

# COSINUS: A cryogenic NaI dark matter detector using the novel “remoTES” design

Presented by: Matthew Stukel  
For the 24<sup>th</sup> International Workshop On Radiation Imaging Detectors

# Dark Matter

# Dark Matter

<https://www.quantumdiaries.org/2014/10/22/have-we-detected-dark-matter-axions/>

- Evidence includes: Rotation curves of galaxies, weak gravitational lensing, cosmological modelling
- Many experiments that employ many techniques!
- Direct Detection: Nuclear or electric recoils

# Direct Detection: Annual Modulation

- The sun moves through the galactic dark matter halo
- The earths rotates around the sun
- Induces a change in the dark matter flux throughout the year
- Unique and detectable signal for dark matter
  - Period of one year
  - Peaks around June 2<sup>nd</sup>
  - Signal expected in low energy region (O(keV))

# DAMA/LIBRA Results

[https://indico.cern.ch/event/1188759/contributions/5230561/attachments/2622519/4534672/belli\\_DM2023\\_web.pdf](https://indico.cern.ch/event/1188759/contributions/5230561/attachments/2622519/4534672/belli_DM2023_web.pdf)

- The DAMA collaboration has detected a peculiar annual modulation signal since 1997
- Signal is consistent with WIMP dark matter halo predictions (0.75 keV threshold shown)
  - ✓ Statistics:  $>13\sigma$
  - ✓ Period:  $0.999 \pm 0.001$
  - ✓ Phase: 25<sup>th</sup> May  $\pm 5$  days
  - ✓ Non-dark matter explanation: No

# Complications with DAMA

- Incompatibility with every other experiment

<https://arxiv.org/abs/2104.07634>

# Response of DAMA

## About interpretation and comparisons

See e.g.: Riv.N.Cim.26 no.1(2003)1, IJMPD13(2004)2127, EPJC47(2006)263, IJMPA21(2006)1445, EPJC56(2008)333, PRD84(2011)055014, JMPA28(2013)1330022

### ...and experimental aspects...

- Exposures
- Energy threshold
- Detector response (phe/keV)
- Energy scale and energy resolution
- Calibrations
- Stability of all the operating conditions.
- Selections of detectors and of data.
- Subtraction/rejection procedures and stability in time of all the selected windows and related quantities
- Efficiencies
- Definition of fiducial volume and non-uniformity
- Quenching factors, channeling
- ...

### ...models...

- Which particle?
- Which interaction coupling?
- Which EFT operators contribute?
- Which Form Factors for each target-material?
- Which Spin Factor?
- Which nuclear model framework?
- Which scaling law?
- Which halo model, profile and related parameters?
- Streams?
- ...

Uncertainty in experimental parameters, as well as necessary assumptions on various related astrophysical, nuclear and particle-physics aspects, affect all the results at various extent, both in terms of exclusion plots and in terms of allowed regions/volumes. Thus comparisons with a fixed set of assumptions and parameters' values are intrinsically strongly uncertain.

No experiment can - at least in principle - be directly compared in a model independent way with DAMA so far

