTH TOKEN>"
```

# Role Assignment Audit Report for OCI (Gen 2) Environments

Users with a Service Administrator role can use this API to generate a Role Assignment Audit Report of users with their pre-defined and application roles on OCI (Gen 2) Environments. This allows you to automate reporting on users role and application role assignments. The report shows all the changes made to the predefined role and application role assignments within the provided time frame. This report can be generated for the previous 90 days from the current date. You can download the report using the Download REST API. The report shows the timestamp (UTC) in the Date and Time column in 24-hour format.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

The presence of status -1 in the response indicates that the generation of the report is in progress. Use the job status URI to determine whether the generation of the report is complete. Any non-zero status except -1 indicates failure of generating the report.

The default retention period for audit data is 30 days; however, you can extend the retention period up to a maximum of 90 days from the Identity Console. If you want a longer duration of audit data, download a Role Assignment Audit Report and archive it.

## Note:

This command is applicable to OCI environments only.

This API is version v1.

#### **Required Roles**

- Service Administrator
- Any predefined role and the Identity Domain Administrator role
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

#### **REST Resource**

**POST** /interop/rest/security/{api version}/roleassignmentauditreport

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Role Assignment Audit Report	POST	/interop/rest/security/{api_version}/ roleassignmentauditreport/
Role Assignment Audit Report Status	GET	<pre>/interop/rest/security/{api_version}/jobs/{jobId}</pre>

#### Request

Supported Media Types: application/x-www-form-urlencoded

## Table 12-89 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
from_date	The start date for the report (in YYYY-MM-DD format)	Form	Yes	None
to_date	The end date for the report (in YYYY-MM-DD format)	Form	Yes	None
filename	CSV file where the report is to be populated, such as roleAssignmentAuditReport.csv	Form	Yes	None

#### Response

Supported Media Types: application/json

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request

#### Table 12-90 Parameters

#### Sample Role Assignment Audit Report

	A	В	С	D	E
1	User Name	Role	Action	Administrator	Date and Time
2	jane.doe@example.com	User	Assign	epm.admin@example.com	July 09, 2021 03:54:52 UTC
3	jane.doe@example.com	Run Integrations	Assign	epm.admin@example.com	July 09, 2021 03:54:52 UTC
4	john.doe@example.com	Service Administrator	Assign	epm.admin@example.com	July 09, 2021 03:51:28 UTC
5	john.smith@example.com	Power User	Unassign	epm.admin@example.com	July 09, 2021 03:53:04 UTC
6	john.smith@example.com	User	Assign	epm.admin@example.com	July 09, 2021 03:54:06 UTC

Information on deleted users who were previously assigned to predefined roles in the environment is listed with the display name (first and last name) of the user in the User Name column. In such cases, the Role column indicates the predefined role that the user had before the user's account was deleted. This change does not apply to application roles, if any, that were assigned to the deleted user; such assignments are shown with the User Login Name of the user. For an example, see the information in the red box in the following illustration.

····\_

	А	В	С	D	E
1	User Name	Role	Action	Administrator	Date and Time
2	Jane Doe	User	Assign	epm.admin@example.com	July 09, 2021 03:54:52 UTC
3	jane.doe@example.com	Run Integrations	Assign	epm.admin@example.com	July 09, 2021 03:54:52 UTC
4	john.doe@example.com	Service Administrator	Assign	epm.admin@example.com	July 09, 2021 03:51:28 UTC
5	john.smith@example.com	Power User	Unassign	epm.admin@example.com	July 09, 2021 03:53:04 UTC
6	john.smith@example.com	User	Assign	epm.admin@example.com	July 09, 2021 03:54:06 UTC

## **Examples of Response Body**

The following show examples of the response body in JSON format.

## Response 1: Job is in Progress

```
"to date": "<toDate>",
                "filename": "<filename>",

}

Java Sample Code

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java

```
public void generateRoleAssignmentAuditReport(String fromDate, String
toDate,String fileName) {
     try {
       String url = this.serverUrl + "/interop/rest/security/" + apiVersion
+ "/roleassignmentauditreport";
       Map<String, String> reqHeaders = new HashMap<String, String>();
       reqHeaders.put("Authorization", "Basic " + DatatypeConverter
            .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
       Map<String, String> reqParams = new HashMap<String, String>();
       reqParams.put("from date", fromDate);
        reqParams.put("to date", toDate);
       regParams.put("filename", fileName);
       Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
"POST");
       String jobStatus =
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, reqHeaders);
       System.out.println(jobStatus);
    } catch (Exception e) {
       e.printStackTrace();
    }
}
```

## Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcGenerateRoleAssignmentAuditReport() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/
roleassignmentauditreport"
    params="from_date=$1&to_date=$2&filename=$3"
        header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
        cssRESTAPI="generateRoleAssignmentAuditReport"
        statusMessage=$(funcCSSRESTHelper "POST" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
        echo $statusMessage
}
```

## **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy

```
def generateRoleAssignmentAuditReport(from date, to date, fileName) {
    String scenario = "Generating Role assignment audit report in " +
fileName;
    String params =
"jobtype=GENERATE ROLE ASSIGNMENT AUDIT REPORT&from date="+from date+"&to date
="+to date+"&filename="+ fileName;
    def url = null;
    def response = null;
    try {
        url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
roleassignmentauditreport");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", params, "application/x-www-form-
urlencoded");
    if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
    }
}
```

# Invalid Login Report for OCI (Gen 2) Environments

Users who have both a Service Administrator role and an Identity Domain Administrator role can use this API to generate an Invalid Login Report on OCI (Gen 2) environments. This allows you to automate reporting on unsuccessful login attempts. This report shows unsuccessful login attempts for users within the provided time frame. This report can be generated for the previous 90 days from the current date. You can download the report using the Download REST API. This report shows all the unsuccessful login attempts to the corresponding Identity Cloud Service. These may not all be to this particular EPM Cloud instance.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

The presence of status -1 in the response indicates that the generation of the report is in progress. Use the job status URI to determine whether the generation of the report is complete. Any non-zero status except -1 indicates failure of generating the report.

The default retention period for audit data is 30 days; however, you can extend the retention period up to a maximum of 90 days from the Identity Console. If you want a longer duration of audit data, download an Invalid Login Report and archive it.

This API is version v1.

#### **Required Roles**

Identity Domain Administrator and any predefined role (Service Administrator, Power User, User, or Viewer)

ORACLE

#### **REST Resource**

POST /interop/rest/security/{api\_version}/invalidloginreport

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

## Table 12-91 Tasks for Invalid Login Report for OCI (Gen 2) Environments

Task	Request	REST Resource
Invalid Login Report	POST	/interop/rest/security/{api_version}/invalidloginreport/
Invalid Login Report Status	GET	<pre>/interop/rest/security/{api_version}/jobs/{jobId}</pre>

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

## Table 12-92 Parameters

Name	Description	Туре	Required	Default
api_version	Specific API version	Path	Yes	None
from_date	The start date for the report (in YYYY-MM-DD format)	Form	Yes	None
to_date	The end date for the report (in YYYY-MM-DD format)	Form	Yes	None
filename	CSV file where the report is to be populated, such as InvalidLoginReport.csv	Form	Yes	None

## Response

Supported Media Types: application/json

## Table 12-93 Parameters

Parameters	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status
data	Parameters as key value pairs passed in the request

## Sample Invalid Login Report

	А	В	с
1	User Name	IP Address	Access Date and Time
2	john.doe@example.com	xxx.xx.xx5	July 15, 2021 11:14:58 UTC
3	jane.doe@example.com	xxx.xx.xx.xx9	July 15, 2021 11:14:58 UTC
4	john.smith@example.com	xxx.xx.xx.xx3	July 15, 2021 11:14:57 UTC

## **Examples of Response Body**

## Java Sample Code

#### Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java

```
public void generateInvalidLoginReport(String fromDate, String toDate, String
fileName) {
       trv {
            String url = this.serverUrl + "/interop/rest/security/" +
apiVersion + "/invalidloginreport";
           Map<String, String> reqHeaders = new HashMap<String, String>();
            reqHeaders.put("Authorization", "Basic " + DatatypeConverter
                    .printBase64Binary((this.userName + ":" +
this.password).getBytes(Charset.defaultCharset())));
            Map<String, String> reqParams = new HashMap<String, String>();
            reqParams.put("from date", fromDate);
            reqParams.put("to date", toDate);
            regParams.put("filename", fileName);
            Map<String, String> restResult = CSSRESTHelper.callRestApi(new
HashMap(), url, reqHeaders, reqParams,
                    "POST");
            String jobStatus =
```

```
CSSRESTHelper.getCSSRESTJobCompletionStatus(restResult, reqHeaders);
    System.out.println(jobStatus);
    catch (Exception e) {
        e.printStackTrace();
    }
}
```

## Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcGenerateInvalidLoginReport() {
    url="$SERVER_URL/interop/rest/security/$API_VERSION/
invalidloginreport"
    params="from_date=$1&to_date=$2&filename=$3"
        header="Content-Type: application/x-www-form-urlencoded;charset=UTF-8"
        cssRESTAPI="generateInvalidLoginReport"
        statusMessage=$(funcCSSRESTHelper "POST" "$url" "$header" "$USERNAME"
"$PASSWORD" "$params" "$cssRESTAPI")
        echo $statusMessage
}
```

## **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy

```
def generateInvalidLoginReport(from date, to date, fileName) {
    String scenario = "Generating Invalid Login report in" + fileName;
    String params =
"jobtype=GENERATE INVALID LOGIN REPORT&from date="+from date+"&to date="+to da
te+"&filename="+ fileName;
    def url = null;
    def response = null;
    trv {
       url = new URL(serverUrl + "/interop/rest/security/" + apiVersion + "/
invalidloginreport");
    } catch (MalformedURLException e) {
        println "Please enter a valid URL"
        System.exit(0);
    }
    response = executeRequest(url, "POST", params, "application/x-www-form-
urlencoded");
   if (response != null) {
        getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
    }
}
```

- See CSS Common Helper Functions for Groovy

# Group Assignment Audit Report

Generates a group assignment audit report. The report contains details on the users and groups that were added to or removed from Access Control groups in a given date range. This report is in CSV format. Each row of the report provides the user or group that was added or removed, the group to which the user or group was added or removed from, the Service Administrator who performed the action, and the date and time when the action was completed. The API writes the report to the filename provided, and the report can then be downloaded using the Download REST API.

This is an asynchronous job and uses the job status URI to determine if the operation is complete.

The presence of status -1 in the response indicates that the generation of Group Assignment Audit Report is in progress. Use the job status URI to determine whether the generation of the report is complete. Any non-zero status except -1 indicates failure of generating the report.

This API is version v2.

#### **Required Roles**

- Service Administrator
- Any predefined role and the Access Control Manage application role
- Any predefined role and the Access Control View application role

#### **REST Resource**

**POST** /interop/rest/{api version}/reports/groupaudit

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Table 12-94 Tasks for Group Assignment Audit Report

Task	Request	REST Resource
Group Assignment Audit Report	POST	/interop/rest/{api_version}/reports/groupaudit
Group Assignment Audit Report Status		/interop/rest/{api_version}/jobs/{jobId}

#### Request

Supported Media Type: application/json

The following table summarizes the request parameters.

## Table 12-95 Parameters

Name	Description	Туре	Required	Default	
api_version	Specific API version	Path	Yes	None	
filename	The CSV file where the report is to be populated, such as	Payload	Yes	None	
	groupAssignmentAuditReport.csv				
from_date	The start date for the report (in YYYY-MM-DD format)	Payload	Yes	None	
to_date	The end date for the report (in YYYY-MM-DD format)	Payload	Yes	None	

## Example Payload

```
{
fileName":"groupauditreport_test.csv",
"from_date":"2022-03-26",
"to_date":"2022-05-30"
}
```

## Response

Supported Media Types: application/json

## Table 12-96 Parameters

Parameters	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation	
data	Parameters as key value pairs passed in the request	

## Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "https://<BASE-URL>/interop/rest/{api_version}/reports/
groupaudit",
            "data": null,
            "action": "POST"
        },
        {
            "rel": "Job Status",
        }
}
```

## Java Sample Code

Prerequisites: json.jar

Common Functions: See CSS Common Helper Functions for Java

```
//
    //BEGIN
    11
    public void groupAssignmentAuditReport(String fileName, String from date,
String to date)
            throws Exception {
        JSONObject params = new JSONObject();
        params.put("fileName", fileName);
        params.put("from date", from date);
        params.put("to date", to date);
        String urlString = String.format("%s/interop/rest/%s/reports/
groupaudit", serverUrl, apiVersion);
        String response = executeRequest(urlString, "POST",
params.toString(), "application/json");
        getJobStatus(fetchPingUrlFromResponse(response, "Job Status"), "GET");
    }
    //
    // END
    11
```

## Shell Script Sample Code

Prerequisites: jq (http://stedolan.github.io/jq/download/linux64/jq)

Common Functions: See CSS Common Helper Functions for cURL

```
funcgroupAssignmentAuditReport () {
    url=$SERVER_URL/interop/rest/v2/reports/groupaudit
    fileName="groupAssignmentAuditReport.csv"
    from_date="2022-03-01"
    to_date="2022-05-30"

param="{\"fileName\":\"$fileName\",\"from_date\":\"$from_date\",\"to_date\":\"
$to_date\"}"
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=$ (cat response.txt)
    status=$ (echo $output | jq '.status')
    echo "Status :$status"
    if [ $status == -1 ]; then
        echo "group assignment audit report generation in progress"
```

```
funcGetStatus "GET"
else
    error='echo $output | jq '.details''
    echo "Error occured. " $error
fi
funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

## **Groovy Sample Code**

Common Functions: See CSS Common Helper Functions for Groovy

```
def groupAssignmentAuditReport (fileName, from date, to date) {
        String scenario = "Group Assignment Audit Report";
        def url;
        def payload = new JsonBuilder()
      payload fileName:fileName,
            from date: from date,
            to date:to date
     url = new URL(serverUrl + "/interop/rest/v2/reports/groupaudit");
     params=payload.toString();
     response = executeRequest(url, "POST", params, "application/
json");
     if (response != null) {
       getJobStatus(getUrlFromResponse(scenario, response, "Job Status"),
"GET");
     }
}
```

## **Common Functions**

## Adding Users to a Team for Account Reconciliation

Adds Oracle Enterprise Performance Management Cloud users listed in a UTF8 formatted CSV file to an existing team in Access Control for Account Reconciliation. The file must be uploaded to the environment before using this API, and the file should be deleted after the API executes. Use the Upload REST API to upload the file.

A primary user is, by default, designated to perform the tasks that are assigned to the team. The file format is as follows:

```
User Login, primary_user
jdoe, yes
jane.doe@example.com,no
```

The users are added only if both these conditions are met:

- · User login IDs included in the file exist in the identity domain that services the environment
- The user is assigned to a pre-defined role in the identity domain

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the process is complete. The presence of status -1 in the response indicates that the update is in progress. Any non-zero status except -1 indicates failure for the update.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles

#### **REST Resource**

POST /armARCS/rest/{version}/jobs

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

Name	Data Type	Description
version	String	The version of the API you are developing with. For the current release, the version is v1.
jobName	String	The name of the job, ADD_USERS_TO_TEAM.
fileName	String	The name of the uploaded ANSI or UTF-8 encoded CSV file containing information on the users to be added, for example, addUsersToTeam.csv.
		The file must have been uploaded already using the Upload REST API. The CSV file should not include the account of the user who executes this command.
		A primary user is, by default, designated to perform the tasks that are assigned to the team. The file format is as follows:
		User Login, primary_user jdoe, yes jane.doe@example.com,no
teamName	String	The name of an existing team in Access Control, such as Team1

#### Table 12-97 Parameters

## **Example URL and Payload**

```
{
   "jobName":"ADD_USERS_TO_TEAM",
    "parameters":{
        "fileName":"users.csv",
        "teamName":"Team1"
   }
}
```

https://<BASE-URL>/armARCS/rest/v1/jobs/

## Response

Supported Media Types: application/json

Table 12-98Parameters

Name	Description	
status	-1 - In Progress	
	0 - Success	
	1 - Failure	
details	In case of errors, details are published with the error string	
descriptiveStat	The status of the job, such as Completed or Error.	
us		
items	Collection of notification categories	
links	Detailed information about the link	
href	Links to the API call	
action	The HTTP call type	
rel	Possible value: self	
data	Parameters as key value pairs passed in the request	

## Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "details": "In Process",
  "links": [
        {
            "rel": "self",
            "href": "https://<BASE-URL>/armARCS/rest/v1/jobs/1000000053010",
            "action": "GET"
        }
    ],
    "status": -1,
    "type": "ARCS",
    "link": null,
    "items": null,
    "error": null
}
```

# Adding Users to a Team for Financial Consolidation and Close and Tax Reporting

Adds Oracle Enterprise Performance Management Cloud users listed in a UTF8 formatted CSV file to an existing team in Access Control. The file must be uploaded to the environment before using this API, and the file should be deleted after the API executes. Use the Upload REST API to upload the file.

A primary user is, by default, designated to perform the tasks that are assigned to the team. The file format is as follows:

```
User Login, primary_user
jdoe, yes
jane.doe@example.com,no
```

The users are added only if both these conditions are met:

- User login IDs included in the file exist in the identity domain that services the environment
- The user is assigned to a pre-defined role in the identity domain

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the process is complete. The presence of status -1 in the response indicates that the update is in progress. Any non-zero status except -1 indicates failure for the update.

## Note:

This feature uses a Planning REST API to run a job. Details about Planning REST APIs are described here: Planning REST APIs.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### **REST Resource**

POST /HyperionPlanning/rest/{api version}/applications/{application}/fcmjobs

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the request parameters.

Name	Description	Туре	Require d	Default
api_version	The version of the API you are developing with; for the current release, it is $v3$	Path	Yes	None
application	The name of the application, for example, FCCS or TRCS	Path	Yes	None

## **Example of Request Body**

The following table summarizes the parameters of the JSON request.

## Table 12-100 Parameters

Name	Description		
jobName	The name of the job, ADD_USERS_TO_TEAM		
fileName	The name of the uploaded ANSI or UTF-8 encoded CSV file containing information on the users to be added, for example, addUsersToTeam.csv.		
	The file must have been uploaded already using the Upload REST API. The CSV file should not include the account of the user who executes this command.		
	A primary user is, by default, designated to perform the tasks that are assigned to the team. The file format is as follows:		
	User Login, primary_user jdoe, yes jane.doe@example.com,no		
teamName	The name of an existing team in Access Control, for example, Team1		

## **Example URL and Payload**

https://<BASE-URL>/HyperionPlanning/rest/v3/applications/FCCS/fcmjobs

```
{
   "jobName":"ADD_USERS_TO_TEAM",
    "parameters":{
        "fileName":"users.csv",
```

```
"teamName":"Team1" }
}
```

## Response

Supported Media Types: application/json

#### Table 12-101 Parameters

Name	Description	
jobName	ADD_USERS_TO_TEAM	
jobID	The ID of the job, such as 100000000114040	
status	-1 - In Progress	
	0 - Success	
	1 - Failure	
details	In case of errors, details are published with the error string	
descriptiveStat us	The status of the job, such as Completed or Error	
items	Collection of notification categories	
links	Detailed information about the link	
href	Links to the API call	
action	The HTTP call type	
rel	Possible value: self	
data	Parameters as key value pairs passed in the request	

## **Example of Response Body**

The following is an example of the response body in JSON format.

```
{
   "jobName": "ADD USERS TO TEAM",
  "jobId":10000000114040,
   "descriptiveStatus":",
   "detail":"In Progress",
   "status":-1,
   "items":null,
   "links":[
      {
         "rel":"self",
         "href":"https://<BASE-URL>/HyperionPlanning/rest/v3/applications/
FCCS/fcmjobs/10000000114040",
         "action":"GET"
      }
   ]
}
```

# Removing Users from a Team for Account Reconciliation

Removes Oracle Enterprise Performance Management Cloud users listed in a UTF8 formatted CSV file from an existing team in Access Control for Account Reconciliation. The file must be uploaded to the environment before using this API, and the file should be deleted after the API executes. Use the Upload REST API to upload the file.

A primary user is, by default, designated to perform the tasks that are assigned to the team. The file format is as follows:

User Login, primary\_user jdoe, yes jane.doe@example.com,no

The users are removed only if both these conditions are met:

- · User login IDs included in the file exist in the identity domain that services the environment
- The user is assigned to a pre-defined role in the identity domain

The API is asynchronous and returns the Job ID. Use the job status URI to determine whether the process is complete. The presence of status -1 in the response indicates that the update is in progress. Any non-zero status except -1 indicates failure for the update.

#### **Required Roles**

Service Administrator

#### **REST Resource**

```
POST /armARCS/rest/{version}/jobs
```

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/x-www-form-urlencoded

The following table summarizes the parameters of the JSON request.

Name	Data type	Description
version	String	The version of the API you are developing with. For the current release, the version is $v1$ .
jobName	String	The name of the job, REMOVE_USERS_FROM_TEAM.

Name	Data type	Description
fileName	String	The name of the uploaded ANSI or UTF-8 encoded CSV file containing information on the users to be remved, for example, removeUsersFromTeam.csv.
		The file must have been uploaded already using the Upload REST API. The CSV file should not include the account of the user who executes this command.
		A primary user is, by default, designated to perform the tasks that are assigned to the team. The file format is as follows:
		User Login, primary_user jdoe, yes jane.doe@example.com,no
teamName	String	The name of an existing team in Access Control, such as Team1

## Table 12-102 (Cont.) Parameters

## Example URL and Payload

https://<<BASE-URL>/armARCS/rest/v1/jobs

```

# 13 Usage Simulation REST APIs

This section describes the REST APIs for simulating user activities for testing purposes.

## Table 13-1 Usage Simulation

Task	Request	REST Resource
Simulate Concurrent Usage	POST	/interop/rest/v1/concurrentusage/run

# Simulate Concurrent Usage

The Simulate Concurrent Usage REST API executes different concurrent operations on an environment by simulating users. It can be used to validate the performance of the environment to verify that the response time is acceptable when the service is under the load during specific operations run by a specific number of users. For example, it can be used to measure performance when 50 users simultaneously open a form using different POVs. It allows the self-service load testing of environments.

This REST API performs the simulation by executing the specified operations for a given number of users and iterations. It runs multiple iterations to calculate the minimum time, the maximum time and the average time for a particular operation. It supports these operations to perform concurrent usage load testing:

- Open forms
- Save forms
- Run business rules
- Run business rulesets
- Run data rules
- Open ad hoc grids
- Execute report
- Execute book

## Note:

This API executes the specified operations on the current environment and may, depending on the operation, update the data in the environment. Run this API on test environments. Running this API on production environments is not advised.

This REST API accepts a ZIP file, that must already have been uploaded to the environment, as input. The ZIP file contains one requirement.csv file, and the input files that support the use cases included in requirement.csv. It can also optionally contain a userVarMemberMapping.csv file to provide user variable member mapping and an options.xml

file to provide Smart View options for some use cases. The REST API then simulates the use cases and creates a report that may be emailed to one or more recipients.

This REST API is version v1.

#### **Required Roles**

Service Administrator (Identity Domain Administrator is also required to use testModes 0, 1, and 2.)

#### **REST Resource**

**POST** /interop/rest/v1/concurrentusage/run

Supported Media Types: application/json

## Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

The following table summarizes the request parameters.

Table 13-2 Paran
------------------

Name	Description	Туре	Data Type	Required	Default
InputFile The name of the zip file that contains concurrent usage test cases. The zip file should contain a file named requirement.csv, which contains the details of all the operations to execute for this simulation test, and the input files that contain the details of each operation. It can also optionally contain a userVarMemberMapping.csv file to provide user variable member mapping and an options.xml file to provide Smart View options for some use cases.		Payload	String	Yes	None
	<ul> <li>For information on how to create these files, see Preparing to Run the simulateConcurrentUsage Command in Working with EPM Automate for Oracle Enterprise Performance Management Cloud.</li> <li>Use the Upload REST API to upload the zip file to the environment prior to calling this REST API.</li> </ul>				
numberOfIterations	Number of iterations each use case identified in requirement.csv has to run to measure the response time.	Payload	Integer	No	1

Name	Description	Туре	Data Type	Required	Default
notificationEmails	Email addresses of the recipients to whom the result will be sent at the end of the concurrent usage simulation. The emails must be separated by semi- colons and enclosed in double quotes. For example: "jdoe@example.com;jane.doe@examp le.com".	Payload	String	No	Email of the user who executed the API
lagTime	Number of seconds (5 seconds or more) between the execution of each use case in requirement.csv.	Payload	Integer	No	5
testMode	Mode in which concurrent usages simulation has to run. Possible values are 0, 1, 2 and 3.	Payload	Integer	No	0
	<ul> <li>0 - Default mode: Adds simulated users to the environment and assigns them the Service Administrator role, runs the simulation, and then deletes the simulated users. This mode is useful if you want to run the test only one time. The simulated users have these properties:         <ul> <li>First Name: testuser1, testuser2, and so on</li> <li>Last Name: testuser1, testuser2, and so on</li> <li>Email Address: testuser1@example.oracle.com , and so on</li> <li>Username: testuser1, testuser2, and so on</li> <li>Username: testuser1, testuser2, and so on</li> </ul> </li> <li>To Add Users Only: Adds simulated users to the environment and assigns them the Service Administrator role, but does not run the simulation or delete the simulated users.</li> <li>2 - Delete Users Only: Deletes simulated users created in a previous concurrent usage simulation run. Does not create users or run the simulation.</li> <li>3 - Simulation Only: Runs the simulation using already existing simulated users without adding or deleting users.</li> </ul> <li>4 - Use Existing Users: Includes users defined in the users .csv file included in the input ZIP file. In this mode, the simulated users are not created.</li>				

## **Example URL and Payload**

```
{
    "inputFile": "<ZIP_FILE_NAME>",
    "numberOfIterations": 1,
    "testMode": 0,
    "notificationEmails": "<EMAIL_ADDRESS>",
    "lagTime": 5
}
```

https://<BASE URL>/interop/rest/v1/concurrentusage/run

## Sample Request

```
{
    "inputFile" : "InputFiles2.zip",
    "numberOfIterations" : 1,
    "testMode" : 0,
    "notificationEmails" : "abc@example.oracle.com",
    "lagTime" : 10
}
```

## Response

Supported Media Types: application/json

Name	Description
details	In the case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Possible values: self or Job Status. If the value is set to Job Status, you
	can use the href to get the status
data	null

#### Table 13-3 Parameters

## **Example of Response Body**

## Example 1: Error Case

```
{
   "details": "InputFile is missing in request body",
   "status": 1,
   "items": null,
   "links": [{
        "href": "https://<BASE URL>/interop/rest/v1/concurrentusage/run",
        "action": "POST",
        "rel": "self",
        "data": {
    }
}
```

```
"jobType": "RUN_CONCURRENTUSAGE",
    "numberOfIterations": 2,
    "testMode": 0,
    "lagTime": 5,
    "inputfile": "",
    "notificationEmails": "abc@example.oracle.com"
}
```

## Example 2: Success Case

}

```
{
    "details": null,
    "status": -1,
    "items": null,
    "links": [{
        "href": "https://<BASE URL>/interop/rest/v1/concurrentusage/run",
        "action": "POST",
        "rel": "self",
        "data": {
            "jobType": "RUN CONCURRENTUSAGE",
            "numberOfIterations": 2,
            "testMode": 0,
            "lagTime": 5,
            "inputfile": "InputFiles2.zip",
            "notificationEmails": "abc@example.oracle.com"
            }
            },
        {
            "href": "https://<BASE URL>/interop/rest/v1/concurrentusage/jobs/
437838742934700",
            "action": "GET",
            "rel": "Job Status",
            "data": null
        }
    1
}
```

# 14 Reporting REST APIs

Use the topics in this chapter to run reports with REST APIs for Account Reconciliation, Financial Consolidation and Close, Tax Reporting, and Data Management.

For reports on users with REST APIs, see User Access Report (v1) and User Access Report (v2).

# Generate Report for Account Reconciliation

Generates either a single predefined Reconciliation Compliance report, predefined Transaction Matching report or a custom report.

This API is version v1.

## Note:

All parameters must be specified for a report.

## **REST Resource**

POST /arm/rest/fcmapi/{api version}/report

## **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

## Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

## Table 14-1 REPORT

Name	Description	Path	Required
api_version	Version of the API you are working with. This release is v1	Yes	Yes
groupName	The name of the group the report is associated with.	No	Yes
reportName	The name of the report to be generated.	No	Yes

Name	Description	Path	Required
generatedReportF ileName	The name specified by the user of the report to be generated. If this parameter is not provided, then the report will get generated with the data for reportName parameter in this table.	No	No
parameters	<ul> <li>Each report may have different parameters. Types of parameters:</li> <li>Numerical - should be in BigDecimal format.</li> <li>Text - standard string</li> <li>Date - can be in format yyyy-MM-dd for example 2020-10-01. To use the current date, use the value "CURRENT_DATE".</li> <li>Date/Time - can be in format yyyy-MM-dd HH:mm:ss or yyyy-MM-dd HH:mm:ss for example 2020-10-01 13:01:00, 2020-10-01T13:01:00. To use the current date and time, use the value "CURRENT_DATE_TIME".</li> <li>Boolean</li> <li>Users - user login ID</li> <li>List of choices - case insensitive values</li> </ul>	Νο	No
format	The format of the report (HTML, PDF, XLSX, CSV or CSV2).	No	No (default is PDF)
module	The module within Account Reconciliation: RC (Reconciliation Compliance) or TM (Transaction Matching.	No	No (default is RC)
emails	Comma separated list of email addresses that will receive the report once it's generated.	No	No
runAsync	Generation of report runs asynchronously (true) or synchronously (false). Oracle recommends setting this value to true (async) for larger reports. An example of request body and output is shown.	No	No (default is false)

## Table 14-1 (Cont.) REPORT

## Note:

If the required parameters, groupName or reportName are not specified, you receive an error.

For details about reportName or parameters, see Working with Predefined Reports in Reconciliation Compliance or Working with Predefined Reports in Transaction Matching in Administering Account Reconciliation.

For details about **Output Format**, see Generating the Report in Administering Account Reconciliation.

For details about retrieving job status while running reports, see Retrieve Job Status for a Report.

#### Example of request body (to be run synchronously)

```
{
"groupName":"Reconciliation Manager",
"reportName":"Balance by Account Type",
"generatedReportFileName":"myReport.pdf",
"parameters":{"Period":"June 2018","Currency Bucket": "Entered", "Rate
Type": "Accounting"},
"format":"PDF",
"module":"RC",
"emails":"user1@oracle.com,user2@oracle.com",
"runAsync":false
}
```

## Example of request body (to be run asynchronously for larger reports)

```
{
"groupName":"Reconciliation Manager",
"reportName":"Balance by Account Type",
"generatedReportFileName":"myReport.pdf",
"parameters":{"Period":"June 2018","Currency Bucket": "Entered", "Rate
Type": "Accounting"},
"format":"PDF",
"module":"RC",
"emails":"user1@oracle.com,user2@oracle.com",
"runAsync":true
}
```

## Response

Supported Media Types: application/json

Parameters:

Name	Description	
type	The module within Account Reconciliation: RC (Reconciliation Compliance) or TM (Transaction Matching.	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to the API call	
action	The HTTP call type	
rel	Relationship type (self, Job Status). if set to Job Status, you can use the href to get the status of the operation	
data	Parameters as key value pairs passed in the request	

#### Table 14-2 Parameters

## **Examples of Response Body**

The following is an example of the response body in JSON format for a Reconciliation Compliance successfully completed report called My Report in pdf format generated synchronously (runAsync=false):

```
{
"type":"RC",
"status":0,
"details": "myReport.pdf",
"links" [{
"action": "POST",
 "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/fcm/rest/fcmapi/v1/report",
  "rel": "self"
 },
       {
            "rel": "report-content",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/interop/rest/v1/
applicationsnapshots/myReport.pdf",
            "action": "GET"
}
]
}
```

The following is an example of the response body in JSON format for a Reconciliation Compliance report generated asynchronously (runAsync=true) where the report is "In Process" and you can use the Job ID generated to retrieve the job status. See Retrieve Job Status for a Report:

```
{
  "links":[
{
  "rel":"self",
  "href": "https://<SERVICE_NAME>-
  <TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/report",
  "action": "POST"
```

```
},
{
    "rel":"Job Status",
    "href": "https://<SERVICE_NAME>-
    <TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/
    report/job/TM/10000001001009",
    "action": "GET"
}
],
"details":"In Process",
"status":-1,
}
```

### Generate Report for Financial Consolidation and Close and Tax Reporting

Generates a report for Financial Consolidation and Close (Task Manager, Supplemental Data, and Enterprise Journal) and Tax Reporting (Task Manager and Supplemental Data).

This API is version v1.

#### Name Description Path Required Version of the API you are Yes Yes api version working with. This release is v1 The name of the group the Yes groupName No report is associated with. The name of the report to be No Yes reportName generated.

Name	Description	Path	Required
generatedReportF ileName	The user-specified name of the report to be generated. If this parameter is not provided, then the report will get generated with the data for reportName parameter in this table.	No	No
parameters	<ul> <li>Each report may have different parameters. Types of parameters:</li> <li>Numerical - should be in BigDecimal format.</li> <li>Text - standard string</li> <li>Date - can be in format yyyy-MM-dd for example 2020-10-01</li> <li>Date/Time: can be in format yyyy-MM-dd HH:mm:ss or yyyy-MM-dd 'T' HH:mm:ss for example 2020-10-01 13:01:00, 2020-10-01T13:01:00</li> <li>Boolean</li> <li>Users - user login ID</li> <li>List of choices - case insensitive values</li> </ul>	No	No
format	The format of the report (HTML, PDF, XLSX, or CSV).	No	No (Default is PDF)
module	Module for which the report is created. For Financial Consolidation and Close, use SDM (Supplemental Data Manager) or Task Manager. For Tax Reporting, use SDM (Supplemental Data Manager) or Task Manager.	No	Νο
emails	Comma separated list of email addresses that will receive the report.	No	No
runAsync	Generation of report runs asynchronously (true) or synchronously (false). Oracle recommends setting this value to true (async) for larger reports. An example of request body and output is shown.	No	No (Default is false)

#### Table 14-3 (Cont.) Report Parameters

For details about reportName or parameters see Using Task Manager and Supplemental Data Manager Reports.

For details about **Output Format**, see Generating the Report.

For details about retrieving job status while running reports, see Retrieve Job Status for a Report.

Example of request body (to be run synchronously)

```
{
"groupName":"Task Manager",
"reportName":"Late Tasks",
"generatedReportFileName":"myReport.pdf",
"parameters":{"Schedule": "Qtr 2 Close", "Period":"Jun" },
"format":"PDF",
"module":"Task Manager",
"emails":"user1@oracle.com,user2@oracle.com",
"runAsync":false
}
```

#### Example of request body (to be run asynchronously for larger reports)

```
{
"groupName":"Task Manager",
"reportName":"Late Tasks",
"generatedReportFileName":"myReport.pdf",
"parameters":{"Schedule" : "Qtr 2 Close", "Period":"Jun" },
"format":"PDF",
"module":"Task Manager",
"emails":"user1@oracle.com,user2@oracle.com",
"runAsync":true
}
```

#### Response

Supported Media Types: application/json

Parameters:

Name	Description
type	Type of report: SDM (Supplemental Data Management) or FCCS {Task Manager).
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to the API call
action	The HTTP call type
rel	Relationship type (self, Job Status). If set to Job Status, you can use the href to get the status of the operation.
data	Parameters as key value pairs passed in the request

#### **Examples of Response Body**

The following is an example of the response body in JSON format for a Financial Consolidation and Close report called MyReport in pdf format that was run successfully synchronously (runAsync=false):

```
{
     "links": [
         {
             "rel": "self",
             "href":
"https://<BASE-URL>/HyperionPlanning/rest/fcmapi/v1/myReport.pdf",
             "action": "POST"
         },
         {
             "rel": "report-content",
             "href":
"https://<BASE-URL>/HyperionPlanning/rest/fcmapi/v1/myReport.pdf",
             "action": "POST"
 "GET"
         }
     ],
     "details": "MyReport.pdf",
     "type": "FCCS",
     "status": 0,
     "link": null,
     "error": null,
     "items": null
}
```

The following is an example of the response body in JSON format for a Financial Consolidate and Close report generated asynchronously (runAsync=true) where the report is "In Process" and you can use the Job ID generated to retrieve the job status. See Retrieve Job Status for a Report:

```
{
 "links":[
{
"rel":"self",
"href": "https://<SERVICE NAME>-<TENANT NAME>.<dcx>.oraclecloud.com/
HyperionPlanning/rest/fcmapi/v1/report",
"action": "POST"
},
{
"rel":"Job Status",
"href": "https://<SERVICE NAME>-<TENANT NAME>.<dcX>.oraclecloud.com/
HyperionPlanning/rest/fcmapi/v1/report/job/FCCS/100000001001009",
"action": "GET"
}
],
"details":"In Process",
"status":-1,
"type":"FCCS",
"link":null,
"error":null
"items":null
}
```

### Generate User Details Report for Account Reconciliation

Generates a User Details report for **Account Reconciliation**. The **User Details** report contains information on the users who have predefined roles in the environment and lists attributes of each user (such as name and email), their status, teams, predefined roles, workflow roles, organizations, groups, and last login timestamps.

You can use the **Download** REST API to download the report after generating it.

#### **REST Resource**

POST /arm/rest/fcmapi/{api\_version}/rc/export/users

A sample Account Reconciliation Access Control report:

1	A	B	C	D	E	F	G	н	1 I -	J	K	L
1	Name	User Login	Status	Teams	Email	Role	Workflow F	Preparer	Reviewer	Organizations	Power User	Last Login
2	John Doe	jdoe	Available	Admins	john.doe@example.com	Administrator		No	No			
3	Jane Doe	janedoe	Available		jane.doe@example.com	Power User		No	No			
4	App User1	app1	Available	Team A	app.user1@example.com	User		No	No			

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 14-5 REPORT

Name	Description	Path	Required
api_version	Version of the API you are working with. This release is v1	Yes	Yes
fileName	The name of the report to be generated.	No	Yes
format	The format of the report (CSV or XLS).	No	No (default = CSV)

#### Note:

For details about retrieving job status while running reports, see Retrieve Job Status for a Report.

