

Dementia

UK

Second
edition

Overview

Document purpose This is an overview of the findings of the research commissioned by Alzheimer’s Society to publish an update to the Dementia UK (2007) report. The full report will be available in autumn 2014. It presents a synthesis of best available evidence for the current cost and prevalence of dementia. It aims to provide an accurate understanding of dementia prevalence and cost in the UK to assist in policy development, influencing, commissioning and service design.

Title **Dementia UK: Second edition – Overview**

Publication date September 2014

Target audiences **Dementia UK: Second edition – Overview** is intended for a wide range of organisations and people who can improve quality of life for people with dementia. This includes partners from the public sector, the research community, local authorities, commissions of healthcare, civic organisations and government.

Acknowledgements The authors would like to thank everyone involved in the project. We gratefully acknowledge advice, comments and support from Anna Dowrick (Alzheimer’s Society), Carol Jagger (Newcastle University), Karen Shalev Greene (University of Portsmouth), Jane Birkett (UK Missing Persons Bureau), Laura Maio and Karen Harrison (Dementia UK), Panos Zerdevas (Department of Health) and the Global Observatory for Ageing and Dementia Care.

Summary

This overview document provides an update on the figures presented in the first edition of Dementia UK (Alzheimer's Society, 2007). It is an overview of the full report, Dementia UK: Second edition, which will be published by Alzheimer's Society in autumn 2014. This document presents the best available evidence for the current cost and prevalence of dementia in the UK.

The full report was commissioned by Alzheimer's Society. It was researched and written by King's College London and London School of Economics in 2014.

Some of the key findings from the report are:

- The total age-standardised 65+ population prevalence of dementia is 7.1% (based on 2013 data).
- This equals one in every 79 (1.3%) of the entire UK population, and 1 in every 14 of the population aged 65 years and over.
- At the current estimated rate of prevalence, there will be 850,000 people with dementia in the UK in 2015.
- Compared to the 2007 estimates, the current prevalence consensus estimates are slightly higher for the youngest (65 to 69) and oldest (90+) age bands and slightly lower for the intermediate age groups (80–89).
- The total number of people with dementia in the UK would increase to over 1 million by 2025 and over 2 million by 2051 if age-specific prevalence remains stable, and increases are only driven by demographic ageing.
- This is a worst-case scenario. Improvements to education standards, cardiovascular health, activity levels and other known risk factors may all help reduce dementia incidence and prevalence in the future. However, available research in this area is not sufficient to allow us to forecast this in our current projections.
- There are over 40,000 people with early-onset dementia (under the age of 65 years) in the UK.

- The total cost of dementia to society in the UK is £26.3 billion, with an average cost of £32,250 per person.
 - £4.3 billion is spent on healthcare costs.
 - £10.3 billion is spent on social care (publicly and privately funded).
 - £11.6 billion is contributed by the work of unpaid carers of people with dementia.

Introduction

Policy context

The Dementia UK report (Alzheimer's Society, 2007) marked a step change in awareness of the gravity of the coming dementia epidemic and the worrying inadequacy of UK policy responses to this challenge at the time. The report contained the first comprehensive evidence-based estimates of the numbers of people with dementia in the UK, with future projections through to the year 2051. Services and treatments for people with dementia were reviewed, and the societal costs of dementia were estimated.

The Dementia UK report was instrumental in raising awareness of the scale of the coming dementia epidemic among public, government and other key stakeholders. It has also been instrumental in guiding policymakers and service providers in designing, planning and costing service innovations, and in monitoring access to a timely diagnosis, treatment and care.

In the last seven years, progress has been made to address these issues. In particular, dementia has been accorded much greater national priority through the formulation of national dementia strategies for England (Department of Health, 2009), Scotland (The Scottish Government, 2010), Wales (Welsh Government, 2011), and Northern Ireland (Department of Health, Social Services and Public Safety, 2011), and the Prime Minister's challenge on dementia (Department of Health, 2012).

Updating estimates on prevalence and costs of dementia

An accurate understanding of dementia prevalence and cost in the UK is an important lever for policy development, influencing, commissioning and service design. This report presents a synthesis of best available evidence for the current cost and prevalence of dementia. However, estimates given in this report are by their nature provisional and subject to reappraisal when the coverage and quality of the evidence improves.

Decisions on priorities for developing services for people with dementia and on priorities for research should be informed by reliable estimates of the numbers of people with dementia and the costs – both to public funds and to society more widely – of providing treatment, care and support.