## Is it an "universal" and "correct" way to approach the problem of DM and comparisons?

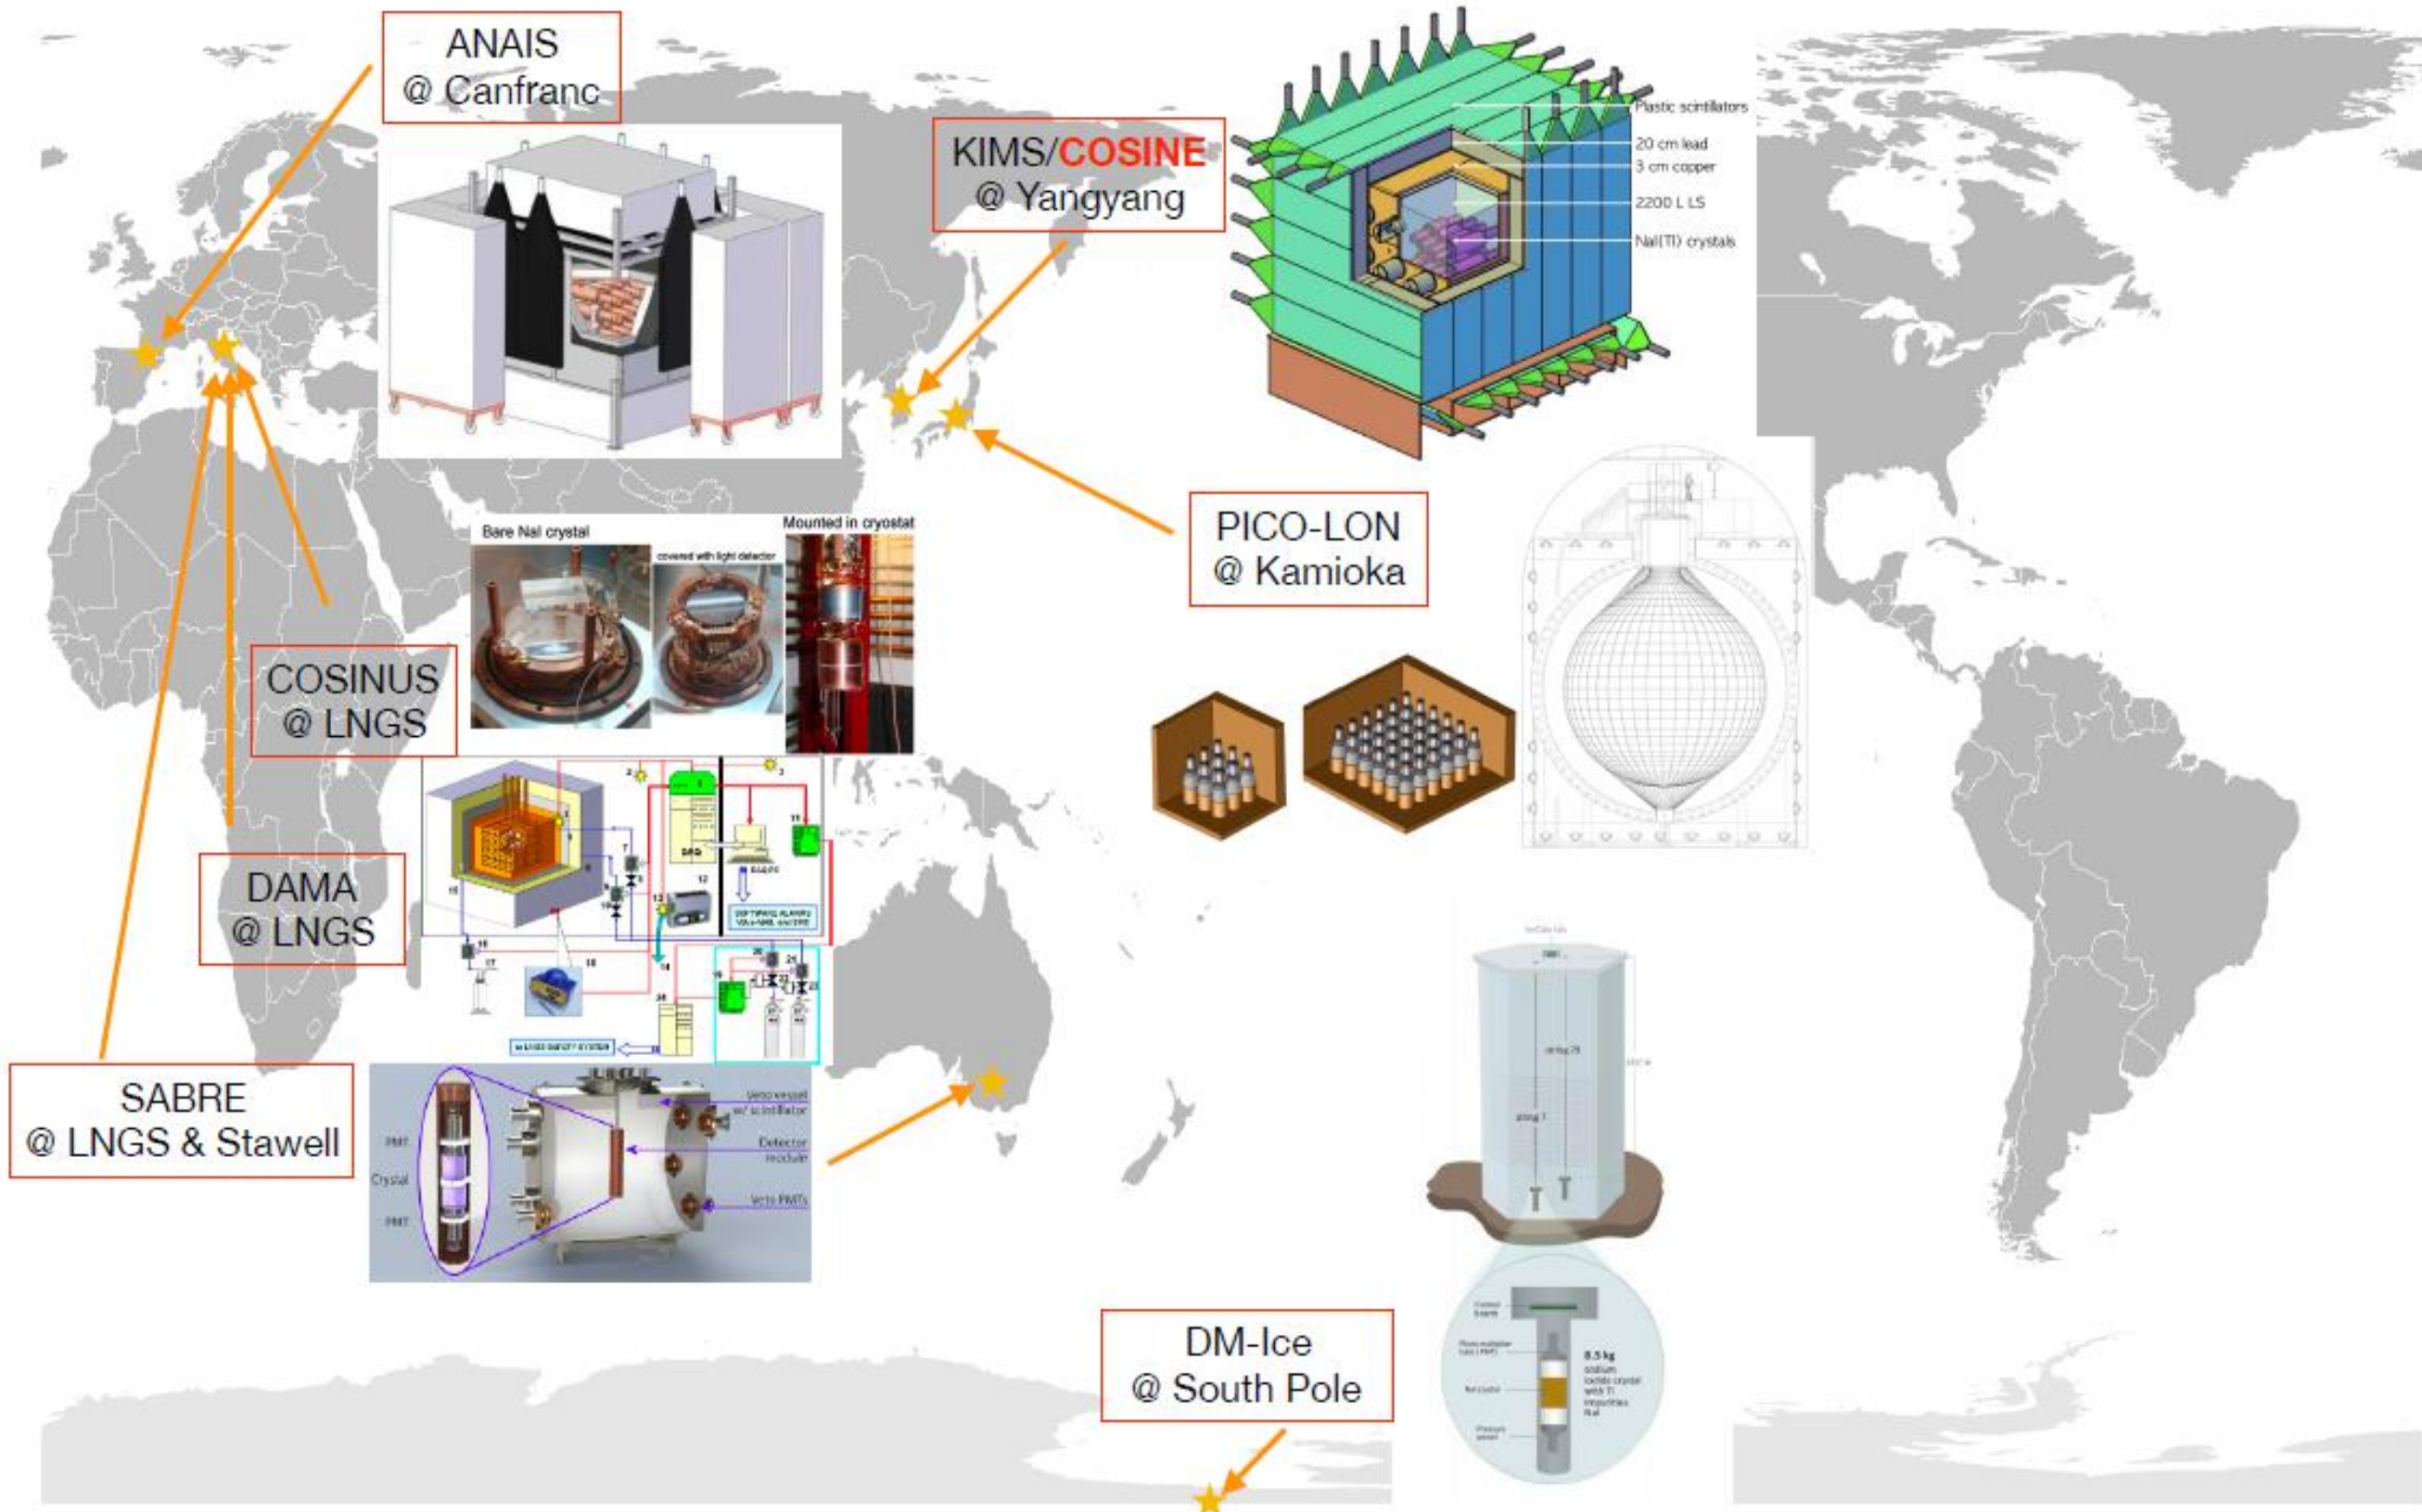

No, it isn't. This is just a largely arbitrary/partial/incorrect exercise

<https://agenda.infn.it/getFile.py/access?contribId=34&sessionId=1&resId=0&materialId=slides&confId=15474>