#### Examples of request body

#### Example 1

```
{
   "fileName":"UserDetails.csv",
   "format":"CSV"
}
```

#### Example 2

```
{
   "fileName":"UserDetails.csv"
}
```

#### Example 3

```
{
   "fileName":"UserDetails.xls",
   "format":"xls"
}
```

#### Response

Supported Media Types: application/json

Parameters:

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to the API call
action	The HTTP call type
rel	Relationship type can be (self, or Job Status). If set to Job Status, yo can use the href to get the status of the operation

#### Table 14-6 Parameters

#### **Examples of Response Body**

The following is an example of the response body in JSON format for an Account Reconciliation User Details report completed successfully:

Job Response

#### Job Status Response

}

```
{
    "links": [
        {
            "rel": "self",
            "href": "https:<BASE-URL>/arm/rest/fcmapi/v1/rc/job/42233",
            "action": "GET"
        },
        {
            "rel": "report-content",
            "href": "https:<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/UserDetails.csv/contents",
            "action": "GET"
        }
    ],
    "details": "File UserDetails.csv generated successfully.",
    "status": 0,
    "type": "rc",
    "link": null,
    "error": null,
    "items": null
}
```

# Generate User Details Report for Financial Consolidation and Close and Tax Reporting

Generates a User Details report (for Task Manager, Supplemental Data, and Enterprise Journal user assignments) in Financial Consolidation and Close and (for Task Manager and Supplemental Data user assignments) in Tax Reporting. The **User Details** report contains information on the users who have predefined roles in the environment and lists attributes of each user (such as name and email) as well as their status, teams, predefined roles, workflow roles, organizations, groups, and last login timestamps.

You can use the **Download** REST API to download the report after generating it.

This API version is v1.

#### **REST Resource**

POST /HyperionPlanning/rest/fcmapi/{api\_version}/fcm/export/users

ORACLE

#### A sample User Details Report:

4	A	В	с	D	E	F	G	н	1	J	к	L	м	N	0
	Name	User Login	Status	Teams	Email	Role	Workflow	Task	Task	Organizati	Last	Form	Form	Form	Groups
								Assignee	Approver		Login	Preparer	Approver	Integrator	
1															
2	John Doe	john.doe@example.com	Available	Admins	john.doe@example.com	Administrator									Service Administrator
3	Jane Doe	jane.doe@example.com	Available		jane.doe@example.com	Power User									Power User
4	user Ats	ats_user	Available		example1@example.com	User									User
5	user2 Ats	ats_user2	Available		example2@example.com	user									User
6	View User	viewUser	Available		view.user@exaple.com	Viewer									Viewer

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 14-7 REPORT

Name	Description	Path	Required
api_version	Version of the API you are working with. This release is v1	Yes	Yes
fileName	The name of the report to be generated.	No	Yes
format	The format of the report (CSV or XLS).	No	No (default = CSV)

#### Note:

For details about retrieving job status while running reports, see Retrieve Job Status for a Report.

#### Examples of request body

#### Example 1

```
{
   "fileName":"UserDetails.csv",
   "format":"CSV"
}
```

#### Example 2

```
{
   "fileName":"UserDetails.csv"
}
```

#### Example 3

```
{
   "fileName":"UserDetails.xls",
   "format":"xls"
}
```

#### Response

Supported Media Types: application/json

Parameters:

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to the API call
action	The HTTP call type
rel	Relationship type can be (self, or Job Status). If set to Job Status, you can use the href to get the status of the operation

#### **Example of Response Body**

The following is an example of the response body in JSON format for User Details report completed successfully:

#### Job Response

```
{
    "links": [
        {
            "rel": "self",
            "href": "https:<BASE-URL>/HyperionPlanning/rest/fcmapi/v1/fcm/
export/users",
            "action": "POST"
        },
        {
            "rel": "Job Status",
            "href": "https:<BASE-URL>/HyperionPlanning/rest/fcmapi/v1/fcm/job/
39068",
            "action": "GET"
        }
    ],
    "details": "In Process",
    "status": -1,
    "type": "fcm",
    "link": {},
    "error": null,
    "items": []
}
```

#### Job Status Response

```
{
    "links": [
        {
            "rel": "self",
            "href": "https:<BASE-URL>/HyperionPlanning/rest/fcmapi/v1/fcm/job/
39068",
            "action": "GET"
        },
        {
            "rel": "report-content",
            "href": "https:<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/userDetail.xls/contents",
            "action": "GET"
        }
    ],
    "details": "File userDetail.xls generated successfully.",
    "status": 0,
    "type": "fcm",
    "link": null,
    "error": null,
    "items": null
}
```

### Retrieve Job Status for a Report

Use this REST API to get the processing state for a report job with a specified ID. Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

GET /arm/rest/fcmapi/{api version}/job/{module}/{jobIdentifier}

**REST Resource** 

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 14-9 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

Name	Description	Туре	Required	Default
module	Module for Account Reconciliation Report (valid values are RC or TM) Valid values for Financial Close & Consolidation or Tax Reporting are SDM or FCCS (Task Manager)	Path	Yes	Yes
jobIdentifier	The ID of the job	Path	Yes	None

#### **Parameters**

Parameters

The following table summarizes the response parameters.

Name	Description
status	Status of the job: -1 = in process; 0 = completed (success); 1 = error
details	Details about the job status, such as "Big Report 10.csv" for generation of a report in csv format named Big Report 10
jobID	The ID of the job, such as 224
type	The type of report: RC (Reconciliation Compliance); TM (Transaction Matching); FCCS (Task Manager) or SDM (Supplemental Data Manager)

#### Table 14-10 Parameters

Supported Media Types: application/json

#### **Examples of Response Body**

The following shows an example of the response body for a completed (successful) report:

```
{
"links": [
{
        "rel": "self",
        "href": "https:<BASE-URL>/arm/rest/fcmapi/v1/report",
        "action": "POST"
    },
}
            "rel": "report-content",
        "href": "https:<BASE-URL>/interop/rest/11.1.2.3.600/
applicationsnapshots/Big+Report+10.csv/contents",
        "action": "GET"
}
],
    "details": "Big Report 10.csv".
    "status": 0,
    "type": "RC",
    "link": null,
    "error": null,
```

```
"items": null }
```

The following shows an example of the response body for an error occurring during report generation:

```
{
"links": [
{
    "rel": "self",
    "href": "https:<BASE-URL>/arm/rest/fcmapi/v1/report/job/TM/1145",
    "action": "GET"
    },
]

    "details": "Invalid query attached to the report".
    "status": 1,
    "type": "RC",
    "link": null,
    "error": null,
    "items": null
    }
```

The following shows an example of the response body for a report generation that is in process:

```
{
"links": [
{
    "rel": "self",
    "href": "https:<BASE-URL>/arm/rest/fcmapi/v1/report/job/TM/1124",
    "action": "GET"
    },
]

"details": "In Process".
"status": -1,
    "type": "RC",
    "link": null,
    "error": null,
    "items": null
    }
```

### **Execute Reports for Data Management**

The Data Management reporting framework represents a unified solution that incorporates source and target data, templates, and user-defined SQL queries. Templates, created in Oracle Business Intelligence Publisher, consume data in XML format and generate reports dynamically. You can add SQL queries to extract data from tables, or couple them with the report parameters to extend the definition of a standard report. Data Management reports can be generated as PDF, Excel, Word, or HTML output.

#### **Required Roles**

Service Administrator, Power User

#### **REST Resource**

POST /aif/rest/{api\_version}/jobs

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 14-11 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V1	Path	Yes	None
јоbТуре	The job type, REPORT	Path	Yes	None
jobName	The name of the report to be executed, such as Dimension Map For POV (Dimension, Cat, Per)	Path	Yes	None
reportFormatType	The file format of the report, pdf, xlsx, html, or excel	Path	Yes	pdf
parameters	Can vary in count and values based on the report	Path	Yes	None
Location	The location of the report, such as Comma_Vision	Path	Yes	None

#### Example of Request Body

The following shows an example of the request body in JSON format.

```
{
"jobType":"REPORT",
"jobName":"Dimension Map For POV (Dimension, Cat, Per)",
"reportFormatType":"PDF",
"parameters":{
    "Dimension Name":"ENTITY",
    "Category":"Actual",
    "Period":"Jan15",
    "Location":"Comma_Vision"
    }
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

#### Response

The following table summarizes the response parameters.

#### Table 14-12 Parameters

Name	Description
jobId	The process ID generated in Data Management for the job, such as 1885
status	The job status, such as RUNNING

Name	Description
logFileName	Log file containing entries for this execution, such as outbox\logs\BESSAPP-DB_1885.log
outputFileName	Name of the output file generated; you can use this name to download the report
processType	Type of process executed, EXECUTE_REPORT
executedBy	Login name of the user used to execute the rule, such as admin
details	Returns the exception stack trace in case of an application error, or null

Supported Media Types: application/json

Parameters

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
"links":
[
0]
"status":"-1",
"details":"null",
"jobId":"1885",
"jobStatus":"RUNNING",
"logFileName":"outbox/logs/1885.log",
"outputFileName":"outbox/reports",
"processType":"EXECUTE_REPORT",
"executedBy":"admin"
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

## 15 Data Integration REST APIs

Use the Data Integration REST APIs to run integrations, import and export data mapping, import and export Data Integration APIs, and to execute reports.

#### Note:

All REST APIs used for Data Integration can be used as REST APIs for Data Management.

### **URL Structure for Data Integration**

#### **URL Structure**

Use the following URL structure to access the Data Integration REST resources:

https://<BASE-URL>/aif/rest/{api version}/{path}

#### Where:

• <BASE-URL>: The first part of your service URL, before the context.

```
For example, if your service URL is https://epm-acme.epm.us-
phoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm-
acme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2-
acme.epm.us6.oraclecloud.com.
```

- api\_version: API version you are developing with. The current REST API version for Data Integration is V1.
- *path*: Identifies the resource.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ internal/" in the URL.

### **Getting API Versions for Data Integration APIs**

You can manage versions using the set of REST resources summarized in the following table.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Get API Versions for Data Integration APIs	GET	/aif/rest/
Get Information about a Specific API Version for Data Integration APIs	GET	<pre>/aif/rest/{apiVersion}</pre>

#### Table 15-1 Manage Versions of Data Integration APIs

### Get API Versions for Data Integration APIs

Returns information about which versions are available and supported. Multiple versions might be supported simultaneously.

#### Note:

An API version is always supported even when deprecated.

#### **REST Resource**

GET /aif/rest/

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 15-2 Parameters

Name	Description
items	Detailed information about the API
version	The version, such as V1
lifecycle	Possible values: active, deprecated
isLatest	Whether this resource is the latest, true or false

#### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
"items": [1]
{
"version": "V1"
"isLatest": "true"
"lifecycle": "active"
"links": [3]
{
   "rel": "self"
  "href": "https://<SERVICE_NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/aif/rest/"
   "action": "GET"
   }, {
  "rel": "canonical"
  "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/aif/rest/"
  "action": "GET"
  },{
  "rel": "current"
  "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/aif/rest/V1"
  "action": "GET"
   }
}
}
```

### Get Information about a Specific API Version for Data Integration APIs

Returns details for a specific REST API version for Data Integration.

#### **REST Resource**

GET /aif/rest/{api version}

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 15-3 Parameters

Name	Description
api_version	Version of the API you are developing with, such as V1

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 15-4 Parameters

Name	Description
version	The version, such as V1
lifecycle	Lifecycle of the resource, active or deprecated
isLatest	Whether this resource is the latest, true or false

#### Example of Response Body

The following shows an example of the response body in JSON format.

### Lock and Unlock POV

The lock REST API prevents data from being loaded to a selected POV by location or application associated with a current period and category.

When a location or application has been locked, you cannot import, validate, export, or rerun a validation.

You can also get the status of a single location or the status of all locactions for a period and category or a single application.

An unlock RESP API is available so that you can unlock a locked location or application.

#### **Prerequisites:**

You must have Service Administrator privileges to execute the lock and unlock REST APIs.

#### **REST Resource**

/aif/rest/V1/POV

#### **Required Roles**

Service Administrator, Power User

Method:

#### POST

#### Lock/Unlock by Location RESP API Request Parameters

The following table summarizes the request parameters for locking by location:

#### Table 15-5 Parameters

Name	Description	Туре	Required	Default
api_version	V1	Path	Yes	None
category	Specify the predefined Scenario value based on the POV Category from the integration (data rule) definition.	JSON payload	Yes	None
	The categories available are those that are created in the Data Integration set- up, such as "Actual."			
period	Specify the period of the POV from the integration or data load rule defined in Data Integration.	JSON payload	Yes	None
location	Specify the name of the location to lock so that data cannot be loaded to it.	JSON payload	Yes	None
locktype	Specify <b>location</b> for the location lock type.	JSON payload	Yes	None
operation	For a lock operation, specify <b>lock</b> . For an unlock operation, specify <b>unlock</b> .	JSON payload	Yes	None

JSON Request Payload to Lock Location Example:

```
{
"category": "Actual",
"period": "Jan-17",
"location": "FCCSAPP1_LOC1A",
"locktype":"location",
"operation": "lock"
}
```

**Response to Locking a Location Example:** 

```
{
  "details":",
  "status": 0,
  "response": "Location:FCCSAPP1_LOC1A has been locked successfully."
}
```

JSON Request Payload to Unlock Location Example:

```
{
"category": "Actual",
"period": "Jan-17",
"location": "FCCSAPP1_LOC1A",
"locktype":"location",
```

```
"operation":"unlock"
}
```

#### **Response to Unlocking a Location Example:**

The following is an example of unlocking a location REST API response.

```
{
"details":",
"status": 0,
"response":"Location:FCCSAPP1_LOC1A has been unlocked successfully."
}
```

#### Lock/Unlock by Application REST API Request Parameters

Name	Description	Туре	Required	Default
api_version	V1	Path	Yes	None
category	Specify the predefined "Scenario" value based on the POV Category from the integration (data rule) definition.	JSON payload	Yes	None
	The categories available are those that were created in the Data Integration set-up, such as"Actual".			
period	Specify the period of the POV from the integration or data load rule defined in Data Integration.	JSON payload	Yes	None
application	Specify the name of the application to lock so that data cannot be loaded to it.	JSON payload	Yes	None
locktype	Specify <b>application</b> for the application lock type.	JSON payload	Yes	None
unlockbylocation	true/false—Boolean option for whether to unlock by location when an application is locked.	JSON payload	No	false
	If the "unlockbylocation" flag is set to "true" when locking the target application, then the system locks all rules present in the location under target application and not the application level lock.			
	If the "unlockbylocation" flag is set to "false" when locking the target application, then the system locks all rules present in the location under the target application and the application level lock.			
	Rules present for locations in the application cannot be executed when the location is unlocked until the application level lock is removed. Furthermore, when you create a new location under the locked target application, rules can't be executed in the new location until the application level lock is removed.			

Name	Description	Туре	Required	Default
operation	For a lock operation, specify <b>lock</b> . For an unlock operation, specify <b>unlock</b> .	JSON payload	Yes	None

JSON Request Payload to Lock an Application Example:

```
{
"category": "Actual",
"period": "Jan-17",
"application": "FCCSAPP1",
"locktype":"application",
"operation": "lock"
}
```

#### **Response to Locking an Application Example:**

The following is an example of locking an application REST API response.

```
{
"details":null,
"status": 0,
"response":"Application: FCCSAPP1 has been locked successfully."
}
```

JSON Request Payload to Unlock a Location for a Locked Application Example:

```
{
"category": "Actual",
"period": "Jan-17",
"application": "FCCSAPP1",
"locktype":"application",
"unlockbylocation":"true",
"operation": "lock"
}
```

#### Response to Unlocking a Location for a Locked Application Example:

The following is an example of unlocking a location when locking an application REST API response.

```
{
"details":null,
"status": 0,
"response":"Application: FCCSAPP1 has been locked successfully."
}
```

#### **Get Lock Status REST API Request**

Get the status of a single location or the status of all locations for a period and category or a single application.

Method:

#### GET

#### **REST Resource**

```
/aif/rest/V1/POV?
location=<locationname>&period=<periodname>&category=<catname>&application=<ap
plicationname>
```

#### **REST Resource Example**

/aif/rest/V1/POV?application=FCCSAPP1&period=Jan-17&category=Actual

#### Response

Supported Media Types: application/json

#### **Example of Response Body**

```
"details": null,
"status": 0,
"response": [
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC11"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "AD_ASO_PBCS_To_FCCS"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "AD ASO EPBCS TO FCCS"
},
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
```

```
"location": "ORCL To FCCS"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "SQL To FCCS"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC31"
},
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC23"
},
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC22"
},
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC27"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC26"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1 LOC25"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
```

```
"location": "FCCSAPP1_LOC24"
},
{
"period": "Jan-17",
"category": "Actual",
"status": "Locked",
"application": "FCCSAPP1",
"location": "FCCSAPP1_LOC21"
}
}
```

### **Running Integrations**

Running an integration entails using the INTEGRATION job type for the jobs REST API to execute an integration or data load rule based on how periods are processed and source filters.

The INTEGRATION job type is an enhanced version of DATARULE job type (see Running Data Rules in Data Management). It is recommended that you use the INTEGRATION job type for future integration jobs.

The INTEGRATION jobtype supports running integrations/data load rules based on:

- period names provided to Planning
- Global POVs
- Planning substitution variables
- source filters selected as runtime parameters
- target options selected as runtime parameters
- existing period ranges

It also supports overriding the source filters and target options at runtime without modifying the integration definition.

#### **Prerequisites:**

You must have the required privileges to execute a specific data rule/integration.

#### **REST Resource**

/aif/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User

Request

Supported Media Types: application/json

Method:

POST

#### Payload:

{

}

```
"jobType":"INTEGRATION",
"jobName":"GLDATA",
"periodName":"{Mar-20}",
"importMode":"Replace",
"exportMode":"Merge",
"fileName":"inbox/GLBALANCE.txt"
```

#### **REST Payload Description**

The following table summarizes the REST payload.

#### Table 15-6 Parameters

Name	Description	Туре	Required	Default
api_version	V1	Path	Yes	None
јоbТуре	INTEGRATION	JSON payload	Yes	None
jobName	The name of the integration defined in Data Integration. You should enclose the rule or name in quotation marks if it contains a space.	JSON payload	Yes	None

Name	Description	Туре	Required	Default
periodname	Name of the period(s)p enclosed in curly brackets ({}).	JSON payload	Yes	None
	periodname includes:			
	<ul> <li>Single Period—Refers to the Data Integration period name for a single period. The parameter is whatever the period name is defined in Period mapping.</li> <li>Multi-Period—Refers to a multi-period load. The parameter is {Month-Year} {Month-Year}. For example, {Jan-20} {Mar-20} refers to a multi-period load from Jan-20 to Mar-20.</li> </ul>			
	<ul> <li>Planning Period Name—Refers to a Planning period name. The parameter is {Month#Year}, for example, {Jan#FY20}{Mar#FY20}. Using this convention, the client executing the API does not need to know the Data Integration period names. Instead you specify the Planning member names for the Year and Scenario dimensions.</li> </ul>			
	This parameter is supported in the Planning, Tax Reporting, and Financial Consolidation and Close business processes. It is functional for both your service applications and cloud deployments derived from on- premises data sources.			
	<ul> <li>This parameter is useful if triggered from an Oracle Enterprise Performance Management Cloud Groovy script by capturing the Year and Period member names. The application period mapping or global period mapping must exist with the Year and Month in the target values of the period mapping.</li> <li>Planning Substitution Variable—This is an extension of the previous Planning period name parameter whereby a substitution variable can be specified instead of the actual Year/ Month member names.</li> </ul>			
	The convention is {Month#&CurYr} {&FcstMonth#&CurYr}; for example, {Jan#&CurYr}{&FcstMonth#&CurYr}. A combination of both actual member names as well as substitution variables is supported.			
	This parameter is supported in the Planning,Tax Reporting, and Financial Consolidation and Close business processes. It is functional for both			

Name	Description		Туре	Required	Default
	your service app deployments de premises data s				
	<ul> <li>The application global period mathe Data Integra where the API is Year and Month the period mapp and Month refert the substitution execution.</li> <li>GLOBAL POV—</li> </ul>	period mapping or apping must exist in tion of the instance s executed, with the in the target values of bing. In this case, Year to the current value of variable during —Executes the data bal POV period. Use			
		Note: If you use any other period naming parameter other than the parameters described above, you get an "Invalid Input – HTTP 400 " error			

Name	Description	Туре	Required	Default
importMode	Determines how the data is imported into Data Integration. Acceptable values are:	JSON payload	Yes	None
	<ul> <li>Append—Add to the existing POV data in Data Integration.</li> <li>Replace—Delete the POV data and replace it with the data from the file.</li> <li>Map and Validate—Skip importing the data, but re-process the data with updated Mappings and Logic Accounts.</li> <li>No Import—Skip data import into Data Integration staging table.</li> <li>Direct—To use the direct load method to extract data from your on-premises data exercise and the data from your on-premises</li> </ul>			
	data sources and then load the data directly to the EPM Cloud using the EPM Integration Agent, you need to pass an importMode of "Direct." Other modes are not applicable for the direct load.			

Name	Description	Туре	Required	Default
exportMode	Determines how the data is exported into Data Integration. Acceptable values for Planning business	JSON payload	Yes	None
	<ul> <li>processes are:</li> <li>Merge—Merge the data in the Data Integration staging table with the existing Planning data.</li> <li>Replace—Clear the POV data and replace it with data in the Data Integration staging table. The data is cleared for Scenario, Version, Year, Period, and Entity dimensions.</li> <li>Accumulate—Add the data in the Data Integration staging table to Planning.</li> <li>Subtract—Subtract the data in the Data Integration staging table from existing Data Integration data.</li> <li>No Export—Skip data export from Data Integration to Planning.</li> <li>Acceptable values for Financial Consolidation and Close and Tax Reporting are:</li> <li>Merge—Merge the data in the staging</li> </ul>			
	<ul> <li>table with the data in the Financial Consolidation and Close and Tax Reporting application.</li> <li>If data already exists in the application, the system overwrites the existing data with the new data from the load file. If data does not exist, the new data is created.</li> <li>Replace—Delete the POV data and replace it with the data from the file.</li> <li>No Export—Skip the data export from Data Integration to Financial Consolidation and Close or Tax Reporting</li> <li>If you use a regular data load for the Numeric Data Only and Numeric Data and All Data Type load methods, note the export mode requirements based on the load method:</li> </ul>			
	<ul> <li>For a Numeric Data Only load method, Accumulate and Subtract are the applicable export modes.</li> <li>For a Numeric Data and All Data Type load method, Merge, Replace, and No Export are the applicable export modes.</li> <li>If you use the direct data load to extract data from your on-premises data sources and then load the data directly to the EPM Cloud using the EPM Integration Agent,</li> </ul>			

Name	Description	Туре	Required	Default
	note the export mode requirements based on the load method:			
	<ul> <li>For a Numeric Data Only load method, Merge, Accumulate, and Subtract are the applicable export modes.</li> </ul>			
	<ul> <li>For a Numeric Data and All Data Type load method, only Replace is the applicable export mode.</li> </ul>			
	<ul> <li>The No Export mode is not applicable for the Numeric Data Only and Numeric Data and All Data Type load methods.</li> </ul>			
	When running a Quick Mode load, valid export modes are:			
	<ul><li>Replace</li><li>Merge</li><li>Accumulate</li></ul>			
fileName	The fileName parameter is applicable only for native file-based data loads and ignored if specified for other loads.	JSON payload	No	None
	The file name is optional. If you do not specify a file name, this API imports the data contained in the file name specified in the load data rule. The data file must already reside in the Inbox prior to executing the data load rule, for example, . inbox/GLBALANCES.txt.			
	You can also upload file to folders accessible from the Applications- Inbox/Outbox Explorer using a file name. Reference the files in this folder using this format:: #epminbox/ <filename>.</filename>			

Name	Description	Туре	Required	Default
sourceFilters	A parameter used to update the source filters defined for the data load rule or integration.	JSON payload	No	None
	File-based applications—You cannot use the sourceFilters parameter for file-based applications. If you use this parameter with a file-based application, you get the HTTP 400 error message: "EPMFDM-ERROR: Data Load Rule does not support sourceFilters for File based loads."			
	Data Source based applications— Replaces the pre-defined source filter parameters at the rule level for a data load rule/integration or specifies them at runtime (if not pre-defined at application level when the data source is the type of source application.			
	Each filter name and its value should be sent as a key/value pair in the nested JSON object. The parameter name and value should be the English display names as seen in the user interface. Do not specify internal codes for parameter names and values using LOV validation. LOV validation is done for parameters having a restricted list of parameter values.			
	All filter names are not mandatory. Only filter names specified in the nested JSON object are replaced or set at runtime. The remaining filters are picked from the application/rule definition.			
	Oracle Essbase/Planning/Oracle General Ledger-based applications—Replaces the already defined dimension source filters for a data load rule/integration at runtime when Essbase/Planning/Oracle General Ledger balance type are the source applications.			
	Each dimension name and its value should be sent as a key/value pair in the nested JSON object.			
	Replacing or setting the dimension filters at run time is only supported for dimensions already having a filter defined in the data load rule/integration definition.			
	All filter names are not mandatory. Only dimension names specified in the nested JSON object will be replaced or set in runtime. The remaining filters are picked from data rule/integration definition.			
	Dimension filters are supported for all dimensions including the "Scenario" dimension. The "Year" and "Period" dimensions are not supported as filters			

Name	Description	Туре	Required	Default
	because they are driven by the POV range.			
	All other source applications are not supported.			
targetOptions	A parameter used to update the target options defined for the data load rule or integration.	JSON payload	No	None
	Data Export based applications— Replaces the pre-defined target option parameters at the rule level for a data load rule/integration or specifies them at runtime (if not pre-defined at the rule level) when the Data Export is the type of target application.			
	Each option name and its value should be sent as a key/value pair in the nested JSON object. The parameter name and value should be the English display names as seen in the user interface. Do not specify internal codes for parameter names and values using the LOV validation. LOV validation is done for parameters having a restricted list of parameter values.			
	All option names are not required. Only option names specified in the nested JSON object are replaced or set at runtime. The remaining options are picked from the application/rule definition.			
	Planning target application—Replaces the following options at runtime.			
	<ul> <li>Refresh Database—Yes/No</li> <li>Dimension Name—Specify a dimension name for a custom dimension load rule. In this way the same rule can be used to build multiple dimensions in runtime.</li> <li>Purge Data File—Yes/No</li> </ul>			
	Other target applications are not			

Name	Description	Туре	Required	Default
executionMode	The executionMode parameter is applicable only for Quick Mode integrations.	JSON payload	Yes	None
	Available options:			
	<ul> <li>SYNC—When executionMode is SYNC, then the REST API call submits and waits until the integration has completed (that is, reached either a successful, failed, or warning state) before returning a response.</li> <li>ASYNC—When executionMode is ASYNC, then the REST API call returns a response immediately without waiting for the integration to complete. Usually the integration is in a running state when the REST API response is received.</li> </ul>			
	executionMode is a mandatory			
	parameter and cannot be blank.			

#### Sample REST Payloads

Below are sample payloads based on the source application type.

#### **File Based Loads**

In this example, the source is a text file running an integration through a native File adapter:

```
{
"jobType":"INTEGRATION",
"jobName":"ERPDATA",
"periodName":"{Jan-20}",
"importMode":"REPLACE",
"exportMode":"NONE",
"fileName":"inbox/TestData.txt"
}
```

#### **Planning Applications**

In these examples, the source is an Essbase/Planning based application. The supported applications include:

- Planning modules
- Reporting cubes (plan types) of Planning
- Financial Consolidation and Close
- Tax Reporting
- Profitability and Cost Management
- Oracle ERP Cloud Oracle General Ledger Balances Cube

Example of Planning to Financial Consolidation and Close Data Synchronization

```
{
  "jobType":"INTEGRATION",
  "jobName":"PBCStoFCCS",
  "periodName":"{Jan-20}",
  "importMode":"REPLACE",
  "exportMode":"NONE",
  "sourceFilters":{
      "Account":"@RELATIVE(Acc1,0)",
      "Entity":" @CHILDREN(Europe)",
      "Scenario":"Actual"
}
```

Example of Planning to a Data Export to File

```
"jobType":"INTEGRATION",
"jobName":"PBCStoFCCS",
"periodName":"{Jan-20}",
"importMode": "REPLACE",
"exportMode": "NONE",
"sourceFilters":{
    "Account": "@RELATIVE (Acc1, 0) ",
    "Entity":" @CHILDREN(Europe)",
    "Scenario":"Actual"
},
"targetOptions":{
    "Download File Name": "PlanningToFile.csv",
    "Column Delimiter":",",
    "Include Header":"Yes"
}
}
```

#### **Data Source Applications**

Example of Incremental File adapter:

```
{
"jobType":"INTEGRATION",
"jobName":"MyIncrementalFileLoad",
"periodName":"{Jan-20}{Mar-20}",
"importMode":"REPLACE",
"exportMode":"NONE",
"sourceFilters":{"Source File":"File1.txt"}
}
```

Example of Netsuite adapter:

```
{
"jobType":"INTEGRATION",
"jobName":"NetsuiteLoad",
"periodName":"{Jan-20}{Mar-20}",
```

```
"importMode":"REPLACE",
"exportMode":"NONE",
"sourceFilters":{
    "Postingperiod":"This Fiscal Quarter",
    "Mainline":"True"
}
```

Example of exporting Oracle NetSuite adapter toPlanning dimensions (metadata rule):

```
{
"jobType":"INTEGRATION",
"jobName":"NetsuiteMetadataLoad",
"periodName":"{Jan-20}{Mar-20}",
"importMode":"REPLACE",
"exportMode":"NONE",
"targetOptions":{
    "Refresh Database":"Yes",
    "Dimension Name":"Product"
}
```

Example of Oracle ERP Cloud (Payables Transactions):

Example of Quick Mode integration:

```
{
{
    "jobType":"INTEGRATION",
    "jobName":"QuickMode_LOC1_DL1",
    "periodName":"{Jan-17}",
    "importMode":"Direct",
    "exportMode":"Merge",
    "executionMode":"ASYNC"
}
```

#### Response

Supported Media Types: application/json

### **Running a Pipeline**

Executes a Pipeline based on job parameters and variables that you select.

The Pipeline jobtype supports running a Pipeline based on the variable list (depends on how many variables have been defined for the Pipeline in the Data Integration user interface.)

#### **Prerequisites:**

- You must have predefined the Pipeline to run it.
- You must have the required privileges to execute a Pipeline.

#### **REST Resource**

```
/aif/rest/{api_version}/jobs
```

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Method:

POST

#### Payload:

#### **REST Payload Description**

The following table summarizes the REST payload.

#### Table 15-7 Parameters

Name	Description	Туре	Required	Default
api_version	V1	Path	Yes	
jobType	PIPELINE	JSON payload	Yes	

Name	Description	Туре	Required	Default
jobName	The Pipeline code defined for the Pipeline in Data Integration.	JSON payload	Yes	
	The code can contain up to 30 alphanumeric characters with a minimum of 3 characters and a maximum of 30 characters. This code cannot be updated after a Pipeline is created.			
variables	Name of the variable(s) used in the Pipeline.	JSON payload	No	
	The list depends on how many variables have been defined in the Pipeline.			
	The default out-of-box variables include:			
	STARTPERIOD			
	ENDPERIOD			
	<ul><li>IMPORTMODE</li><li>EXPORTMODE</li></ul>			
	ATTACH_LOGS			
	• SEND_MAIL			
	• SEND_TO			
STARTPERIOD	The first period for which data is to be loaded. This period name must be defined in Data Integration Period mapping.		Yes	
	You can also specify a Planning substitution variable whereby a substitution variable can be specified instead of the actual Year/Month member names for the start period.			
	The convention is {Month#&CurYr} {&FcstMonth#&CurYr}; for example, {Jan#&CurYr} {&FcstMonth#&CurYr}.			
	A combination of both actual member names as well as substitution variables is supported.			
	This parameter is supported in the Planning, Tax Reporting, and Financial Consolidation and Close business processes. It is functional for both your service applications and cloud deployments derived from on- premises data sources.			
ENDPERIOD	The last period for which data is to be loaded. This period name must be defined in Data Integration period mapping.	JSON payload	Yes	
	You can also specify a Planning substitution variable whereby a substitution variable can be specified instead of the actual Year/Month member names for the start period.			
	The convention is {Month#&CurYr} {&FcstMonth#&CurYr}; for example, {Jan#&CurYr} {&FcstMonth#&CurYr}.			
	A combination of both actual member names as well as substitution variables is supported.			
	This parameter is supported in the Planning, Tax Reporting, and Financial Consolidation and Close business processes. It is functional for both your service applications and cloud deployments derived from on- premises data sources.			

#### Table 15-7(Cont.) Parameters

Name	Description	Туре	Required Default
IMPORTMODE	Determines how the data is imported into Data Integration. Acceptable values are: • Append—Add to the existing POV data in Data		Yes
	<ul> <li>Integration.</li> <li>Replace—Delete the POV data and replace it with t data from the file.</li> </ul>	he	
	<ul> <li>Map and Validate—Skip importing the data, but re process the data with updated Mappings and Logic Accounts.</li> </ul>		
	<ul> <li>No Import—Skip data import into Data Integration staging table.</li> </ul>	l	
exportMode	Determines how the data is exported into Data Integration. Acceptable values for Planning business processes are:		Yes
	<ul> <li>Merge—Merge the data in the Data Integration staging table with the existing Planning data.</li> </ul>		
	<ul> <li>Replace—Clear the POV data and replace it with data in the Data Integration staging table. The data cleared for Scenario, Version, Year, Period, and Entity dimensions.</li> </ul>	ı is	
	• Accumulate—Add the data in the Data Integration staging table to Planning.		
	<ul> <li>No Export—Skip data export from Data Integration to Planning.</li> </ul>		
	Acceptable values for Financial Consolidation and Clos and Tax Reporting are:		
	<ul> <li>Merge—Merge the data in the staging table with th data in the Financial Consolidation and Close and Tax Reporting application.</li> </ul>	ie	
	If data already exists in the application, the system overwrites the existing data with the new data from the load file. If data does not exist, the new data is created.		
	• Replace—Delete the POV data and replace it with t data from the file.	he	
	<ul> <li>No Export—Skip the data export from Data Integration to Financial Consolidation and Close or Tax Reporting</li> </ul>	r	
ATTACH_LOGS	• Yes—Logs are zipped and included as an attachme to an email, which can then be download	nt	No
	<ul> <li>No—Logs are not included as an attachment to an email.</li> </ul>		

#### Table 15-7(Cont.) Parameters

#### Table 15-7 (Cont.) Parameters

Name	Description	Туре	Required Default
SEND_MAIL	Determines when an email is sent when a Pipeline is run. Options include:		
	Always		
	No—Default value		
	• On Failure		
	On Success		
	For variables, the default value is set in the Pipeline definition. Overriding individual variables is done by passing it in the JSON payload, for example, STARTPERIOD.		
SEND_TO	Determines the recipient email ID for the email notification.		No
	Email IDs are comma separated.		

### Import Data Mapping

Member mappings are used to derive the target members for each dimension based on source value. Member mappings are referenced during the data load, enabling Data Integration to determine how to dimensionalize the data that is loaded to the target application. Member mappings define relationships between source members and target dimension members within a single dimension. You must create a member mapping for each target dimension.

You can import member mappings from a selected Excel, .CSV or .TXT file. You can also create new mappings in a text file and import them. Import member mappings support merge or replace modes, along with validate or no validate options for target members.

#### **REST Resource**

POST /aif/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 15-8 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V1	Path	Yes	None
jobType	The job type, MAPPINGIMPORT	Path	Yes	None
jobName	The dimension name for a specific dimension to import, such as ACCOUNT, or ALL to import all dimensions	Path	Yes	None

Name	Description	Туре	Required	Default
fileName	The file and path from which to import mappings. The file format can be .CSV, .TXT, .XLS, or .XLSX. The file must be uploaded prior to importing, either to the inbox or to a sub-directory of the inbox. Include the inbox in the file path, for example,inbox/ BESSAPPJan-06.csv	Path	Yes	None
importMode	The import mode: MERGE to add new rules or replace existing rules, or REPLACE to clear prior mapping rules before import	Path	No	MERGE
validationMode	Whether to use validation mode, true or false An entry of true validates the target members against the target application; false loads the mapping file without any validations. Note that the validation process is resource intensive and takes longer than the validation mode of false; the option selected by most customers is false	Path	No	false
locationName	The Data Integration location where the mapping rules should be loaded; mapping rules are specific to a location in Data Integration.	Path	No	None

#### Table 15-8 (Cont.) Parameters

Example of Request Body

The following shows an example of the request body in JSON format.

```
{
"jobType":"MAPPINGIMPORT",
"jobName":"ACCOUNT"
"fileName":"inbox/BESSAPPJan-06.csv",
"importMode":"MERGE",
"validationMode":"false",
"locationName":"BESSAPP"
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

#### Response

The following table summarizes the response parameters.

#### Table 15-9 Parameters

Name	Description		
jobId	The process ID generated in Data Management for the job, such as 1880		
jobStatus	The job status, such as RUNNING		
logFileName	Log file containing entries for this execution, such as outbox/logs/ BESSAPP-DB_1880.log		
outputFileName	Name of the output file generated, if any, or else null		
processType	Type of process executed, IMPORT_MAPPING		
executedBy	Login name of the user used to execute the rule, such as admin		
details	Returns the exception stack trace in case of an application error, or null		

Supported Media Types: application/json

Parameters

#### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
"links":
[
0]
"status":"-1"
"details":"null"
"jobId":"1880"
"jobStatus":"RUNNING",
"logFileName":"nulbox/logs/BESSAPP-DB_1880.log",
"outputFileName":"null",
"processType":"IMPORT_MAPPING",
"executedBy":"admin"
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

### **Export Data Mapping**

Member mappings are used to derive the target members for each dimension based on source value. Member mappings are referenced during the data load, enabling Data Integration to determine how to dimensionalize the data that is loaded to the target application. Member mappings define relationships between source members and target dimension members within a single dimension. You must create a member mapping for each target dimension.

You can export member mappings to a selected file of format .csv, .txt, .xls, or .xlsx.

#### **REST Resource**

```
POST /aif/rest/{api_version}/jobs
```

#### **Required Roles**

Service Administrator, Power User

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 15-10 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V1	Path	Yes	None
јоbТуре	The job type, MAPPINGEXPORT	Path	Yes	None
jobName	The dimension name for a specific dimension to import, such as ACCOUNT, or ALL to import all dimensions	Path	Yes	None
fileName	The file and path from which to export mappings. The file format can be .CSV, .TXT, .XLS, or .XLSX. Include the outbox in the file path, for example, outbox/BESSAPPJan-06.csv	Path	Yes	None
locationName	The name of the location, such as BESSAPP	Path	Yes	None

#### Example of Request Body

The following shows an example of the request body in JSON format.