Since the 2007 report new evidence has been published that suggests there may have been changes in the prevalence of dementia. Most significantly for the UK have been the findings from the MRC Cognitive Function and Ageing Study II (Matthews et al, 2013), which suggest a decline in prevalence of dementia in England. Similarly, data available on the costs of healthcare, social care and unpaid care for people with dementia have significantly improved since 2007.

Projections of numbers of people living with dementia in the future generally assume that age-specific prevalence remains constant, and that demographic ageing is the only influence on numbers. This assumption is unlikely to be true. Prevalence may be affected by:

- changes in the incidence (the rate at which new cases occur in the population) due to interventions which reduce risk of developing dementia
- changes in duration of dementia (effectively survival with dementia, since cure is currently not possible).

However, available research in this area is not sufficient to allow us to forecast this in the current projected increases. These projections are underpinned by demographic change only.

Part 1: Dementia prevalence

Method

A Delphi consensus approach was used to estimate current dementia prevalence in the UK. This approach had been used successfully for calculating prevalence of dementia for the 2009 World Alzheimer report (Alzheimer's Disease International, 2009) and for the Dementia UK report (Alzheimer's Society, 2007).

The expert consensus group comprised 13 senior academics (see below for full list), nine of whom were part of the panel for the previous 2007 Dementia UK Delphi consensus.

Estimating dementia prevalence: Expert Delphi consensus

Systematic review of the available literature

The systematic review carried out for the 2009 World Alzheimer Report was updated. A review of titles and abstracts was undertaken to identify research conducted in Western Europe before applying other specific inclusion and exclusion criteria.

Synthesis of evidence

For the UK studies, details were provided of excluded studies along with the reason for exclusion. For each of the included studies, the methodology was summarised. Data on prevalence was extracted, providing tables with age-specific, gender-specific and age-and gender-specific prevalence with 95% confidence intervals where possible.

The updated Western European prevalence database (1980–2014) was subjected to quantitative meta-analysis. For the purposes of contextualisation the individual UK studies were compared with each other, and with the review of Western European prevalence.

Phase 1 of the Delphi consensus

Draft versions of the background evidence and the prevalence questionnaires were sent to the expert consensus panel for comments and suggestions. Suggestions for modifications were then incorporated into final versions of the background material and questionnaires.

Phase 2 of the Delphi consensus

Members of the expert consensus group were contacted individually and asked to review all of the materials provided, and then to use their judgement to answer the questions posed, regarding:

- the age- and gender-specific prevalence of dementia (in five-year age bands from 60–64 years to 90–94 years, and then 95 years and over) in the UK population, including care home residents
- as above, but for care home residents
- the total overall prevalence for those aged 60 years and over among residents of extra care homes, residential care homes, nursing homes, and elderly mentally infirm (EMI) care homes.

To ensure independence, experts were asked not to consult with each other in formulating their responses to these questions. They were encouraged to provide comments to explain or justify their choices, which would then be fed back in anonymised form to all experts in the next round.

Phase 3 of the Delphi consensus

The age- and gender-specific estimates from each expert were entered into Excel worksheet grids. The overall age- and gender-standardised prevalence (60 years and over) was calculated for each expert to facilitate comparisons. Estimates were anonymised, and experts were then asked to reconsider their earlier estimates in the light of group-wide choices, and any comments made.

Reaching a consensus

After the experts had reconsidered their estimates, a mean of these was used as the final consensus figure.

Estimates of the numbers of people with dementia were made by applying a prevalence estimate (the proportion of people affected) to the numbers of people in any given population.

The prevalence figures obtained by the Delphi consensus were applied to estimates of population numbers for the UK. Mid-year population estimates for 2013 were obtained from the National Statistics website for England and Wales (www.statistics.gov.uk), the Scottish census results website (www.scrol.gov.uk) and the Northern Ireland census data site (www.nisranew.nisra.gov.uk).

Projections of numbers of people with dementia were made by applying the population prevalence rates to projected population estimates for the years 2012 through to 2051. The latter were obtained from the Government Actuary Department (www.gad.gov.uk).

Consensus group

Dr Emiliano Albanese, Assistant Professor in Public Mental Health, Psychiatry Department, Medical School (University of Geneva, Switzerland)

Professor Sube Banerjee, Professor of Dementia (Brighton and Sussex Medical School, UK)

Professor Carol Brayne, Professor of Public Health Medicine, Institute of Public Health (University of Cambridge, UK)

Professor Alistair Burns, Professor of Old Age Psychiatry, Institute of Brain, Behaviour and Mental Health (University of Manchester, UK)

Dr Cleusa Ferri, Senior Epidemiologist and Affiliated Professor (UNIFESP, Sao Paulo, Brazil)

Professor Laura Fratiglioni, Professor in Medical Epidemiology, Karolinska Institute (Stockholm, Sweden)