# Global Efforts using NaI(Tl)

Astroparticle Physics European Consortium (APPEC)

Recommendation:

- “The long-standing claim from DAMA/LIBRA [...] needs to be independently verified using the same target material.”

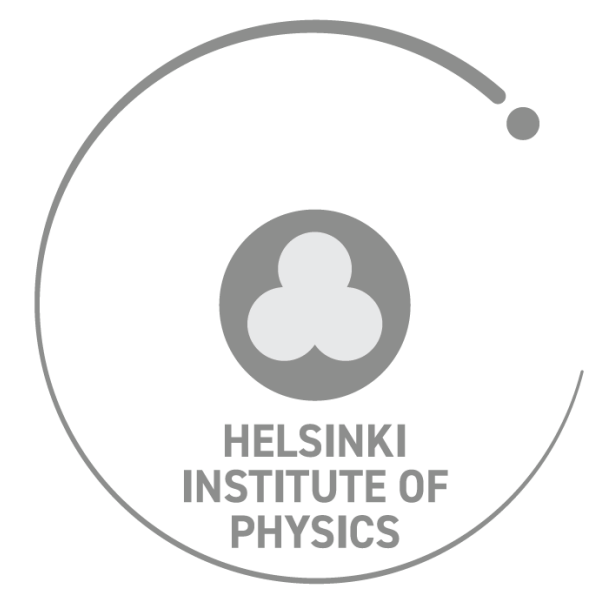

# COSINUS

Cryogenic Observatory for Signatures seen in Next-generation Underground Searches