```
{
"jobType":"MAPPINGEXPORT",
"jobName":"ACCOUNT",
"fileName":"outbox/BESSAPPJan-06.csv",
"locationName":"BESSAPP"
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

#### Response

The following table summarizes the response parameters.

#### Table 15-11 Parameters

Name	Description
jobId	The process ID generated in Data Integration for the job, such as 1881
jobStatus	The job status, such as SUCCESS
logFileName	Log file containing entries for this execution, such as outbox/logs/ BESSAPP-DB_1881.log
outputFileName	Name of the output file generated, such asoutbox/ BESSAPPJan-06.csv
processType	The type of process executed, EXPORT_MAPPING

#### Table 15-11 (Cont.) Parameters

Name Description	
executedBy	Login name of the user used to execute the rule, such as admin
details	Returns the exception stack trace in case of an application error, or else null

Supported Media Types: application/json

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
"links":
[
0]
"status":"0",
"details":"null",
"jobId":"1881",
"jobStatus":"SUCCESS",
"logFileName":"outbox/logs/BESSAPP-DB_1881.log",
"outputFileName":"outbox/BESSAPPJan-06.csv",
"processType":"EXPORT_MAPPING",
"executedBy":"admin"
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

### **Export Data Integration**

The Export Data Integration API enables you to back up setup and staging data in Data Integration as a snapshot.

#### **REST Resource**

/aif/rest/V1/snapshots

#### **Required Roles**

Service Administrator, Power User

Method

POST

{

#### Request

Supported Media Types: application/json

#### Sample REST API Payload for Export Data Integration

```
"action":"EXPORT",
"snapshotType":"ALL",
```

```
"fileName":"MyBackup.zip",
"overwriteFile":true
```

The following table summarizes the client request.

#### Table 15-12 Parameters

}

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V1.	Path	Yes	None
action	EXPORT	Payload	Yes	None
snapshottype	<ul> <li>Snapshot type: ALL, ALL_INCREMENTAL, INCREMENTAL, SETUP</li> <li>ALL—Include all setup and staging data.</li> <li>ALL_INCREMENTAL—Include only new or changed staging data based on the POV since the last snapshot was exported and include SETUP and all POVs (old and new) in the output file.</li> <li>INCREMENTAL—Include only new or changed staging data based on the POV since the last snapshot was exported and include only SETUP and new POVs in the output file.</li> <li>SETUP—Include only setup data.</li> </ul>	Payload	Yes	None
fileName	Name of the output file in ZIP format. This file is generated in the outbox as: outbox/ <filename>.zip.</filename>	Payload	Yes	None
	If the file doesn't end with a ZIP extension, Data Management appends the ZIP file extension at the end of the file name.			
overwriteFile	true/false—Boolean option to specify whether or not to replace the output file specified in the filename parameter. This parameter prevents a user from accidentally overwriting the output file if it already exists by throwing a HTTP 400 error.	Payload	No	false

#### Response

The following table summarizes the response parameters.

Name	Description
action	Always EXPORT
snapshotType	Name of the snapshot type
jobId	The process ID generated in Data Integration for the job, such as 1880
links	Describes links to other resources and actions applicable on the current resource.
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 =cancel pending; 3 = cancelled; 4 = invalid parameter;Integer.MAX_VALUE = unknown

#### Table 15-13 Parameters

Supported Media Types: application/json

The following shows an example of the response in JSON format.

```
{
    "action": "EXPORT",
    "snapshotType": "SETUP",
    "jobId": 423,
    "links": [
        {
            "rel": "self",
                "href": "https://<BASE-URL>/aif/rest/v1/jobs/jobID",
                "action": "GET"
        }
    ],
    "status": -1
}
```

### **Import Data Integration**

The Import Data Integration API enables you to restore setup and staging data from one environment to another. The system clears the existing data in the target environment and then imports the data from the backup files without merging any operations.

#### **REST Resource**

/aif/rest/V1/snapshots

#### **Required Roles**

Service Administrator, Power User

Method

POST

#### Request

Supported Media Types: application/json

#### Sample REST API Payload for Import Data Integration

```
{
    "action":"IMPORT",
    "fileName":"inbox/MyBackup.zip"
}
```

The following table summarizes the client request.

#### Table 15-14 Parameters

Name	Description	Туре	Required	Default
action	IMPORT	Payload	Yes	None
filename	File name of the import snapshot (for example: inbox/ <filename>.zip, or inbox/ mybackup/<filename>.zip).</filename></filename>	Payload	Yes	None
	If no path is specified, it is assumed that the file is in the Data Integration root folder. (Files to the Data Integration root folder can only be uploaded from the Data Integration user interface.)			

#### Response

The following table summarizes the response parameters.

#### Table 15-15 Parameters

Name	Description
action	Always IMPORT
jobId	The process ID generated in Data Integration for an import Data Integration job is "0."
links	Describes links to other resources and actions applicable on the current resource.
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 =cancel pending; 3 = cancelled; 4 = invalid parameter;Integer.MAX_VALUE = unknown

Supported Media Types: application/json

The following shows an example of the response in JSON format.

```
{
    "action": "IMPORT",
    "jobId": 0,
    "links": [
        {
            "rel": "self",
            "rel": "self",
            "self",
```

```
"href": "https://<BASE-URL>/aif/rest/v1/jobs/jobID",
"action": "GET"
}
],
"status": -1
}
```

### **Retrieve Job Status**

Polls the environment to get the processing state for a job with a specified ID.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. **Required Roles** 

Service Administrator, Power User

#### **Rest Resource**

```
GET /application/rest/{api_version}/applications/{application}/jobs/
{jobIdentifier}
```

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

Table 15-16	<b>Parameters</b>
-------------	-------------------

Name	Description
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 = cancel pending; 3 = cancelled; 4 = invalid parameter; Integer.MAX_VALUE = unknown
details	Details about the job status, such as "SUCCESS" when member mappings have been processed successfully.
jobID	The ID of the job, such as 228
jobName	The name of the job, such as BESSAPP
descriptiveStatus	The status of the job, such as Completed or Error

Supported Media Types: application/json

Example of Response Body

The following is an example of the response body in JSON format that shows the job status when member mappings are exported.

```
{
"links":
```

```
[
0]
"status":"0",
"details":"null",
"jobId":"1881",
"jobStatus":"SUCCESS",
"logFileName":"outbox/logs/BESSAPP-DB_1881.log",
"outputFileName":"outbox/BESSAPPJan-06.csv",
"processType":"EXPORT_MAPPING",
"executedBy":"admin"
}
```

# 16 Data Management REST APIs

Use the Data Management REST APIs to run data rules and batch rules.

#### Note:

All REST APIs used for Data Integration can be used as REST APIs for Data Management.

### **URL Structure for Data Management**

#### **URL Structure**

Use the following URL structure to access the Data Management REST resources:

https://<BASE-URL>/aif/rest/{api version}/{path}

#### Where:

<BASE-URL>: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- api\_version: API version you are developing with. The current REST API version for Data Management is V1.
- *path*: Identifies the resource.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ <code>internal/"</code> in the URL.

### **Getting API Versions for Data Management APIs**

You can manage versions using the set of REST resources summarized in the following table.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Getting API Versions for Data Management APIs	GET	/aif/rest/
Get Information about a Specific API Version for Data Management APIs	GET	/aif/rest/{apiVersion}

#### Table 16-1 Manage Versions of Data Management APIs

### Get API Versions for Data Management APIs

Returns information about which versions are available and supported. Multiple versions might be supported simultaneously.

#### Note:

An API version is always supported even when deprecated.

#### **REST Resource**

GET /aif/rest/

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 16-2 Parameters

Name Description		
items	Detailed information about the API	
version	The version, such as V1	
lifecycle	Possible values: active, deprecated	
isLatest	Whether this resource is the latest, true or false	

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
"items": [1]
{
"version": "V1"
"isLatest": "true"
"lifecycle": "active"
"links": [3]
{
   "rel": "self"
   "href": "https://<BASE-URL>/aif/rest/"
  "action": "GET"
  },{
   "rel": "canonical"
   "href": "https://<BASE-URL>/aif/rest/"
  "action": "GET"
   },{
   "rel": "current"
  "href": https://<BASE-URL>/aif/rest/V1"
  "action": "GET"
   }
}
}
```

Get Information about a Specific API Version for Data Management APIs

Returns details for a specific REST API version for Data Management.

#### **REST Resource**

```
GET /aif/rest/{api_version}
```

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 16-3 Parameters

Name	Description
api_version	Version of the API you are developing with, such as V1

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 16-4 Parameters

Name	Description
version	The version, such as V1
lifecycle	Lifecycle of the resource, active or deprecated
isLatest	Whether this resource is the latest, true or false

#### Example of Response Body

The following shows an example of the response body in JSON format.

### Running Data Rules in Data Management

Executes a Data Management data load rule based on the start period and end period, and import or export options that you specify.

#### Prerequisites

- Data Rules: Data load rules define how Integrations load data from a file. You must have predefined data load rules to load data.
- You must have the required privileges to execute a specific data rule.

#### **REST Resource**

POST /aif/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request.

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V1	Path	Yes	None
јоbТуре	should be set to "DATARULE"		Yes	None
jobName	The name of a data load rule defined in Data Management. You should enclose the rule name in quotation marks if it contains a space.		Yes	None
startPeriod	The first period for which data is to be loaded. This period name must be defined in Data Management period mapping.		Yes	None
endPeriod	The last period for which data is to be loaded. This period name must be defined in Data Management period mapping.		Yes	None
importMode	Determines how the data is imported into Data Management. Acceptable values are:		Yes	None
	<ul> <li>APPEND to add to the existing POV data in Data Management</li> <li>REPLACE to delete the POV data and replace it with the data from the file.</li> <li>RECALCULATE to skip importing the data, but re-process the data with updated Mappings and Logic Accounts.</li> <li>NONE to skip data import into Data Management staging table</li> </ul>			

#### Table 16-5 Parameters

Name	Description	Туре	Required	Default
exportMode	<ul> <li>Determines how the data is exported into Data Management.</li> <li>Acceptable values for Planning Modules and Planning are:</li> <li>STORE_DATA to merge the data in the Data Management staging table with the existing Planning data</li> <li>ADD_DATA to add the data in the Data Management staging table to Planning</li> <li>SUBTRACT_DATA to subtract the data in the Data Management staging table to Planning</li> <li>SUBTRACT_DATA to clear the POV data and replace it with data in the Data Management staging table. The data is cleared for Scenario, Version, Year, Period, and Entity</li> <li>NONE to skip data export from Data Management to Planning</li> <li>Acceptable values for Financial Consolidation and Close and Tax Reporting are:</li> <li>REPLACE to delete the POV data and replace it with the data from the file</li> <li>MERGE: By default, all data load is processed in the Merge mode. If data already existed in the application, the system overwrites the existing data with the new data from the load file. If</li> </ul>	Type	Yes	None
	data does not exist, the new data will be created.			
fileName	• NONE to skip the data export An optional file name. If you do not specify a file name, this API imports the data contained in the file name specified in the load data rule. The data file must already reside in the Inbox prior to data rule execution.		Yes	None
	Import data files from the EPM INBOX accessible from the Applications-Inbox/ Outbox Explorer using a file name. Reference the files in this folder using #epminbox/ <filename>.</filename>			

#### Table 16-5 (Cont.) Parameters

#### Example URL

https://<BASE-URL>/aif/rest/V1/jobs
Example of Request Body

```
{"jobType":"DATARULE",
"jobName":"aso to bso dr",
"startPeriod":"Dec-18",
"endPeriod":"Dec-18",
```

```
"importMode":"REPLACE",
"exportMode":"NONE",
"fileName":"#epminbox/TestData.txt"
}
```

#### Response

Supported Media Types: application/json

#### Table 16-6 Parameters

Name	Description
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 = cancel pending; 3 = cancelled; 4 = invalid parameter
jobStatus	A text representation of the job status, with one of the following values" RUNNING," "SUCCESS," and "FAILED".
jobId	The process ID generated in Data Management for the job
logFileName	Log File containing entries for this execution.
outputFileName	Name of the output file generated, if any.
processType	Type of the process executed. Will contain "COMM_LOAD_BALANCES" for all Data Rule executions
executedBy	Login name of the user used to execute the rule.
details	Returns the exception stack trace in case of an application error

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "jobStatus": "RUNNING",
    "jobId": 2019,
    "logFileName": "\outbox\logs\Account Reconciliation Manager_2019.log",
    "outputFileName": null,
    "processType": "COMM_LOAD_BALANCES",
    "executedBy": "admin",
    "status": -1,
    "links": [1],
        0:    {
            "rel": "self",
            "href": "https://<BASE-URL>/aif/rest/V1/jobs/2019",
            "action": "GET",
    }
    "details": null
}
```

### **Running Batch Rules**

Executes a batch of jobs that have been defined in Data Management .

#### Prerequisites

- The batch must be defined in Data Management before it can be executed using the REST API.
- You must have the required privileges to execute a specific batch.

#### **REST Resource**

POST /aif/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 16-7 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V1	Path	Yes	None
јоbТуре	should be set to "BATCH"		Yes	None
jobName	The name of a batch defined ir Data Management.	ו	Yes	None

#### Example URL

https://<BASE-URL>/aif/rest/V1/jobs
Example of Request Body

```
{"jobType":"BATCH",
"jobName":"BatchDataLoad"
}
```

#### Response

The following table summarizes the response parameters.

#### Table 16-8 Parameters

Name	Description
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 = cancel pending; 3 = cancelled; 4 = invalid parameter
jobStatus	A text representation of the job status, with one of the following values "RUNNING", "SUCCESS". "FAILED"
jobld	The process Id generated in Data Management for the job
logFileName	Log File containing entries for this execution.
outputFileName	Name of the output file generated, if any.
processType	Type of the process executed. Will contain "COMM_BATCH" for all Data Rule executions
executedBy	Login name of the user used to execute the rule.
details	Returns the exception stack trace in case of an application error

Supported Media Types: application/json

#### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
    "jobStatus": "SUCCESS",
"jobId": 2024,
"logFileName": "\outbox\logs\BATCH1 7595.log",
"outputFileName": null,
"processType": "COMM BATCH",
"executedBy": "admin",
"status": -1,
"links": [1],
    0: {
    "rel": "self",
    "href": "https://<BASE-URL>/aif/rest/V1/jobs/2016",
    "action": "GET",
}
"details": null
}
```

For sample code, see the code samples included in Running Data Rules in Data Management.

### **Retrieve Job Status**

Polls the environment to get the processing state for a job with a specified ID.

Using this REST API requires prerequisites, such as understanding how to use jobs. See Prerequisites. Be sure that you understand how to use jobs as described in Managing Jobs. Required Roles

Service Administrator, Power User

#### **REST Resource**

```
GET /application/rest/{api_version}/applications/{application}/jobs/
{jobIdentifier}
```

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 16-9 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
applicationName	The name of the application	Path	Yes	None
jobIdentifier	The ID of the job	Path	Yes	None

#### Response

Parameters

The following table summarizes the response parameters.

#### Table 16-10 Parameters

Name	Description
status	Status of the job: -1 = in progress; 0 = success; 1 = error; 2 = cancel pending; 3 = cancelled; 4 = invalid parameter; Integer.MAX_VALUE = unknown
details	Details about the job status, such as "SUCCESS" when a batch has processed successfully.
jobID	The ID of the job, such as 226
jobName	The name of the job, such as BATCH1
descriptiveStatus	The status of the job, such as Completed or Error

Supported Media Types: application/json

#### Example of Response Body

The following shows an example of the response body in JSON format when a batch is run.

```
{
"jobStatus": "SUCCESS",
"jobId": 2024,
"logFileName": "\outbox\logs\BATCH1 7595.log",
"outputFileName": null,
"processType": "COMM BATCH",
"executedBy": "admin",
"status": -1,
"links": [1],
   0: {
   "rel": "self",
   "href": "https://<SERVICE_NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/aif/rest/V1/jobs/2024,
   "action": "GET"
}
"details": null
}
```

# 17 Account Reconciliation APIs

Use the Account Reconciliation REST APIs to get the REST API version, create reconciliations, change period status, import pre-mapped transactions, import profiles, import currency rates, import balances, import pre-mapped balances, monitor reconciliations, and retrieve job status. In Transaction Matching, you can use REST APIs to import pre-mapped transactions, or run auto match.

### **URL Structure for Account Reconciliation**

This topic shows the general URL structure for Account Reconciliation REST APIs..

Use the following URL structure to access the Account Reconciliation REST resources:

https://<BASE-URL>/armARCS/rest/{api version}/{path}

#### Where:

• <BASE-URL>: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- *api\_version*: API version you are developing with. The current REST API version for Account Reconciliation is V1.
- *path*: Identifies the resource.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ internal/" in the URL.

### Getting API Versions for Account Reconciliation REST APIs

You can manage versions using the set of REST resources summarized in the following table.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

Task	Request	REST Resource
Get API Versions for Account Reconciliation REST APIs	GET	/armARCS/rest/
Get Information about a Specific API Version for Account Reconciliation REST APIs	GET	<pre>/armARCS/rest/{apiVersion}</pre>

#### Table 17-1 Manage Versions of Account Reconciliation APIs

### Get API Versions for Account Reconciliation REST APIs

Returns information about which versions are available and supported. Multiple versions might be supported simultaneously.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

GET /armARCS/rest/

#### Request

Supported Media Types: application/json

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 17-2 Parameters

details status	In case of errors, details are published with the error string
atatua	
Status	See Migration Status Codes
items	Version of the API you are developing with
version	The version, such as v1
lifecycle	Possible values: active, deprecated
isLatest	Whether this resource is the latest, true or false
links	Detailed information about the link
href	Links to API call

Name	Description
action	The HTTP call type
rel	Can be self or Job Status. If set to Job Status, you can use the href to get the status of the import operation
data	The parameters as key value pairs passed in the request

Table 17-2 (Cont.) Parameters

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
   "items": [{
        "isLatest": false,
        "lifecycle": "deprecated",
        "version": "v1",
        "links": [{
             "href": "https://<SERVICE_NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
            "rel": "canonical"
        }, {
            "href": "https://<SERVICE_NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
            "rel": "successor-version"
        }]
    }, {
        "isLatest": true,
        "lifecycle": "active",
        "version": "v1",
        "links": [{
            "href": "https://<SERVICE_NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
            "rel": "canonical"
        }, {
            "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
            "rel": "predecessor-version"
        }]
   }],
    "links": [{
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
        "rel": "canonical"
    }, {
        "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
        "rel": "current"
   }]
}
```

# Get Information about a Specific API Version for Account Reconciliation REST APIs

Returns details for a specific REST API version for Account Reconciliation.

#### **REST Resource**

GET /armARCS/rest/{api\_version}

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 17-3 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, such as V1	Path	Yes	None

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 17-4 Parameters

Name	Description
version	The version, such as v1
lifecycle	Possible values: active, deprecated
isLatest	Whether this resource is the latest, true or false
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	The parameters as key value pairs passed in the request

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
"version": "v1",
"lifecycle": "active",
"isLatest": true,
"links": [{
"rel": "canonical",
"href": "https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
}, {
"rel": "predecessor-version",
"href": "https://<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1",
}]
}
```

### Execute a Job in Account Reconciliation

Use this resource to execute a job by providing the job name and type.

The job is expected to be defined in Account Reconciliation with all the required parameters saved with the job definition. For some job types, the parameters can be either provided or overwritten at runtime.

#### **Reconciliation Compliance Supported Job Types:**

- CREATE\_RECONCILIATIONS
- SET\_PERIOD\_STATUS
- IMPORT\_PREMAPPED\_TRANSACTIONS
- IMPORT\_PREMAPPED\_PROFILES
- IMPORT\_RATES
- IMPORT\_BALANCES
- MONITOR\_RECONCILIATIONS
- IMPORT\_PREMAPPED\_BALANCES

#### **Transaction Matching Supported Job Types:**

- IMPORTTMPREMAPPEDTRANSACTIONS
- RUNAUTOMATCH

This topic describes general information for executing a job. Details for each job type are described in separate topics for individual jobs.

#### **REST Resource**

**POST** /armARCS/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

This table summarizes the request parameters that are generic to all jobs. The following tables describe parameters specific to individual rules.

#### Table 17-5 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

Example URL

https://<BASE-URL>/armARCS/rest/v1/jobs

#### Response

Supported Media Types: application/json

#### Parameters

This table summarizes the response parameters that are generic to all jobs. The following tables describe parameters specific to individual rules.

Name		Description
jobName		The name of the job, such as Create Reconciliations
period		The name of period, such as July2016
	Note:	
	For monitor_reconciliation s, the parameter is periodName.	

#### Table 17-6 Parameters

Name		Description
filter	_	The name of filter, such as MyFilter
	Note:	
	For monitor_reconciliation s, the parameter is filterName.	

#### Table 17-6 (Cont.) Parameters

### **Retrieve Periods with a Specific Status**

Retrieves a list of periods based on the specified status.

#### **REST Resource**

GET /armARCS/rest/periods?status={status}

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this API.

#### Table 17-7 GET PERIODS

Name	Description	Required	Туре
status	<ul> <li>Status of the periods to be retrieved. The value can be one of the following:</li> <li>OPEN - All open periods</li> <li>CLOSED - All closed periods</li> <li>LOCKED - All locked periods</li> <li>PENDING - All pending periods</li> <li>OPEN_PENDING - All open or pending periods</li> <li>ALL - All periods</li> </ul>	Yes	Query

#### Example URLs

https://<BASE-URL>oraclecloud.com/armARCS/rest/periods?status=ALL

https://<BASE-URL>/armARCS/rest/periods?status=OPEN PENDING

#### Response

Supported Media Types: application/json

Parameters:

Name	Description	
details	In case of errors, details are published with the error string	
status	Status of the request. See Migration Status Codes.	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
items	List of periods with the specified status. The format is:	
	<pre>{     "Status": <status code="">,     "Id": <internal id="" period="">,     "Name": <name of="" period="" the=""> }</name></internal></status></pre>	
	<ul> <li>The status code can be one of the following:</li> <li>51 - PENDING</li> <li>52 - OPEN</li> <li>53 - CLOSED</li> <li>54 - LOCKED</li> </ul>	

#### Table 17-8 Parameters

Example of Response Body

The following is an example of the response body, in JSON format.

```
{
  "type": "ARCS",
  "items": [
    {
       "Status": "53",
       "Id": "10000000135004",
       "Name": "January 2022"
    },
    {
       "Status": "53",
       "Id": "10000000135007",
       "Name": "February 2022"
    },
    {
}
```

```
"Status": "53",
      "Id": "10000000135009",
      "Name": "March 2022"
    },
    {
      "Status": "53",
      "Id": "10000000135011",
      "Name": "April 2022"
    }
  ],
  "status": 0,
  "links": [
    {
      "rel": "self",
      "href": "https://<BASE-URL>/armARCS/rest/periods",
      "action": "GET"
    }
  ]
}
```

### Change Period Status (Reconciliation Compliance)

Changes the status of a period (open, closed, pending, locked) and returns the success or failure status.

When a period's status is changed to Open, the returned job corresponds to the opening of reconciliations for the specified period. The job's success or failure does not impact the period's status because this change is made immediately. Even if there are failures while reopening reconciliations, the period status still remains Open.

If a period's status is set to Closed or Locked, no job is returned.

#### **REST Resource**

POST /armARCS/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, SET_PERIOD_STATUS	Yes
period	The name of the period, such as July2016	Yes
status	Status to be changed; supported values: pending, open, closed, locked	Yes

#### Table 17-9 SET PERIOD STATUS

#### Example of request body

#### Response

Supported Media Types: application/json

Parameters:

Table 17-	- <b>10</b>	Parameters
-----------	-------------	------------

Name	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes. When the period's status is changed to Open, the status of the job that opens reconciliations for the specified period is sent as additional information. Use this additional information to check the status of the open reconciliations job.	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type	
data	Parameters as key value pairs passed in the request	

#### Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "type": "ARCS",
    "status": -1,
    "details": "In Process",
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE_NAME>-
```

```
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1/jobs/2141",
"action": "GET"
}
]
}
```

### Create Reconciliation (Reconciliation Compliance)

Copies all selected profiles to a period and returns success or failure status.

#### **REST Resource**

```
POST /armARCS/rest/{api version}/jobs
```

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job. For additional parameters that are common to all jobs, see Execute a Job.

Table 17-11	. RULES
-------------	---------

Name	Description	Required	Default
api_version	Version of the API you are working with, such as v1.	Yes	None
jobName	The name of a job, CREATE_RECONCILIATIONS.	Yes	None
period	The name of the period, such as July2016	Yes	None
filter	The name of filter, such as MyFilter	No	None

#### Example of request body

```
{
  "jobName" : "CREATE_RECONCILIATIONS",
  "parameters": {
         "period":"July2016",
         "filter":"MyFilter"
         }
}
```

Response

Parameters:

Name	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type	
data	Parameters as key value pairs passed in the request	

Table 17-12 Parameters

#### Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "type": "ARCS",
  "status": -1,
  "details": "In Process",
  "links": [
    {
        "rel": "self",
        "href": "https://<SERVICE_NAME>-
    <TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1/jobs/2141",
        "action": "GET"
    }
  ]
}
```

### **Delete Profile**

Deletes an Account Reconciliation profile.

#### **REST Resource**

POST /armARCS/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User, User

Users with User predefined role may require additional application roles.

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

#### Table 17-13 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with: v1	Path	Yes	None
jobname	The name of the job, DELETE_PROFILE	Payload	Yes	None
accountId	The name of the profile that must be deleted.	Payload	Yes	None

#### Example of Request Body

```
{
    "jobName": "DELETE_PROFILE",
    "parameters": {
        "accountId": "101-1234-5678",
    }
}
```

#### Response

#### Parameters

The following table summarizes the response parameters.

Name	Description
type	The value is "RC".
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

#### Table 17-14 Parameters

Supported Media Types: application/json

#### Example of Response Body

### ]

### Import Pre-Mapped Balances (Reconciliation Compliance)

Imports pre-mapped balances and returns the success or failure status.

#### **REST Resource**

POST /armARCS/rest/{api version}/jobs

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

#### Table 17-15 IMPORT\_PREMAPPED\_BALANCES

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, IMPORT_PREMAPPED_BALANCES	Yes
period	The name of the period, such as July2016	Yes
balanceType	Supported balance types are SRC for source system balance, and SUB for subsystem balance	Yes
currencyBucket	Currency bucket such as Functional	Yes
file	Name of the import file, such as balances.csv	Yes

#### Example of request body

{

}

```
"jobName" : "IMPORT_PREMAPPED_BALANCES",
"parameters": {
    "period":"July2016",
    "balanceType":"SRC",
    "file":"balances.csv",
    "currencyBucket":"Functional"
    }
```

ORACLE

#### Response

Supported Media Types: application/json

Parameters:

#### Table 17-16 Parameters

Name	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type	
data	Parameters as key value pairs passed in the request	

#### Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "type": "ARCS",
  "status": -1,
  "details": "In Process",
  "links": [
    {
        "rel": "self",
        "href": "https://<SERVICE_NAME>-
    </texted>
<
```

# Import Pre-Mapped Transactions (Reconciliation Compliance)

Imports pre-mapped transactions for a particular period and returns the success or failure status.

#### **REST Resource**

POST /armARCS/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

# Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Table 17-17 IMPORT\_PREMAPPED\_TRANSACTIONS

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, IMPORT_PREMAPPED_TRANSACTIONS	Yes
transactionType	<ul> <li>Transaction Type is one of the following:</li> <li>BEX for loading Balance Explanations</li> <li>SRC for loading Source System Adjustments</li> <li>SUB for loading Subsystem Adjustments</li> <li>VEX for loading Variance Explanations</li> </ul>	Yes
file	The file name, such as transactions.csv	
dateFormat	Date Format, such as DD/MM/YYYY, MMM d, yyyy, or All	Yes

## Example of request body

```
{
  "jobName" : "IMPORT_PREMAPPED_TRANSACTIONS",
  "parameters": {
            "period":"July2016",
            "transactionType":"SRC",
            "file":"transactions.csv",
            "dateFormat": "MMM d,yyyy"
            }
}
```

# Response

Supported Media Types: application/json

Parameters:

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Relationship type

# Table 17-18 (Cont.) Parameters

Name	Description
data	Parameters as key value pairs passed in the request

Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "type": "ARCS",
  "status": -1,
  "details": "In Process",
  "links": [
    {
        "rel": "self",
        "href": "https://<SERVICE_NAME>-
    </texted>
        </texted>

        <
```

# Import Balances (Reconciliation Compliance)

Imports balances data using Data Management from a previously created Data Load definition, and returns success or failure status.

When using Data Management, if a data load rule fails, the Account Reconciliation log file includes a message such as the following:

```
Dataload process failed for process {JOB_ID}. Check the Data Management log
for more details.
Data Management log file name: {LOG_FILE_NAME}
Detailed error from Data Management process: {DETAILS}
```

Refer to the Data Management log file to understand the reason for the job failure. If multiple data load rules fail, a separate log is created for each data load rule.

#### **REST Resource**

POST /armARCS/rest/{api version}/jobs/

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request.

#### Table 17-19 IMPORT\_BALANCES

Name	Description	Path	Required
api_version	Version of the API you are working with, such as v1	Yes	Yes
jobName	The name of the job, IMPORT_BALANCES	No	Yes
period	The name of the period, such as April 2016	No	Yes
dl_Definition	The name of a previously saved data load using the format DL_name.	No	Yes

# Example of request body

```
{
  "jobName" : "IMPORT_BALANCES",
    "parameters": {
        "period":"April 2016",
        "dl_Definition":"DL_test"
        }
}
```

#### Response

Supported Media Types: application/json

Parameters:

Name	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to the API call	
action	The HTTP call type	
rel	Relationship type (self, Job Status). if set to Job Status, you can use the href to get the status of the operation	
data	Parameters as key value pairs passed in the request	

Example of Response Body

The following is an example of the response body in JSON format.

```
{
"type": "ARCS",
"status": -1,
"details": "In Process",
```

```

```

# Import Profiles (Reconciliation Compliance)

Imports profiles and returns the success or failure status.

#### **REST Resource**

POST /armARCS/rest/{api version}/jobs

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, IMPORT_PROFILES	Yes
importType	The import type; supported values are Replace and ReplaceAll	Yes
period	The period for which to import, such as July2016	
profileType	The profile type; supported values are Profiles and Children	Yes
fileLocation	The file name, such as profiles.csv	Yes
dateFormat	Date Format, such as DD/MM/YYYY, MMM d, yyyy, or All	Yes

# Table 17-21 IMPORT\_PROFILES

# Example of request body

```
"period":"July2016",
    "importType":"Replace",
    "fileLocation":"profiles.csv",
    "dateFormat": "MMM d,yyyy"
    }
```

}

#### Response

Supported Media Types: application/json

Parameters:

Table 17-22 Parameters	,
------------------------	---

Name	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type	
data	Parameters as key value pairs passed in the request	

#### Example of Response Body

The following is an example of the response body in JSON format.

# Import Rates (Reconciliation Compliance)

Imports rates for a particular period and rate type, and returns the success or failure status.

#### **REST Resource**

POST /armARCS/rest/{api version}/jobs

### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

# Table 17-23 IMPORT\_RATES

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, IMPORT_RATES	Yes
period	The name of the period, such as July2016	Yes
rateType	The rate type, such as Accounting	Yes
file	Name of the import file, such as rates.csv	Yes
importType	Supported import types are Replace and ReplaceAll	Yes

# Example of request body

```
{
  "jobName" : "IMPORT_RATES",
  "parameters": {
        "period":"July2016",
        "rateType":"Accounting",
        "file":"rates.csv",
        "importType":"ReplaceAll"
        }
}
```

#### Response

Supported Media Types: application/json

Parameters:

arameters

Name	Description	
details	In case of errors, details are published with the error string	
status	See Migration Status Codes	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	

# Table 17-24 (Cont.) Parameters

Name	Description
rel	Relationship type
data	Parameters as key value pairs passed in the request

Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "type": "ARCS",
  "status": -1,
  "details": "In Process",
  "links": [
    {
        "rel": "self",

</
```

# Import Pre-Mapped Transactions (Transaction Matching)

Imports a file of pre-mapped transactions into Transaction Matching, and returns the success or failure status.

#### **REST Resource**

POST /arm/rest/{api\_version}/jobs

### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

### Table 17-25 IMPORTTMPREMAPPEDTRANSACTIONS

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes

Name	Description	Required
jobName	The name of a job, IMPORT_PREMAPPED_TRANSACTIONS	Yes
dataSource	Text ID of the data source where the transaction will be imported to	
file	The file name, such as transactions.csv	
reconciliationType	Text ID of the reconciliation type where the transaction file will be imported to	Yes
dateFormat	Date Format is a parameter that includes the format of the date fields in the transactions import file. The default is DD/MM/YYYY. Other supported date formats are MM/dd/yyyy, dd/MM/yyyy, MM-dd-yyyy, d-M-yyyy, and MMM d.yyyy.	Yes

Table 17-25 (Cont.) IMPORTTMPREMAPPEDTRANSACTIONS

# Example of request body

```
"jobName" : "importtmpremappedtransactions",
"parameters": {
    "dataSource":"CLEARING",
    "reconciliationType":"CLEARING",
    "file":"clearingTransaction.csv",
    "dateFormat": "MM-DD-YYYY"
    }
```

#### Response

{

}

Supported Media Types: application/json

Parameters:

Table 17-26 Parameters	s
------------------------	---

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

# Example of Response Body

The following is an example of the response body in JSON format.

```
{
"type": "TM",
```

```
"status": -1,
"details": "In Process",
"links": [
    {
        "rel": "self",
        "href": "https://<SERVICE_NAME>-

        "action": "GET"
    }
]
}
```

# Import Attribute Values

Imports attribute values into an existing list attribute or group attribute. In Transaction Matching, you can only import group attributes.

## **REST Resource**

POST /armARCS/rest/{api\_version}/jobs

## **Required Roles**

Service Administrator, Power User

Users with Power User predefined role may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

### Table 17-27 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with: v1	Path	Yes	None
jobname	The name of the job, IMPORT_ATTRIBUTE_VALUES	Payload	Yes	None
importType	The import type. Supported values are Replace, Replace All, and Update.	Payload	No	Replace
fileLocation	The file name containing the values to be imported; example: StoreData.csv	Payload	Yes	None

# Table 17-27 (Cont.) Parameters

Name	Description	Туре	Required	Default
dateFormat	Format of date fields in the import file. Supported date formats are as follows: d MMM, yyyy MMM d, yyyy MM/dd/yyyy dd/MM/yyyy dd/MM/yyyy dd-Myyyy dd-MMM-yyy dd-MMM-yyy	Payload	No	dd-MMM-yyyy
attribute	The name of the list attribute or group attribute into which values must be imported.	Payload	Yes	None
module	The name of the module. Supported values are: RC for Reconciliation Compliance and TM for Transaction Matching.	Payload	Yes	None

Example of Request Body

```
{
"jobName" : "IMPORT_ATTRIBUTE_VALUES",
"parameters": {
"attribute":"Store",
"importType":"Replace",
"fileLocation":"StoreData.csv",
"dateFormat": "MMM d,yyyy",
"module": "RC"}
}
```

### Response

Parameters

The following table summarizes the response parameters.

# Table 17-28 Parameters

Name	Description
type	The application type
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call or status API
action	The HTTP call type
rel	Relationship type

Supported Media Types: application/json

# Example of Response Body

```
{
"type": "ARCS",
"status": -1,
"details": "In Process",
"links": [
{
    "rel": "self",
    "href": "https://<SERVICE_NAME>-
    <TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/oraclecloud.com/arm/rest/
fcmapi/v1/RC/job/2141",
    "action": "GET"
}
]
```

# Monitor Reconciliations (Reconciliation Compliance)

Returns the list of reconciliations for a given period name and filter name.

### Note:

- If the Reconciliation status for all the Reconciliations in the given Period Name and Filter Name were closed, then the output status would be '0'.
- If the Reconciliations status for any one of the Reconciliations in the given Period Name and Filter Name is open, then the output status would be '-1'.

#### **REST Resource**

POST /armARCS/rest/{api version}/jobs/

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

Name	Description	Path	Required
api_version	Version of the API you are working with, such as v1	Yes	Yes
jobName	The name of the job, MONITOR_RECONCILIATIONS	No	Yes
periodName	The name of the period, such as September 2017	No	Yes
filterName	The name of the filter. For example, Recon status filter.	No	Yes

# Table 17-29 MONITOR\_RECONCILIATIONS

# Example of request body

```
{
  "parameters":
  {"periodName":"September 2017","filterName":"DemoFilter"},
  "jobName":"MONITOR_RECONCILIATIONS"
}
```

#### Response

Supported Media Types: application/json

Parameters:

#### Table 17-30 Parameters

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link
href	Links to the API call
action	The HTTP call type
rel	Relationship type (self, Job Status). if set to Job Status, you can use the href to get the status of the operation
data	Parameters as key value pairs passed in the request

#### Examples of Response Body

The following is an example of the response body in JSON format when all reconciliations are closed:

```
{
"error":null,
"details":"Account ID : 100-1210, Name : Accounts Receivable, Status :
Closed",
"items":null,
"status":0,
```

```
"link":null,
"links":[{"action":"GET", "rel":"self", "href":"https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1/jobs/
monitorReconciliations/September%202017/DemoFilter"}],
"type":"ARCS"
}
```

The following is an example of the response body in JSON format when any reconciliation status is open:

```
{
"error":null,
"details":"Account ID : 100-1210, Name : Accounts Receivable, Status : Open",
"items":null,
"status":-1,
"link":null,
"links":[{"action":"GET", "rel":"self", "href":"https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1/jobs/
monitorReconciliations/September%202017/DemoFilter"}],
"type":"ARCS"
}
```

# Import Reconciliation Attributes (Reconciliation Compliance)

Performs flat file loads of attribute values into existing reconciliations.