Professor Kenneth Langa, Professor Internal Medicine, Gerontology, and Health Management and Policy, Institute for Social Research and Institute of Gerontology (University of Michigan, USA)

Dr Fiona Matthews, Senior Research Scientist, MRC Biostatistics Unit (Cambridge, UK)

Professor Martin Prince, Professor of Epidemiological Psychiatry, Centre for Global Mental Health, Institute of Psychiatry (King's College London, UK)

Professor Gill Livingston, Professor of Psychiatry of Older People (University College London, UK)

Dr Karen Ritchie, Neuropsychologist and Epidemiologist, Research Director (University of Montpellier/INSERM, France)

Professor Ingmar Skoog, Professor of Psychiatry, Institute of Neuroscience and Physiology (University of Goteborg, Sweden)

Professor Robert Stewart, Professor of Psychiatric Epidemiology and Clinical Informatics, Department of Psychological Medicine, Institute of Psychiatry (King's College London, UK)

Results

Prevalence of late-onset dementia

The current consensus estimates (male and female combined) are slightly higher than the previous Delphi estimates for the youngest (65–69) and oldest (90+) age bands and slightly lower for the intermediate age groups (80–89).

The number of people with late-onset dementia continues to rise for each five-year age band up to the age of 80–84.

The age standardised population prevalence for those aged 65 years and over was similar in both Delphi consensus exercises (7.1%).

This age-standardised prevalence is intermediate between the 7.5% estimated in the MRC CFAS I (MRC CFAS, 1998) and the 6.4% from the MRC CFAS II (Matthews et al, 2013) studies, but substantially lower than the 8.6% indicated by the Western Europe region meta-analysis.

Table 1: The consensus estimates of the population prevalence (%) of late-onset dementia

Age in years	Previous estimates (Dementia UK 2007)			Current estimates (Dementia UK 2014)		
	Female	Male	Total	Female	Male	Total
60–64	(0.1)*	(0.2)*	(0.2)*	0.9	0.9	0.9
65–69	1.0	1.5	1.3	1.8	1.5	1.7
70–74	2.4	3.1	2.9	3.0	3.1	3.0
75–79	6.5	5.1	5.9	6.6	5.3	6.0
80–84	13.3	10.2	12.2	11.7	10.3	11.1
85–89	22.2	16.7	20.3	20.2	15.1	18.3
90–94	29.6	27.5	28.6	33.0	22.6	29.9
95 +	34.4	30.0	32.5	44.2	28.8	41.1

* In the Dementia UK 2007 report, the prevalence of dementia among those aged 60–64 was estimated as part of the young-onset dementia consensus.

Table 2: Comparison of current consensus estimates for the prevalence (%) of late-onset dementia with estimate from previous literature reviews and key surveys

Age in years	60–64	65–69	70–74	75–79	80–84	85–89	90–94	95+	Age-standardised 65+
Dementia UK report 2014	0.9	1.7	3.0	6.0	11.1	18.3	29.9	41.1	7.1
MRC-CFAS I	-	1.5	2.6	6.3	13	25.3	7.5		
MRC-CFAS II	-	1.5	2.7	5.7	10.0	16.1	30.1	6.4	
Updated World Alzheimer’s Report (Western Europe)	1.6	2.5	4.2	7.2	12.4	20.7	40.7	8.6	
Dementia UK Report 2007	-	1.3	2.9	5.9	12.2	20.3	28.6	32.5	7.1

Prevalence of dementia in different care settings

Table 3: The mean consensus estimates of the prevalence (%) of dementia in different care settings

Care setting	Female	Male	Total
Extra care housing	8.8	7.9	8.1**
Residential homes	62.1	52.7	57.9
Nursing homes	75.8	67.8	73.0
EMI care homes	90.6	86.7	90.1

**Consensus not achieved – therefore this estimate should be treated with caution.

Due to limited new evidence, the following estimates from the 2007 report have not been updated:

- Prevalence of dementia among black, Asian and minority ethnic (BAME) groups – Prevalence among BAME groups is the same as for the UK population as a whole.
- Dementia severity – among people with late-onset dementia:
 - 55.4% have mild dementia
 - 32.1% have moderate dementia
 - 12.5% have severe dementia
- Dementia sub-types
 - Alzheimer’s disease 62%
 - vascular dementia 17%
 - mixed dementia 10%
 - Lewy body dementia 4%
 - frontotemporal dementia 2%
 - Parkinson’s dementia 2%
 - other 3%