# The Group

# Gran Sasso National Laboratory (LNGS)

<https://www.planetware.com/map/italy-italy-republic-map-i-i37.htm>

COSINUS  
Location

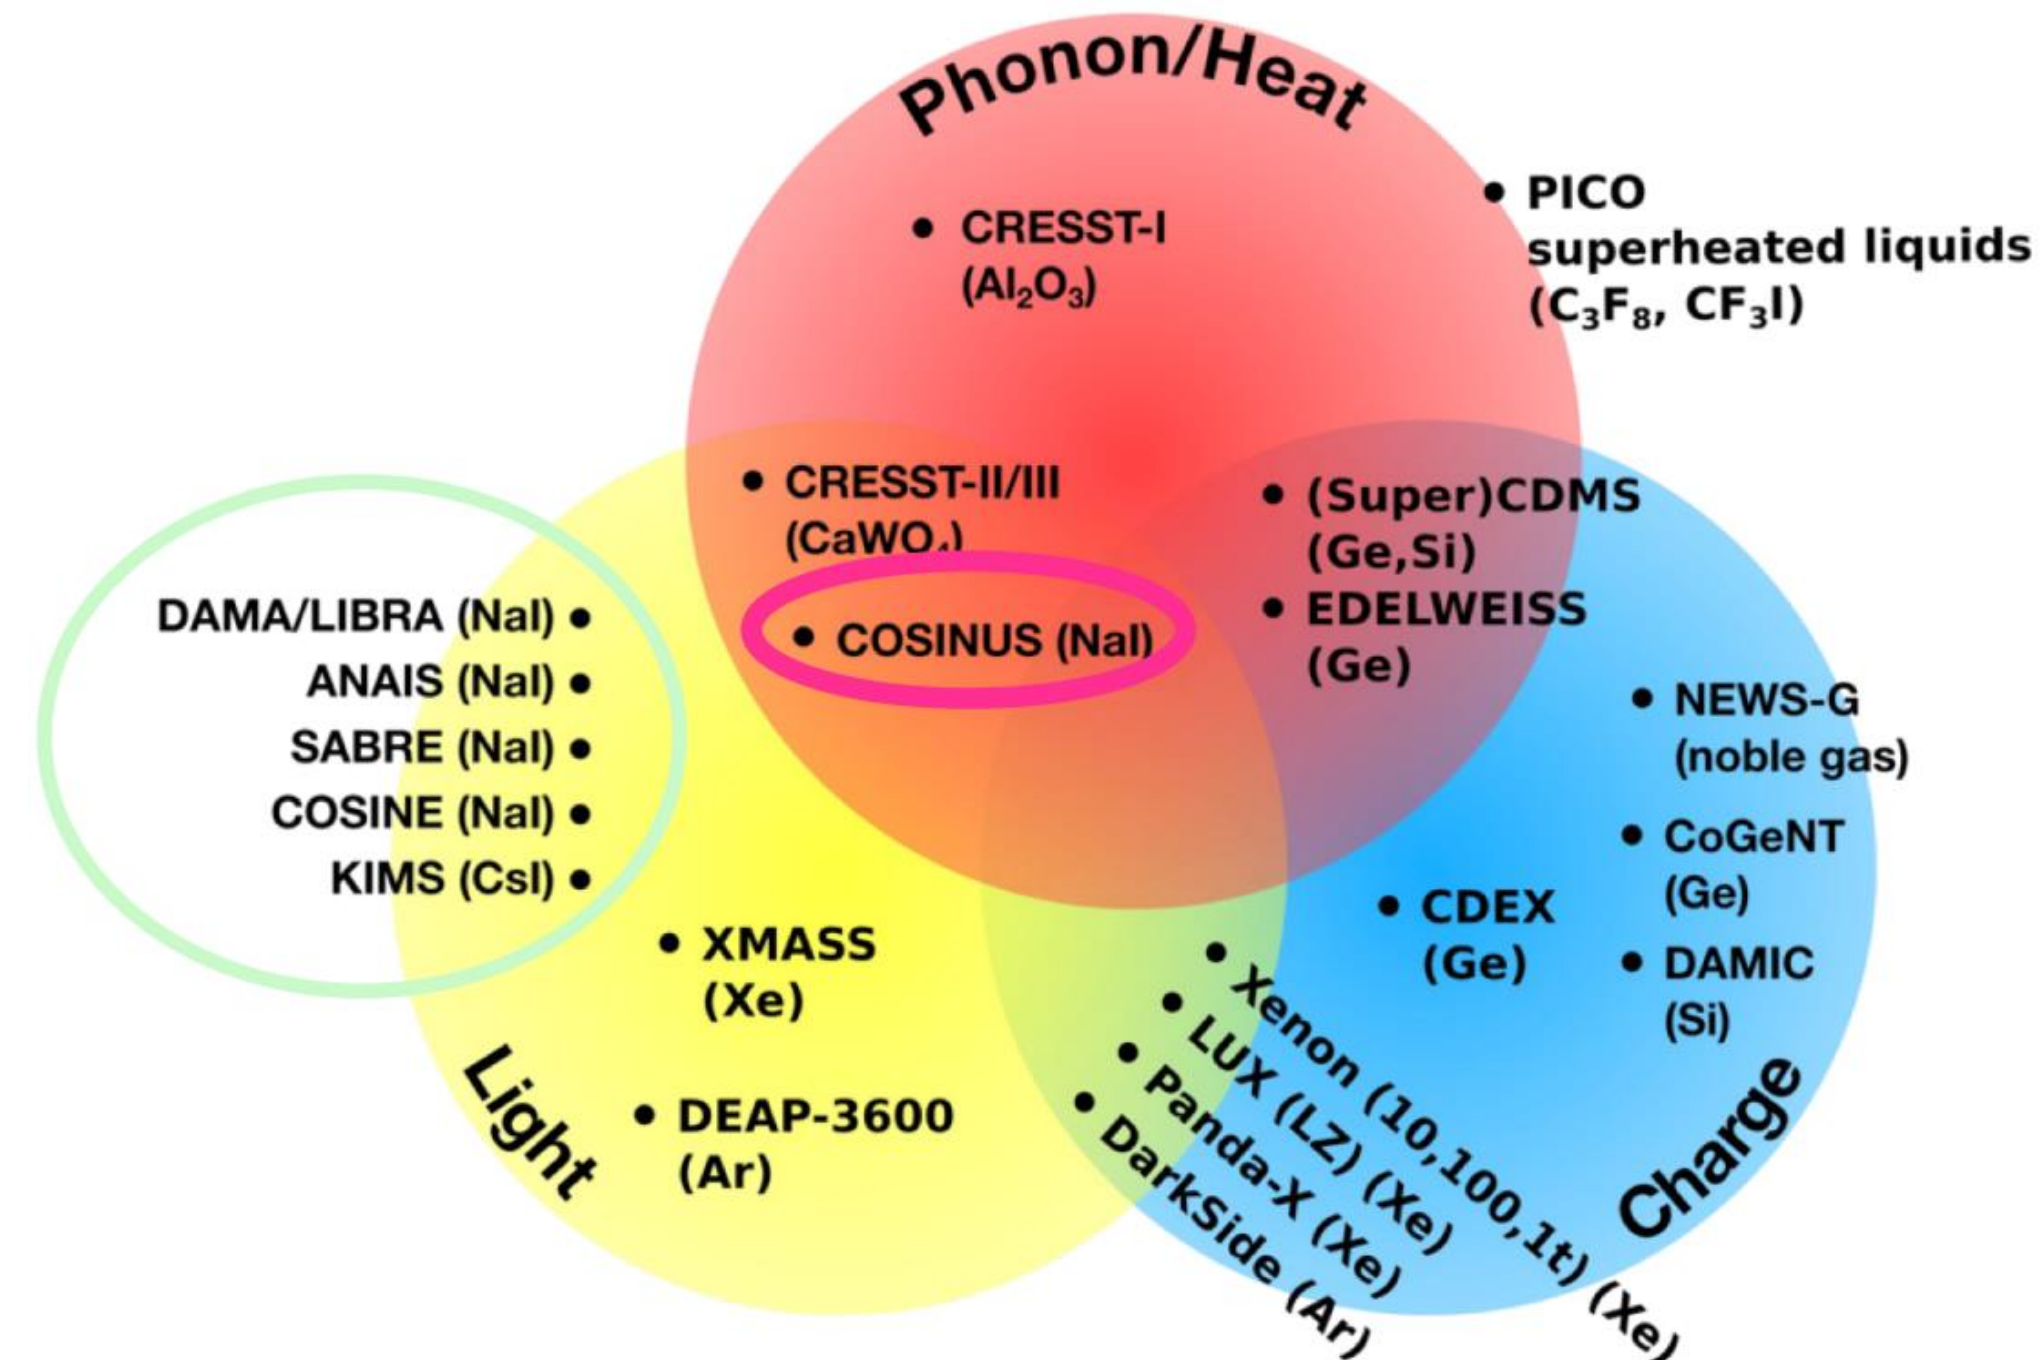

<https://www.appec.org/news/hands-on-experimental-underground-physics-at-lngs>

- LNGS provides 3500 m of water equivalent shielding from cosmic radiation

# Landscape of Dark Matter Experiments

Credits to: F. Reindl

- **Goal:** Aims at a model independent test of the DAMA/LIBRA experiment
  - Same material (NaI)
  - Same location (LNGS)
- **Unique Technique:** Operate NaI as a cryogenic detector (First ever!!)
  - Dual Channel: Phonon (90%) and Light (10%) signal for **event-by-event particle discrimination**

# NaI - Phonon Signal Measurement

- Deposition of energy  $\rightarrow$  Lattice vibrations (**Phonons**)  $\rightarrow$  Change of temperature  $\rightarrow$  Change in resistance  $\rightarrow$  Signal
- Thermometer: Transition Edge Sensor (TES)
  - TES is Tungsten superconducting film operated at **mK** temperatures
  - TES readout technology developed and used by CRESST

# NaI not so NICE

- Difficulties with attaching TES directly to NaI
  - NaI is hygroscopic (cannot come into contact with humid air)
  - Very soft and low melting point (easy to damage when handling)
  - Not suited for traditional thin film deposition