#### **REST Resource**

POST /armARCS/rest/{api version}/jobs

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

# Table 17-31 Import Reconciliation Attributes

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, IMPORT_RECONCILIATION_ATTRIBUTES	Yes
fileName	The name of the upload import file	Yes
period	The name of the period, such as $July2020$	Yes

Name	Description	Required
rules	The rules to run upon completion. Allowed values are: <ul> <li>ALL</li> <li>SET ATTR. VAL (Set Attribute Value)</li> </ul>	No
	<ul> <li>SET_ATTR_VAL(Set Attribute Value)</li> <li>CRT_ALT (Create Alert)</li> <li>AUTO_APP(Auto Approve Reconciliation)</li> <li>AUTO_SUB(Auto Submit Reconciliation)</li> <li>You can send multiple values separated by</li> </ul>	
reopen	comma. Default is None.	No
reopen	reconciliations upon completion. Values is either true or false (default).	NO
dateFormat	List of valid date formats, such asDD/MM/ YYYY. You can send multiple values separated by semi-colon.	No

# Table 17-31 (Cont.) Import Reconciliation Attributes

Here are some examples of the request body:

# Example 1

```
{
    "jobName" : "IMPORT_RECONCILIATION_ATTRIBUTES",
    "parameters":
        {
          "fileName":"import_recon.csv",
          "period":"January 2010",
          "rules":"AUTO_APP,AUTO_SUB",
          "reopen":"true",
          "dateformat":"MM-dd-yyyy;MMM d, yyyy"
        }
}
```

### Example 2

```
{
   "jobName" : "IMPORT_RECONCILIATION_ATTRIBUTES",
   "parameters":
    {
        "fileName":"Reconciliations.csv",
        "period":"June 2019",
        "rules":"AUTO_APP,AUTO_SUB",
        "reopen":"true"
    }
}
```

## Example 3

{

"jobName" : "IMPORT\_RECONCILIATION\_ATTRIBUTES",

```
"parameters":
    {
        "fileName":"import_recon.csv",
        "period":"January 2010",
        "rules":"ALL",
        "reopen":"true"
    }
```

# Example 4

}

```
{
   "jobName" : "IMPORT_RECONCILIATION_ATTRIBUTES",
   "parameters":
        {
            "fileName":"Reconciliations.csv",
            "period":"June 2019"
        }
}
```

### Response

Supported Media Types: application/json

Parameters:

### Table 17-32 Parameters

Name	Description	
details	In case of errors, details are published with the error string	
status	<ul> <li>-1 = In Progress</li> </ul>	
	• 0 = Success	
	• 1 = Fail	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type. Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation.	

# Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "type": "ARCS",
    "links": [
        {
            "rel": "self",

            "action": "GET"
        }
    ],
```

```
"details": "In Process",
"status": -1
```

# Run Auto Match (Transaction Matching)

Runs the auto match process in Transaction Matching.

### **REST Resource**

}

POST /arm/rest/{api version}/jobs

### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

# Table 17-33 runautomatch

Name	Description	Required
api_version	Version of the API you are working with, such as v1	Yes
jobName	The name of a job, runautomatch	Yes
ReconTypeId	The Text ID of the Reconciliation type to be auto matched	Yes

#### Example of request body

```
{"jobName":"runautomatch",
"parameters":{"reconTypeId":"INTERCO"}}
```

### Response

Supported Media Types: application/json

Parameters:

### Table 17-34 Parameters

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
links	Detailed information about the link

Name	Description
href	Links to API call or status API
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

# Table 17-34 (Cont.) Parameters

Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "type": "TM",
  "status": -1,
  "details": "In Process",
  "links": [
    {
      "rel": "self",
      "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/arm/rest/v1/jobs/2141",
      "action": "GET"
    }
 ],
  "error": null,
 "items": null,
  "link": null
}
```

# Purge Transactions (Transaction Matching)

Removes matched transactions for Account Reconciliation using the provided parameters.

You can specify filterOperator and filterValue to further filter the matched transactions. Otherwise, all matched transactions older than or equal to the age from all accounts for the specified matchType are purged.

#### **REST Resource**

```
POST /arm/rest/{api version}/jobs
```

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Users with Power User, User, and Viewer predefined roles may require additional application roles.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Name	Description	Туре	Required	Values
api_version	Version of the API you are working with, such as v1	Path	Yes	v1
jobName	The name of a job	Payload	Yes	purgetransactions
ReconTypeId	The identifier (TextID) of the match type from which matched transactions should be deleted	Payload	Yes	Example: CLEARING
matchedStatu s	The status of the transactions to be deleted. The only value currently supported is matched.	Payload	No	Default value: matched
age	Identifies the number of days since the transaction was matched. Matched transactions older than or equal to this value will be deleted.	Payload	Yes	Example: 180
filterOperat or	Optionally, use one of the following filter conditions to identify the accounts containing matched transactions for deletion. This value is combined with the filterValue to identify the accounts from which matched transactions should be purged: • EQUALS • NOT_EQUALS • NOT_EQUALS • STARTS_WITH • ENDS_WITH • CONTAINS • NOT_CONTAINS	Payload	No	Examples: EQUALS Starts_With

# Table 17-35 Parameters

Name	Description	Туре	Required	Values
filterValue	Optionally use one or more filter values to identify the transactions to purge. Use a space- separated list to specify multiple values as shown in the examples. If multiple values are specified, transactions from accounts matching any filter operator and filter value combination are selected for purging. EQUALS and NOT_EQUALS support multiple values. STARTS_WITH, ENDS_WITH, CONTAINS, and NOT_CONTAINS only support a single value.	Payload	No	Examples: ["101-1234","102-12 34"] ["102"]
logFileName	Optionally, enter the name of a log file to record information about the API activity.	Payload	No	If a file name is not specified, a log file named PurgeTransactions_J ob_ID is automatically generated. The file is located in the Outbox.

# Table 17-35 (Cont.) Parameters

# Example of request body

Example of purging matched transactions 120 days or older for CLEARING match type and accounts equal to 101-1234 and 102-1234:

Example of purging matched transactions 120 days or older for CLEARING match type and accounts start with 101:

```
{
    "jobName" : "purgetransactions",
    "parameters":
```

```
{
    "reconTypeId" : "CLEARING",
    "age" : 120,
        "filterOperator":"STARTS_WITH",
                      "filterValue" : ["101"],
                     "logFileName" : "purge-clearing"
}
```

#### Response

}

Supported Media Types: application/json

Parameters:

Table 17-36 Para	amet	ters
------------------	------	------

    ]
}
```

# **Export Application Properties**

Exports Account Reconciliation application settings (related to Redwood Experience, theme, email notification, and business process name), background image, and logo image to a JSON file so that you can import them into the same or another environment.

This command is useful when you import an application from prod to test environments. If your application settings are different in prod and test environments, you can export them from the test environment before importing the application from the prod environment, and then import the settings in to the test environment to maintain the original settings.

You can download the export file using the Download REST API. This is a synchronous API.

#### **REST Resource**

POST /arm/rest/fcmapi/{api version}/rc/export/applicationproperties

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Name	Description	Required	Default
fileName	The name of the JSON file that stores the exported property values.	Yes	None
	Use the Upload API to upload the file to the target environment and then restore these settings in the target environment, as described in Import Application Properties.		
properties	The comma-separated list of properties to be exported.	No	All valid properties are exported.
	Valid values include the following:		
	Theme exports the display     theme used in the     environment		
	<ul> <li>EmailNotification exports the email notification settings defined in the environment</li> </ul>		
	<ul> <li>DisplayBusinessProcessN ame exports whether to display the business process name on the page in the</li> </ul>		
	environment		
	<ul> <li>RedwoodExperience exports the Redwood Experience setting of the environment</li> </ul>		
	• BackgroundImage exports the backgound image used in the environment		
	LogoImage exports the logo     image used in the     environment		

# Table 17-41 EXPORT APPLICATION PROPERTIES

#### Examples of request body

Example 1: Exporting all exportable application properties

```
{
  "fileName": "ApplicationProperties.json"
}
```

# Example 2: Exporting specific application properties

```
{
   "fileName": "ApplicationProperties.json",
   "properties":["Theme", "EmailNotification", "DisplayBusinessProcessName",
   "RedwoodExperience"]
}
```

## Response

Supported Media Types: application/json

#### Parameters:

Name	Description	
details	In case of errors, details are published with the error string.	
status	Status of the job:	
	<ul> <li>-1 = In Progress</li> </ul>	
	• 0 = Success	
	• 1 = Fail	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type. It can be self or export-content. If the export succeeds, you can use the href to download the exported file.	

### Table 17-42 Parameters

Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "details": "Application properties exported successfully",
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/rc/
export/applicationproperties",
            "action": "POST"
        },
        {
            "rel": "export-content",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1/
ApplicationProperties.json/contents",
            "action": "GET"
        }
    ],
    "status": 0,
    "type": "RC",
    "link": {},
    "error": null,
    "items": []
}
```

# **Import Application Properties**

Imports Account Reconciliation application settings (related to Redwood Experience, theme, email notification, and business process name), background image, and logo image from an export file into an Account Reconciliation environment.

The export file is available for import after the file is uploaded using the Upload REST API. This a synchronous API.

### **REST Resource**

POST /arm/rest/fcmapi/{api version}/rc/import/applicationproperties

# **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

# Table 17-43 IMPORT APPLICATION PROPERTIES

Name	Description	Required	Default
api_version	The REST API version for the API. This release is v1.	Yes	v1
fileName	The name of the JSON file that contains exported property values from another environment.	Yes	None
	This file, exported from another environment as described in Export Application Properties, must be available in the environment where you are restoring application settings.		

Example of request body

```
{
   "fileName":"applicationProperties.json"
}
```

### Response

Supported Media Types: application/json

Parameters:

Table 17-44	Parameters
-------------	------------

Name	Description
details	In case of errors, details are published with the error string
status	Status of the job:
	<ul> <li>-1 = In Progress</li> </ul>
	• 0 = Success
	• 1 = Fail
links	Detailed information about the link
href	Links to API call or status API

# Table 17-44 (Cont.) Parameters

Name	Description
action	The HTTP call type
rel	Relationship type. Possible values: self.

Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "details": "Application properties imported successfully",
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/rc/
import/applicationproperties",
            "action": "POST"
    ],
    "status": 0,
    "type": "RC",
    "link": {},
    "error": null,
    "items": []
}
```

# Export Background Image

Exports the background image used in an Account Reconciliation environment to a JPG file so that you can import it into another environment.

You can download the image file using the Download REST API. This is a synchronous API.

#### **REST Resource**

POST /arm/rest/fcmapi/{api version}/rc/export/backgroundImage

### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Name	Description	Required	Default
api_version	The current REST API version for the API. For example, v1 for this API.	Yes	v1
fileName	The name for the background image file in JPG, JPEG, GIF, or PNG format.	Yes	None
	Use the Upload API to upload the background image file to the target environment and then import it into the target environment, as described in Import Background Image.		

## Table 17-45 EXPORT BACKGROUND IMAGE

Example of request body

```
{
   "fileName":"backgroundImage.jpg"
}
```

# Response

Supported Media Types: application/json

Parameters:

Table 17-46 F	Parameters
---------------	------------

Name	Description	
details	In case of errors, details are published with the error string	
status	Status of the job:	
	<ul> <li>-1 = In Progress</li> </ul>	
	• 0 = Success	
	• 1 = Fail	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type. It can be self or export-content. If the export succeeds, you can use the href to download the exported file.	

# Example of Response Body

The following is an example of the response body in JSON format.

```
{
   "details": "Background Image exported successfully",
   "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE NAME>-
```

```
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/rc/
export/backgroundImage",
            "action": "POST"
        },
        {
            "rel": "export-content",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/interop/rest/11.1.2.3.600/
applicationsnapshots/bgImage.jpg/contents",
            "action": "GET"
        }
    ],
    "status": 0,
    "type": "RC",
    "link": {},
    "error": null,
    "items": []
}
```

# Import Background Image

Imports the background image from an export file into an Account Reconciliation environment and then sets it as the current background image.

The image will be available for import after you upload the file using the Upload REST API. This is a synchronous API.

#### **REST Resource**

POST /arm/rest/fcmapi/{api version}/rc/import/backgroundImage

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

#### Table 17-47 IMPORT BACKGROUND IMAGE

Name	Description	Required	Default
api_version	The current REST API version for the API. For example, v1 for this API.	Yes	v1
fileName	The name of the background image file that was exported from another environment. Supported formats include JPG, JPEG, GIF, and PNG.	Yes	None

### Example of request body

```
{
   "fileName":"backgroundImage.jpg"
}
```

# Response

Supported Media Types: application/json

Parameters:

Name	Description	
details	In case of errors, details are published with the error string	
status	Status of the job:	
	<ul> <li>-1 = In Progress</li> </ul>	
	• 0 = Success	
	• 1 = Fail	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type. Possible values: self.	

# Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "details": "Background image imported successfully.",
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/rc/
import/backgroundImage",
            "action": "POST"
        }
    ],
    "status": 0,
    "type": "RC",
    "link": {},
    "error": null,
    "items": []
}
```

# Export Logo Image

Exports the corporate logo used in an Account Reconciliation business process to a JPG file so that you can import it into another environment.

The exported file can be download using the Download REST API. This is an asynchronous API.

#### **REST Resource**

POST /arm/rest/fcmapi/{api version}/rc/export/logo

# **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

### Table 17-49 EXPORT LOGO IMAGE

Name	Description	Required	Default
api_version	The current REST API version for the API. For example, v1 for this API.	Yes	v1
fileName	The name of the logo image file in JPG, JPEG, GIF, or PNG format.	Yes	None
	Use the Upload API to upload the background image file to the target environment and then import it into the target environment, as described in Import Logo Image.		

Example of request body

```
{
    "fileName":"logo.jpg"
}
```

# Response

Supported Media Types: application/json

Parameters:

Name	Description	
details	In case of errors, details are published with the error string.	
status	Status of the job:	
	<ul> <li>-1 = In Progress</li> </ul>	
	• 0 = Success	
	• 1 = Fail	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type. It can be self or export-content. If the export succeeds, you can use the href to get the status of the import operation.	

# Table 17-50Parameters

#### Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/arm/rest/fcmapi/v1/RC/
export/logo",
            "action": "POST"
        },
        {
            "rel": "export-content",
            "href": "<SERVICE NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/interop/rest/11.1.2.3.600/
applicationsnapshots/logo.jpg/contents",
            "action": "GET"
        }
    ],
    "details": "Logo image exported successfully.",
    "type": "RC",
    "status": 0,
    "link": {},
    "error": null,
    "items": []
}
```

# Import Logo Image

Imports the corporate logo used in an Account Reconciliation environment from an export file into another environment.

The logo is available for import after you upload the image file using the Upload REST API. This is an asynchronous API.

## **REST Resource**

POST /arm/rest/fcmapi/{api version}/rc/import/logo

# **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

### Table 17-51 IMPORT LOG IMAGE

Name	Description	Required	Default
api_version	The current REST API version for the API. For example, v1 for this API.	Yes	v1
fileName	The name of the logo image file that contains the image to be imported. Supported formats include JPG, JPEG, GIF, and PNG.	Yes	None

Example of request body

```
{
    "fileName":"logo.jpg"
}
```

### Response

Supported Media Types: application/json

Parameters:

# Table 17-52 Parameters

Name	Description	
details	In case of errors, details are published with the error string.	
status	Status of the job:	
	<ul> <li>-1 = In Progress</li> </ul>	
	• 0 = Success	
	• 1 = Fail	
links	Detailed information about the link	
href	Links to API call or status API	
action	The HTTP call type	
rel	Relationship type. Possible values: self.	

#### Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "<SERVICE NAME>-

    "link": {},
    "error": null,
    "items": []
}
```

## Working with Connections in Account Reconciliation

Use these REST APIs to work with connections.

With multiple environments, using REST APIs saves you time and effort by automating the process of logging in and configuring connections. For information about accessing environments, see Accessing EPM Cloud.

Table 17-53	Working with Connections in Account Reconciliation
-------------	--

Task	Request	REST Resource
Create a Connection	POST	<pre>/arm/rest/fcmapi/{api_version}/{module}/ connections</pre>
View All Connections	GET	<pre>/arm/rest/fcmapi/{api_version}/{module}/ connections</pre>
Update a Connection	PUT	<pre>/arm/rest/fcmapi/{api_version}/{module}/ connections/{id}</pre>
Delete a Connection	DELETE	<pre>/arm/rest/fcmapi/{api_version}/{module}/ connections/{id}</pre>

### Create a Connection

Use this REST API to create a connection that will be saved in an application.

#### **REST Resource**

POST /arm/rest/fcmapi/{api version}/{module}/connections

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request parameters specific to this job.

#### Table 17-54Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which to create a connection. For Account Reconciliation, set this value to RC.	Path	Yes	None
url	The URL of the connection, such as https:// < <i>BASE-URL</i> >	Payload	Yes	None
username	A username with the Service Administrator predefined role	Payload	Yes	None
password	The encrypted password for the user For security reasons, only an encrypted password is allowed. Use the EPM Automate encrypt command to generate the encrypted password. See encrypt.	Payload	Yes	None
type	<ul> <li>The type of connection. Valid values include the following:</li> <li>ENTERPRISE_JOURNALS - for Enterprise Journals connections</li> <li>OBJECT_STORAGE - for Object Storage connections</li> </ul>	Payload	Yes	None

#### Example URL

https://<BASE-URL>/arm/rest/fcmapi/v1/rc/connections

#### Example of Request Body

```
{
    "url": "https://<BASE-URL>",
    "username": "<NEW_USERNAME>",
    "password": "<NEW_PASSWORD>",
    "type" : "ENTERPRISE_JOURNALS"
}
```

#### Response

Supported Media Type: application/json

#### Table 17-55 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.

#### Example of Response Body

```
{
  "details": "Connection created successfully."
}
```

## **View All Connections**

Use this REST API to view details for all of the connections saved in an application.

#### **Required Roles**

Service Administrator

#### **REST Resource**

GET /arm/rest/fcmapi/{api version}/{module}/connections

#### Request

Parameters:

The following table summarizes the client request.

#### Table 17-56 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which to view connections. For Account Reconciliation, set this value to RC.	Path	Yes	None

#### Example URL

https://<BASE-URL>/arm/rest/fcmapi/v1/rc/connections

#### Response

Supported Media Types: application/json

The following table summarizes the parameters.

#### Table 17-57 Parameters

Parameters	Description
items	Collection of information about the resource
id	Unique identifier for the connection, such as 1c89922d-92ba-46c1-850f- e2a8a416ddf2
type	The type of connection
url	The URL of the connection, such as https:// <base-url></base-url>
links	Detailed information about the link
details	In case of errors, details are published with the error string

#### Example Response

```
{
    "links": [
        {
            "rel": "self",
            "href": "http://<BASE-URL>/arm/rest/fcmapi/v1/rc/connections",
            "action": "GET"
        }
    ],
    "details": null,
    "items": [
        {
            "username": "ats admin2",
            "password": null,
            "url": "https://<BASE-URL>",
            "id": 10000000558005,
            "type": "ENTERPRISE JOURNALS"
        }
    ]
}
```

## Update a Connection

Use this REST API to update a specific connection that is saved in an application.

#### **REST Resource**

PUT /arm/rest/fcmapi/{api version}/{module}/connections/{id}

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

#### Table 17-58 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which to update a connection. For Account Reconciliation, set this parameter to RC.	Path	Yes	None
id	The identifier of the connection that must be updated	Path	Yes	None
url	The URL of the connection, such as https:// < <i>BASE-URL</i> >	Payload	Yes	None

Name	Description	Туре	Required	Default
username	A username with Service Administrator predefined role	Payload	Yes	None
password	The encrypted password for the user	Payload	Yes	None
	For security reasons, only an encrypted password is allowed. Use the EPM Automate encrypt command to generate the encrypted password. See encrypt.			
type	<ul> <li>The type of connection. Valid values include the following:</li> <li>ENTERPRISE_JOURNALS - for Enterprise Journals connections</li> <li>OBJECT_STORAGE - for Object Storage connections</li> </ul>	Payload	Yes	None

#### Table 17-58 (Cont.) Parameters

#### Example URL

https://<BASE-URL>/arm/rest/fcmapi/v1/rc/connections/10000000658005

#### Example of Request Body

```
{
    "url": "https://<SERVICE_NAME>-
    <TENANT_NAME>.<SERVICE_TYPE>.<dcx>.oraclecloud.com",
    "username": "<NEW_USERNAME>",
    "password": "<NEW_PASSWORD>"
}
```

#### Response

Supported Media Type: application/json

#### Table 17-59 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.

#### Example of Response Body

Example 1:

```
{
   "details": "Connection updated successfully."
}
```

#### Example 2:

```
{
  "details": "Invalid parameters. Test Connection is failed"
}
```

### Delete a Connection

Use this REST API to delete a specific connection that is saved in an application.

#### **Required Roles**

Service Administrator

#### **REST Resource**

DELETE /arm/rest/fcmapi/{api version}/{module}/connections/{id}

#### Request

Parameters:

The following table summarizes the client request.

#### Table 17-60 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which to delete a connection. For Account Reconciliation, set this parameter to RC.	Path	Yes	None
id	The identifier of the connection that must be deleted	Path	Yes	None

#### Example URL

https://<BASE-URL>/arm/rest/fcmapi/v1/rc/connections/10000000552006

#### Response

Supported Media Type: application/json

#### Table 17-61 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.

Example of Response Body

```
{
  "details": "Connection deleted successfully."
}
```

# Set Application Access Level

Sets the access level for an Account Reconciliation application. You can specify that the application can be accessed only by Service Administrators or by all users.

#### **REST Resource**

POST /armARCS/rest/{api\_version}/appaccess

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request parameters.

#### Table 17-62 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
access	<ul> <li>Specify the access level for users. Valid values include the following:</li> <li>ALL_USERS - all users can access the application</li> <li>ADMINISTRATORS - only Service Administrators can access the application</li> </ul>	Payload	Yes	None

Examples of Request Body

#### Example 1

{
 "access": "ALL\_USERS"
}

#### Example 2

```
{
    "access": "ADMINISTRATORS"
}
```

#### Response

#### Table 17-63 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.
status	See Migration Status Codes
links	Detailed information about the link

#### Example of Response Body

```
{
   "status": 0,
   "details": "Application access updated successfully",
   "links": [
        {
            "rel": "self",
            "href": "http://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/armARCS/rest/v1/appaccess",
            "action": "GET",
            "data": null
        }
   ]
}
```

## **Retrieve Application Access Level**

Returns the access level for an Account Reconciliation application, indicating if all users can access the application or only Service Administrators can access the application.

#### **REST Resource**

GET /armARCS/rest/{api\_version}/appaccess

#### **Required Roles**

Service Administrator

#### Request

Parameters:

The following table summarizes the client request parameters.

#### Table 17-64 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None

#### Example URL

https://<BASE-URL>/armARCS/rest/v1/appacess

#### Response

Supported Media Type: application/json

Table 17-65	Parameters
-------------	------------

Parameters	Description
links	Detailed information about the link
access	<ul> <li>Indicates the access level for users.</li> <li>ALL_USERS - all users can access the application</li> <li>ADMINISTRATORS - only Service Administrators can access the application</li> </ul>

Example of Response Body

```
{
    "items": [
        {
            "access": "ALL_USERS"
        }
    ],
    "links": [
        {
            "rel": "self",
            "href": "https://<BASE-URL>/armARCS/rest/v1/appaccess",
            "action": "GET",
            "data": null
        }
    ]
}
```

## **View Reconciliation Comments**

Returns all the comments, including attachments, for the specified reconciliation.

#### **REST Resource**

```
GET /armARCS/rest/{api_version}/period/{period}/reconciliation/
{accountId}/comments
```

#### **Required Roles**

Service Administrator, Power User, User, Viewer

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request specific to this job.

#### Table 17-66 VIEW RECONCILIATION COMMENTS

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v1	Path	Yes	None
period	The name of the reconciliation's period	Path	Yes	None
accountId	The Account ID of the reconciliation for which comments must be retrieved	Path	Yes	None

Example URL

https:// <SERVICE\_NAME>-<TENANT\_NAME>.<SERVICE\_TYPE>.<dcX>.oraclecloud.com/ armARCS/rest/v1/period/Jan 2022/reconciliation/101-BC2-Premapped/comments

#### Response

Supported Media Types: application/json

Example of Response Body

The following is an example of a reconciliation with one comment and two attachments.

```
[
    {
        "commentId": 10000002580008,
        "parentObjectId": 10000001956143,
        "commentText": "Please investigate the alert on the account. The Risk
Rating has been increased.",
        "postedBy": "admin1",
        "postedDate": "Oct 6, 2022 4:03 PM",
        "carryForward": null,
        "references": [
            {
                "referenceId": 10000002580012,
                "type": "FILE",
                "url": null,
                "name": "adjustment1.pdf",
                "fileDownloadLink": "https://<BASE-URL>/arm/rest/fcmapi/v1/rc/
references/10000002580012/file"
            },
            {
                "referenceId": 10000002580010,
                "type": "URL",
                "url": "https://www.my-example.com",
                "name": "my-example",
                "fileDownloadLink": null
        ]
    }
1
```

# Archive Matched Transactions (Transaction Matching)

Archives matched transactions, including support and adjustment details, that are equal to or older than a specified age. The matched transactions are stored in an archive file.

#### **REST Resource**

POST /arm/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request specific to this job.

#### Table 17-67 ARCHIVE MATCHED TRANSACTIONS

Name	Description	Туре	Required
api_version	Version of the API you are working with: v1	Path	Yes
jobName	The name of a job, archivetransactions	Payload	Yes
reconTypeId	The TextID of the match type from which matched transactions must be archived	Payload	Yes
age	Matched transactions older than or equal to this value will be archived	Payload	Yes
filterOperator	Filter to identify the accounts	Payload	No
	Valid values are EQUALS, NOT_EQUALS, STARTS_WITH, ENDS_WITH, CONTAINS, NOT_CONTAINS		
filterValue	The Account IDs for the filter operation	Payload	No
logFileName	The name of the log file If a file name is not provided, the log file is named Archive_Transactions_ <recon TypeId&gt;_<job_id>.log.</job_id></recon 	Payload	Νο
fileName	The name of the archive zip file If a file name is not provided, the archive file is named Archive_Transactions_ <recon TypeId&gt;_<job_id>.zip.</job_id></recon 	Payload	No

#### Example of request body

```
{
  "jobName": "archivetransactions",
  "parameters": {
    "reconTypeId": "Pos2Processor",
    "age": 120,
    "logFileName" : "Archive_Transactions_IC120XXXX.log",
    "fileName" : "Archived_Transactions_IC120XXXX.zip",
    "filterOperator": "EQUALS",
    "filterValue": [
        "201-1234",
        "202-1234"
    ]
  }
}
```

#### Response

Supported Media Types: application/json

Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "type": "TM",
    "items": null,
    "error": null,
    "link": null,
    "status": -1,
    "details": null,
    "links": [
        {
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/arm/rest/v1/jobs/
10000003846005",
            "action": "GET",
            "rel": "self",
            "data": null
        }
    ]
}
```

To get the status of the archive matched transactions job and view its details, see Retrieve Job Status (Transaction Matching).

# Purge Archived Transactions (Transaction Matching)

Purges matched transactions that are already archived in Transaction Matching.

#### **REST Resource**

POST /arm/rest/{api\_version}/jobs

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request specific to this job.

#### Table 17-68 PURGE ARCHIVED TRANSACTIONS

Name	Description	Туре	Required	
api_version	Version of the API you are working with: v1	Path	Yes	
jobName	The name of a job, purgearchivetransactions	Payload	Yes	
jobId	Job Id of the Archive job which needs to be purged	Payload	Yes	
logFileName	The name of the log file If a file name is not provided, the log file is named Purge_Transactions_ <reconty peId&gt;_<job_id>.log.</job_id></reconty 	Payload	No	

Example of request body

```
{
  "jobName": "purgearchivetransactions",
  "parameters": {
     "jobId": "100000003801002"
     "logFileName" : "Purge_Archive_Transactions_IC120XXXX.log"
}
```

#### Response

Supported Media Types: application/json

Example of Response Body

The following is an example of the response body in JSON format.

To get the status of the purge archived transactions job and view its details, see Retrieve Job Status (Transaction Matching).

# **Unmatch Matched Transactions (Transaction Matching)**

Unmatches matched transactions in Transaction Matching. Users must specify the match type and one or more match Ids associated with this match type for which transactions must be unmatched.

For Transaction Matching profiles that are integrated with Reconciliation Compliance, the unmatch operation is skipped if the Accounting Date of one or more transactions that are being unmatched is lower than the Purge Through Date of the reconciliation.

#### **REST Resource**

POST /arm/rest/{api version}/jobs

#### **Required Roles**

Service Administrator, Power User, Preparer

The user who created a profile can also unmatch transactions associated with that profile.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request specific to this job.

#### Table 17-69 UNMATCH MATCHED TRANSACTIONS

Name	Description	Туре	Required
api_version	Version of the API you are working with: v1	Path	Yes
jobName	The name of a job, such as unmatchtransactions	Payload	Yes
matchTypeTextId	The ID of the match type to which the matched transactions belong	Payload	Yes

Name	Description	Туре	Required
matchIds	The Match Ids, in a comma separated array Transactions with the following status are considered for unmatching: Confirmed Match, Confirmed Adjust, Suggested Match, Suggested Adjust.	Payload	Yes
forceReopen	<ul> <li>Valid values are:</li> <li>True - Reconciliations will be reopened if the Adjustment Accounting Date is less than the Closed Through Date.</li> <li>False - Matched transactions whose Adjustment Accounting Date is less than the Closed Through Date are skipped. This is the default setting.</li> </ul>		No

#### Table 17-69 (Cont.) UNMATCH MATCHED TRANSACTIONS

Example of request body

```
{
  "jobName": "unmatchtransactions",
  "parameters": {
    "matchTypeTextId": "IC120",
    "matchIds":[9195754,9219755],
    "forceReopen": false
   }
}
```

#### Response

Supported Media Types: application/json

Example of Response Body

The following is an example of the response body in JSON format.

} ]

To get the status of the unmatch transactions job and view its details, see Retrieve Job Status (Transaction Matching).

# Update Unmatched Transactions (Transaction Matching)

Updates one or more editable attributes in an unmatched transaction.

#### **REST Resource**

```
POST /arm/rest/{api_version}/dataSources/{dataSource}/transactions/
{transaction}
```

#### **Required Roles**

Service Administrator, Power User, Preparer

The user who created a profile can also update transactions associated with that profile.

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request specific to this job.

#### Table 17-70UPDATE UNMATCHED TRANSACTIONS

Name	Description	Туре	Required
api_version	Version of the API you are working with: v1	Path	Yes
dataSource	Text ID of the data source associated with the unmatched transaction whose attributes must be updated	Path	Yes
transaction	Transaction ID of the unmatched transaction whose attributes must be updated	Path	Yes
reconId	Text Id of the reconciliation associated with the unmatched transaction that must be updated	Payload	Yes
attributeId	Text Id of the attribute within the unmatched transaction that must be updated	Payload	Yes

Name	Description	Туре	Required
calculate	<ul> <li>Set to one of the following values:</li> <li>True - Values of calculated attributes are recalculated</li> <li>False - Values of calculated attributes are left unchanged.</li> <li>The default setting is False.</li> </ul>	Payload	No
forceReopen	<ul> <li>Valid values are:</li> <li>True - Reconciliations will be reopened if the Adjustment Accounting Date is less than the Closed Through Date.</li> <li>False - Matched transactions whose Adjustment Accounting Date is less than the Closed Through Date are skipped. This is the default setting.</li> </ul>		No

#### Table 17-70 (Cont.) UPDATE UNMATCHED TRANSACTIONS

#### Example URL

```
https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/arm/rest/v1/
dataSources/POS/transactions/1012
```

#### Example of request body

```
{
    "reconId": "INTERCO133",
    "attributeId": "POS_AMOUNT",
    "value": "210015.05",
    "calculate": false,
    "forceReopen": false
}
```

#### Response

Supported Media Types: application/json

Example of Response Body

The following is an example of the response body in JSON format.

```
{
    "type": "TM",
    "items": null,
    "error": null,
    "link": null,
    "status": 0,
```

# Financial Consolidation and Close REST APIs

Use the Financial Consolidation and Close REST APIs to get the REST API version, retrieve journals and journal details, submit, approve, post, unpost, and reject journals, and update journal periods. You can also import supplementation data, copy data, clear data, and deploy form templates.

## Getting API Versions for Financial Consolidation and Close APIs

You can get information on REST API versions using REST resources. See Getting API Versions for Planning. Financial Consolidation and Close APIs use the same version numbers as Planning.

# Get Information about a Specific API Version for Financial Consolidation and Close APIs

Returns details for a specific REST API version for Financial Consolidation and Close.

#### **REST Resource**

GET /HyperionPlanning/rest/{api version}

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 18-1 Parameters

#### Name Description

<code>api\_version</code> Version of the API you are developing with, such as V1

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 18-2 Parameters

Name	Description
version	The version, such as V1

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
"version": "v1",
"lifecycle": "active",
"isLatest": true,
"links": [{
    "rel": "canonical",
    "href": "https://<SERVICE_NAME>-
    <TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v2"
}, {
    "rel": "predecessor-version",
    "href": "https://<SERVICE_NAME>-
    <TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v1"
}]
}
```

## Perform Journal Actions for Financial Consolidation and Close

Performs journal action for the specified journal. Changes the journal status to the new state specified.

Journal actions supported: SUBMIT, APPROVE, POST, UNPOST, REJECT

This API works only for Financial Consolidation and Close.

#### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/
journals/{journalLabel}/actions
```

#### **Required Roles**

Role	Available Actions
Service Administrator	All
Power User	Submit/Post/Unpost: Need Write access to all the members in the journal
	Approve/Reject. Need Read access to all the members in the journal
User	Approve/Reject. Need Read access to all the members in the journal and Journal option must have been enabled

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 18-3 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
journalLabel	Label for the journal	Path	Yes	None
parameters	Parameters for journals, for example:	JSON	Yes	None
	<pre>{"parameters" :{     "scenario": "Actual",     "year": "FY17",     "period": "Jan",     "consolidation": "FCCS_Entity Input",     "action": "POST" }</pre>			
	These parameter fields are described in rows below.			
scenario	The scenario for which you are performing the journal action	Query	Yes	None
year	The year for which you are performing the journal action	Query	Yes	None
period	The period for which you are performing the journal action	Query	Yes	None
consolidation	The consolidation for which you are performing the journal action	Query	No	Entity Input
action	The journal action. Supported valid Action values: SUBMIT,REJECT,APPROVE,POST,UNPOS T	Query	Yes	None

#### Response

Parameters

The following table summarizes the response parameters.

#### Table 18-4 Parameters

Name	Description
actionDetail	Journal action, such as Posted

Table 18-4	(Cont.)	Parameters
------------	---------	------------

Name	Description	
actionStatus	Action status, such as 0	

Supported Media Types: application/json

#### Sample JSON Input

{

{

```
"scenario": "Actual",
"year": "FY17",
"period": "Jan",
"action": "POST"
}
```

#### Example of Response Body

The following shows an example of the response body.

```
"actionDetail": "Posted",
"actionStatus": 0
}
```

# Perform Journal Period Updates for Financial Consolidation and Close

Performs journal period update action for the specified period.

Journal period actions supported: OPEN, CLOSE

This API works only for Financial Consolidation and Close.

#### **REST Resource**

```
POST /HyperionPlanning/rest/{api_version}/applications/{application}/
journalPeriods/{period}/actions
```

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
period	The period for which you are performing the journal action	Path	Yes	None
parameters	Parameters for the journal period, for example:	JSON	Yes	None
	{			
	"parameters": {			
	"scenario": "Actual",			
	"year": "FY17",			
	"action": "OPEN"			
	}			
	J			
	These parameters are described in rows below.			
scenario	The scenario for which you are performing the journal action	JSON	Yes	None
year	The year for which you are performing the journal action	JSON	Yes	None
action	The journal period action. Supported valid Action values: OPEN, CLOSE	JSON	Yes	None

#### Table 18-5 Parameters

#### Response

Parameters

The following table summarizes the response parameters.

#### Table 18-6 Parameters

Description
Journal scenario, such as Actual
Journal year, such as FY18
Journal period, such as Jan
Journal period action, such as Open

Supported Media Types: application/json

#### Sample JSON Input

{

```
"scenario": "Actual",
"year": "FY17",
"period": "Jan",
"action": "OPEN"
```

```
}
```

#### Example of Response Body

The following shows an example of the response body.

```
{
    "actionDetail": "Open",
    "actionStatus": 0
    }
```

## **Retrieve Journals for Financial Consolidation and Close**

Returns the list of journals for the given scenario, year, period, journal status and other specified filters.

Paging is supported if the optional offset and limit parameters are provided.

This API works only for Financial Consolidation and Close.

#### **REST Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/
journals?
q={"scenario":"Actual","year":"FY16","period":"Jan","consolidation":"FCCS_Enti
ty Input","status":
"WORKING","group":"group1","label":"J1","description":"JournalDesc","entity"
:"FCCS_Total Geography"}&offset=0&limit=5
```

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 18-7 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None

Name	Description	Туре	Required	Default
q	Filters for retrieving the journals, for example:	Query	No	5 journals are returned.
	<pre>{"scenario":"Actual","year":"FY1 6","period":"Jan","consolidation ":"FCCS_Entity Input","status": "WORKING","group":"group1" ,"lab el":"J1" ,"description":"Journal Desc","entity":"FCCS_Total Geography"}</pre>			
	Possible values are described in the following rows.			
cenario	Scenario for the journal, for example: "scenario":"Actual"	Query	Yes	None
ear	Year for the journal, for example: "year":"FY16"	Query	Yes	None
eriod	Period for the journal, for example: "period":"Jan"	Query	Yes	None
onsolidation	Consolidation for the journal, for example: "consolidation":"FCCS_Entity Input"	Query	No	Entity Input
tatus	Status for the journal, for example: "status":"WORKING"	Query	Yes	None
	Valid values are "WORKING" , "SUBMITTED", "POSTED", "APPROVED"			
roup	Group for the journal, for example: "group":"group1"	Query	No	None
abel	Label for the journal, for example: "label":"j1"	Query	No	None
lescription	Description for the journal, for example: "description": "adjustment for salary"	Query	No	None
entity	Entity for the journal, for example: "entity":"FCCS_Total Geography"	Query	No	None
offset	Used for pagination of the records. Indicates the actual index from which the records are returned. It is 0 based.	Query	No	0
imit	Used for pagination of the records. Controls how many items to return. Defaults to 5 if not specified.	Query	No	5

#### Table 18-7 (Cont.) Parameters

#### Response

The following table summarizes the response parameters.