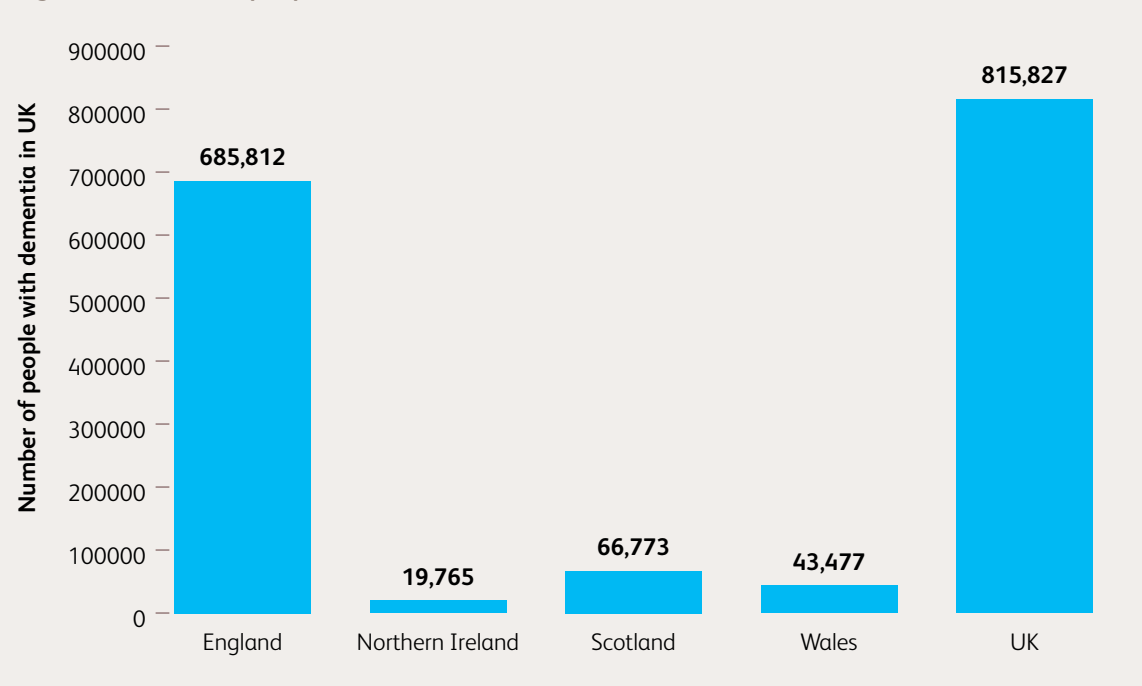

Numbers of people with dementia

Current number of people with dementia in the UK

Applying estimated prevalence to 2013 population data, there were 815,827 people with dementia in the UK, of whom 773,502 were aged 65 years or over. This represents one in every 79 (1.3%) of the entire UK population, and 1 in every 14 of the population aged 65 years and over.

Eighty-four per cent of those with dementia live in England, 8% in Scotland, 5% in Wales and 2% in Northern Ireland (Figure 1).

Figure 1: Number of people with dementia in the UK (2013)

Projected increases in the number of people with dementia in the UK

If the prevalence of dementia remains the same, the number of people with dementia in the UK is forecast to increase to 1,142,677 by 2025 and 2,092,945 by 2051, an increase of 40% over the next 12 years and of 157% over the next 38 years.

This growth would be driven solely by population ageing. Life expectancy for older people is increasing, as mortality declines, even for the oldest old. Older people are most at risk for dementia. Hence the largest increases in the number of people with dementia would occur in the oldest age groups (Figure 2). Numbers of men and women with dementia in the UK are projected to increase at a similar rate (Figure 3). These projections should be seen as a 'worst case scenario' rather than an expected outcome. Some current evidence suggests that the prevalence and incidence of dementia among older people is already beginning to fall in high income countries such as the UK, associated with improvements in the level of education and improvements in public health (healthier lifestyles and better prevention and control of cardiovascular risk factors). These trends, if they continue, have the potential to greatly attenuate or even eliminate the projected increases in numbers of people with dementia in the coming decades.