.14 Solution: **remoTES**

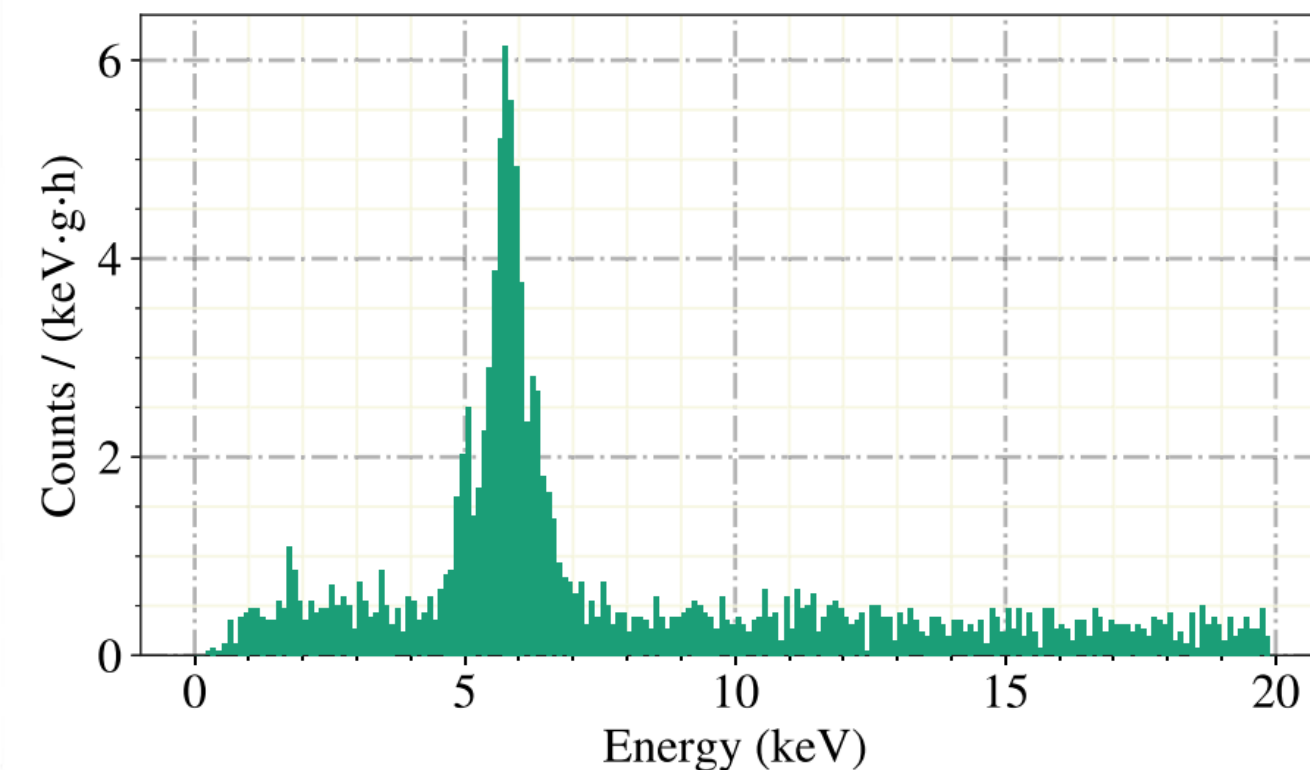

# Nal- remoTES design

- Implement remoTES design, first proposed by Matt Pyle
- Separate wafer that holds the TES: Wafer:  $\text{Al}_2\text{O}_3$
- Gold pad on absorber with a gold bonding wire connected to TES
- Wafer and TES setup is constructed separately then attached to the NaI

# First measurement of remoTES

- Although ideal for NaI the first measurements of the novel remoTES idea was performed on Si and TeO<sub>2</sub>
  - Si is highly studied for low temperature detectors
  - TeO<sub>2</sub> is thermally very similar to NaI
- Si resolution achieved was 88 eV
- TeO<sub>2</sub> resolution achieved as 193 eV
- Baseline threshold is 5 times lower then quoted resolution