#### Table 18-8 Parameters

Name	Description
totalResults	Total number of journals matching the filter criteria
hasMore	True/False, if there are more pages of records

Name	Description
count	Number of journals in this page
limit	Current page size
offset	Current page number
items	List of journals, followed by attributes of journals, such as below:

Table 18-8 (Cont.) Parameters

```

# Retrieve Journal Details for Financial Consolidation and Close

Returns the journal details for the given scenario, year, period, consolidation, and the journal name.

This API works only for Financial Consolidation and Close.

#### **REST Resource**

```
GET /HyperionPlanning/rest/{api_version}/applications/{application}/
journals/{journal label}?
q={"scenario":"Actual","year":"FY16","period":"Jan","consolidation":"Entity
Input"}&"lineItems"="true"
```

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 18-9 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	The name of the application	Path	Yes	None
journal label	The label of the journal for which to retrieve journal details	Path	Yes	None
ď	Filters to retrieve the journal, for example:	Query	Yes	None
	<pre>q={"scenario":"A ctual","year":"F Y16","period":"J an","consolidati on":"Entity Input"}</pre>			
scenario	Scenario for the journal, for example: "scenario":"Actual"	Query	Yes	None
year	Year for the journal, for example: "Year":"FY16	Query	Yes	None
period	Period for the journal, for example: "period":"Jan"	Query	Yes	None
consolidation	Consolidation for the journal, for example: "consolidation": "Entity Input"	Query	No	Entity Input
lineItems	Line items for the journal. Valid values are true or false.	Query	No	True

#### Response

Parameters

The following table summarizes the response parameters.

Table 18-10	Parameters
-------------	------------

Name	Description
totalResults	Total number of journals matching the filter criteria
hasMore	True/False, if there are more pages of records
count	Number of journals in this page
limit	Current page size
offset	Current page number
items	List of journals, followed by attributes of journals, such as below:

```
[{
```

```

## **Export Consolidation Journals**

This REST API is used to execute an Export Consolidation Journals job using the job name. Before executing this job, you should create an Export Consolidation Journals job in Financial Consolidation and Close.

For details on this task, see "Exporting Consolidation Journals" in *Working with Financial Consolidation and Close*.

This REST API returns the job ID after starting the Export Consolidation Journals job.

#### **REST Resource**

POST /HyperionPlanning/rest/{api version}/applications/{application}/jobs

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

#### Table 18-11 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None

Name	Description	Туре	Required	Default
application	The name of the application	Path	Yes	None
	Get the application name by using the Get Applications API. See Get Applications.			
jobName	Name of the job should be: Export Journal	String	Yes	None
јоbТуре	Type of Job. Supported value: EXPORT_JOURNAL	String	Yes	None
fileName	Name of the file into which the journal entries are to be exported	String	Yes	None

Table 18-11 (Cont.) Parameters

#### **Example of Request Body**

```
{
"jobType": "EXPORT_JOURNAL,
"jobName": "Export Journal",
"parameters": {
    "fileName": "JExport1"
  }
}
```

#### **Response Body**

Name	Description
status	Status of the job: -1 =In progress; 0 = Success; 1 = Fail
details	In case of errors, details are published with the error string.
descriptiveStatus	The status of the job, such as Completed or Error
items	Collection of Notification categories
links	Detailed information about the link
href	Links to API call
action	The HTTP call type

#### Table 18-12 (Cont.) Parameters

Name	Description	
rel	Relationship type. Possible values: self	

#### Example of Response Body:

The following shows an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "http://slc10xth:9000/HyperionPlanning/rest/v3/
applications/FccsRef3/jobs/184",
            "action": "GET"
        },
        {
            "rel": "job-details",
            "href": "http://slc10xth:9000/HyperionPlanning/rest/v3/
applications/FccsRef3/jobs/184/details",
            "action": "GET"
        }
    ],
    "descriptiveStatus": "Processing",
    "status": -1,
    "jobId": 184,
    "jobName": "JExport1",
    "details": null
```

## **Import Consolidation Journals**

This REST API is used to execute an Import Consolidation Journals job using the job name. Before executing this job, you should create an Import Consolidation Journals job in Financial Consolidation and Close.

For details on this task, see "Importing Consolidation Journals" in *Working with Financial Consolidation and Close*.

This REST API returns the job ID, job status and job details after starting the Import Consolidation Journals job.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api version}/applications/{application}/jobs

#### **Required Roles**

Service Administrator

#### Request

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application	The name of the application Get the application name by using the Get Applications API. See Get Applications.	Path	Yes	None
jobName	Name of the job should be an existing journal import job: <job name&gt;</job 	String	Yes	None
јоbТуре	Type of Job. Supported value: IMPORT_JOURNAL	String	Yes	None
fileName	Name of the file from which the journal entries are to be imported	String	No	File specified in the Job
errorFileName	Name of the log file in which messages generated during the import process are to be recorded	String	No	None

#### Table 18-13 Parameters

#### **Example of Request Body**

```
{
   "jobType": "IMPORT_JOURNAL",
   "jobName": "IMPORT1",
   "parameters": {
        "fileName": "TestImport1.jlf",
        "errorFileName": "DHQA_TestImport1_error.log"
   }
}
```

#### **Response Body**

Name	Description
type	Application type, for example, FCCS
status	Status of the job: -1 =In progress; 0 = Success; 1 = Fail
details	In case of errors, details are published with the error string.in the job error file and Job Console.
descriptiveStatus	The status of the job, such as Completed or Error
items	Collection of Notification categories
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type. Possible values: self

#### Table 18-14 Parameters

#### Example of Response Body:

The following shows an example of the response body in JSON format.

```
{
"links":[
{
"rel": "self",
"href": " https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/FccsRef3/jobs/13",
"action": "GET"
},
"rel": "job-details",
"href": " https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
/applications/FccsRef3/jobs/13/details",
"action": "GET"
}
],
"descriptiveStatus": "Processing",
"status": -1,
"jobId": 13,
"jobName": "JIMPORT1",
"details": null
}
```

## Copy Data

This REST API is used to execute a Copy Data job using the profile name. Before executing this job, you should create a Copy Data profile in Financial Consolidation and Close.

For details on this task, see Using Copy Data Profiles.

#### This REST API returns the job id after starting the Copy Data job.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api\_version}/applications/{application}/jobs

**Required Roles** 

Service Administrator

Request

Supported Media Types: application/json

#### Table 18-15 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application	The name of the application	Path	Yes	None
	Get the application name by using the Get Applications API, for example, FCCS or TRCS. See Get Applications.			
jobName	Name of the job should be: EXECUTE PROFILE	String	Yes	None
јоbТуре	Type of Job. Supported value: COPY_DATA	String	Yes	None
ProfileName	Name of the profile to use to copy data	String	Yes	None

#### Example of Request Body

```
{
   "jobType": "Copy_Data",
   "jobName": "Execute Profile",
   "parameters": {
        "ProfileName": "<ProfileName>",
    }
}
```

#### **Response Body**

Name	Description
type	Financial Consolidation and Close Application type, for example, FCCS
status	Status of the job: -1 =In progress; 0 = Success; 1 = Fail
details	In case of errors, details are published with the error string.
descriptiveStatus	The status of the job, such as Completed or Error
items	Collection of Notification categories
links	Detailed information about the link
href	Links to API call

#### Table 18-16 (Cont.) Parameters

Name	Description
action	The HTTP call type
rel	Relationship type. Possible values: self

Example of Response Body:

The following shows an example of the response body in JSON format.

```
{
  "jobId": 8,
  "descriptiveStatus": "Processing",
  "details": null,
  "jobName": "Copy Data",
  "status": -1,
  "links": [
    {
      "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/<applicationName>/jobs/<JobId>","rel":"self","action":"GET"},
      "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/,
      "rel":"job-details","action":"GET"},
    }
  1
1
```

## **Clear Data**

This REST API is used to execute a Clear Data job using the profile name. Before executing this job, you should create a Clear Data profile in Financial Consolidation and Close.

For details on this task, see Using Clear Data Profiles.

This REST API returns the job id after starting the job.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api version}/applications/{application}/jobs

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application	The name of the application Get the application name by using the Get Applications API, for example, FCCS or TRCS. See Get Applications.	Path	Yes	None
jobName	Name of the job should be: EXECUTE PROFILE			
јорТуре	<b>Type of Job.</b> <b>Supported value</b> : Clear_Data	String	Yes	None
ProfileName	The name of the profile to use to clear data	String	Yes	None

#### Table 18-17 Clear Data

#### Example of request body

Example:

```
{
   "jobType": "Clear_Data",
   "jobName": "Execute Profile",
   "parameters": {
        "ProfileName": "<ClearData_01>",
    }
}
```

#### Response

#### Table 18-18 Parameters

Name	Description	
type	Financial Consolidation and Close Application type, for example, FCCS	
status	Status of the job: -1 =In progress; 0 = Success; 1 = Fail	
details	In case of errors, details are published with the error string.	
descriptiveStatus	The status of the job, such as Completed or Error	
items	Collection of Notification categories	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Relationship type. Possible values: self	

Supported Media Types: application/json

#### **Example of Response Body**

The following is an example of the response body in JSON format.

```
{
  "jobId": 8,
  "descriptiveStatus": "Processing",
  "details": null,
  "jobName": "Clear Data",
  "status": -1,
  "links": [
    {
      "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/<applicationName>/jobs/<JobId>","rel":"self","action":"GET"},
      "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/,
      "rel":"job-details","action":"GET"},
    }
 1
}
```

#### Sample

```
{
  "jobId": 8,
  "descriptiveStatus": "Processing",
  "details": null,
  "jobName": "Clear Data",
  "status": -1,
  "links": [
    {
      "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/ Testapp /jobs/8",
      "rel":"self", "action":"GET"},
      "href":"https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/Testapp/jobs/8/details",
      "rel":"job-details","action":"GET"}
                                            }
  1
}
```

### Validate Metadata

This REST API is used to automatically run the Validate Metadata process to ensure an errorfree database refresh and consolidation.

For details on this task, see "Validating Metadata" in Administering Financial Consolidation and Close.

**Required Roles** 

#### Service Administrator

#### **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application\_name}/
application/validatemetadata?logFileName={logfile\_name}

#### Request

Supported Media Types: application/json

#### Table 18-19 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application_name	The name of the application	Path	Yes	None
	Get the application name by using the Get Applications API. See Get Applications.			
logFileName	Name of the log file of exported results	Payload	No	None

#### Response

Supported Media Types: application/json

#### Table 18-20 Parameters

Name Description	
numWarnings	Number of metadata warnings
numInfo	Number of metadata information messages
outPutFileName	Ouput file name with the extension of .csv
numErrors	Number of metadata error messages
status	The status of the job, such as Completed or Error

#### Example of Response Body:

The following shows an example of the response body in JSON format.

```
{
"numWarnings": 0,
"numInfo": 0,
"outPutFileName": "ValidateMetadata.csv,
"numErrors": 20,
"status": "Validate Metadata Completed"
}
```

### Generate an Intercompany Matching Report

This REST API is used to execute an Intercompany Matching Report job.

For details on this task, see Managing Intercompany Matching Reports.

This REST API returns the job ID after starting the Intercompany Matching Report job.

#### **Required Roles**

Service Administrator, Power User or User

#### **REST Resource**

POST /HyperionPlanning/rest/{api version}/applications/{application}/jobs

#### Request

Supported Media Types: application/json

#### Table 18-21 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application_name	The name of the application	Path	Yes	None
	Get the application name by using the Get Applications API. See Get Applications.			
jobName	The name of the saved Intercompany report definition, for example: IC_Job_01	Payload	Yes	None
јорДуре	Type of Job. Supported value: GENERATE_INTERCOMPANY_REPORT	Payload	Yes	None
parameters	Pass optional parameters to set the report POV	Payload	No	None

#### Table 18-22Optional Parameters

Name	Description
scenario	The member of the Scenario dimension for the report, for example, Actual
years	The member of the Year dimension for the report, for example, FY22
period	The member of the Period dimension for the report, for example, December
reportFormat	The format for the report, for example, HTML
fileName (optional)	A filename for the report, for example, intercompany_receivables_report

#### **Example of Request Body**

```
{
"jobType": "GENERATE_INTERCOMPANY_REPORT",
"jobName": "icp1",
"parameters": {
"scenario":"actual",
"years": "FY22",
"period":"Dec",
"reportFormat":"HTML"
"fileName":"intercompany_receivables_report"
}
```

#### **Response Body**

Supported Media Types: application/json

Name	Description
type	Financial Consolidation and Close Application type, for example, FCCS
status	Status of the job: -1 =In progress 0 = Success; 1 = Fail 2 = Cancel Pending 3 = Cancelled 4 = Invalid Parameter >4 = Unknown
details	In case of errors, details are published with the error string.
descriptiveStatus	The status of the job, such as Completed or Error
items	Collection of Notification categories
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type. Possible values: self

#### Table 18-23Parameters

#### Example of Response Body:

The following shows an example of the response body in JSON format.

```
{
    "descriptiveStatus": "Processing",
    "jobId": 33,
    "jobName": "icp1",
    "details": null,
    "status": -1,
    "links": [
        {
            "rel": "self",
            "href": "http://slcar262.usdv1.oraclecloud.com:12055/
HyperionPlanning/rest/v3/applications/tst/jobs/33",
            "action": "GET"
        },
        {
            "rel": "job-details",
            "href": "http://slcar262.usdv1.oraclecloud.com:12055/
HyperionPlanning/rest/v3/applications/tst/jobs/33/details",
            "action": "GET"
        }
    ]
}
```

# 19 Task Manager REST APIs

Use the Task Manager REST APIs to deploy task manager templates, update the task status for event monitoring, and manage Oracle Integration Cloud connections.

### Getting API Versions for Task Manager APIs

You can get information on REST API versions using REST resources. See Getting API Versions for Planning. Task Manager REST APIs use the same version numbers as Planning.

#### Table 19-1 Task Manager REST APIs

API Name	Versions
Deploy Task Manager Templates	v1
Update Task Status for Event Monitoring	v1

### **Deploy Task Manager Templates**

Deploys a Task Manager template to provided year and period to create a new schedule.

This API executes the job based on the job type (TM\_DEPLOY\_TEMPLATE) provided as a JSON parameter. This is an asynchronous API and responds with a callback API to get the job status.

#### Parameters

The following table summarizes the client request:

Table 19-2 TM\_DEPLOY\_TEMPLATES Parameters

Name	Description	Туре	Required	Default
jobType	Type of the Job, value for this Job is TM_DEPLOY_TEM PLATE	String	Yes	None
templateName	The name of the task manager template to be deployed	String	Yes	None
scheduleName	The name of the new schedule that will be created from the template	String	Yes	None
year	The member of the Year dimension where the template will be deployed	String	Yes	None

Name	Description	Туре	Required	Default
period	The member of the Period dimension where the template will be deployed	String	Yes	None
dayZeroDate	The Day Zero date used in creating the Schedule in a valid format	String	Yes	None
dateFormat	The date format for the Day Zero Date	String	No	YYY-MM-DD
orgUnit	The Organization Unit name	String	No	None

#### Table 19-2 (Cont.) TM\_DEPLOY\_TEMPLATES Parameters

#### **REST Resource**

POST/HyperionPlanning/rest/cmapi/{api version}/jobs

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request parameters specific to this job.

#### Table 19-3 Parameters

Name	Description	Туре	Required	Default
api_version	It is a path parameter. Version of the API you are developing with for example, v1	String	Yes	None

#### **Examples of Request Body**

```
"templateName":"Template1",
```

```
"scheduleName": "scheduleA",
```

```
"year":"2021",
"period":"Jan",
"dayZeroDate":"2021-01-01"
}
```

#### Example 2:

```
{
```

}

```
"jobType":"TM_DEPLOY_TEMPLATE",
```

```
"parameters":{
```

```
"templateName":"Template1",
```

```
"scheduleName": "scheduleA",
```

```
"year":"2021",
```

```
"period":"Jan",
```

```
"dayZeroDate":"2021-01-01",
```

```
"orgUnit":"JPAC"
```

}

#### Response

}

Supported Media Types: application/json

Name	Description
jobId	Job ID
descriptiveStatus	Any additional details
details	Message to the end user. In case of errors, details are published.
status	-1 – In Progress; 0 – Success; 1 – Fail
items	Not applicable for this job type
links	Detailed information about the link
rel	Possible values: self
href	Links to API call

#### Table 19-4 (Cont.) Parameters

Name	Description
action	The HTTP call type

#### **JSON Output**

The following is an example of the response body in JSON format.

```
{
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/
cmapi/v1/jobs",
            "action": "POST"
        },
        {
            "rel": "Job Status",
            "href": "https://<SERVICE NAME>-
<TENANT NAME>.<SERVICE TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/
cmapi/v1/jobs/14008",
            "action": "GET"
        }
    ],
    "details": "In Process",
    "status": -1,
    "type": "TM",
    "link": {},
    "error": null,
    "items": []
```

}

### Update Task Status for Event Monitoring

This API is used to update the task status to "completed" based on an event monitoring integration type. For information on setting up integration type for Event Monitoring, see Creating Custom Event Monitoring Integrations in Administering Financial Consolidation and Close.

#### **REST Resource**

**POST** /HyperionPlanning/rest/cmapi/{api\_version}/updateTasksForEventMonitoring

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

#### **Parameters**

The following table summarizes the client request.

#### Table 19-5 Parameters

Name	Description	Туре	Require d	Default Value
api_version	Version of the API you are developing with	Path	Yes	v1
eventName	Event name as specified in the custom event monitoring integration type.	JSON (String)	Yes	None
integrationName	Integration Code of the custom event monitoring integration type.	JSON (String)	Yes	None
integrationConnectionName	Connection name which the event monitoring integration belongs to.	JSON (String)	Yes	None
parameters	Parameter values as per the custom event monitoring integration type.	JSON	Yes	None
	<pre>The format is: [ {"name" :"param1", "value":"value1" , {"name" :"param2",</pre>			
	"value":"value2" }]			
message	A message needs to be added while closing the task. This information is displayed on the task dialog.	JSON (String)	No	None
logLocation	Any location which needs to be added which refers to a log. This information is displayed on the task dialog.	JSON (String)	No	None

Name	Description	Туре	Require d	Default Value
reportLocations	One or more URLs to add while closing the task. The format is: ["Example_URL1", "Example_URL2"]	JSON (List of Strings)	No	None
	This information will be displayed on the Task dialog box.			

#### Table 19-5 (Cont.) Parameters

#### **Example URL**

```
https://<BASE-URL>/HyperionPlanning/rest/cmapi/v1/
updateTasksForEventMonitoring
```

#### Payload

#### Example 1

If the custom event monitoring integration has the following properties:

- Integration Connection Name: customAppConn
- Integration Code: customPeriodClose
- Event Name: custom.CloseProcess.period.close
- Parameter Code: periodName and ledgerID

And the task is set up with following parameters:

- periodName: FY18
- ledgerID: 123

The following payload should be sent to close the task:

```
{
    "eventName" : "custom.CloseProcess.period.close",
    "integrationName" : "customPeriodClose",
    "integrationConnectionName" : "customAppConn",
    "parameters": [{
        "name": "periodName",
        "value": "FY18"
    }, {
        "name": "ledgerID",
        "value": "123"
    }]
}
```

#### Note:

The API expects integration code to be passed for the parameter integrationName.

#### Example 2

```
{
    "eventName": "custom.CloseProcess.period.close",
    "integrationName": "customPeriodClose",
    "integrationConnectionName": "customAppConn",
    "parameters": [
        {
            "name": "periodName",
            "value": "FY18"
        },
        {
            "name": "ledgerID",
            "value": "123"
        }
    ],
    "message": "Close period",
    "logLocation": "/logs/closeperiod.txt",
    "reportLocations": [
        "http://oracle.com/reportLocation.html"
    1
}
```

#### Response

Supported Media Types: application/json

#### Example of a Successful Response

```
Http status code: 200
{
    "type": "RC",
    "items": null,
    "error": null,
    "link": null,
    "status": null,
    "details": "2 task(s) updated.",
    "links": [
        {
            "rel": "self",
            "href": "https://<BASE-URL>/HyperionPlanning/rest/cmapi/v1/
updateTasksForEventMonitoring",
            "action": "POST"
        }
    ]
}
```

#### **Example of an Error Response**

Http status: 500

### Working with Connections in Task Manager

Use these REST APIs to work with Oracle Integration Cloud connection in Task Manager.

Oracle Integration Cloud is used by custom Process Automation and Event Monitoring Integration tasks.

With multiple environments, using REST APIs saves you time and effort by automating the process of logging in and configuring connections. For information about accessing environments, see Accessing EPM Cloud.

Task	Request	REST Resource
Create a Connection	POST	<pre>/HyperionPlanning/rest/fcmapi/{api_version}/ {module}/connections</pre>
View All Connections	GET	/HyperionPlanning/rest/fcmapi/{api_version}/ {module}/connections
Update a Connection	PUT	/HyperionPlanning/rest/fcmapi/{api_version}/ {module}/connections/{id}
Delete a Connection	DELETE	<pre>/HyperionPlanning/rest/fcmapi/{api_version}/ {module}/connections/{id}</pre>

#### Table 19-6 Working with Connections in Task Manager

### Create a Connection

Use this REST API to create a connection to Oracle Integration Cloud using Task Manager.

#### **REST Resource**

POST /HyperionPlanning/rest/fcmapi/{api version}/{module}/connections

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request parameters for Basic authentication and OAuth 2.0 authentication.

#### Table 19-7 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you're developing with (must be v1)	Path	Yes	None
module	The name of the module for which to create a connection. Set this value to FCM.	Path	Yes	None

Name	Description	Туре	Required	Default
url	The URL of the Integration Cloud environment.  Note:  The URL must be provided only till the server name, which is oraclecloud.com.	Payload	Yes	None
authType	Type of authentication: Basic OAuth	Payload	Yes	None
	Note: The parameter is applicable only for OAuth 2.0 authentication type.			
oauthProperties	Specify the access token, client ID, and scope of the URL for OAuth 2.0 authentication.	of Payload	Payload	None
	Note: The parameter is applicable only for OAuth 2.0 authentication type.			
username	A username with the Service Administrator predefined role.	Payload	Yes	None
	Note: This parameter is applicable only for basic authentication type.			

#### Table 19-7 (Cont.) Parameters

Name	Description	Туре	Required	Default
password	The encrypted password for the user.	Payload	Yes	None
	For security reasons, only an encrypted password is allowed. Use the EPM Automate encrypt command to generate the encrypted password. See encrypt.			
	Note: This parameter is applicable only for basic authentication type.			
type	The type of connection. For Oracle Integration Cloud, set this value to ICS.	Payload	Yes	None

#### Table 19-7 (Cont.) Parameters

```
Example of Request Body- Basic Authentication
```

```
{
    "url": "<URL of Oracle Integration Cloud>",
    "username": "<NEW_USERNAME>",
    "password": "<NEW_PASSWORD>",
    "type" : "ICS"
    "authType": "BASIC"
}
```

#### Example of Request Body- OAuth 2.0 Authentication

```
{
    "url": "<URL of Oracle Integration Cloud>",
    "type": "ICS",
    "authType": "OAUTH2",
    "oauthProperties": {
        "accessTokenUrl": "<Access token URL>",
        "clientId": "<Client ID>",
        "scope": "<Scope URL>",
        "clientSecret": "<EPMAUTOMATE Encrypted password>"
    }
}
```

#### Response

Supported Media Type: application/json

#### Table 19-8 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.

#### Example of Response Body

```
{
  "details": "Connection created successfully."
}
```

### **View All Connections**

Use this REST API to view all the connections to Oracle Integration Cloud using Task Manager.

#### **Required Roles**

Service Administrator

#### **REST Resource**

GET /HyperionPlanning/rest/fcmapi/{api\_version}/{module}/connections

#### Request

Parameters:

The following table summarizes the client request.

#### Table 19-9 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which you want to view the connections. Set this value to FCM.	Path	Yes	None

#### Response

Supported Media Types: application/json

The following table summarizes the parameters.

#### Table 19-10 Parameters

Parameters	Description
items	Collection of information about the resource
id	Unique identifier for the connection
type	The type of connection. For Oracle Integration Cloud, set this value to ICS.

Parameters	Description	
url	The URL of the Integration Cloud environment.	
	Note: The URL must be provided only till the server name, which is oraclecloud.com.	
authType	Type of authentication: <ul> <li>Basic</li> <li>OAuth</li> </ul>	
oauthProperties	Provides the access token, client ID, and scope of the URL for OAuth 2.0 authentication.	
details	In case of errors, details are published with the error string	

#### Table 19-10 (Cont.) Parameters

**Example Response - Basic Authentication** 

```
{
    "links": [
        {
            "rel": "self",
            "href": "<URL of Oracle Integration Cloud>",
            "action": "GET"
        }
    ],
    "details": null,
    "items": [
        {
            "username": "ats admin2",
            "password": null,
            "url": "<URL of Oracle Integration Cloud>",
            "id": 10000000558008,
            "type": "ICS"
            "authType": "BASIC"
        }
    ]
}
```

#### Example Response - OAuth 2.0 Authentication

```
"accessTokenUrl": "<Access token URL>",
    "clientId": "<Client ID>",
    "scope": "<Scope URL>"
    }
    }
    /
    links": [
      {
            "rel": "self",
            "href": "<URL of Oracle Integration Cloud>",
            "action": "GET"
        }
    ]
}
```

### Update a Connection

Use this REST API to update a specific connection to Oracle Integration Cloud using Task Manager.

#### **REST Resource**

PUT /HyperionPlanning/rest/fcmapi/{api\_version}/{module}/connections/{id}

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

Parameters:

The following table summarizes the client request.

#### Table 19-11 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which to update a connection. Set this value to FCM.	Path	Yes	None
id	The identifier of the connection that must be updated	Path	Yes	None
url	The URL of the Integration Cloud environment.		Yes	None
	Note: The URL must be provided only till the server name, which is oraclecloud.com.			

#### Table 19-11 (Cont.) Parameters

Name	Description	Туре	Required	Default
type	The type of connection. For Oracle Integration Cloud, set this value to ICS.	Payload	Yes	None

#### Table 19-11 (Cont.) Parameters

#### **Example of Request Body - Basic Authentication**

```
{
    "url": "<URL of Oracle Integration Cloud>",
    "username": "<NEW_USERNAME>",
    "password": "<NEW_PASSWORD>"
    "authType": "BASIC"
}
```

Example of Request Body – OAuth 2.0 Authentication

```
{
    "url": "<URL of Oracle Integration Cloud>",
    "type": "ICS",
    "authType": "OAUTH2",
    "oauthProperties": {
        "accessTokenUrl": "<Access token URL>",
        "clientId": "<Client ID>",
        "scope": "<Scope URL>",
        "clientSecret": "<EPMAUTOMATE Encrypted password>"
    }
}
```

#### Response

Supported Media Type: application/json

#### Table 19-12 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.

#### **Example of Response Body**

Example 1:

```
{
   "details": "Connection updated successfully."
}
```

Example 2:

```
{
  "details": "Invalid parameters. Test Connection is failed"
}
```

### Delete a Connection

Use this REST API to delete a specific connection to Oracle Integration Cloud using Task Manager.

#### **Required Roles**

Service Administrator

#### **REST Resource**

DELETE /HyperionPlanning/rest/fcmapi/{api version}/{module}/connections/{id}

#### Request

Parameters:

The following table summarizes the client request.

#### Table 19-13 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with (must be v1)	Path	Yes	None
module	The name of the module for which to delete a connection. Set this value to FCM.	Path	Yes	None
id	The identifier of the connection that must be deleted	Path	Yes	None

#### Response

Supported Media Type: application/json

#### Table 19-14 Parameters

Parameters	Description
details	In case of errors, details are published with the error string.

Example of Response Body

```
{
  "details": "Connection deleted successfully."
}
```

# 20 Supplemental Data Manager REST APIs

Use the Supplemental Data Manager REST APIs to import supplemental collection data for Financial Consolidation and Close and deploy form templates.

### Getting API Versions for Supplemental Data Manager APIs

You can get information on REST API versions using REST resources. See Getting API Versions for Planning. Supplemental Data Manager REST APIs use the same version numbers as Planning.

#### Table 20-1 Supplemental Data Manager REST APIs

API Name	Versions
Import Supplemental Collection Data for Financial Consolidation and Close	v3
Deploy Form Templates	v3

# Import Supplemental Collection Data for Financial Consolidation and Close

Imports supplemental data to a collection for the frequency dimensions defined in the collection interval of the collection. Returns the success or failure status.

#### **REST Resource**

POST /HyperionPlanning/rest/{api\_version}/applications/{application}/
fcmjobs

#### **Required Roles**

Service Administrator

Request

Supported Media Types: application/json

Parameters

#### Table 20-2 IMPORT\_SUPPLEMENTAL\_COLLECTION\_DATA

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None

Name	Description	Туре	Required	Default
application	The name of the application Get the application name by using the Get Applications API, for example, FCCS or TRCS. See Get Applications.	Path	Yes	None
jobName	Name of the job	String	No	None
jobType	Type of the Job. Supported value for this Job IMPORT_SUPPLEMENT AL_COLLECTION_DATA	String	Yes	None
fileName	File name to be imported, for example, dataset.csv	String	Yes	None
collection	Collection or sub- collection name	String	Yes	None
year	The year for which the collection is deployed	String	Yes	None
period	Period name for which the collection is deployed	String	Yes	None
parameter	Runtime parameter. This is the frequency dimension used for the Collection.	String	No	None
value	Runtime parameter value. This is the member value for the dimension specified in the parameter.	String	No	None

#### Table 20-2 (Cont.) IMPORT\_SUPPLEMENTAL\_COLLECTION\_DATA

#### Table 20-3 Examples of runtime parameters

Parameter	Value	
Product	Oracle EPM	
Consolidation	Entity Input	
Movement	Actual	

Examples of request body

Example 1

```
{
  "jobType" : "IMPORT_SUPPLEMENTAL_COLLECTION_DATA",
  "parameters": {
        "fileName":"import_sdm_data.csv",
        "collection":"Investment Detail Collection",
        "year":"2019",
        "period":"Dec",
```

```
"product:"Oracle EPM",
                             "consolidation":"Entity Input",
                              }
Example 2
 "jobType" : "IMPORT SUPPLEMENTAL COLLECTION DATA",
"parameters": {
                             "fileName":"import sdm data.csv",
                             "collection":"Investment Detail Collection",
                             "year":"2020",
                             "period":"January",
                             "category":"Oracle EPM",
                             "movement":"Actual",
```

```
}
```

}

{

#### Example 3

```
{
"jobType" : "IMPORT SUPPLEMENTAL COLLECTION DATA",
"parameters": {
                              "fileName":"import sdm data.csv",
                              "collection":"Investment Detail Collection",
                              "year":"2019",
                              "period":"December",
                              "scenario":"Actual",
                              }
}
```

#### Response

Supported Media Types: application/json

Parameters:

#### Table 20-4 Parameters

Name	Description	
type	FCCS Application type, for example, FCCS	
status	-1 - In Progress; 0 - Success; 1 - Fail	
details	In case of errors, details are published with the error string	
descriptiveStatus	The status of the job, such as Completed or Error	
items	Collection of Notification categories	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Relationship type. Possible values: self	

Example of Response Body

The following is an example of the response body in JSON format.

```
{
  "jobId":10000000114040,
  "descriptiveStatus":"In Progress",
  "details": "In Progress",
  "status": -1,
  "items": [],
  "links": [
    {
      "rel": "self",
      "href": "https://<SERVICE NAME-
<TENANT NAME.<SERVICE TYPE.<dcx>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/FCCS/fcmjobs/10000000114040"
    }, {",
      "action":"GET"
    }
 ],
ļ
```

### **Deploy Form Templates**

Enables you to deploy form templates that have been created in Financial Consolidation and Close.

For details on Using Deploying a Form Template to a Data Collection Period.

This REST API returns the job id after starting the job.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api version}/applications/{application}/fcmjobs

#### **Required Roles**

Service Administrator, Power User

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request parameters specific to this job.

#### Table 20-5 Deploy Form Template

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None

Name	Description	Туре	Required	Default
application	The name of the application Get the application name by using the Get Applications API, for example, FCCS. See Get Applications.	Path	Yes	None
jobName	Name of the job that has been defined in Financial Consolidation and Close or no value for the job	String	No	None
јоbТуре	Type of Job. Supported value: DEPLOY_FORM_TEM PLATES	String	Yes	None
CollectionInter valName	The name of the collection interval to which the template should be deployed	String	Yes	None
Parameter for frequency dimension 1	Dimension and member name of interval frequency dimension, to which the template should be deployed.	String	No	None
	This optional key value parameter depends on the number of frequency dimensions in the interval. The key should be dimension name and the value should be member name.			

#### Table 20-5 (Cont.) Deploy Form Template

Name	Description	Туре	Required	Default
Parameter for frequency dimension 2	Dimension and member name of interval frequency dimension, to which the template should be deployed. This optional key value parameter depends on the number of frequency dimensions in the interval. The key should be dimension name and the value should be member name.	String	Νο	None
Parameter for frequency dimension 3	Dimension and member name of interval frequency dimension, to which the template should be deployed. This optional key value parameter depends on the number of frequency dimensions in the interval. The key should be dimension name and the value should be member name.	String	No	None
Parameter for frequency dimension 4	Dimension and member name of interval frequency dimension, to which the template should be deployed. This optional key value parameter depends on the number of frequency dimensions in the interval. The key should be dimension name and the value should be member name.	String	No	None

#### Table 20-5 (Cont.) Deploy Form Template

Name	Description	Туре	Required	Default
Template	Names of the form templates to deploy. You can provide multiple parameters with the same key as "TEMPLATE" and this will be converted to a JSON array and passed as a single parameter in the JSON string.	JSON Array	No	None
	This is an optional parameter. However, if nothing is specified for the TEMPLATE key, this parameter is still present as an empty JSON Array in the JSON string, and all templates for the given interval will be deployed. Even if you give only one template name, this should still be passed as a JSON array.			
ResetWorkflows	Either true or false. Optional parameter indicating whether all forms should be reset back to the first stage after redeploying. This parameter is also derived by the system based on changes to the template and collection, so the system-derived value can override	Boolean	No	false

	Table 20-5 (	(Cont.)	Deploy	Form	Template
--	--------------	---------	--------	------	----------

#### Examples of request body

Example 1:

{

```
"jobType" : "DEPLOY_FORM_TEMPLATES",
```

```
"parameters":
    {
        "CollectionIntervalName" : "Journal Collection Interval",
        "Year" : "2020",
        "Period" : "July",
        "Product" : "Oracle EPM",
        "Consolidation" : "Entity Input",
        "Consolidation" : "Entity Input",
        "Template" : [ "Template,1","Template 2" ],
        "ResetWorkflows" : "true"
    }
}
```

#### Example 2:

```
{
   "jobType" : "DEPLOY_FORM_TEMPLATES",
   "parameters":
        {
            "CollectionIntervalName" : "Loan Collection Interval",
            "Year" : "2020",
            "Period" : "July",
            "Category" : "Oracle EPM",
            "Movement" : "Actual",
            "Template" : ["Template 3"]
        }
}
```

```
Example 3:
```

```
{
    "jobType" : "DEPLOY_FORM_TEMPLATES",
    "parameters":
        {
            "CollectionIntervalName" : "Default",
            "Year" : "2020",
            "Period" : "July",
            "Scenario" : "Actual",
            "Template" : ["Template 5","Template 6"],
            "ResetWorkflows" : "false",
        }
}
```

#### Example 4:

```
{
    "jobType" : "DEPLOY_FORM_TEMPLATES",
    "parameters":
        {
            "CollectionIntervalName" : "Custom Interval",
            "Year" : "2020",
            "Period" : "July",
            "Template" : ["Template 5","Template 6","Template
7","Template 8"]
```

#### Response

}

#### Table 20-6 Parameters

}

Name	Description	
jobId	Financial Consolidation and Close job ID	
descriptiveStatus		
details	Any additional details	
Status	-1 = In progress; 0 = Success; 1 = Fail	
items	Not applicable for this job type	
links	Detailed information about the link	
href	Links to API call	
action	The HTTP call type	
rel	Possible values: self	

Supported Media Types: application/json

#### **JSON Output**

The following is an example of the response body in JSON format.