Table 4: Projected number of people with dementia in the UK

Years	Number of people with dementia UK
2012	802,820
2013	815,827
2014	835,927
2015	856,700
2016	877,777
2017	902,502
2018	927,812
2019	954,099
2020	980,844
2021	1,007,485
2051	2,092,945

Figure 2: Projected increases in the number of people with dementia in the UK, by age group (2012–2051)

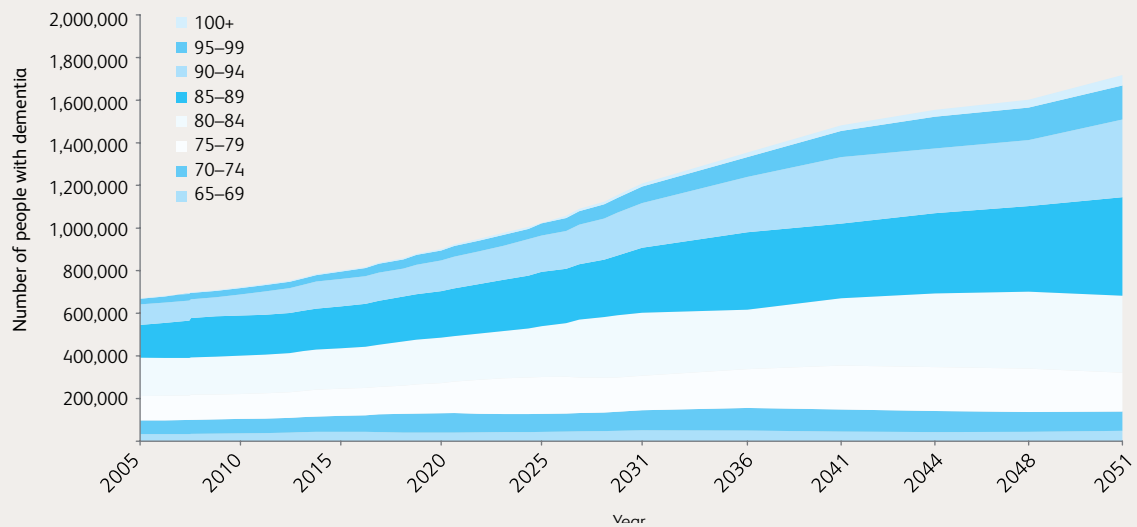

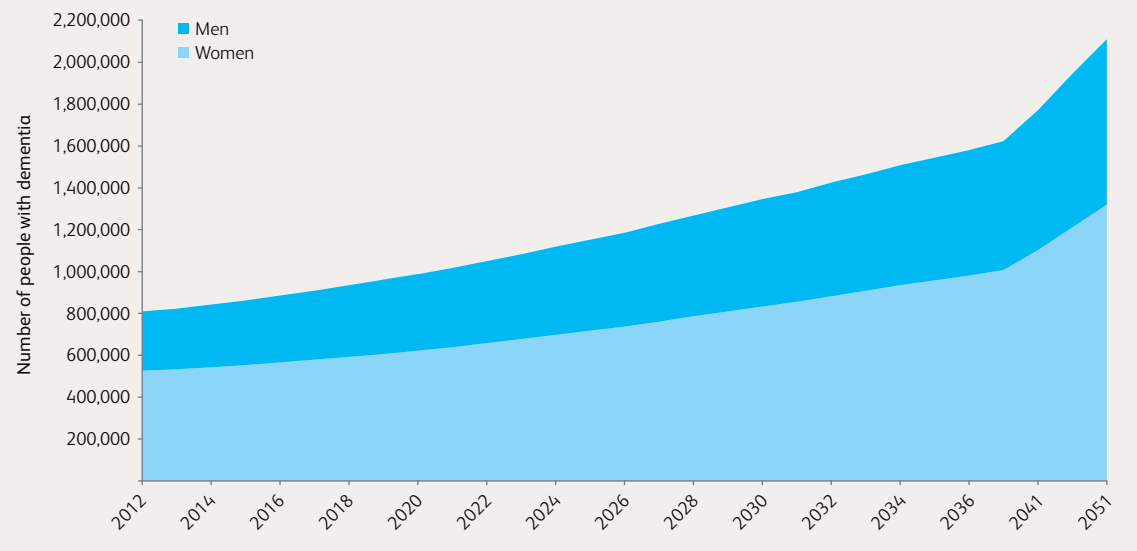

Figure 3: Projected increases in the number of people with dementia in the UK, by gender (2012–2051)

Population prevalence by regions

The number of people with dementia for each local authority, clinical commissioning group (or equivalent) and parliamentary constituency in the UK was estimated. Detailed results are provided in the appendix. These are based on 2013 data.

Early-onset dementia

It was estimated that there are now 42,325 people with early-onset dementia (under the age of 65 years) in the UK. This number has significantly increased since the 2007 Dementia UK report, where it was thought to be underestimated. This is because in the 2007 report estimates were based on referrals of younger people to services, whereas now the 60–64 years old estimate was provided by the new Delphi consensus as part of late-onset dementia.

Discussion

This report provides an expert consensus estimate of the current prevalence of dementia in the UK, applying a rigorous methodology to all of the available evidence. A balanced judgment suggests that the overall prevalence for all those aged 65 years and over is somewhere in the region of 7.1%. It seems unlikely that the true prevalence would lie outside of the bounds of the CFAS II survey estimates (6.4%) and the Western European meta-analysis (8.6%).