# Nal – Light Detector

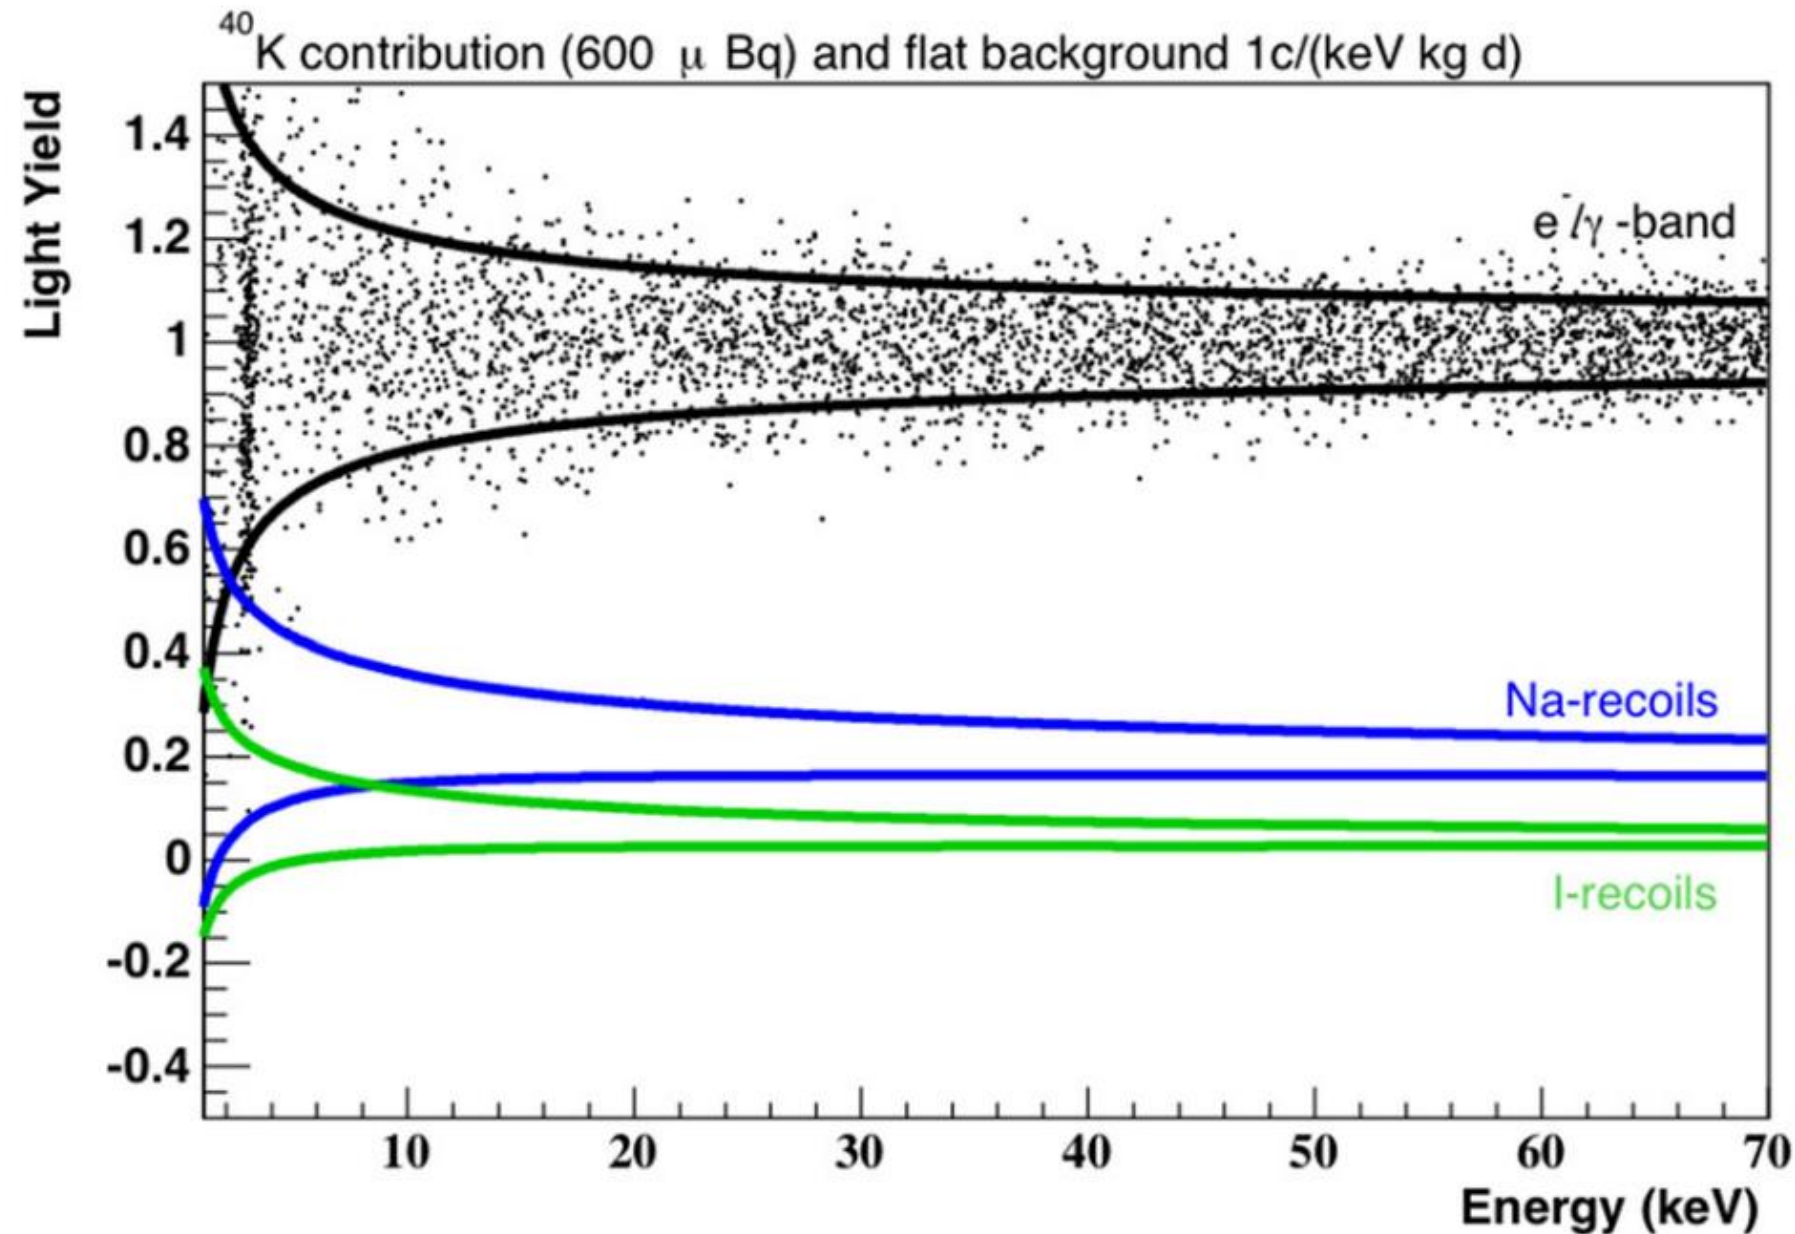

- Scintillation light is detected by a surrounding silicon beaker
- 1mm thick, 40mm in diameter
- $4\pi$  coverage to maximize light collection
- TES is evaporated directly onto the silicon
- Resolution:  $990 \text{ eV}_{ee}$