```
{
   "jobId":10000000114040,
  "descriptiveStatus":",
  "detail":"In Progress",
   "status":-1,
   "items":null,
   "links":[
      {
         "rel":"self",
         "href":"https://<SERVICE NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v3/
applications/FCCS/fcmjobs/10000000114040",
         "action":"GET"
     }
  ]
}
```

## 21 Enterprise Journal REST APIs

Use the Enterprise Journal REST APIs to:

- Monitor Enterprise Journals for Financial Consolidation and Close
- Execute an Enterprise Journal job
- Retrieve Enterprise Journals for Financial Consolidation and Close
- Retrieve Enterprise Journal Content for Financial Consolidation and Close
- Retrieve Enterprise Journal Content by Year and Period for Financial Consolidation and Close
- Update Enterprise Journal Posting Status for Financial Consolidation and Close

### **Getting API Versions for Enterprise Journal APIs**

You can get information on REST API versions using REST resources. See Getting API Versions for Planning. The Enterprise Journal REST APIs use the same version numbers as Planning.

API Name	Versions
Execute an Enterprise Journals Job	v1
Monitor Enterprise Journals for Financial Consolidation and Close	v1
Retrieve Enterprise Journals for Financial Consolidation and Close	v1
Retrieve Enterprise Journal Content for Financial Consolidation and Close	v1
Retrieve Enterprise Journal Content by Year and Period for Financial Consolidation and Close	v1
Update Enterprise Journal Posting Status for Financial Consolidation and Close	v1
Update Validation Status of Enterprise Journals for Financial Consolidation and Close	v1

#### Table 21-1 Enterprise Journal REST APIs

# Monitor Enterprise Journals for Financial Consolidation and Close

Returns the status of Journals for the given parameters.

#### Note:

- If all journals for given parameters are closed, then the output status would be '0' and detail text specifies that all journals are closed.
- If any journal for the given parameters is in Open status (Pending, Open with Preparer, Open with Approver etc.), then the output status would be '-1'.
- In case of error, a positive number will be returned in status.

#### **REST Resource**

```
POST /rest/ej/{api version}/jobs/
```

#### **Required Roles**

Service Administrator and Power User

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

#### Table 21-2 Parameters

Name	Description	Path	Required
api_version	Version of the API you are working with, such as v1.	Yes	Yes
јоbТуре	The name of the job EJ_MONITOR_JOURNALS.	No	Yes
year	The name of the year, such as 2021, 2022 etc.	No	No
period	The name of the period, such as Jan, Feb etc.	No	No
filterName	The name of the filter. For example, Journal status filter.	No	Yes

#### Note:

Either the combination of Year and Period or the Filter Name must be passed. If Year and Period can be part of filter, then Filter Name is sufficient in the parameters.

#### Example of request body

```
{
   "jobType": "EJ_MONITOR_JOURNALS",
   "parameters": {
        "year": "2022",
```

```
"period": "Jan",
    "filterName": "Jan22_ERPDirectJournals"
}
```

#### Response

Supported Media Types: application/json

#### Parameters:

Name	Description
details	Journal Name and Status. First 100 journals only. Shows Open journals first. In case of errors, details are published with the error string.
status	See Migration Status Codes
links	Detailed information about the link
href	Links to the API call
action	The HTTP call type
rel	Relationship type (self, Job Status). if set to Job Status, you can use the href to get the status of the operation

#### **Examples of Response Body**

The following is an example of the response body in JSON format when all journals are closed:

```
{
    "status": 0,
    "details": "All journals for the given filter are closed.",
    "links": [
        {
            "rel": "self",
            "href": "https://<SERVICE_NAME>-<TENANT_NAME>.<SERVICE_TYPE>.<dcX>/
HyperionPlanning/rest/ej/{api_version}/jobs/rest/ej/v1/jobs/monitorJournals?
year=2022&period=Jan&filterName=ERP_Direct",
            "action": "GET"
            }
        ],
        "type": "EPM",
}
```

The following is an example of the response body in JSON format when any journal status is open:

```
{
    "status": -1,
    "details": "Journal_NonDirect1|2022|Jan|1000000001, Status:Open with
Preparer; \n
    Journal_NonDirect1|2022|Jan|100000002, Status:Closed",
```

### Execute an Enterprise Journals Job

This API will execute the job based on the job type provided as a JSON parameter. It is an asynchronous API. This API will respond with a callback API to get the Job status.

Job Type	Description
exportEJJournals	This job exports the data of "Ready To Validate" or "Ready to Post" journals based on the operation defined. It creates one CSV file per journal based on the target definition and mappings defined in Enterprise Journals and copies it to an EPM Automate-designated directory. The resulting file follows the naming pattern: <year>_<period>_<journal_id>.csv. After creating the export file, it updates the journal Post status to "Post in Progress" if operation is "posting or updated the validation status to "Validation In Progress" if operation is "validation".</journal_id></period></year>
setEJJournalStatus	This job updates the Post status or Validation status of a journal after importing the journal to the ERP system.
	If operation = posting:
	A CSV file containing the results of the journal posting is provided. The file contains these columns: Year, Period, Journal ID, Posting Status (Posted/Failed), Message, Error Code, Error Message. The Message, Error Code and Error Message columns are optional. Posting status of the journals is updated based on the status provided in the file. Only journals with a Posting status of "Post in Progress" will be updated.
	If operation = validation:
	A CSV file containing the results of the journal validation is provided. The file contains these columns: Year, Period, Journal ID, Validation Statu (Valid/Failed), Message, Error Code, Error Message. The Message, Error Code and Error Message columns are optional. Validation status of the journals is updated based on the status provided in the file. Only journals with a Validation status of "Validation In Progress" will be updated.

Table 21-4 Enterprise Journals Supported Job Types

Job Type	Description
deployEJTemplates	This job is used to deploy finalized journal templates to new journal periods to create journals for year-period combinations, ensuring a consistent and repeatable journal collection process.

#### Table 21-4 (Cont.) Enterprise Journals Supported Job Types

#### **REST Resource**

**POST** /HyperionPlanning/rest/ej/{api\_version}/jobs

#### **Required Roles**

Јор Туре	Role	
exportEJJournals	Service Administrator	
setEJJournalStatus	Service Administrator	
deployEJTemplates	Service Administrator, Power User	

#### Request

Supported Media Types: application/json

#### Parameters

This table summarizes the request parameters that are generic to all jobs. The following tables describe parameters specific to individual rules.

#### Table 21-5 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

#### Table 21-6exportEJJournalsParameters

Name	Description	Туре	Required	Default
јорТуре	Type of the Job. Value for this job is exportEJJournal s.	String	Yes	None
filename	The name of the zip file to which each individual journal file is added	String	Yes	None
year	The year for which the journal is used for data collection	String	No	None

Name	Description	Туре	Required	Default
period	The period for which the journal is used for data collection	String	No	None
operation	Specifies the operation - posting or validation	String	No	posting

#### Table 21-6 (Cont.) exportEJJournals Parameters

#### Table 21-7 setEJJournalStatus Parameters

Name	Description	Туре	Required	Default
јоbТуре	Type of the Job. Value for this job is setEJJournalStatus.	String	Yes	None
filename	<ul> <li>Filename is the file in CSV format that contains the following information regarding the posting process:</li> <li>Year: Year of the Journal posted</li> <li>Period: Period of the Journal posted</li> <li>JournalID: Journal Identifier of Journal posted</li> <li>Posting Status: Valid values are Posted or Failed. (if operation = posting)</li> <li>Validation Status: Valid values are Valid or Failed. (if operation = validation) Failed status has a message and attached error list returned from ERP</li> <li>Message: Optional. Can be used for error messages from ERP in case there is a posting failure</li> <li>Note: Multiple Journal Posting statuses may be included as records in the CSV file.</li> </ul>	String	Yes	None
operation	Specifies the operation. posting or validation	String	No	posting

#### Table 21-8 deployEJTemplates Parameters

Name	Description	Туре	Required	Default
јоbТуре	Type of the Job. Value for this job is EJ_DEPLOY_TEMPL ATES	String	Yes	None

Name	Description	Туре	Required	Default
year	The year used for the journal	String	Yes	None
period	The period for the journal	String	Yes	None
Template	Names of journal templates that need to be deployed.	JSON Array	No	None
	You can specify multiple parameters with the same key as "TEMPLATE" in the command, and it will be converted into JSON array and passed as a single parameter in JSON string. If you only specify one template name, it is still passed as JSON array. This parameter is optional. If no value is specified in the command for the TEMPLATE key, then this parameter would still be present as an empty JSON array in JSON string, and all templates for the			
	specified year and period will be deployed.			
ResetJournals	Value values: True or False. Optional. Indicates whether or not all journals need to be reset to the first stage after re- deployment.	Boolean	No	False
	This parameter is also derived by the system based on changes to the template. The system-derived value can override the user-specified value.			

<b>Table 21-8</b>	(Cont.)	deployEJ	Templates	Parameters
-------------------	---------	----------	-----------	------------

**Examples of Request Body** 

#### Example for Job Type: exportEJJournals

```
Example 1:
```

```
{
  "jobType" : "exportEJJournals",
  "parameters": {
        "Filename":"export.zip",
        "Year":"2020"
        "Period":"Jan"
        "Operation":"validation"
        }
}
```

#### Example 2:

#### Example for Job Type: setEJJournalStatus

#### Examples for Job Type: deployEJTemplates

Example 1:

```
"Year":"2020"
"Period":"July"
```

#### Example 4:

```
{
  "jobType" : "EJ_DEPLOY_TEMPLATES",
  "parameters": {
          "Year":"2020"
          "Period":"July"
          "Template": []
        }
}
```

#### Response

Supported Media Types: application/json

Name	Description
jobId	Enterprise Journals job identifier
descriptiveStatus	Additional details about the status
details	Message to the user. In cases where there are errors, the error details are published.
status	<ul><li>-1: In Progress</li><li>0: Success</li><li>1: Failed</li></ul>
items	Not applicable for this job type
links	Detailed information about the link
rel	Valid value: self
href	Links to API call
action	The HTTP call type

#### Table 21-9 Parameters

#### **Example of Response Body**

The following is an example of the response body in JSON format.

```
{
  "jobId":14013,
  "details": "In Process",
  "status": -1,
  "links": [
      {
            "rel": "self",
            "href": "https://<BASE-URL>/HyperionPlanning/rest/ej/v1/jobs/14013",
            "action": "GET"
        }
    "error": null,
    "items": [ ],
    "type": EPM
}
```

## Retrieve Enterprise Journals for Financial Consolidation and Close

Returns the list of journals ready to validate or ready to post based on the parameter sent.

This API works only for Financial Consolidation and Close.

#### **REST Resource**

GET /HyperionPlanning/rest/ej/{api version}/ejjournals

#### **Required Roles**

Service Administrator

**Request URL with Optional Parameters** 

```
GET /HyperionPlanning/rest/ej/{api_version}/ejjournals?
Year=2018&Period=Jan&PostingStatus=ReadyToPost&ValidationStatus=ReadyToValidat
e
```

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

"Year", "Period", "PostStatus" and "ValidationStatus" are optional. If "Year" and "Period" are not passed, journals from all year and period are listed.

By default, only ReadyToPost journals are listed, however you can provide any valid value for the PostingStatus parameter to get corresponding journals. If a valid value is provided for "ValidationStatus", journals are listed based on the provided value.

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with: v1	Path	Yes	None
Year	Year for which to list journals, for example, Year=2018. If you do not specify a Year and Period, journals from all Years and Periods are listed.	Query	No	All Years
Period	Period for the journal, for example: Period=Jan. If you do not specify a Year and Period, journals from all Years and Periods are listed. If you specify only Year or only Period, journals from all Years and Periods are listed.	Query	No	All Periods
Postingstatus	Posting status for the journal, for example:	Query	No	ReadyToPost
	PostingStatus=ReadyToPost			
	Valid values are NotPosted, ReadyToPost, PostInProgress, Failed, Posted			
ValidationStatus	Validation status for the journal. Valid Values are NotValidated, ReadyToValidate, ValidationInProgress, Failed, Valid	Query	No	None

#### Table 21-10 Parameters

#### Response

Supported Media Types: application/json

#### **Example of Response Body**

The following shows an example of the response body.

```
{
 "items": [
   {
  "year": 2020
  "period": "Jan",

}
```

## Retrieve Enterprise Journal Content for Financial Consolidation and Close

Returns journal content for the instance identifier provided as Path parameter. Each item in the items list represents a line item of the journal.

This API works only for Financial Consolidation and Close.

#### **REST Resource**

GET /HyperionPlanning/rest/ej/{api version}/ejjournals/{instanceId}

#### **Required Roles**

Service Administrator

#### **Example of Request URL**

GET /HyperionPlanning/rest/ej/v1/ejjournals/1000000008821

Supported Media Types: application/json

#### Table 21-11 Parameters

Name	Description	Туре	Required	Default	
api_version	Version of the API you are developing with	Path	Yes	None	
instanceId	Identifier for the journal for which you want to retrieve journal content	Path	Yes	None	

#### **Example of Response Body**

The following shows an example of the response body.

```
{
  "year": 2018
  "period": "Jan",
  "journalId": "100000001",

```

## Retrieve Enterprise Journal Content by Year and Period for Financial Consolidation and Close

Returns Enterprise journal content for the provided Year, Period, and Journal ID. This API can be used if a user wants to query an Enterprise Journal without knowing the journal identifier.

This API works only for Financial Consolidation and Close.

#### **REST Resource**

```
GET /HyperionPlanning/rest/ej/{api_version}/ejjournalcontent?
Year={year}&Period={period}&JournalId={journalId}
```

#### **Required Roles**

Service Administrator

#### Example of Request URL

```
GET /HyperionPlanning/rest/ej/v1/ejjournalcontent?
Year=2018&Period=Jan&JournalId=100000001
```

Supported Media Types: application/json

#### Table 21-12 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

Name	Description	Туре	Required	Default
Year	Year for which to list journal, for example, Year=2018	Query	Yes	None
Period	Period for the journal, for example: Period=Jan	Query	Yes	None
JournalId	Identifier for the journal for which you want to retrieve journal content	Query	Yes	None

#### Table 21-12 (Cont.) Parameters

#### Example of Response Body

The following shows an example of the response body.

```
{
  "year": 2018
  "period": "Jan",
  "journalId": "100000001",
  "instanceId": "10000000008821",

```

## Update Enterprise Journal Posting Status for Financial Consolidation and Close

Updates the Enterprise Journal Posting status. After journal content has been read and the import to ERP begins, this API must be invoked to update the status to PostInProgress, and after completion of posting, the status should be updated with either Posted or Failed. Error items are read-only if the Posting status is Failed.

This API works only for Financial Consolidation and Close.

#### **REST Resource**

```
POST /HyperionPlanning/rest/ej/{api_version}/ejjournals/{instanceId}/
poststatus
```

#### **Required Roles**

Service Administrator

#### Example of Request URL

POST /HyperionPlanning/rest/ej/v1/ejjournals/1000000008821/Posted

Supported Media Types: application/json

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with: v1	Path	Yes	None
instanceId	The ID of the journal for which you want to update Posting status.	Path	Yes	None
year	Year value of journal period	String	No	None
period	Period of journal	String	No	None
journalId	Journal ID value	String	No	None
status	Journal Post Status	String	Yes	None
	Note: Only "PostInProgres s", "Failed" and "Posted" are supported for status value.			
message	Posting message to be set to the journal	String	No	None
journalBatch	Journal Batch represents the identifier from target ERP system for the current batch of posting.	String	No	None
errorItems	List of errors if any	Array	No	None
errorCode	Identifier for the individual error	String	No	None
errorMessage	Detailed message of the error	String	No	None
entryId	Journal entry identifier, for which error has occurred	String	No	None

#### Table 21-13 Parameters

#### Example of Post In Progress:

```
{
"year": "2019",
"period": "Jan",
"journalId": "1000000012",
"status": "PostInProgress"
}
```

#### Example of an Error:

```
{
    "year": "2019",
    "period": "Jan",
    "journalId": "100000001",
    "status": "Failed",
    "errorItems": [
    {
        "errorCode": "EF04",
        "
```

```
"errorMessage": "The account combination is invalid.",
     "entryId": "Journal Ent 1"
},
{
     "errorCode": "EU07",
     "errorMessage": "Accounting period is not open for the ledger.",
     "entryId": "Journal Ent 2"
]
}
```

#### **Example When Posted:**

```
"year": "2021",
"period": "Jan",
"journalId": "1000000003",
"status": "Posted",
"journalBatch": "111720201001-LNR11432"
}
```

#### Response

}

```
"detail": "Journal 2021 Jan 1000000001 is not in 'Post In Progress' or
'Ready to Post' status.",
"status": 400,
"message": "oracle.apps.epm.sdm.model.common.SDMModelException: Journal 2021
Jan 1000000001 is not in 'Post In Progress' or 'Ready to Post' status.",
"localizedMessage": "oracle.apps.epm.sdm.model.common.SDMModelException:
Journal 2021 Jan 10000000001 is not in 'Post In Progress' or 'Ready to Post'
status.",
"suppressed": []
```

#### Note:

The maximum character limit of the following fields are:

- journalBatch 255 characters
- errorMessage 255 characters
- errorCode 20 characters
- entryld 500 characters

## Update Validation Status of Enterprise Journals for Financial **Consolidation and Close**

Updates the journal validation status. Once journal content has been read, you can invoke this API to update the status to "ValidationInProgress". After completion of validation, the status

must be updated as either "Valid" or "Failed". Error items are read only if validation status is "Failed".

#### **REST Resource**

```
POST /HyperionPlanning/rest/ej/{api_version}/ejjournals/{identifier}/
validationstatus
```

#### **Required Roles**

Service Administrator

#### **Example of Request URL**

```
POST https://<BASE-URL>/HyperionPlanning/rest/ej/v1/ejjournals/
10000000008821/validationstatus
```

Supported Media Types: application/json

#### Table 21-14 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, for example, v1	Path	Yes	None
instanceId	Identifier for the journal for which you want to update the validation status.	Path	Yes	None
status	Validation status to be updated for the journal	String	Yes	None
	Note: Only "ValidationInProgr ess", "Failed" and "Valid" are supported for status value.			
message	Validation message to be set to the journal	String	No	None
errorItems	List of errors if any	Array	No	None
	Note: Errors are updated only if status is "Failed".			
errorCode	Identifier for the individual error	String	No	None
errorMessage	Detailed message of the error	String	No	None
entryId	Journal entry identifier, for which error has occurred	String	No	None

**Example of Validation in Progress:** 

```
{
   "status": "ValidationInProgress",
   "message":"Validation initiated"
}
```

#### Example of an Error:

```
{
   "status": "Failed",
    "message":"Validation failed"
    "errorItems": [
        {
            "errorCode": "EF04",
            "errorMessage": "The account combination is invalid.",
            "entryId": "Journal Ent 1"
        },
        {
            "errorCode ": "EU07",
            "errorMessage ": "Accounting period is not open for the ledger.",
            "entryId ": "Journal Ent 2"
        }
   ]
}
```

#### Example of Response Body:

## 22 Tax Reporting REST APIs

Use the Tax Reporting REST APIs to get the REST API version, to import supplementation data, copy data, clear data, and deploy form templates.

## **URL Structure for Tax Reporting**

Use the following URL structure to access the Tax Reporting REST resources:

https://<BASE-URL>/HyperionPlanning/rest/{api version}/{path}

#### Where:

• <BASE-URL>: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- api\_version: API version you are developing with. The current REST API version for Tax Reporting is v3.
- path: Identifies the resource.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ internal/" in the URL.

## Getting API Versions for Tax Reporting APIs

You can get information on REST API versions using REST resources. See Getting API Versions for Planning. Tax Reporting APIs use the same version numbers as Planning.

### Get Information about a Specific API Version for Tax Reporting

Returns details for a specific REST API version for Tax Reporting.

#### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the parameters.

#### Table 22-1 Parameters

Name	Description
api_version	Version of the API you are developing with, such as V1

#### Response

Supported Media Types: application/json

Parameters

The following table summarizes the parameters.

#### Table 22-2 Parameters

Name	Description
version	The version, such as V3

#### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
"version": "v1",
"lifecycle": "active",
"isLatest": true,
"links": [{
"rel": "canonical",
"href": "https://https://<BASE-URL>/HyperionPlanning/rest/v2"
}, {
"rel": "predecessor-version",
"href": "https://<SERVICE_NAME>-
<TENANT_NAME>.<SERVICE_TYPE>.<dcX>.oraclecloud.com/HyperionPlanning/rest/v1"
}]
}
```

## Copy Data

This REST API is used to execute a Copy Data job using the job name. Before executing this job, you should create a Copy Data job in Tax Reporting.

For details on this task, see "Using Copy Data Job" in Administering Tax Reporting

This REST API returns the job ID after starting the Copy Data job.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api\_version}/applications/{application}/jobs

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

#### Table 22-3 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application	The name of the application Get the application name by using the Get Applications API, for example, FCCS or TRCS. See Get Applications.	Path	Yes	None
jobName	Name of the job should be: Execute Profile	Payload	Yes	None
jobType	Type of Job. Supported value: COPY_DATA	Payload	Yes	None
ProfileName	Name of the saved copy data job	Payload	Yes	None

#### **Example of Request Body**

```
{
"jobType": "COPY_DATA",
"jobName": "Execute Profile",
"parameters": {
    "ProfileName": "CopyJobTesting"
  }
}
```

#### **Response Body**

Supported Media Types: application/json

Name	Description
type	Tax Reporting Application type, for example, TRCS
status	Status of the job: -1 =In progress; 0 = Success; 1 = Fail
details	In case of errors, details are published with the error string.
descriptiveStatus	The status of the job, such as Completed or Error
items	Collection of Notification categories
links	Detailed information about the link

#### Table 22-4 Parameters

#### Table 22-4 (Cont.) Parameters

Name	Description
href	Links to API call
action	The HTTP call type
rel	Relationship type. Possible values: self

#### Example of Response Body:

The following shows an example of the response body in JSON format.

```
{
    "jobId": 45,
    "jobName": "Copy Data",
    "descriptiveStatus": "Processing",
    "details": null,
    "status": -1,
    "links": [
        {
            "href": "https://ttps://<BASE-URL>/HyperionPlanning/rest/v3/
applications/<applicationName>/jobs/<JobId>",
            "rel": "self",
            "action": "GET"
        },
        {
            "href": "https://https://<BASE-URL>/HyperionPlanning/rest/v3/
applications/<applicationName>/jobs/<JobId>/details",
            "rel": "job-details",
            "action": "GET"
        }
    ]
}
```

## **Clear Data**

This REST API is used to execute a Clear Data job using the profile name. Before executing this job, you should create a Clear Data job in Tax Reporting.

For details on this task, see "Using Clear Data Jobs" in Administering Tax Reporting

This REST API returns the job ID after starting the job.

#### **REST Resource**

**POST** /HyperionPlanning/rest/{api\_version}/applications/{application}/jobs

#### **Required Roles**

Service Administrator

#### Request

Supported Media Types: application/json

#### Parameters

The following table summarizes the client request parameters specific to this job.

Table 22-5	Clear Data
------------	------------

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with: v3	Path	Yes	None
application	The name of the application Get the application name by using the Get Applications API, for example, FCCS or TRCS. See Get Applications.	Path	Yes	None
jobName	Name of the job should be: Execute Profile	Payload	Yes	None
јоbТуре	Type of Job. Supported value: CLEAR_DATA	Payload	Yes	None
ProfileName	Name of the saved clear data job	Payload	Yes	None

#### **Example of Request Body**

#### **Response Body**

Supported Media Types: application/json

#### Table 22-6 Parameters

Name	Description
type	Tax Reporting Application type, for example, TRCS
status	Status of the job: -1 =In progress; 0 = Success; 1 = Fail
details	In case of errors, details are published with the error string.
descriptiveStatus	The status of the job, such as Completed or Error
items	Collection of Notification categories
links	Detailed information about the link

Name	Description
href	Links to API call
action	The HTTP call type
rel	Relationship type. Possible values: self

#### Table 22-6 (Cont.) Parameters

#### **Example of Response Body**

The following is an example of the response body in JSON format.

```
{
 "jobId": 46,
  "jobName": "Clear Data",
   "descriptiveStatus": "Processing",
   "details": null,
   "status": -1,
    "links": [
        {
            "href": "https://ttps://<BASE-URL>/HyperionPlanning/rest/v3/
applications/<applicationName>/jobs/<JobId>",
            "rel": "self",
            "action": "GET"
        },
        {
            "href":"https://ttps://<BASE-URL>/HyperionPlanning/rest/v3/
applications/<applicationName>/jobs/<JobId>/details",
            "rel": "job-details",
            "action": "GET"
        }
   ]
}
```

# Enterprise Profitability and Cost Management REST APIs

#### **Related Topics**

- URL Structure for Enterprise Profitability and Cost Management
- Getting API Versions for Enterprise Profitability and Cost Management
- Getting Information About a Specific REST API Version for Enterprise Profitability and Cost Management

#### Table 23-1 REST APIs

Task	Request	REST Resource
Calculate Model	POST	/HyperionPlanning/rest/v3/applications/{AppName}/jobs/
Clear Data By Point of View	POST	/HyperionPlanning/rest/v3/applications/{AppName}/jobs/
Copy Data by Point of View	POST	/HyperionPlanning/rest/v3/applications/{AppName}/jobs/
Delete Point of View	POST	/HyperionPlanning/rest/v3/applications/{AppName}/jobs/
Generate Model Documentation Report	POST	/HyperionPlanning/rest/v3/applications/{AppName}/jobs/
Validate Model	POST	/HyperionPlanning/rest/v3/applications/{AppName}/jobs/

## URL Structure for Enterprise Profitability and Cost Management

Use the following URL structure to access the Enterprise Profitability and Cost Management REST resources:

https://<BASE-URL>/HyperionPlanning/rest/{api version}/{path}

#### Where:

• *<BASE-URL>*: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- {api\_version}: API version you are developing with. The current REST API version for Enterprise Profitability and Cost Management is v3.
- {path}: Identifies the resource.

#### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ internal/" in the URL.

## Getting API Versions for Enterprise Profitability and Cost Management

You can get information on REST API versions using REST resources.

**Important**: The version number is case-sensitive. For example, if the version number is listed as v3 with a lowercase v, you cannot enter the version number with a capital V as in this incorrect example, V3, which would result in an error. Instead, you must enter the version number with a lowercase v as in this correct example: v3.

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using REST APIs requires prerequisites. See Prerequisites.

There are two sets of REST APIs relevant for Enterprise Profitability and Cost Management.

- Planning REST APIs (See Getting API Versions for Planning).
- Enterprise Profitability and Cost Management-specific REST APIs. (See Getting Information About a Specific REST API Version for Enterprise Profitability and Cost Management).

## Getting Information About a Specific REST API Version for Enterprise Profitability and Cost Management

Returns information about a specific REST API version for Enterprise Profitability and Cost Management.

#### **Required Roles**

Service Administrator, Power User, User, Viewer

#### **REST Resource**

GET /HyperionPlanning/rest/{api\_version}

#### Request

Supported Media Types: application/json

Parameters

The following table summarizes the client request.

#### Table 23-2 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are working with, such as V3	Path	Yes	None

#### **Response Body**

Supported Media Types: application/json

The following table summarizes the response parameters.

#### Table 23-3 Parameters

Attribute	Description
version	v3
lifecycle	Lifecycle of the resource, active or deprecated
isLatest	Whether this resource is the latest, true or false

#### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
    "version": "v3",
    "lifecycle": "active",
   "isLatest": true,
    "links": [{
        "rel": "canonical",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v3"
    }, {
        "rel": "predecessor-version",
        "href": "https://<BASE-URL>/HyperionPlanning/rest/v2"
    }]
```

## **Calculate Model**

1

Runs the calculation on a given point of view in a selected cube. This API supports batch calculation with multiple POVs.

This is an asynchronous call, so use the job status URI to determine whether the operation is complete.

This API is version v3.

**Required Roles** 

Service Administrators

#### **REST Resource**

**POST** /HyperionPlanning/rest/v3/applications/{AppName}/jobs/

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request parameters specific to this job.

#### Table 23-4 Parameters

Name	Description	Туре	Required	Default
jobType	Calculation	Payload	Yes	None
jobName	Name of the job Example: "Calculation"	Payload	Yes	None
povDelimiter	<pre>Delimiter used in POV values. The default delimiter is _ (under score). The delimiter must be enclosed in double quotation marks. Only these delimiters are supported:     _ (under score)     # (hash)     &amp; (ampersand)     ~ (tilde)     % (percentage)     ; (semicolon)     : (colon)     . (dash) Example: "povDelimiter":":" Note: When submitting multiple POVs for calculation, do not use a comma as the delimiter to separate POV members. Comma is reserved for separating POV groups as shown in this example: FY21: Jan:Actual:Working, FY21:Feb:Actual:Working ,FY21:Mar:Actual:Working</pre>	Payload	Yes	:: (Double Colon)
povName	Name of the POV to calculate. You can pass one or more POVs separated by a comma (,). Example: "sourcePOVName":"FY16:May:Actual:Working"	Payload	Yes	None
modelName	Name of the model to calculate Example: "modelName":"10 Actuals Allocation Process"	Payload	Yes	None

Table 23-4	(Cont.) Parameters
------------	--------------------

Name	Description	Туре	Required	Default
executionType	<ul> <li>(ALL_RULES   RULESET_SUBSET   SINGLE_RULE   RUN_FROM_RULE   STOP_AFTER_RULE) Identifies the rule execution type</li> <li>If executionType=ALL_RULES, rule related parameters are not required.</li> <li>If executionType=SINGLE_RULE  RUN_FROM_RULE  STOP AFTER RULE, then provide ruleName only.</li> </ul>	Payload	Yes	None
	<ul> <li>If executionType=RULESET_SUBSET, then provide values for rulesetSeqNumStart and rulesetSeqNumEnd.</li> </ul>			
	<b>Example</b> : "executionType":"ALL_RULES"			
ruleName	Name of the single rule to run Example: "ruleName": "Utlities Expense Adjustment"	Payload	No	None
rulesetSeqNumStart	Sequence number of the first rule in the rule set to run <b>Example</b> : "rulesetSeqNumStart:1"	Payload	No	None
rulesetSeqNumEnd	Sequence number of the last rule in the rule set to run <b>Example</b> : "rulesetSeqNumStart:10"	Payload	No	None
clearCalculatedDat a	(True   False) Specifies whether to clear existing calculations	Payload	No	False
	<pre>Example: "clearCalculatedData":"true",</pre>			
executeCalculation s	(True   False) Specifies whether to run calculations Example: "executeCalculations":"true"	Payload	No	False
optimizeForReporti ng	(True   False) Specifies whether to optimize the calculation process for reporting When running multiple concurrent calculation jobs, set	Payload	No	False
	optimizeReporting=true for all jobs. Only the last job to complete will perform the aggregation, which avoids redundant processing and prevents running jobs from slowing down.			
	Set optimizeReporting=false only when necessary to save processing time; for example, when running a single rule or a sequential series of several POVs.			
	<pre>Example: "optimizeForReporting":"false",</pre>			
captureDebugScript s	(True   False) Specifies whether to generate debug scripts	Payload	No	False
	<b>Example</b> : "captureDebugScripts":"false"			
comment	Comment to describe the job	Payload	No	None

#### Sample Payload

{

```
"jobType":"Calculation",
"jobName":"Calculation",
"parameters":{
"povDelimiter":":",
```

```
"povName":"FY21:Jan:Actual:Working",,
"modelName":"10 Actuals Allocation Process",
"executionType":"ALL_RULES",
"rulesetSeqNumStart":"1",
"rulesetSeqNumEnd":"1",
"clearCalculatedData":"true",
"executeCalculations":"true",
"optimizeForReporting":"true",
"captureDebugScripts":"false"
}
```

#### Response

}

Supported Media Types: application/json

#### Table 23-5 Parameters

Name	Description
jobId	ID of the job that is created
jobName	Name of the job
details	In case of errors, details are published with the error string
status	See Migration Status Codes.
links	Detailed information about the link
href	Links to the API call
action	HTTP call type
rel	Can be self and/or Job-details. If set to Job Status, you can use the <code>href</code>
	to get the status of the job.
data	Parameters as key value pairs passed in the request

#### **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

#### Example 1: Job is in Progress

```
{
    "jobId": 26,
    "jobName": "Calculation",
    "status": -1,
    "descriptiveStatus": "Processing",
    "details": null,
    "links": [
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26",
            "action": "GET",
            "rel": "self",
        },
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26/details",
",
```

```
"action": "GET",
"rel": "job-details "
}
]
}
```

#### **Example 2: Job Status with No Errors**

```
{
    "jobId": 26,
    "jobName": "Calculation",
    "status": 0,
    "descriptiveStatus": "Success",
    "details": null
    "links": [
        {
            "rel": "self"
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26",
            "action": "GET",
        },
 {
            "rel": "job-details"
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26/details",
            "action": "GET",
        }
    ]
}
```

### Clear Data By Point of View

Clears the data for a given point of view in a selected cube.

This is an asynchronous call, so use the job status URI to determine whether the operation is complete.

This API is version v3.

#### **Required Roles**

Service Administrators

#### **REST Resource**

**POST** /HyperionPlanning/rest/v3/applications/{AppName}/jobs/

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request parameters specific to this job.

#### Table 23-6 Parameters

Name	Description	Туре	Required	Default
јоbТуре	Clear POV	Payload	Yes	None
jobName	Name of the job Example: "Clear POV"	Payload	Yes	None
povDelimiter	<pre>Delimiter used in POV values. The delimiter must be enclosed in double quotation marks. Other than a comma, only these delimiters are supported: • _ (under score) • # (hash) • &amp; (ampersand) • ~ (tilde) • % (percentage) • ; (semicolon) • : (colon) • . (dash) Example: "povDelimiter":":" Note: When submitting multiple POVs for calculation, do not use a comma as the delimiter to separate POV members. Comma is reserved for separating POV groups as shown in this example: FY21: Jan:Actual:Working, FY21: Feb:Actual:Working , FY21: Mar:Actual:Working</pre>	Payload	Yes	:: (Double Colon)
povName	Name of the POV to clear Example: "povName": "to FY21: Jan: Actual: Working"	Payload	Yes	None
cubeName	Name of the cube on which clear operation is to be executed Example: "cubeName": "PCM_CLC"	Payload	Yes	PCM_CLC
clearInput	(True False) Specifies whether to clear input data Example: "clearInput":"true"	Payload	Yes	None
clearAllocatedValu es	(True False) Specifies whether to clear allocated data Example: "clearAllocatedValues":"true"	Payload	Yes	None
clearAdjustmentVal ues	(True False) Specifies whether to clear adjustment data <b>Example</b> : "clearAdjustmentValues":"true"	Payload	Yes	None

#### **Sample Payload**

{

```
"jobType":"Clear POV",
"jobName":"Clear POV",
"parameters":{
    "povDelimiter":":",
    "povName":"FY21:Jan:Actual:Working",
```

```
"cubeName":"PCM_CLC",
   "clearInput":"true",
   "clearAllocatedValues":"true",
   "clearAdjustmentValues":"true"
}
```

#### Response

}

Supported Media Types: application/json

#### Table 23-7 Parameters

Name	Description
jobId	ID of the job that is created
jobName	Name of the job
details	In case of errors, details are published with the error string
status	See Migration Status Codes.
links	Detailed information about the link
href	Links to the API call
action	HTTP call type
rel	Can be self and/or Job-details. If set to Job Status, you can use the href
	to get the status of the job.
data	Parameters as key value pairs passed in the request

#### Examples of Response Body

The following examples show the contents of the response body in JSON format:

#### Example 1: Job is in Progress

```
{
    "jobId": 26,
    "jobName": "Clear POV",
    "status": -1,
    "descriptiveStatus": "Processing",
    "details": null,
    "links": [
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26",
            "action": "GET",
            "rel": "self",
        },
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26/details",
",
            "action": "GET",
            "rel": "job-details "
        }
```

```
]
}
Example 2: Job Status with No Errors
{
    "jobId": 26,
    "jobName": " Copy POV",
    "status": 0,
    "descriptiveStatus": "Success",
    "details": null
    "links": [
        {
            "rel": "self"
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26",
            "action": "GET",
        },
 {
            "rel": "job-details"
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26/details",
            "action": "GET",
        }
```

## Copy Data by Point of View

Copies data from a source to a destination point of view in a selected cube.

This is an asynchronous call, so use the job status URI to determine whether the operation is complete.

This API is version v3.

#### **Required Roles**

Service Administrators

#### **REST Resource**

**POST** /HyperionPlanning/rest/v3/applications/{AppName}/jobs/

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request parameters specific to this job.

Name	Description	Туре	Required	Default
јорТуре	Copy POV	Payload	Yes	None
jobName	Name of the job	Payload	Yes	None
	Example: "Copy POV"			
povDelimiter	<pre>Delimiter used in POV values. The delimiter must be enclosed in double quotation marks. Other than a comma, only these delimiters are supported: _ (under score) # (hash) &amp; (ampersand) ~ (tilde) % (percentage) ; (semicolon) : (colon) - (dash) Example: "povDelimiter":":" Note: When submitting multiple POVs for calculation, do not use a comma as the delimiter to separate POV members. Comma is reserved for separating POV groups as shown in this example: FY21: Jan: Actual: Working, FY21: Feb: Actual: Working , FY21: Mar: Actual: Working</pre>		Yes	:: (Double Colon)
sourcePOVName	Name of the source POV	Payload	Yes	None
Sourcerovname	Example: "sourcePOVName":"FY21:Jan:Actual:Working "	Payloau	165	None
destPOVName	Name of the destination POV Example: "destinationPOVName":"FY21:Feb:Actual:Working"	Payload	Yes	None
соруТуре	(ALL_DATA   INPUT) specifies the data to copy from the source Example: "copyType": "ALL_DATA"	Payload	Yes	None
sourceCubeName	Name of the source Oracle Essbase cube Example: "sourceCubeName":"PCM_CLC"	Payload	Yes	None
destCubeName	Name of the destination Essbase cube <b>Example:</b> "destCubeName":"PCM_CLC"	Payload	Yes	None

#### Table 23-8 Parameters

#### **Sample Payload**

{

```
"jobType":"Copy POV",
"jobName":"Copy POV",
"parameters":{
    "povDelimiter":":",
    "sourcePOVName":"FY21:Jan:Actual:Working",
    "destPOVName":"FY21:Feb:Actual:Working",
    "sourceCubeName":"PCM_CLC",
    "destCubeName":"PCM_CLC",
    "createDestPOV":"true",
```

```
"copyType":"ALL_DATA"
}
```

#### Response

}

Supported Media Types: application/json

#### Table 23-9 Parameters

Name	Description
jobId	ID of the job that is created
jobName	Name of the job
details	In case of errors, details are published with the error string
status	See Migration Status Codes.
links	Detailed information about the link
href	Links to the API call
action	HTTP call type
rel	Can be self and/or Job-details. If set to Job Status, you can use the href
	to get the status of the job.
data	Parameters as key value pairs passed in the request

#### **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

#### Example 1: Job is in Progress

```
{
    "jobId": 26,
    "jobName": "Copy POV",
    "status": -1,
    "descriptiveStatus": "Processing",
    "details": null,
    "links": [
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26",
            "action": "GET",
            "rel": "self",
        },
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26/details",
",
            "action": "GET",
            "rel": "job-details "
        }
    1
}
```

#### **Example 2: Job Status with No Errors**

```
{
    "jobId": 26,
    "jobName": " Copy POV",
    "status": 0,
    "descriptiveStatus": "Success",
    "details": null
    "links": [
        {
            "rel": "self"
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26",
            "action": "GET",
        },
 {
            "rel": "job-details"
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26/details",
            "action": "GET",
        }
```

### **Delete Point of View**

Deletes the data associated with a point of view from the calculation cube.

This is an asynchronous call, so use the job status URI to determine whether the operation is complete.

This API is version v3.

#### **Required Roles**

Service Administrators

#### **REST Resource**

**POST** /HyperionPlanning/rest/v3/applications/{AppName}/jobs/

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request parameters specific to this job.

Name	Description	Туре	Required	Default
јорТуре	Delete POV	Payload	Yes	None
jobName	Name of the job Example: "Delete POV"	Payload	Yes	None
povDelimiter	<pre>Delimiter used in POV values. The delimiter must be enclosed in double quotation marks. Other than a comma, only these delimiters are supported:     _ (under score)     # (hash)     &amp; (ampersand)     ~ (tilde)     % (percentage)     ; (semicolon)         : (colon)         - (dash) Example: "povDelimiter":":"</pre>	Payload	Yes	:: (Double Colon)
	<b>Note:</b> When submitting multiple POVs for calculation, do not use a comma as the delimiter to separate POV members. Comma is reserved for separating POV groups as shown in this example:			
	FY21:Jan:Actual:Working,FY21:Feb:Actual:Working ,FY21:Mar:Actual:Working			
povName	Name of the POV to delete Example: "povName":"FY21:Jan:Actual:Working"	Payload	Yes	None

#### Table 23-10 Parameters

#### Sample Payload

```
{
  "jobType":"Delete POV",
  "jobName":"Delete POV",
  "parameters":{
        "povDelimiter":":",
        "povName":"FY21:Jan:Actual:Working"
   }
}
```

#### Response

Supported Media Types: application/json

#### Table 23-11 Parameters

Name	Description
jobId	ID of the job that is created
jobName	Name of the job
details	In case of errors, details are published with the error string
status	See Migration Status Codes.

Name	Description
links	Detailed information about the link
href	Links to the API call
action	HTTP call type
rel	Can be self and/or Job-details. If set to Job Status, you can use the href to get the status of the job.
data	Parameters as key value pairs passed in the request

#### Table 23-11 (Cont.) Parameters

#### Example of Response Body

The following examples show the contents of the response body in JSON format:

#### Example 1: Job is in Progress

```
{
    "jobId": 26,
    "jobName": "Delete POV",
    "status": -1,
    "descriptiveStatus": "Processing",
    "details": null,
    "links": [
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26",
            "action": "GET",
            "rel": "self",
        },
        {
            "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/26/details",
",
            "action": "GET",
            "rel": "job-details "
        }
    ]
}
```

#### **Example 2: Job Status with No Errors**

```
},
{
    "rel": "job-details"
    "href": "http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
jobs/26/details",
    "action": "GET",
    }
]
}
```

## **Generate Model Documentation Report**

Generates an Enterprise Profitability and Cost Management Model Documentation report.

This is an asynchronous call, so use the job status URI to determine whether the operation is complete.

Any validation failures are written to file with file name provided in the parameters, and can be accessed from Inbox/Outbox Explorer.

This API is version v3.

#### **Required Roles**

Service Administrators

#### **REST Resource**

**POST** /HyperionPlanning/rest/v3/applications/{AppName}/jobs/

#### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request parameters specific to this job.

#### Table 23-12 Parameters

Name	Description	Туре	Required	Default
јоbТуре	Generate EPCM Report	Payload	Yes	None
jobName	User-specified name for this job execution	Payload	Yes	None
	Example: "Model Documentation Report for 10			
	Actuals Allocation Process"			
reportName	"MODEL_DOC"	Payload	Yes	None

Name	Description	Туре	Required	Default
outputFileName	Name of the output file to which the report will be generated	Payload	Yes	None
	<b>Example:</b> "My_Model_Doc_Report_Output"			
outputType	(PDF   Word   Excel   HTML   XML) Format in which the output will be generated	Payload	Yes	None
	Example: "PDF"			
modelName	Name of model for which the report is generated Example: "10 Actuals Allocation Process"	Payload	Yes	None

# Table 23-12 (Cont.) Parameters

### Sample Payload

```
{
  "jobType":"Generate EPCM Report",
  "jobName":"Model Documentation Report for 10 Actuals Allocation Process",
  "parameters":{
        "reportName":"MODEL_DOC",
        "outputFileName":"My_Model_Doc_Report_Output",
        "outputType":"PDF",
        "modelName":"10 Actuals Allocation Process"
   }
}
```

# Response

Supported Media Types: application/json

### Table 23-13 Parameters

Name	Description
jobId	ID of the job that is created
jobName	Name of the job
details	In case of errors, details are published with the error string
status	See Migration Status Codes.
links	Detailed information about the link
href	Links to the API call
action	HTTP call type
rel	Can be self and/or <code>Job-details</code> . If set to <code>Job Status</code> , you can use the <code>href</code>
	to get the status of the job.
data	Parameters as key value pairs passed in the request

### **Example of Response Body**

The following examples show the contents of the response body in JSON format:

## Example 1: Job is in Progress

```
{
    "jobId": 26,
    "jobName": "Generate Report",
    "status": -1,
    "descriptiveStatus": "Processing",
    "details": null,
    "links": [
         {
            "rel": "self",
            "href":http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/6,
            "action": "GET"
         },
         {
            "rel": "job-details",
            "href":http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/6/details,
            "action": "GET"
        }
    ]
}
```

### **Example 2: Job Status with No Errors**

```
{
    "jobId": 26,
    "jobName": "Generate Report",
    "status": 0,
    "descriptiveStatus": "Success",
    "details": null
    "links": [
        {
            "rel": "self",
            "href":http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/6,
            "action": "GET"
        },
        {
            "rel": "job-details",
            "href":http://<BASE-URL>/HyperionPlanning/rest/v3/applications/
BksML40/jobs/6/details,
            "action": "GET"
        }
    ],
}
```

# Validate Model

Automates the calculation process for validating a model.

This is an asynchronous call, so use the job status URI to determine whether the operation is complete.

Any validation failures are written to file with file name provided in the parameters, and can be accessed from Inbox/Outbox Explorer.

This API is version v3.

#### **Required Roles**

Service Administrators

### **REST Resource**

**POST** /HyperionPlanning/rest/v3/applications/{AppName}/jobs/

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request parameters specific to this job.

### Table 23-14 Parameters

Name	Description	Туре	Required	Default
јорТуре	Validate Model	Payload	Yes	None
jobName	Name of the job Example: "Validate Model"	Payload	Yes	None
modelName	Name of the model to validate Example: "modelName":"10 Actuals Allocation Process"	Payload	Yes	None
fileName	Name of the output file to which all the validations (if any) will be written <b>Example</b> : "fileName":"results.txt"	Payload	Yes	None

### Sample Payload

```
{
  "jobType":"Validate Model",
  "jobName":"Validate Model",
  "parameters":{
      "modelName":"10 Actuals Allocation Process",
      "fileName":"results.txt"
  }
}
```

### Response

Supported Media Types: application/json

Name	Description
jobId	ID of the job that is created
jobName	Name of the job
details	In case of errors, details are published with the error string
status	See Migration Status Codes.
links	Detailed information about the link
href	Links to the API call
action	HTTP call type
rel	Can be self and/or Job-details. If set to Job Status, you can use the href to get the status of the job.
data	Parameters as key value pairs passed in the request

### **Examples of Response Body**

The following examples show the contents of the response body in JSON format:

### Example 1: Job is in Progress

```
{
    "jobId": 26,
    "jobName": "Validate Model",
    "status": -1,
    "descriptiveStatus": "Processing",

### Table 24-1 (Cont.) REST APIs

# URL Structure for Profitability and Cost Management

Use the following URL structure to access the Profitability and Cost Management REST resources:

https://<BASE-URL>/epm/rest/{api version}/{path}

### Where:

• <BASE-URL>: The first part of your service URL, before the context.