The fact that the mean of the current consensus estimates was somewhat higher than that of CFAS II (but lower than CFAS I), and had not changed from the consensus of Dementia UK 2007, does not exclude the possibility that the prevalence of dementia has declined from the early 1990s to the late 2000s, as suggested by the CFAS surveys.

It would be preferable to move to a purely quantitative method for synthesising prevalence data, but this will not be possible until the quality and coverage of prevalence estimates improves. There is no substitute for contemporary, good quality population-based research for the estimation of numbers of people with dementia in the UK and other countries: their residential status, their needs for care, their access to and use of services, and attendant costs.

In high income countries, the number of dementia prevalence studies being carried out has declined sharply this century. Future policymaking and planning require accurate up-to-date figures on prevalence and, ideally, incidence and mortality. Only then can current and future needs be met and anticipated. This data is vital for rational health planning, monitoring service delivery, and quality improvement in prevention and care.

There is no reason to assume that age-specific prevalence will remain constant over time. Improvements in education standards, cardiovascular health, and activity levels may all help to reduce dementia incidence, but we need to monitor trends to see if efforts in these directions have been successful.

With growing emphasis in government policy on earlier diagnosis, increased use of evidence-based healthcare services, improved integration and co-ordination of care, and reduced transition into residence in care homes, changes in these directions can also be anticipated, and should be monitored.

Part 2: Cost

Method

Modelling the costs of dementia

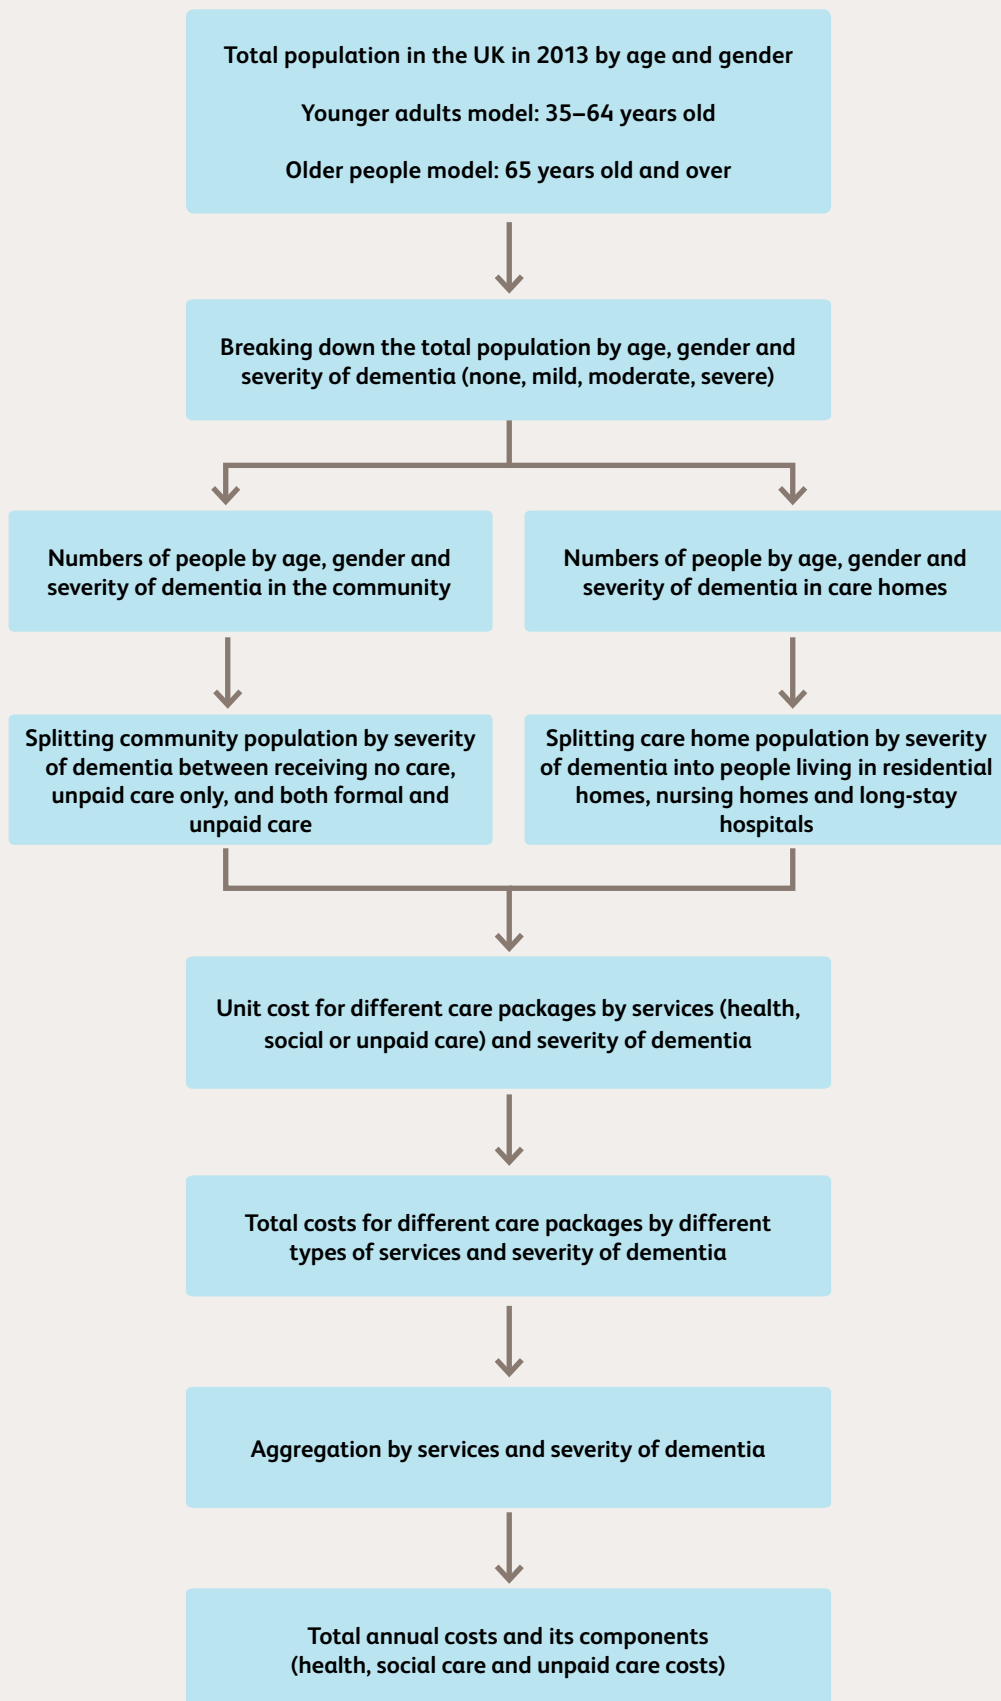

Estimates were generated for the costs of healthcare, social care and unpaid care for people with dementia using the best currently available information.

These studies were:

- SADD (Banerjee et al, 2011; Romeo et al, 2013)
- Component studies within the SHIELD programme (Orrell et al, 2014; D'Amico et al, 2014; unpublished CSP data)
- DADE (Lacey et al, 2012; Trigg et al, 2014)
- DOMINO (Howard et al, 2012 for quality of life data only)
- EVIDEM (Lowery et al, 2013; and unpublished cost data), CST (Spector et al, 2003; Knapp et al, 2006)
- CANE (Orrell et al, 2007)
- START (Livingston et al, 2013; Knapp et al, 2013).

The overarching framework used to pull these data together is a new version of a model of the costs and outcomes of dementia that builds on previous versions of the PSSRU aggregate long-term care model (Wittenberg et al 1998, 2001) and of the PSSRU dementia care model (Comas-Herrera et al 2007). Findings from England were grossed to the UK.

Figure 4: Structure of aggregate dementia models for younger adults and older people

Health and social care costs

Data from a number of UK trials and other studies were used to identify the detailed patterns of care and support for each group of people with dementia in the community.

This service use data was then converted to cost estimates, based on unit costs that are widely employed in UK studies, largely from publicly available sources. All costs were inflated to 2012/13 prices.

Costing unpaid care

There is no clear consensus on the best approach to measure carer costs. The two most widely used methods to cost unpaid carers are the replacement cost and opportunity cost methods.

- The replacement cost method assigns a cost to an hour of unpaid care equal to the cost of employing a professional carer such as a homecare worker.
- The opportunity cost method attempts to reflect the value to carers of the activities that they are no longer able to carry out because of their caring commitments (such as paid employment, leisure, housework, caring for other people such as their children).

The approach adopted to produce our 'core' estimate of unpaid care costs draws on both the replacement and opportunity cost methods, distinguishing between the type of care activities provided, and using all available information about carer characteristics and circumstances.

Others costs

Data was collected on other costs of dementia, including research, advocacy, police and fire service costs.

Results

The overall economic impact of dementia in the UK is £26.3 billion, working out at an average annual cost of £32,250 per person.