For example, if your service URL is https://epm-acme.epm.usphoenix-1.ocs.oraclecloud.com/epmcloud, your <BASE-URL> is https://epmacme.epm.us-phoenix-1.ocs.oraclecloud.com. Similarly, if your service URL is https://
epm2-acme.epm.us6.oraclecloud.com/epmcloud, your <BASE-URL> is https://epm2acme.epm.us6.oraclecloud.com.

- {api\_version}: API version you are developing with. The current REST API version for Profitability and Cost Management is V1.
- {*path*}: Identifies the resource.

### Note:

Oracle does not authorize or support the use of REST APIs with the path token "/ <code>internal/"</code> in the URL.

# Get API Versions for Profitability and Cost Management REST APIs

Returns information about which versions are available and supported. Multiple versions might be supported simultaneously.

# Note:

An API version is always supported even when deprecated.

### **Required Roles**

Service Administrator, Power User, User, Viewer

### **REST Resource**

GET /epm/rest/

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Response

Supported Media Types: application/json

Table 24-2 Par	rameters
----------------	----------

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
items	Version of the API you are developing with
version	The version, such as v1
lifecycle	Possible values: active, deprecated
isLatest	Whether this resource is the latest, true or false

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "items": [{
        "isLatest": false,
        "lifecycle": "deprecated",
        "version": "11.1.2.4.000",
        "links": [{
            "href": "https://<BASE-URL>>/epm/rest/11.1.2.4.000",
            "rel": "canonical"
        }, {
            "href": "https://<BASE-URL>>/epm/rest/v1",
            "rel": "successor-version"
        }]
    }, {
        "isLatest": true,
    }
}
```

```
"lifecycle": "active",
    "version": "v1",
    "links": [{
        "href": "https://<BASE-URL>>/epm/rest/v1",
        "rel": "canonical"
    }, {
        "href": "https://<BASE-URL>>/epm/rest/11.1.2.4.000",

```

### Java Sample - GetRestAPIVersionsInfo.java for Profitability and Cost Management

### Prerequisites: json.jar

}

Prerequisites: See Profitability and Cost Management Common Helper Functions for Java

```
public void getRestAPIVersionsInfo() throws Exception {
    String urlString = String.format("%s/epm/rest", serverUrl);
    String response = executeRequest(urlString, "GET", null, "application/
json");
    System.out.println("Response String : " + response);
    JSONObject jsonObj = new JSONObject(response);
    JSONArray itemsArray = jsonObj.getJSONArray("items");
    System.out.println("Details : " + itemsArray.toString());
}
```

### cURL Sample - GetRestAPIVersionInfo.sh for Profitability and Cost Management

Common functions: See Profitability and Cost Management Common Helper Functions for cURL

```
funcGetRestAPIVersionInfo()
{
    url=$SERVER URL/epm/rest/$API VERSION
    funcExecuteRequest "GET" $url "application/x-www-form-urlencoded"
    status=$?
    echo "status code :$status"
    output='cat response.txt'
    if [ $status == 200 ]; then
        echo "Version $API VERSION details :"
        count='echo $output | jq '.links | length''
        i = 0
        while [ $i -lt $count ]; do
            echo "Service : " 'echo $output | jq '.links['$i'].rel''
            echo "URL :" 'echo $output | jq '.links['$i'].href''
            echo "Action :" 'echo $output | jq '.links['$i'].action''
            echo ""
```

```
i='expr $i + 1'
    done
else
    error='echo $output'
    echo "Error occurred. " $error
fi
funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

Groovy Sample - GetRestAPIVersionsInfo.groovy for Profitability and Cost Management

```
Prerequisites: json.jar
```

Common functions: See Appendix C: Common Helper Functions for Groovy.

```
def getRestAPIVersionsInfo() {
                 def url;
                 def response;
    try {

The following shows an example of the response body in JSON format.

### Java Sample - CopyPOV.java for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void copyPOVData() throws Exception {
    JSONObject json = new JSONObject(); String
modelViewName = "Operating Expenses";
    json.put("isManageRule", true);
    json.put("isInputData", true);
    json.put("modelViewName", modelViewName);
    json.put("createDestPOV", true);
    json.put("stringDelimiter", "_");
```

### cURL Sample - CopyPOV.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcCopyPOVData() {
    stringDelimiter=" ";
                           modelViewName="Operating Expenses";
    destPovGroupMember="2014 December Actual";
param="{\"isManageRule\":\"true\",\"isInputData\":\"true\",\modelViewName\":\"
$modelViewName\",\"createDestPOV\":\"true\",\"stringDelimiter\":\"$stringDelim
iter\"}"
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/
povs/$POV GROUP MEMBER/jobs/copyPOVJob/$destPovGroupMember
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started Copying POV successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Java Sample - CopyPOV.java for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void copyPOVData() throws Exception {
    JSONObject json = new JSONObject(); String
modelViewName = "Operating Expenses";
    json.put("isManageRule", true);
    json.put("isInputData", true);
    json.put("modelViewName", modelViewName);
    json.put("createDestPOV", true);
    json.put("stringDelimiter", "_");
```

# **Create File-Based Application**

Creates an application using a flat file using a REST API.

### **Required Roles**

Service Administrator

### **REST Resource**

**POST** /epm/rest/{api\_version}/fileApplications/{application}

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-9 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application to create	Path	Yes	None
description	User comment for this application	Payload	Yes	None
ruleDimensionName	Rule dimension name	Payload	Yes	None
balanceDimensionNa	Balance dimension name	Payload	Yes	None
me				

### **Example URL and Payload**

https://<BASE-URL>/epm/rest/v1/fileApplications/BksML12

```
{"description":
"description","ruleDimensionName":"Rule","balanceDimensionName":"Balance"}
```

### Response

Supported Media Types: application/json

Name	Description
details	Task ID, such as BksML12_BksML12_LoadData_D20160118T051020_ba8_1
status	See Migration Status Codes
statusMessage	Message about the status, such as Success
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-10 Parameters

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "type":"Profitability",
    "status":-1,
    "statusMessage":"In Progress",
    "details":"BksML30_UpdateDimensions_D20220513T062046_c61",
    "links":[
        {
                "href":"http://<<BASE-URL>/epm/rest/v1/applications/jobs/
ChecktaskStatusJob/BksML30_UpdateDimensions_D20220513T062046_c61",
                "action":"GET",
                "rel":"Job Status"
        }
    ]
}
```

### Java Sample - CreateFlatFileApplication.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void createFlatFileApplication() throws Exception {
    JSONObject json = new JSONObject();
    json.put("description", "Flat file based application");
    json.put("ruleDimensionName", "Rule");
    json.put("balanceDimensionName", "Balance");
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
```

```
fileApplications/" + "BksML13";
    String response = executeRequest(urlString, "POST", json.toString(),
"application/json");
    JSONObject jsonObj = new JSONObject(response);
    int resStatus = jsonObj.getInt("status");
    if(resStatus == 0) {
        System.out.println("Application created successfully");
    } else {
        System.out.println("Application creation failed");
    }
}
```

### cURL Sample - CreateFlatFileApplication.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcCreateFlatFileApplication() {
    description="Flat file based application";
    ruleDimensionName="Rule"
   balanceDimensionName="Balance"
param="{\"description\":\"$description\",\"ruleDimensionName\":\"$ruleDimensio
nName\", \"balanceDimensionName\":\"$balanceDimensionName\"}"
    url=$SERVER URL/epm/rest/$API VERSION/fileApplications/BksML13
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == 0 ]; then
        echo "Application created successfully"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
```

# Groovy Sample – CreateFlatFileApplication.groovy for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def createFlatFileApplication() {
    JSONObject json = new JSONObject();
    json.put("description", "Flat file based application");
    json.put("ruleDimensionName", "Rule");
    json.put("balanceDimensionName", "Balance");
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
fileApplications/" + "BksML13";
```

```
def url;

            println "Application created successfully"
        } else {
            println "Application creation failed"
        }
}
```

# **Deploy ML Cube**

Deploys or redeploys the calculation cube for a selected Profitability and Cost Management application.

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

**POST** /epm/rest/{api\_version}/applications/{application}/jobs/ledgerDeployCubeJob

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-11 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None

# Table 24-11 (Cont.) Parameters

Name	Description	Туре	Required	Default
application	Name of the application for which to deploy the cube	Path	Yes	None
isKeepData	Specify whether to preserve existing data	Payload	Yes	None
isReplaceCube	Specifies whether to replace existing cube	Payload	Yes	None
	<b>Note: Bo</b> th isKeepData <b>and</b> isReplaceCube cannot be true at the same time.			
isRunNow	Run now or schedule for later. (Schedule for later is not currently supported.)	Payload	Yes	None
comment	Any user comments	Payload	Yes	None

### **Example URL and Payload**

https://<BASE-URL>/epm/rest/v1/applications/{applicationName}/jobs/ ledgerDeployCubeJob

{"isKeepData":"true","isRunNow":"true","comment":"Test Ml Deploy"}

# Response

Supported Media Types: application/json

Name	Description
details	In case of errors, details are published with the error string
status	See Migration Status Codes
statusMessage	Message about the status, such as In Progress
type	Profitability
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### **Example of Response Body**

The following shows an example of the response body in JSON format.

```
{
    "type":"Profitability",
    "status":-1,
    "statusMessage":"In Progress",

            "rel":"Job Status"
        }
    ]
}
```

Java Sample - EssbaseDataLoad.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void loadData() throws Exception {
    JSONObject json = new JSONObject();
    json.put("clearAllDataFlag", false);
    json.put("dataLoadValue", "ADD_EXISTING_VALUES");
    json.put("dataFileName", "BksML12C.txt");
    String urlString = "%s/epm/rest/%s/applications/%s/jobs/
essbaseDataLoadJob";
    executeJob(urlString, "POST", json.toString());
```

### cURL Sample - EssbaseDataLoad.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcLoadData() {
    dataLoadValue="ADD EXISTING VALUES"
    dataFileName="BksML12C.txt"
param="{\"clearAllDataFlag\":\"false\",\"dataLoadValue\":\"$dataLoadValue\",\"
dataFileName\":\"$dataFileName\"}"
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/jobs/
essbaseDataLoadJob
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started Loading Data successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample – EssbaseDataLoad.groovy for Profitability and Cost Management

### Prerequisites: json.jar

}

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def loadData() {
        JSONObject json = new JSONObject();
        json.put("clearAllDataFlag", false);
        json.put("dataLoadValue", "ADD EXISTING VALUES");
        json.put("dataFileName", "BksML12C.txt");
        def url;
        def response;
        try {
                 url = new URL(serverUrl + "/epm/rest/" + apiVersion + "/
applications/" + appName + "/jobs/essbaseDataLoadJob")
        } catch (MalformedURLException e) {
                 println "Malformed URL. Please pass valid URL"
                 System.exit(0);
        }
        executeJob(url, "POST", json.toString());
}
```

# **Export Query Results**

Exports query results for a given query or exports all Oracle Essbase data into a file in the Outbox.

When exporting all Essbase data, there is an option for writing the output in columnar format, and columnar-formatted data can be filtered by level-0 dimension members. This API triggers a job that can be monitored in the Job Library.

### **Required Roles**

Service Administrator, Power User, User, Viewer

### **REST Resource**

```
POST /epm/rest/{api_version}/applications/{application}/jobs/
exportQueryResultsJob
```

# Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

Table 24-17	Parameters
-------------	------------

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, such as $\mathtt{v1}$	Path	Yes	None
application	Name of the application	Path	Yes	None
exportOnlyLevelOFl g	Whether to export only Level0 data; values are true or false	Payload	No	false
fileName	Name of the query output file to be exported into the Outbox folder	Payload	Yes	None
fileOutputOptions	<ul> <li>File output options. Available options are:</li> <li>ZIP_ONLY</li> <li>ZIP AND TEXT</li> </ul>	Payload	No	ZIP_ONLY

TEXT\_ONLY

# Table 24-17 (Cont.) Parameters

Name	Description	Туре	Required	Default
queryName	Query name from the Profitability and Cost Management application When queryName has a value, results for the given query are exported; exportOnlyLevelOFlg is considered if it is included.	Payload	No	None
	When queryName is blank or not included, data for the entire application is exported. In this case, exportOnlyLevelOFlg is ignored.			
roundingPrecision	The rounding precision (decimal places) for exported data. ( <b>Note:</b> Applies only if <code>queryName</code> is also used.)	Payload	No	2
dataFormat	Select the output format as native Essbase format, or as columnar format. Values are NATIVE or COLUMNAR. With the COLUMNAR option, all Essbase data is exported, so the queryName parameter is ignored. Data can be filtered using the memberFilters parameter.	Payload	No	NATIVE
The following parameter	rs are only considered when dataFormat=COLUMNAF	۲.		
memberFilters	Accepts a JSON formatted string for dimension and respective level-0 member format. For example: {\"Dim1\":[\"Mem1\"], \"Dim2\": [\"Mem21\", \"Mem22\"]}	Payload	No	None
includeHeader	Adds dimension names as column headers. Values are true or false.	Payload	No	true
delimiter	Character used to separate dimension members in the results file; must be enclosed in double quotes.	Payload	No	Space
keepDuplicateMembe rFormat	When this parameter is set to true, prints member names in Essbase duplicate member format, such as [Account]@[Accoun1]. If set to false, only the member name is printed.	Payload	No	true

### **Example URL and Payload**

https://<BASE-URL>/epm/rest/v1/applications/Ex3F3/jobs/exportQueryResultsJob

```
{"queryName":"Profitability -
Product","fileName":"ProfitabilityProduct_03232016.txt","exportOnlyLevel0Flg":"tr
ue","roundingPrecision":"3"}
```

### Example of Response Body

The following shows an example of the response body in JSON format.

Java Sample - ExportQueryResult.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void exportTemplate() throws Exception {
    String fileName = applicationName + "_Template_Export_File";
    JSONObject json = new JSONObject();
    json.put("fileName", fileName);
    String urlString = "%s/epm/rest/%s/applications/%s/jobs/
templateExportJob";
    executeJob(urlString, "POST", json.toString());
}
```

### cURL Sample - ExportQueryResult.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcExportQueryResult() {
    queryName="Profitability - Product";
    fileName=$APP NAME+" "+$queryName+" Query Result"
param="{\"queryName\":\"$queryName\",\"fileName\":\"$fileName\",\"exportOnlyLe
velOFlg\":\"false\"}"
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/jobs/
exportQueryResultsJob
    funcExecuteRequest "POST" $url "$param" "application/json"
   output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started Exporting successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample – ExportQueryResult.groovy for Profitability and Cost Management

#### Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def exportQueryResult() {
        String queryName = "Profitability - Product";
        String fileName = appName +" "+ queryName + " Query Result";
        JSONObject json = new JSONObject();
        json.put("queryName", queryName);
        json.put("fileName", fileName);
        json.put("exportOnlyLevelOFlg", false);
        String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
applications/" + appName + "/jobs/exportQueryResultsJob";
        def url;
         try {
                 url = new URL(urlString)
         } catch (MalformedURLException e) {
                 println "Malformed URL. Please pass valid URL"
                 System.exit(0);
         }
        executeJob(url, "POST", json.toString());
}
```

# Export Template for Profitability and Cost Management

Exports Profitability and Cost Management applications as a template into the Outbox.

#### **Required Roles**

Service Administrator, Power User

#### **REST Resource**

POST/epm/rest/{api\_version}/applications/{application}/jobs/templateExportJob?
fileName={fileName}

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

# Table 24-19 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application	Path	Yes	None
fileName	Name of the template zip file to be exported to the outbox folder	Query	Yes	None

### Note:

If the file name is the same as an existing file name, this will override content in existing file.

### Example URL and Payload

```
https://<BASE-URL>/epm/rest/v1/applications/BksML30/jobs/
templateExportJob{"fileName":"testFile"}
```

#### Response

Supported Media Types: application/json

Name	Description
details	Task ID, such as BksML30_ExportTemplate_D20180201T210316_a80
status	See Migration Status Codes
statusMessage	Message about the status, such as In Progress
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-20 Parameters

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "type":"Profitability",
    "status":-1,
    "statusMessage":"In Progress",
    "details":"BksML30_ExportTemplate_D20220511T114738_16e",
    "links":[
        {
            "href":"http://<BASE-URL>/epm/rest/v1/applications/jobs/
ChecktaskStatusJob/BksML30_ExportTemplate_D20220511T114738_16e",
            "action":"GET",
            "rel":"Job Status"
        }
    ]
}
```

### Java Sample - ExportTemplate.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void exportTemplate() throws Exception {
    String fileName = applicationName + "_Template_Export_File";
    JSONObject json = new JSONObject();
    json.put("fileName", fileName);
    String urlString = "%s/epm/rest/%s/applications/%s/jobs/
templateExportJob";
    executeJob(urlString, "POST", json.toString());
```

cURL Sample - ExportTemplate.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcExportTemplate() {
    fileName=$APP NAME+" Template Export File"
   param="{\"fileName\":\"$fileName\"}"
   url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/jobs/
templateExportJob
   funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ status == -1 ]; then
        echo "Started Exporting successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample – ExportTemplate.groovy for Profitability and Cost Management

### Prerequisites: json.jar

}

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def exportTemplate() {
    String fileName = appName + "_Template_Export_File";
    JSONObject json = new JSONObject();
    json.put("fileName", fileName);
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
    applications/" + appName + "/jobs/templateExportJob";
    def url;
    try {
        url = new URL(urlString)
    } catch (MalformedURLException e) {
        println "Malformed URL. Please pass valid URL"
        System.exit(0);
    }
    executeJob(url, "POST", json.toString());
}
```

### **Generate Program Documentation Report**

Generates a Program Documentation report for a given Profitability and Cost Management point of view.

The report is generated in the profitoutbox folder with the name

HPCMMLProgramDocumentationReport\_{AppName)\_{POV}.pdf. The file can be downloaded using File Explorer.

### **Required Roles**

Service Administrator, Power User, User, or Viewer

### **REST Resource**

GET epm/rest/{api\_version}/applications/{application}/povs/{POV}/ programDocumentationReport

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-21 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, such as $\mathrm{vl}$	Path	Yes	None
application	Name of the application for which to create the report	Path	Yes	None
pov	The POV for which to create the report, for example, FY17_JUN_Actual_Working	Path	Yes	None
fileType	The file format to use for the report, PDF, XML, WORD, EXCEL, or HTML	Query	No	PDF
useAlias	Boolean value to specify whether to use aliases in the report, true or falset	Query	No	false

### Example URL with fileType set to PDF and useAlias set to true:

https://<BASE-URL>/epm/rest/v1/applications/BksML30/povs/2016\_January\_Actual/
programDocumentationReport?queryParameter={"fileType":"PDF","useAlias":"true"}

### Response

Supported Media Types: application/json

Name	Description
details	<b>Program Documentation report name, such as</b> HPCMMLProgramDocumentationReport_BksML30_2016_January_Ac tual.pdf, and report status
status	See Migration Status Codes
statusMessage	Message about the status, such as Success
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-22 Parameters

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "type":"Profitability",
    "status":0,
    "statusMessage":"Success",
    "details":"Program Documentation report
HPCMMLProgramDocumentationReport_BksML30_2016_January_Actual.pdf generated
successfully in the Outbox folder."
}
```

Java Sample - GeneratePrgrmDocReport.java for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void generatePrgrmDocReport() throws Exception {
    JSONObject json = new JSONObject();
    json.put("fileType", "PDF");
    json.put("useAlias", false);
    json.put("stringDelimter", "_");
    String povGroupMember = "2016_January_Actual";
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
    applications/" + applicationName + "/povs/" +
    povGroupMember.trim().replaceAll(" ", "%20") + "/programDocumentationReport";
        urlString = urlString + "?" + "queryParameter=" + json.toString();
        String response = executeRequest(urlString, "GET", null, "application/
json");
```

```
JSONObject jsonObj = new JSONObject(response);
int resStatus = jsonObj.getInt("status");
if(resStatus == 0) {
    System.out.println("Program Documentation Report Generated
Successfully");
    }
    String details = jsonObj.getString("details");
    System.out.println(details);
}
```

### cURL Sample - GeneratePrgDocReport.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcGeneratePrgDocReport() {
       url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/
povs/$POV GROUP MEMBER1/programDocumentationReport
       echo $url
       curl -G "$url" --data-urlencode
'queryParameter={"fileType":"PDF","stringDelimter":" ","useAlias":"false"}' -
u "$USERNAME:$PASSWORD" -o "response.txt" -D "respHeader.txt"
       output=`cat response.txt`
       status=`echo $output | jq '.status'`
       echo $status
    if [ $status == 0 ]; then
       echo "Program Documentation Report generated successfully"
       message=`echo $output | jg '.details'`
       echo $message
    else
       error=`echo $output | jq '.details'`
       echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
```

}

### Groovy Sample – GeneratePrgrmDocReport.groovy for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def generateProgramDocReportJob() {
   JSONObject json = new JSONObject();
   json.put("fileName", "2016JanActual.pdf");
   json.put("fileType", "PDF");
   json.put("useAlias", false);
   json.put("stringDelimter", "_");

String povGroupMember = "2016_January_Actual";
String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/applications/"
+ appName + "/povs/" + povGroupMember.trim().replaceAll(" ", "%20") + "/
```

```
jobs/programDocReportJob";
def url;
try {
    url = new URL(urlString)
} catch (MalformedURLException e) {
    println "Malformed URL. Please pass valid URL"
    System.exit(0);
}
executeJob(url, "POST", json.toString());
}
```

### Generate Program Documentation Report - Run as a Job

Submits a job to generate a Program Documentation report for a given Profitability and Cost Management point of view.

The report is generated in the profitoutbox folder with the name as fileName parameter value or HPCMMLProgramDocumentationReport\_{AppName)\_{POV}.pdf as default. The file can be downloaded using File Explorer or by using the EPM Automate downloadfile command.

### **Required Roles**

Service Administrator, Power User, User, or Viewer

### **REST Resource**

### POST

/epm/rest/{api\_version}/applications/<applicationName>/povs/<povName>/jobs/
programDocReportJob

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-23 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with, such as $\mathbb{v}\mathbb{1}$	Path	Yes	None
applicationName	Name of the application for which to create the report	Path	Yes	None
povName	The POV for which to create the report, for example, FY17_JUN_Actual_Working	Path	Yes	None

Name	Description	Туре	Required	Default
fileType	The file format to use for the report, PDF, XML, WORD, EXCEL, or HTML	Request Payload	No	PDF
fileName	Name of the output file	Request Payload	No	HPCMMLProgr amDocumenta tionReport_ <appname>_P OV.pdf</appname>
subsetStart	Rule set starting sequence number to specify a range of rule sets to include in the report	Request Payload	No	None
subsetEnd	Rule set ending sequence number to specify a range of rule sets to include in the report	Request Payload	No	None
useAlias	Boolean value to specify whether to use aliases in the report, true or false	Request Payload	No	False
stringDelimiter	POV Dimension members separator	Request Payload	No	" " _

### Table 24-23 (Cont.) Parameters

### Example URL

https://<BASE-URL>/rest/v1/applications/<applicationName>/povs/<povName>/jobs/
programDocReportJob

### **Request Payload**

```
{
    "fileName":"FY12ActualReport.pdf",
    "fileType": "PDF",
    "subsetStart":"1",
    "subsetEnd":"6",
    "useAlias": false,
    "stringDelimiter":"_"
}
```

### Response

Supported Media Types: application/json

### Table 24-24 Parameters

Name	Description
details	Program Documentation report name, such as HPCMMLProgramDocumentationReport_BksML30_2016_January_Ac tual.pdf, and report status
status	See Migration Status Codes
statusMessage	Message about the status, such as Success
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call

Name	Description
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-24 (Cont.) Parameters

### Example of Response Body

The following shows an example of the response body in JSON format.

### Java Sample - GeneratePrgrmDocReport.java for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

### cURL Sample - GeneratePrgDocReport.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcProgramDocReportJob() {
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/
povs/$POV GROUP MEMBER1/jobs/programDocReportJob
        stringDelimter=" ";
param="{\"fileName\":\"2016JanActual.pdf\",\"fileType\":\"PDF\",\"subsetStart\
":\"1\",\"subsetEnd\":\"6\",
\"useAlias\":\"false\", \"stringDelimter\":\"$stringDelimiter\"}"
        echo $param
    funcExecuteRequest "POST" $url $param "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started program doc report generation"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
```

### Groovy Sample – GeneratePrgrmDocReport.groovy for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def generateProgramDocReportJob() {
   JSONObject json = new JSONObject();
    json.put("fileName", "2016JanActual");
    json.put("fileType", "PDF");
    json.put("subsetStart", "1");
    json.put("subsetEnd", "6");
    json.put("useAlias", false);
   json.put("stringDelimter", " ");
    String urlString = serverUrl + "/epm/rest/"+ apiVersion +
        "/applications/" + appName + "/povs/" +
        povGroupMember.trim().replaceAll(" ", "%20") +
        "/jobs/programDocReportJob";
    def url;
    try {
          url = new URL(urlString)
    } catch (MalformedURLException e) {
          println "Malformed URL. Please pass valid URL"
          System.exit(0);
    }
```

```
executeJob(url, "POST", json.toString());
```

### Import Template for Profitability and Cost Management

Imports a template zip file as an application from the inbox.

### **Required Roles**

}

Service Administrator, Power User

### **REST Resource**

**POST** /epm/rest/{api\_version}/applications/{application}/jobs/templateImportJob

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

#### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-25 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application	Path	Yes	None
description	User comment for the application	Payload	Yes	None
fileName	Name of the template zip file to be imported from the inbox folder	Payload	Yes	None
isApplicationOverw rite	Whether to override an application if one already exists with same name. Values are <i>true</i> or <i>false</i> .	Payload	Yes	None

### **Example URL and Payload**

https://<BASE-URL>/epm/rest/v1/applications/Ex3F3/jobs/templateImportJob

```
{"description":"description","fileName":"
testFile12345.zip","isApplicationOverwrite":"true"}
```

### Response

Supported Media Types: application/json

Name	Description
details	Task ID, such as TD_ae61e427d9ab4d6f99e3b87378fa1c94
status	See Migration Status Codes
statusMessage	Message about the status, such as In Progress
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-26 Parameters

### Example of Response Body

The following shows an example of the response body in JSON format.

Java Sample - ImportTemplate.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void importTemplate() throws Exception {
    JSONObject json = new JSONObject();
    json.put("description", "Import Template");
    json.put("instanceName", "PROFITABILITY_WEB_APP");
    json.put("essApplicationServer", "EssbaseCluster-1");
    json.put("sharedServicesProject", "EssbaseCluster-1");
    json.put("applicationType", "Management Ledger");
    json.put("fileName", "HPCM_BksML12_20160128_200053.zip");
    json.put("isApplicationOverwrite", true);
    String urlString = "%s/epm/rest/%s/applications/%s/jobs/
```

```
templateImportJob";
    executeJob(urlString, "POST", json.toString());
}
```

### cURL Sample - ImportTemplate.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcImportTemplate() {
    description="Import Template through Curl Sample"
    instance="PROFITABILITY WEB APP"
    essAppServer="EssbaseCluster-1"
    sharedServicesProject="EssbaseCluster-1"
    applicationType="Management Ledger"
    fileName="PCM BksML12 20160413 042937.zip"
    isApplicationOverwrite="true"
param="{\"description\":\"$description\", \"instanceName\":\"$instance\", \"essA
pplicationServer\":\"$essAppServer\",\"sharedServicesProject\":\"$sharedServic
esProject\",\"applicationType\":\"$applicationType\",\"fileName\":\"$fileName\
", \"isApplicationOverwrite \": \"$isApplicationOverwrite \"}"
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/jobs/
templateImportJob
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started importing successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample - ImportTemplate.groovy for Profitability and Cost Management

#### Prerequisites: json.jar

Common unctions: See Appendix C: Common Helper Functions for Groovy.

```
def importTemplate() {
    JSONObject json = new JSONObject();
    json.put("description", "Import Template");
    json.put("instanceName", "PROFITABILITY_WEB_APP");
    json.put("essApplicationServer", "EssbaseCluster-1");
    json.put("sharedServicesProject", "EssbaseCluster-1");
    json.put("applicationType", "Management Ledger");
    json.put("fileName", "BksML12_Template.zip");
    json.put("isApplicationOverwrite", true);
```

### Merge Slices for Profitability and Cost Management

Merges all incremental data slices into the main database slices.

Optionally, removes the Oracle Essbase cells with zero values to make the cube compact.

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

POST /epm/rest/{api version}/applications/{application}/jobs/mergeSlices

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-27 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the Profitability and Cost Management application	Path	Yes	None
removeZeroCells	If "true", removes cells with zero values	Path	No	"false"

### **Request URI Example**

https://<BASE-URL>/epm/rest/v1/applicaitions/BksML30/jobs/mergeSlices

### Request Payload:

```
{
   "removeZeroCells":"true"
)
```

### Response

Supported Media Types: application/json

### Table 24-28 Parameters

Name	Description
details	In case of errors, details are published with the error string.
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation.
data	Parameters as key value pairs passed in the request

### Example of Response Body

### **Optimize ASO Cube**

Optimizes the performance of queries for data extraction by creating aggregate views in ASO cubes for Profitability and Cost Management applications.

This command allows you to perform query optimization operations on ASO cubes in cases where default aggregation is deemed insufficient to meet your data extraction or reporting needs because of large data size. The typical optimization process is as follows:

- Drop default and query-based aggregations.
- Start query tracking.

- Run sample queries from Profitability and Cost Management Query Manager, Oracle Smart View for Office (Windows), or Data Management, and any other MDX queries representative of the type of queries for which optimization is desired to train Oracle Essbase.
- Create aggregation based on optimized or default queries.

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

**POST** /epm/rest/v1/applications/{AppName}/jobs/optimizeASOCube

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-29 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
appName	Name of the application used to run Optimize ASO	Path	Yes	None
type	<ul> <li>Type of operation. Valid values are:</li> <li>clearAggregations removes default and query-based views.</li> </ul>	Form	Yes	None
	<ul> <li>createAggregations creates default Essbase aggregate views. Use this option to perform default aggregation instead of query- based aggregation.</li> </ul>			
	<ul> <li>startQueryTracking starts query tracking. Use this option to allow Essbase to collect optimization information for creating query- based aggregations.</li> </ul>			
	<ul> <li>stopQueryTracking stops query tracking. Use this option to stop Essbase from collecting optimization information. Essbase continues to collect optimization information until you stop query tracking or stop Essbase.)</li> </ul>			
	• createQBOAggregations creates Essbase aggregate views based on the optimized queries that you run after enabling query tracking.			

### Response

Supported Media Types: application/json

Name	Description
details	In case of errors, details are published with the error string.
status	See Migration Status Codes
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Can be self and/or Job Status. If set to Job Status, you can use the href to get the status of the import operation.
data	Parameters as key value pairs passed in the request

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "type":"Profitability",
    "status":-1,
    "statusMessage":"In Progress",
    "details":"BksML30_OptimizeASOCube_D20220511T115135_55d",
    "links":[
        {
            "href":"http://<BASE-URL>/epm/rest/v1/applications/jobs/

            "action":"GET",
            "rel":"Job Status"
        }
    ]
}
```

Java Sample - OptimizeASOCube.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void optimizeASOCube() throws Exception {
    JSONObject json = new JSONObject();
    json.put("type", "createAggregations");
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
applications/" + applicationName+"/jobs/optimizeASOCube";
    executeJob(urlString, "POST", json.toString());
}
```

### cURL Sample - OptimizeASOCube.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcOptimizeASOCube() {
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/jobs/
optimizeASOCube
        param="{\"type\":\"createAggregations\"}"
                echo $param
     funcExecuteRequest "POST" $url $param "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ $status == -1 ]; then
        echo "Started Optimize ASO Cube successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample – OptimizeASOCube.groovy for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def optimizeASOCube() {
    JSONObject json = new JSONObject();
    json.put("type", "createAggregations");
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
    applications/" + appName + "/jobs/optimizeASOCube";
    def url;
    try {
        url = new URL(urlString)
    } catch (MalformedURLException e) {

        System.exit(0);
    }
    executeJob(url, "POST", json.toString());
}
```

### Retrieve Task Status for Profitability and Cost Management

Displays the current status of the job process name.

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

GET /epm/rest/{api\_version}/applications/jobs/ChecktaskStatusJob/{processName}

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-31 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
applications	Included in the path	Path	Yes	None
processName	The ID of the process or task flow for which to check the task status	Path	Yes	None

### Response

Supported Media Types: application/json

The following table summarizes the response parameters.

### Table 24-32 Parameters

Name	Description
processName	The Process Name or Taskflowld, such as RBkML1_ExportTemplate_D20160112T025419_836
task	Task name, such as ExportTemplate
status	Task status, such as Success

### Example of Response Body

```
{
    "type": "Profitability",
    "links": [{
```

```
"href": "https://<BASE-URL>/epm/rest/v1/applications/jobs/
ChecktaskStatusJob/RBkML1_ExportTemplate_D20160112T025419_836",
    "action": "GET",
    "rel": "self"
    }],
    "status": 0,
    "details":
"ExportTemplate=Success,RBkML1_ExportTemplate_D20160112T025419_836=Done",
    "statusMessage": "Success"
}
```

### **Run ML Calculations**

Runs or clears calculations for a selected application. You can run calculations using rules in a model POV against data in a different data POV without copying rules.