- £4.3 billion spent of healthcare costs, of which around £85 million is spent on diagnosis.
- £10.3 billion is spent on social care for people with dementia in the UK.
- Social care is either publicly funded (£4.5 billion; 17.2% of the overall total cost of dementia) or privately funded (£5.8 billion; 22.9% of the total).
- The cost of unpaid care for people with dementia in the UK is £11.6 billion, working out as 44% of the total cost of dementia.
- The total number of unpaid hours of care provided to people with dementia in the UK is 1.34 billion.
- £111 million is spent on other dementia costs.

Figure 5: Estimated breakdown of costs of dementia for the UK, 2013

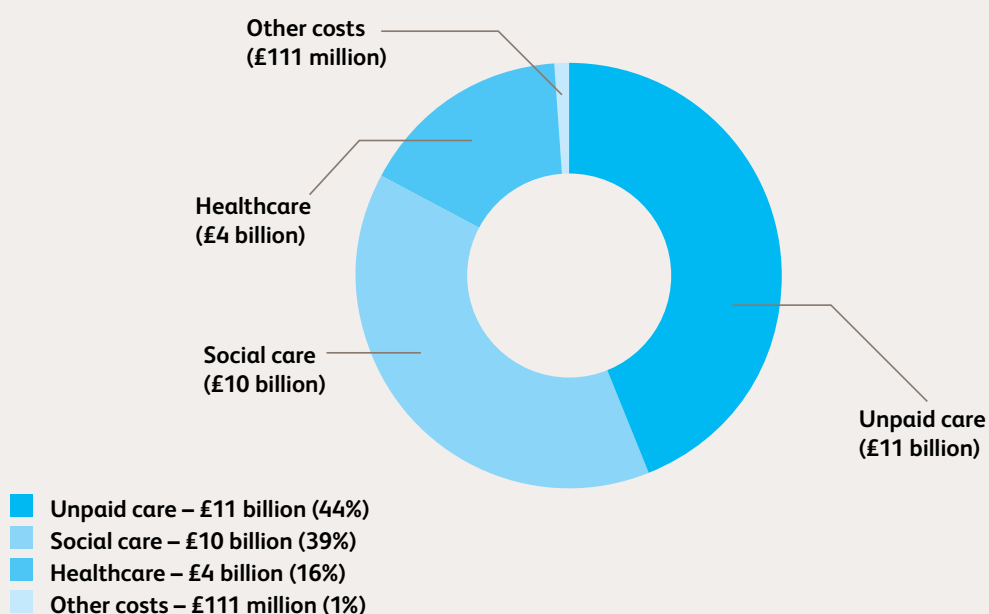

Table 5: Average annual cost per person with dementia, by severity and setting (£, 2012/13 prices)

	Healthcare	Social care	Unpaid care	Other costs	Total costs

(Sector cost as % of total)	(16.4%)	(39.0%)	(44.2%)	(0.4%)	(100.0%)

Discussion

The overall total of £26.3 billion (after excluding the costs of early onset dementia) is 24% higher than the figure reported in the first edition of Dementia UK (Alzheimer's Society, 2007), with most of the difference being driven by the increase in numbers of people with dementia. This comparison is made after adjusting costs to 2012/13 price levels. It should be noted that both direct and indirect costs are calculated in similar but not quite identical ways between the two studies.

The overall economic impact of dementia in the UK is enormous: £14.6 billion in direct costs, £11.6 billion in indirect costs associated with inputs from unpaid carers, between £2.4 billion and £3.8 billion as the imputed cost of premature mortality, and some other, much smaller, measurable costs (research and advocacy).

Even though the direct health (£4.9 billion) and social care costs (£11.2 billion) of dementia are high, they are dwarfed by the indirect costs associated with unpaid care and support provided by family members and other carers (£11.6 billion).

The cost of unpaid care is now 54% higher (after adjusting for inflation) than in 2005/06. The contribution to society by unpaid dementia carers is not only huge but also growing faster than expenditure on 'formal' health and social care services.

The estimates generated in this study should be interpreted and employed carefully. These figures cannot be used as a basis for guiding detailed resource allocation decisions by commissioners or providers. However, the sheer scale of the overall economic impact demonstrates the importance of the dementia challenge facing the UK today and in the decades ahead.

Alzheimer's Society is the UK's leading support and research charity for people with dementia, their families and carers. We provide information and support to people with any form of dementia and their carers through our publications, National Dementia Helpline, website, and more than 2,000 local services. We campaign for better quality of life for people with dementia and greater understanding of dementia. We also fund an innovative programme of medical and social research into the cause, cure and prevention of dementia and the care people receive.