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

POST /epm/rest/{api\_version}/applications/{application}/povs/{povGroupMember}/
jobs/runLedgerCalculationJob

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-33 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application for which to run calculations	Path	Yes	None
povGroupMember	The model POV group member from which the rules will be used for calculations, such as 2016_January_Actual	Path	Yes	None
	If <i>dataPOVName</i> is not passed, <i>povGroupMember</i> is used as both model and data POV.			
dataPOVName	The data POV group member for which to run calculations, such as 2015_January_Actual	Payload	No	None
	exeType=ALL_RULES is the valid combination while using <i>dataPOVName</i> .			

Name	Description	Туре	Required	Default
isClearCalculated	Whether to clear the calculation data, true or false	Payload	No	None
isRunNow	Whether to run now (true) or schedule for later (false); schedule for later is not currently supported	Payload	Yes	true
optimizeReporting	Whether to optimize for reporting (true) or not (false).	Payload	No	true
	When <i>optimizieReporting</i> is used, Profitability and Cost Management runs default aggregations on the Essbase cube when the calculation is complete. You can also run this setting by itself, which improves performance for queries and analytics.			
	If you don't pass this parameter, its setting is assumed to be true ("About Optimizing for Reporting" in <i>Administering Profitability and Cost</i> <i>Management</i> ).			
subsetStart	Rule Set Starting Sequence Number	Payload	No	None
subsetEnd	Rule Set Ending Sequence Number	Payload	No	None
ruleName	Rule Name for a SINGLE_RULE option	Payload	No	None
ruleSetName	Rule Set Name for a SINGLE_RULE option	Payload	No	None
ехеТуре	The execution type specifies which rules to run; possible values are ALL_RULES, RULESET_SUBSET, SINGLE_RULE. Other parameters are required based on the exeType value:	Payload	Yes	None
	<ul> <li>exeType = ALL_RULES overrides all other options like subsetStart, subsetEnd, ruleSetName, and ruleName.</li> </ul>			
	<ul> <li>exeType = RULESET_SUBSET considers only subsetStart and subsetEnd.</li> </ul>			
	<ul> <li>exeType = SINGLE_RULE considers only ruleSetName and ruleName.</li> </ul>			
comment	Use comment text, such as "This is run by user1"	Payload	No	None
stringDelimiter	String delimiter for POV group members, such as _	Payload	No	None

### Table 24-33 (Cont.) Parameters

### Example URL and Payload without Passing Data POV

https://<BASE-URL>/epm/rest/{api\_version}/applications/{application}/povs/
{povGroupMember}/jobs /runLedgerCalculationJob

```
{"isClearCalculated":"true","isExecuteCalculations":"true","isRunNow":"true","opt
imizeReporting":"false","comment":"This is run by
user1","exeType":"ALL RULES","stringDelimiter":" "}
```

### Example URL and Payload with Data POV Passed

https://<BASE-URL>/epm/rest/{api\_version}/applications/{application}/povs/
{povGroupMember}/jobs/runLedgerCalculationJob

{"dataPOVName":"2015\_January\_Actual","isClearCalculated":"true","isExecuteCalcula tions":"true","isRunNow":"true","optimizeReporting":"false","comment":"This is run by userl","exeType":"ALL RULES","stringDelimiter":" "}

### Response

Supported Media Types: application/json

Name	Description
details	Task ID, such as BksML1_BksML1_RunCalcs_D20160113T070358_1da_1
status	See Migration Status Codes
statusMessage	Message about the status, such as In Progress
type	Profitability
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Example of Response Body

The following shows an example of the response body in JSON format.

```
{
    "type":"Profitability",
    "status":-1,
    "statusMessage":"In Progress",
    "details":"BksML30_RunCalcs_D20220511T114716_a14",
    "links":[
        {
            "href":"http://<BASE-URL>/epm/rest/v1/applications/jobs/
ChecktaskStatusJob/BksML30_RunCalcs_D20220511T114716_a14",
            "action":"GET",
            "rel":"Job Status"
        }
    ]
}
```

### Java Sample - RunCalculation.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void runCalculation() throws Exception {
   String subsetStart = null;
   String subsetEnd = null;
   String ruleName = null;
   String ruleSetName = null;
```

```
JSONObject json = new JSONObject();
        json.put("isClearCalculated", true);
        json.put("isExecuteCalculations", true);
        json.put("isRunNow", true);
        json.put("comment", "Run Calculation");
        json.put("subsetStart", subsetStart);
        json.put("subsetEnd", subsetEnd);
        json.put("ruleName", ruleName);
        json.put("ruleSetName", ruleSetName);
        json.put("exeType", "ALL RULES");
        json.put("stringDelimiter", " ");
        String povGroupMember = "2014 January Actual";
        String urlString = "%s/epm/rest/%s/applications/%s/povs/" +
povGroupMember.trim().replaceAll(" ", "%20")
                                       + "/jobs/runLedgerCalculationJob";
        executeJob(urlString, "POST", json.toString());
   }
```

### cURL Sample - RunCalculation.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcRunCalculation() {
    subsetStart=""
    subsetEnd=""
   ruleName=""
   ruleSetName=""
    comment="Run Calculation Curl"
    exeType="ALL RULES"
   stringDelimiter=" "
param="{\"isClearCalculated\":\"true\", \"isExecuteCalculations\":\"true\", \"is
RunNow\":\"true\",\"comment\":\"$comment\",\"subsetStart\":\"$subsetStart\",\"
subsetEnd\":\"$subsetEnd\",\"ruleName\":\"$ruleName\",\"ruleSetName\":\"$ruleS
etName\",\"exeType\":\"$exeType\",\"stringDelimiter\":\"$stringDelimiter\"}"
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/
povs/$POV GROUP MEMBER/jobs/runLedgerCalculationJob
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$ status == -1 ]; then
        echo "Started Running Calc successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample – RunCalculation.groovy for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
def runCalculation() {
        String subsetStart = null;
        String subsetEnd = null;
        String ruleName = null;
        String ruleSetName = null;
        JSONObject json = new JSONObject();
        json.put("isClearCalculated", true);
        json.put("isExecuteCalculations", true);
        json.put("isRunNow", true);
        json.put("comment", "Run Calculation");
        json.put("subsetStart", subsetStart);
        json.put("subsetEnd", subsetEnd);
        json.put("ruleName", ruleName);
        json.put("ruleSetName", ruleSetName);
        json.put("exeType", "ALL RULES");
        json.put("stringDelimiter", " ");
        String povGroupMember = "2014 January Actual";
        String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
applications/" + appName + "/povs/"
                                       + povGroupMember.trim().replaceAll("
", "%20") + "/jobs/runLedgerCalculationJob";
        def url;
        try {
                url = new URL(urlString)
        } catch (MalformedURLException e) {
                println "Malformed URL. Please pass valid URL"
                System.exit(0);
        }
        executeJob(url, "POST", json.toString());
    }
```

### Run ML Clear POV

Clears model artifacts and data from a POV combination for any application.

#### **Required Roles**

Service Administrator, Power User

### **REST Resource**

POST /epm/rest/{api\_version}/applications/{application}/povs/{povGroupMember}/
jobs/clearPOVJob

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-35 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application for which to run calculations	Path	Yes	None
povGroupMembe r	The POV group member for which to clear model artifacts sand data, such as 2015_January_Actual	Path	Yes	None
isManageRule	To clear the program rule details or not; true/false	Payload	No	None
isInputData	To clear input data or not; true/false	Payload	No	None
queryName	A query name already existing within the application; used to clear a region within the given POV	Payload	No	None
isAllocatedVa lues	To clear allocation values or not; true/ false	Payload	No	None
isAdjustmentV alues	To clear adjustment values or not; true/ false	Payload	No	None
stringDelimit er	String delimiter for POV group members	Payload	No	"_" (Undersco re)

### Note:

If queryName is used (is not null), then isManageRule, isAllocatedValues, and isAdjustmentValues must be set to false.

If one of these parameters or isInputData is not passed, it is considered as false.

### Example URL and payload to clear to a particular region within input data

https://<BASE-URL>/epm/rest/{api\_version}/applications/{application}/povs/
{povGroupMember}/jobs/clearPOVJob

{"isInputData":"true", "queryName": "myQueryName", "stringDelimiter":" "}

### Response

Supported Media Types: application/json

Name	Description
details	Task ID, such as BksML1_BksML1_ClearMLPOV_D20160113T070358_1da_1
status	See Migration Status Codes
statusMessage	Message about the status, such as In Progress
type	Profitability
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-36 Parameters

### Example of Response Body

The following shows an example of the response body in JSON format.

### Java Sample - clearPOV.java for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

```
public void clearPOVData() throws Exception {
    JSONObject json = new JSONObject();
    json.put("isManageRule", true);
    json.put("isInputData", true);
    json.put("stringDelimiter", "_");
    String povGroupMember = "2014_January_Actual";
```

### cURL Sample - ClearPOV.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
uncClearPOVData() {
   stringDelimiter=" ";
param="{\"isManageRule\":\"true\",\"isInputData\":\"true\",\"stringDelimiter\"
:\"$stringDelimiter\"}"
    url=$SERVER URL/epm/rest/$API VERSION/applications/$APP NAME/
povs/$POV GROUP MEMBER/jobs/clearPOVJob
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [ \$status == -1 ]; then
        echo "Started Clearing POV successfully"
        funcGetStatus "GET"
    else
        error=`echo $output | jq '.details'`
        echo "Error occurred. " $error
    fi
    funcRemoveTempFiles "respHeader.txt" "response.txt"
}
```

### Groovy Sample - ClearPOV.groovy for Profitability and Cost Management

### Prerequisites: json.jar

Common Functions: See Appendix C: Common Helper Functions for Groovy.

```
} catch (MalformedURLException e) {
    println "Malformed URL. Please pass valid URL"
    System.exit(0);
}
executeJob(url, "POST", json.toString());
```

### Run ML Rule Balancing

}

Retrieves Rule Balancing data for a particular POV for a given application.

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

```
GET /epm/rest/{api_version}/applications/{application}/povs/{povGroupMember}/
ruleBalance
```

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-37 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application for which to retrieve rule balancing data	Path	Yes	None
povGroupMember	POV name for which to retrieve the results, such as 2015_January_Actual	Path	Yes	None
modelViewName	Model view name to filter the results within the POV area	Query	Yes	None
stringDelimiter	String delimiter for POV group members, such as "_"	Query	No	Underscore, "_"

### Example URL and Sample Query Parameter

https://<BASE-URL>/epm/rest/{api\_version}/applications/{application}/povs/
{povGroupMembers}/ruleBalance?queryParameter={"modelViewName":"modelViewName"}

### Response

Supported Media Types: application/json

Name	Description
details	Rule balancing output for the given POV
status	See Migration Status Codes
statusMessage	Message about the status, such as Success
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Table 24-38 Parameters

### **Example of Response Body**

The following shows an example of the response body in JSON format.

```

            println "Details : " + itemsArray.toString()
        } else {
            String details = jsonObj.getString("details");
            println "Rule Balancing failed. Details : " + details
        }
    }
```

### Update Dimensions As a Job

Updates one or more dimensions from a dimension text/csv file.

Update Dimensions As a Job runs asynchronously; it immediately returns the job ID and the job status (Running or Failed).

### **Required Roles**

Service Administrator, Power User

### **REST Resource**

**POST** /epm/rest/{api\_version}/fileApplications/{application}/jobs/updateDimension

### Note:

Before using the REST resources, you must understand how to access the REST resources and other important concepts. See Implementation Best Practices for EPM Cloud REST APIs. Using this REST API requires prerequisites. See Prerequisites.

### Request

Supported Media Types: application/json

The following table summarizes the client request.

### Table 24-39 Parameters

Name	Description	Туре	Required	Default
api_version	Version of the API you are developing with	Path	Yes	None
application	Name of the application to update	Path	Yes	None
dataFileName	Dimension Metadata flat file name that has already been uploaded to the Inbox folder; multiple file names can be passed separated by comma or other separator character listed in the stringDelimiter parameter	Payload	Yes	None
stringDelimiter	Separator character to use if different from commas	Payload	No	Comma (,)
acceptableDecrease Percentage	Specifies the percentage difference in member count that is allowed for the operation.	Payload	No	None
	If the new member count from the incoming file is less than the existing member count, this represents the percentage decrease that is allowed. If the percentage is exceeded, then the operation will fail.			
	Use this parameter to safeguard against data loss that can happen during a subsequent cube deploy if one or more dimensions did not get fully updated due to missing data in the input file.			

### **Example URL and Payload**

```
https://<BASE-URL>/epm/rest/<api_version>/fileApplications/BksML12/jobs/
updateDimension{"dataFileName":"input.txt","stringDelimiter":",","acceptableDec
reasePercentage":"5"}
```

### Response

Supported Media Types: application/json

Name	Description
details	Task ID, such as BksML12_BksML12_ UpdateDimension_D20160118T051020_bb8_1
status	See Migration Status Codes
statusMessage	Message about the status, such as In Progress
type	Profitability
data	Parameters as key value pairs
links	Detailed information about the link
href	Links to API call
action	The HTTP call type
rel	Relationship type
data	Parameters as key value pairs passed in the request

### Example of Response Body

The following shows an example of the response body in JSON format.

### Java Sample - UpdateDimensionJob.java for Profitability and Cost Management

Prerequisites: json.jar

Common Functions: See Profitability and Cost Management Common Helper Functions for Java

public void updateDimensionJob() throws Exception {

```
JSONObject json = new JSONObject();
json.put("dataFileName", "Accounts.txt,Activity.txt");
String urlString = serverURL + "/epm/rest/" + apiVersion + "/
fileApplications/" + applicationName + "/updateDimensionJob";
exe4cuteJob(urlString, "POST", json.toString(();
}
```

### Note:

In the main method, enter the following statement:

```
restSamplesObj.updateDimensionsJob();
```

### cURL Sample - UpdateDimensionJob.sh for Profitability and Cost Management

Common Functions: See Profitability and Cost Management Common Helper Functions for cURL.

```
funcUpdateDimensionJob() {
    dataFileName="Accounts.txt,Activity.txt"
    param="{\"dataFileName\":\"$dataFileName\"}"
    url=$SERVER URL/epm/rest/$API VERSION/fileApplications/$APP NAME/
updateDimensionJob
    funcExecuteRequest "POST" $url "$param" "application/json"
    output=`cat response.txt`
    status=`echo $output | jq '.status'`
    if [status == -1]; then
       echo "Started Update Dimensions Job successfully"
            funcGetStatus "GET"
    else
       error=`echo $output | jq '.details'`

             funcRemoveTempFiles "respHeader.txt" response.txt"
```

### Note:

At the end, call this statement along with other statements:

funcUpdateDimensionsJob

Groovy Sample – UpdateDimensionJob.groovy for Profitability and Cost Management Prerequisites: json.jar

Common functions: See Appendix C: Common Helper Functions for Groovy.

```
def updateDimensionsJob() {
    JSONObject json = new JSONObject();
    json.put("dataFileName", "Accounts.txt,Activity.txt");
    String urlString = serverUrl + "/epm/rest/"+ apiVersion + "/
fileApplications/"+ appName + "/updateDimensionJob";
    def url;
    try {
        url = new URL(urlString)
    } catch (MalformedURLException e) {
        println "Malformed URL. Please pass valid URL"
        System.exit(0);
    }
    executeJob(url,"POST",json.toString());
}
```

### Note:

In the main method, add the following statement:

```
restSamplesObj.updateDimensionJob();
```

# 25 Narrative Reporting REST APIs

You can use the **REST APIs for Narrative Reporting** to work with Narrative Reporting artifacts, report packages, report snapshots, and reports.

You can use the REST APIs for Narrative Reporting to execute these actions:

- Files
  - Download a file from the temporary repository or to the Library.
  - Upload a temporary file to the Narrative Reporting repository.
- Jobs
  - Start a new Narrative Reporting job for asynchronous execution by the service.
  - Get a Narrative Reporting job's status that provides links to the job results when the job is complete.
- Reports
  - You can get the corresponding Report information
  - You can get the global point of view selections and member suggestions for the Report
  - You can get the required member selection prompts for the Report
- Books
  - You can get the corresponding Book information
  - You can get the global point of view selections and member suggestions for Book
- Bursting Definitions
  - You can view the Bursting Definitions and their content
  - You can execute the Bursting Definition file

## 26

# Enterprise Data Management Cloud REST APIs

Use the REST APIs for Enterprise Data Management Cloud to work with applications, files, jobs, requests, and views.

# A Common Helper Functions for Java

This appendix shows the common helper functions for Java for the EPM REST APIs.

## C Common Helper Functions for cURL

This appendix shows the common helper functions for cURL for the EPM Cloud REST APIs.

Note: the USERNAME variable is < domain>.< username>. See Authentication.

```
#!/bin/sh
SERVER URL="https://<BASE-URL>"
USERNAME = < username >
PASSWORD=<password>
APP NAME="Vision"
API VERSION="11.1.2.3.600"
funcRemoveTempFiles() {
    for var in "$@"
    do
        if [ -f $var ]; then
            rm $var
        fi
    done
}
funcPrintErrorDetails() {
    contentType=`echo $(grep 'Content-Type:' respHeader.txt) | tr -d
[:space:]
    if [ ! -z $contentType ] && [[ $contentType = *"application/json"* ]];
then

## **REST API Examples with Postman**

This appendix provides examples of how to run selected REST APIs using a web client called Postman.

- Example: Using REST APIs to Upload with Postman
- Example: Using REST APIs to Upload to an External Directory with Postman
- Example: Using REST APIs to Upload a Snapshot with Postman

### Example: Using REST APIs to Upload with Postman

In this example, we upload a file named users.csv to our environment, https://<BASE-URL>.

For an example of coding parameters, scroll down to the end of this topic.

Notes:

- This example uses the 11.1.2.3.600 Upload API, which is a simpler non-chunked version.
- The name of the file is passed in the URL itself, for example, https://<BASE-URL>/ interop/rest/11.1.2.3.600/applicationsnapshots/users.csv/contents
- If the filename contains special characters or has whitespace, it should be encoded using any online resource, such as urlencode.org.
- 1. Example of Upload parameters.

2. Example of Upload authorization.

# Example: Using REST APIs to Upload to an External Directory with Postman

In this example, we upload a file named data.txt to the inbox directory in our environment, https://<BASE-URL>.

Notes:

- This example uses the 11.1.2.3.600 Upload API, which is a simpler non-chunked version.
- The name of the file is passed in the URL itself, for example, https://<BASE-URL>/ interop/rest/11.1.2.3.600/applicationsnapshots/data.txt/contents? extDirPath=inbox
- If the filename contains special characters or has white space, it must be encoded using any online resource, such as urlencode.org. (See an example at the bottom of this topic: Example: Using REST APIs to Upload with Postman.)
- 1. Example of parameters for Upload to external directory.

# Sample Starter Kit for Consultants - Integration with Business Intelligence Cloud Service

This topic describes a sample starter kit that can be used by infrastructure consultants to plan integration for Planning with Business Intelligence Cloud Service.

#### Prerequisites

- You have accounts for Business Intelligence Cloud Service, Planning, and Oracle Application Express.
- You have considerable technical and functional expertise with Business Intelligence Cloud Service, Planning, Oracle Application Express, REST, Groovy, and scripting.

These are the basic tasks for the sample starter kit for consultants:

- Export data and metadata from Planning using the Planning REST API.
- Download data and metadata to an on-premise server using the Planning REST API.
- Use the metadata to create schema/tables in Business Intelligence Cloud Service using the Business Intelligence Cloud Service REST API.
- Populate the tables in Business Intelligence Cloud Service using the data imported from Planning by using the Business Intelligence Cloud Service REST API.

#### Note:

If you are using DBaaS, the target reporting database can optionally be accessed by

standard tools like SQL Developer and Toad.

#### Note:

The DataSync tool (available from OTN) can also be used to create tables and load and update data in the tables. Data uploads can be scheduled using the DataSync jobs and native scheduler. This approach will work for Database Schema Service and DBaaS used as reporting database for BICS.

These are the basic steps for the sample starter kit for consultants:

- **1.** Install the scripting engine and deploy demo scripts.
- 2. Use the SQL APEX REST API client to call a client sample that calls a SQL query with a bind variable passed on the URL.
- Use the Business Intelligence REST API client to provide methods as necessary for your use case.
- 4. Use the Planning REST API client to provide methods as necessary for your use case.

- 5. Incorporate helper functions.
- 6. Integrate Planning with Business Intelligence Cloud Service using a demo script.

Planning, Business Intelligence Cloud Service, and SQL Web REST services expose functions available in EPM Automate, DataSync, and for direct database SQL/PLSQL calls. The REST APIs can be scripted using any language. This appendix describes a sample starter kit to show how this can be implemented using Groovy for demonstration purposes. For information on REST APIs for Business Intelligence Cloud Service and Application Express, see:

- Business Intelligence REST APIs
- Application Express REST APIs

## Installing the Scripting Engine and Deploying Demo Scripts

For reference, demo scripts are described here: Integration of Planning to Business Intelligence Cloud Service.

1. Install the Groovy engine, http://www.groovy-lang.org/install.html

Select the binary release (https://bintray.com/artifact/download/groovy/maven/apache-groovy-binary-2.4.5.zip).

2. Create the files as shown in Integration of Planning to Business Intelligence Cloud Service, and put them in a folder structure similar to the following:

```
pbcsbics
   PBCSBICSAutomation.properties
   com
      oracle
      ceal
      <groovy files>
```

3. Open a shell:

```
cd <yourrootfolder>\pbcsbics
```

On a single line, type:

```
<yourrootfolder>\apache-groovy-binary-2.4.5\groovy-2.4.5\bin\groovy -
classpath
<yourrootfolder>\pbcsbics
<yourrootfolder>\pbcsbics\com\oracle\ceal\PBCSBICSIntegration.groovy
```

## SQL Application Express REST API client

The Application Express REST API client sample demonstrates calling an SQL query with a bind variable passed on the URL.

Client creation using com.oracle.ceal.ApexRestClient

```
apexClient=new ApexRestClient(apexRestUrl, proxy Host, proxy Port,cloud
identityDomain, cloud username, cloud password,
ignoreSSLCertificationPathErrors)
```

- Apex REST URL in the format: https://server

Example: https://<SERVER>.oraclecloud.com/apex

- proxy host:
  - \* Leave empty if not using a proxy
  - \* If using a tool like Fiddler for HTTP captures, specify localhost.
  - If you need to go through a proxy to connect to Oracle cloud services, specify the proxy host.
- proxy port:
  - \* Leave empty if not using a proxy
  - \* If using Fiddler, use 8888.
  - \* Otherwise, enter your proxy port.
- Cloud identity domain: this is provided with your cloud login. You can also find this in the APEX URL.
- ignoreSSLCertificationPathErrors (true or false): Set this to true if connecting through a proxy like Fiddler.
- Calling an SQL Query defined in APEX / SQL Workshop / RESTful web services

The REST web service must be created first. For more information, read this Oracle By Example: http://www.oracle.com/webfolder/technetwork/tutorials/obe/cloud/13\_2/dbservice/ restfulws/restfulws.html

```
apexClient.launchSQLQueryUsingGETAndVariableOnUrl("<module name>/<uri>",
"<bind variable>")
```

#### Example:

apexClient.launchSQLQueryUsingGETAndVariableOnUrl("bics/test", "7839")

This example uses the following definition of the REST service in APEX:

RESTful Service Module: bics/ URI Template: test/{ID} Method: GET Source Type: Query Format: JSON Requires Secure Access: YES Source: Select EMPNO, ENAME, JOB, MGR, HIREDATE, SAL, COMM, DEPTNO from EMP where EMPNO = :ID

The URL call will be in the following format:

https://<SERVER>.oraclecloudapps.com/apex/bics/test/7839

The response will be in the following format:

```
Response Content-Type:application/json
```

```
{"next":{"$ref":"https://<SERVER>.oraclecloudapps.com/apex/bics/test/7839?
page=1"},"items":
[{"empno":7839,"ename":"KING","job":"PRESIDENT","hiredate":"1981-11-17T00:0
0:002","sal":5000,"deptno":10}]}
```

Calling a PL/SQL defined in APEX / SQL Workshop / RESTful web services

A method is available, but all the configuration work must be done in APEX.

```
apexClient.launchProcUsingGET("<module name>/<uri>")
```

The definition of the REST service in APEX is for this example:

RESTful Service Module: bics/ URI Template: plsql/ Method: GET Source Type: PL/SQL Requires Secure Access: YES Source:

```
DECLARE
       prevdeptno
                    number;
       deptloc
                    varchar2(30);
       deptname
                    varchar2(30);
       CURSOR getemps IS select * from emp
               where ((select job from emp where ename = :empname) IN
('PRESIDENT', 'MANAGER'))
                        or deptno = (select deptno from emp where ename
= :empname)
                        order by deptno, ename;
       BEGIN
           sys.htp.htmlopen;
           sys.htp.headopen;
           sys.htp.title('Departments');
           sys.htp.headclose;
           sys.htp.bodyopen;
            for emprecs in getemps
           loop
           if emprecs.deptno != prevdeptno or prevdeptno is null then
                           select dname, loc into deptname, deptloc
                               from dept where deptno = (select deptno
from emp where ename = emprecs.ename);
                     if prevdeptno is not null then
                            sys.htp.print('');
         end if;
                     sys.htp.print('Department ' || deptname || ' located
in ' || deptloc || '');
                     sys.htp.print('');
         end if;
           sys.htp.print('' || emprecs.ename || ', ' || emprecs.job
|| ', ' || emprecs.sal || '');
           prevdeptno := emprecs.deptno;
           end loop;
           sys.htp.print('');
           sys.htp.bodyclose;
            sys.htp.htmlclose;
       END;
       URL call will be in the form: https://<SERVER>.oraclecloudapps.com/
apex/bics/plsql/
       Response will be in following format for this specific plsql
example
                Response Content-Type:text/html; charset=UTF-8
                <HTML>
                <HEAD>
                <TITLE>Departments</TITLE>
                </HEAD>
                <BODY>
                </BODY>
                    </HTML>
```

## **Business Intelligence REST API Client**

The Business Intelligence REST API client provides the following methods:

Client creation using com.oracle.ceal.BicsRestClient

```
(BicsClientRestClient.groovy)bicsClient=new BicsRestClient(bics Rest Url, proxy Host, proxy Port,cloud identityDomain, cloud username, cloud password, ignoreSSLCertificationPathErrors)
```

- Business Intelligence REST URL in the format: https://servername

Example: https://<SERVER>.oraclecloud.com

- proxy host:
  - \* Leave empty if not using a proxy
  - \* If using a tool like Fiddler for HTTP captures, specify localhost.
  - \* If you need to go through a proxy to connect to Oracle cloud services, specify the proxy host.
- proxy port:
  - Leave empty if not using a proxy
  - \* If using Fiddler, use 8888.
  - \* Otherwise, enter your proxy port.
- Cloud identity domain: this is provided with your cloud login. You can also find this in the BI URL.
- ignoreSSLCertificationPathErrors (true or false): Set this to true if connecting through a proxy like Fiddler.
- About bics

```
bicsClient.aboutBics()
```

List all tables

bicsClient.listAllTables()

Get table info

bicsClient.getTableInfo(table name)

Delete table

```
bicsClient.deleteTable(table name)
```

Create a table with X columns and a specific column name prefix

bicsClient.createTableToLoadCSV(table name, number of columns , column prefix)
Example:

```
bicsClient.createTableToLoadCSV("ceal 4", 3 ,"MYCOL")
```

This creates a table called CEAL\_4 with three columns named: MYCOL1, MYCOL2, MYCOL3

By default the columns have the following properties:

```
"dataType":"VARCHAR" // creates a VARCHAR2 column in database
    "length":300,
    "precision":0,
    "nullable":true,
    "defaultValue":null,
```

These values can be modified in BicsRestClient.groovy in the createTableToLoadCSV method

Delete data from table

bicsClient.deleteDataFromTable(table name)

Load data in table

```
loadDataInTableUsingCSV(tableName, localCsvFilePath, localCsvFileName,
delimiterInCsv,numberOfColumnsInCsv,numberOfLinesToSkip,columnPrefixInTable,is
Zipped)
```

#### Example:

```
bicsClient.loadDataInTableUsingCSV("ceal_4","d:\
\temp","export.csv",",",3,0,"MYCOL",false)
```

Create a table with a specific column name

bicsClient.createTableToLoadCSVWithHeaderNames("ceal 8", listHeaders )

Load data in table using mappings to specific column names

```
loadDataInTableUsingCSVAndHeader(tableName, localCsvFilePath,
localCsvFileName, delimiterInCsv,numberOfLinesToSkip,listHeaders,isZipped)
```

#### Example:

```
bicsClient.loadDataInTableUsingCSVAndHeader("ceal_8","d:\
\temp",fileNameInZip,",",1,listHeaders,false)
```

## Planning REST API Client

The Planning REST API client provides the following methods:

 Client creation using com.oracle.ceal.PbcsRestClient (PbcsClientRestClient.groovy)

```
PbcsRestClient pbcsClient=new
PbcsRestClient(pbcsParams.planningRestUrl,pbcsParams.interopRestUrl,pbcsPar
ams.proxyHost,pbcsParams.proxyPort,pbcsParams.identityDomain,pbcsParams.use
rname, pbcsParams.password, pbcsParams.ignoreSSLCertificationPathErrors)
```

List all files

```
pbcsClient.listFiles()
```

Delete a file

pbcsClient.deleteFile(fileName)

Export data

response=pbcsClient.exportData(appName, Job name for export, export filename
on server)

Get job status

pbcsClient.getJobStatus(appName,jobId)

Download file

pbcsClient.downloadFile(server file name, local destination folder)

Export metadata

pbcsClient.exportMetaData(appName,job name for metadata export, Export filename on server)

#### Execute LCM Export

pbcsClient.executeLCMExport(snapshot name)

#### Run business rule

pbcsClient.runBusinessRule(appname, business rule, runtime prompts)

#### Example:

pbcsClient.runBusinessRule("Vision", "AggOliv", "{Period:Q1, Entity:USA}")

Cube refresh

pbcsClient.cubeRefresh(appname,jobname)

#### Example:

pbcsClient.cubeRefresh("Vision", "RefreshOliv")

#### Run plantype map

pbcsClient.runPlanTypeMap(appname, jobname, cleardata true/false)

#### Example:

pbcsClient.cubeRefresh("Vision","RefreshOliv")pbcsClient.runPlanTypeMap("Visio n","MapOliv","false")

#### Run Ruleset

pbcsClient.runRuleSet(appname, ruleset)

Import data

pbcsClient.importData(appname, jobname, export filename)

Last parameter (export filename) defaults to jobname if no server import filename is specified

#### Import metadata

pbcsClient.importMetaData(appname, jobname, export metadata filename)

Last parameter defaults to jobname if no server import filename is specified

#### Example:

pbcsClient.importMetaData("Vision", "ImportMetaOliv", "ExportMetadataOliv.zip")

#### Execute LCM import

pbcsClient.executeLCMImport(snapshot name)

Upload file

pbcsClient.uploadFile(Local folder containing file to upload to server,file to upload)

#### Example:

```
//local folder, and filename as parameters
pbcsClient.uploadFile("d:\\temp","ExportOliv.zip")
```

## **Helper Functions**

The properties file containing connection parameters can also be accessed using this class:

com.oracle.ceal.BICSAutomationParameters Or com.oracle.ceal.PBCSAutomationParameters Or

com.oracle.ceal.APEXAutomationParameters

The Properties file must contain for BICS:

```
proxyHost=
proxyPort=
ignoreSSLCertificationPathErrors=true or false
bicsRestUrl=https://biserverurl
bicsIdentityDomain=
bicsUsername=
bicsPassword=
```

// this loads a file named PBCSBICSAutomation.properties
PbcsRestClient pbcsClient

```
PBCSAutomationParameters pbcsParams=new
PBCSAutomationParameters('PBCSBICSAutomation.properties')
```

```
pbcsClient=new
```

PbcsRestClient(pbcsParams.planningRestUrl,pbcsParams.interopRestUrl,pbcsPar ams.proxyHost,pbcsParams.proxyPort,pbcsParams.identityDomain,pbcsParams.use rname, pbcsParams.password, pbcsParams.ignoreSSLCertificationPathErrors)

#### Properties file must contain for Planning:

```
pbcsPlanningRestUrl=https://<SERVER>/rest/11.1.2.3.600
pbcsInteropRestUrl=https://<SERVER>/interop/rest/11.1.2.3.600
pbcsIdentityDomain=
pbcsUsername=
pbcsPassword=
proxyHost=
proxyHost=
ignoreSSLCertificationPathErrors=true or false
// this loads a file named PBCSBICSAutomation.properties
ApexRestClient apexClient
APEXAutomationParameters apexParams=new
```

APEXAutomationParameters ('PBCSBICSAutomation.properties')

```
apexClient=new
ApexRestClient(apexParams.apexRestUrl,apexParams.proxyHost,apexParams.proxy
Port,apexParams.identityDomain,apexParams.username, apexParams.password,
apexParams.ignoreSSLCertificationPathErrors)
```

#### The properties file must contain for Planning:

```
apexRestUrl=https://apexserver/apex
apexIdentityDomain=
apexUsername=
apexPassword=
proxyHost=
proxyPort=
ignoreSSLCertificationPathErrors=true or false
```

- The Planning REST client also contains helper functions for dealing with CSV files:
  - Finding the number of columns in a .csv file

Example:

```
nbColsInCsv=pbcsClient.findNbOfColsInCSV("d:\\temp\\", "export.csv", ",")
```

Finding header names in a .csv file (first line):

```
listHeaders=pbcsClient.getHeadersInCSVAsList(folder containing csv file,
csv filename, delimiter)
```

Example:

listHeaders=pbcsClient.getHeadersInCSVAsList("d:\\temp\\", fileName, ",")

The Planning REST client also contains helpers functions for dealing with asynchronous calls:

```
Class WaitForCode
```

Method retry(sleep time, nb of retries) { code to run }

#### Example:

}

The Business Intelligence Cloud Service REST client also contains helpers functions for trimming lists:

```
def truncateList(listName, truncateLength)
```

Example to truncate headers for columns to 30 characters:

## Integration of Planning to Business Intelligence Cloud Service

The demo scripts in the following topics show Groovy examples of integration for Planning and Business Intelligence Cloud Service. Review these topics to see Groovy examples.

### Groovy Sample – PBCSBICSIntegration.groovy

```
package com.oracle.ceal
class PBCSBICSIntegration {
    static main(args) {
        def pbcsExportfiles
        PbcsRestClient pbcsClient
        BicsRestClient bicsClient
        ApexRestClient apexClient
        PBCSAutomationParameters pbcsParams=new
PBCSAutomationParameters ('PBCSBICSAutomation.properties')
        if (pbcsParams.isConfigValid() == true) {
            pbcsClient=new
PbcsRestClient(pbcsParams.planningRestUrl,pbcsParams.interopRestUrl,pbcsParams
.proxyHost,pbcsParams.proxyPort,pbcsParams.identityDomain,pbcsParams.username,
 pbcsParams.password, pbcsParams.ignoreSSLCertificationPathErrors)
            pbcsClient.listFiles()
            pbcsClient.deleteFile("ExportOliv.zip")
            pbcsClient.deleteFile("ExportMetadataOliv.zip")
            def response
            //last parameter is server filename for export. If not set, this
defaults to jobname as filename
response=pbcsClient.exportData("Vision", "JobOliv", "ExportOliv.zip")
            String jobId = "";
            jobId=pbcsClient.getJobIdFromJSONResponse(response)
            if (jobId!="") println "Export running with jobid:"+jobId
            // Looping to get jobId status while it s being processed on
server
            // In this example waiting 6 secs each time, and trying 100 times
to get a valid status (not processing)
            WaitForCode.retry(6000,100) {
                // second parameter is jobid (is obtained from json response
from server)
```

```
def responseJobStatus
                responseJobStatus=pbcsClient.getJobStatus("Vision",jobId)
                if (responseJobStatus.contains("Processing")) throw new
Exception ("Job not finished"
            }
            //download server file name to local folder
            pbcsClient.downloadFile("ExportOliv.zip", "d:\\temp")
            //last parameter is server filename for export. If not set, this
defaults to jobname as filename
pbcsClient.exportMetaData("Vision", "JobOlivMeta", "ExportMetadataOliv.zip")
            pbcsClient.downloadFile("ExportMetadataOliv.zip","d:\\temp")
            pbcsExportfiles=pbcsClient.unZip("d:\\temp\\ExportOliv.zip","d:\
\temp/\")
            pbcsExportfiles.each { fileNameInZip ->
                println "-->"+fileNameInZip
                println "Nb of cols in csv:"+pbcsClient.findNbOfColsInCSV("d:\
\temp\\", fileNameInZip, ",")
                def headers
                headers=pbcsClient.getHeadersInCSVAsList("d:\\temp\\",
fileNameInZip, ",")
                headers.each { header ->
                    println "header -- "+header+"--"
                }
                println "<--"
            }
        } else {
            println "Configuration for PBCS is invalid. Please check
PBCSBICSAutomation.properties"
        }
        BICSAutomationParameters bicsParams=new
BICSAutomationParameters ('PBCSBICSAutomation.properties')
        if (bicsParams.isConfigValid() == true) {
            // load to bics
            bicsClient=new
BicsRestClient (bicsParams.bicsRestUrl, bicsParams.proxyHost, bicsParams.proxyPor
t, bicsParams.identityDomain, bicsParams.username, bicsParams.password,
bicsParams.ignoreSSLCertificationPathErrors)
            bicsClient.aboutBics()
            bicsClient.listAllTables()
            bicsClient.getTableInfo("ceal 4")
            bicsClient.deleteTable("ceal 4")
            // this creates a table with x columns MYCOL1 MYCOL2 MYCOL3
            bicsClient.createTableToLoadCSV("ceal 4", 3 ,"MYCOL")
            bicsClient.deleteDataFromTable("ceal 4")
            //loadDataInTableUsingCSV(tableName, localCsvFilePath,
localCsvFileName,
delimiterInCsv,numberOfColumnsInCsv,numberOfLinesToSkip,columnPrefixInTable,is
```

```
Zipped)
            bicsClient.loadDataInTableUsingCSV("ceal 4", "d:\

       return true
    }
}
```

# Troubleshooting the Integration

Use an HTTP proxy such as Fiddler to trace HTTP calls

- In this case, set proxyHost / proxyPort to localhost 8888 in your properties file defining the configuration
- Also set ignoreSSLCertificationPathErrors=true