# COSINUS: Particle Discrimination

- Particle discrimination is the COSINUS advantage

$$\text{Light Yield} = \frac{\text{Light Energy}}{\text{Phonon Energy}}$$

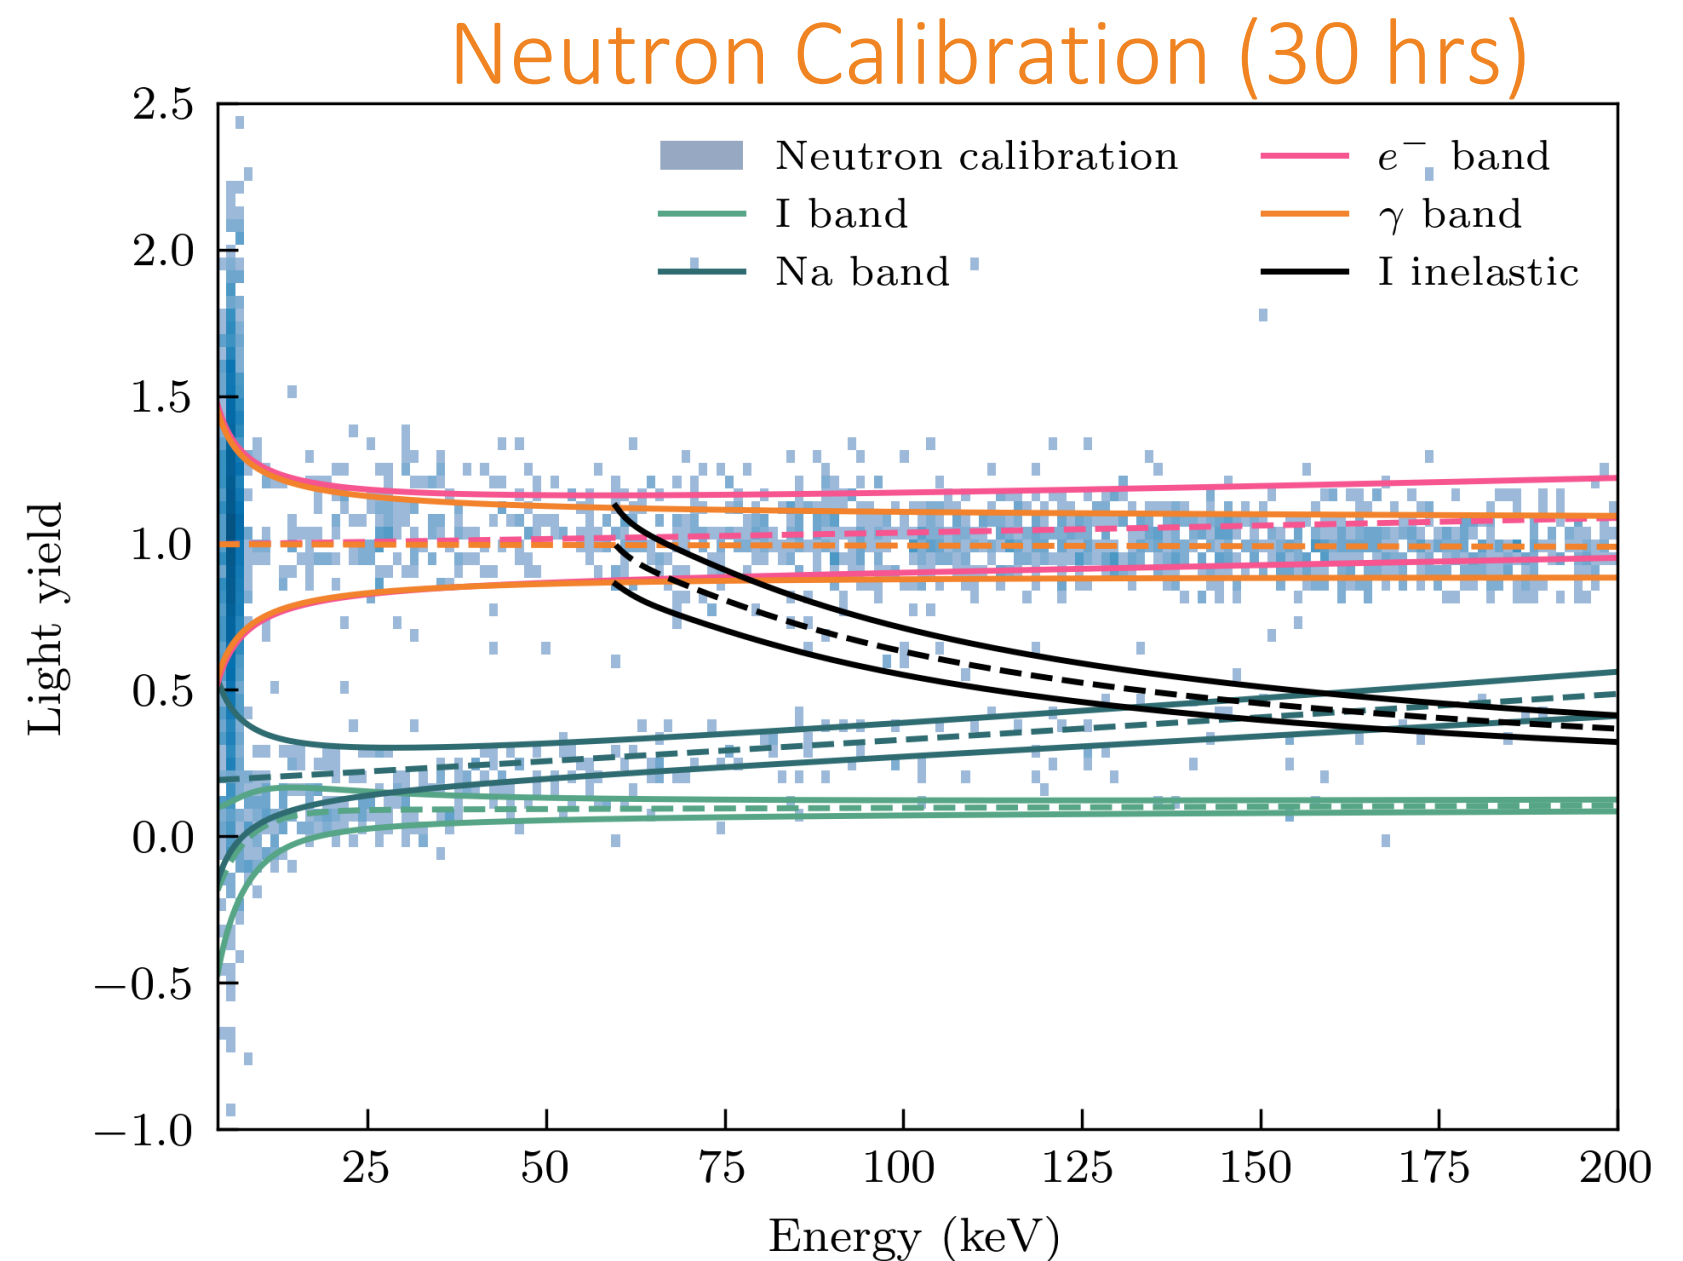

- Electromagnetic interactions will emit more light than nuclear recoils
- Use for particle discrimination on an event-by-event basis
- Left is simulated data
- Position of the bands is very dependent on the quenching factor (QF)
  - Dedicated QF performed at TUNL (See backup slide)

Angloher, G., et al. "Simulation-based design study for the passive shielding of the COSINUS dark matter experiment." *The European Physical Journal C* 82.3 (2022): 1-11

# COSINUS: Particle Discrimination

- December 2021: Demonstrated the first particle discrimination in NaI at a surface setup
- June 2022: Measurement was carried out using a CRESST test facility at the Gran Sasso National Laboratory (underground)
- Plots by Leonie Einfalt, publication in preparation
- NaI phonon resolution:  $440 \text{ eV}_{\text{nr}}$
- Neutron band is clearly visible, proof of particle discrimination in NaI

# COSINUS: Current Status

- 1 module (3.6g) of NaI
- 11.6 g·d exposure
- 1 order of magnitude away from DAMA/LIBRA
- 3 order of magnitude lower than COSINE-100
- They have  $10^5$  times larger exposure

# COSINUS: Dry Dilution Refrigerator

- Detectors housed in a pulse tubed assisted dilution refrigerator (mK)
- Three stage vibration decoupling: Global, Cryostat and Detector
- Ultra-pure copper for shielding the detectors from cryostat radiogenics

# Experimental Setup I

# Experimental Setup II

June 2022

# Experimental Setup III

Control Room

Clean Room

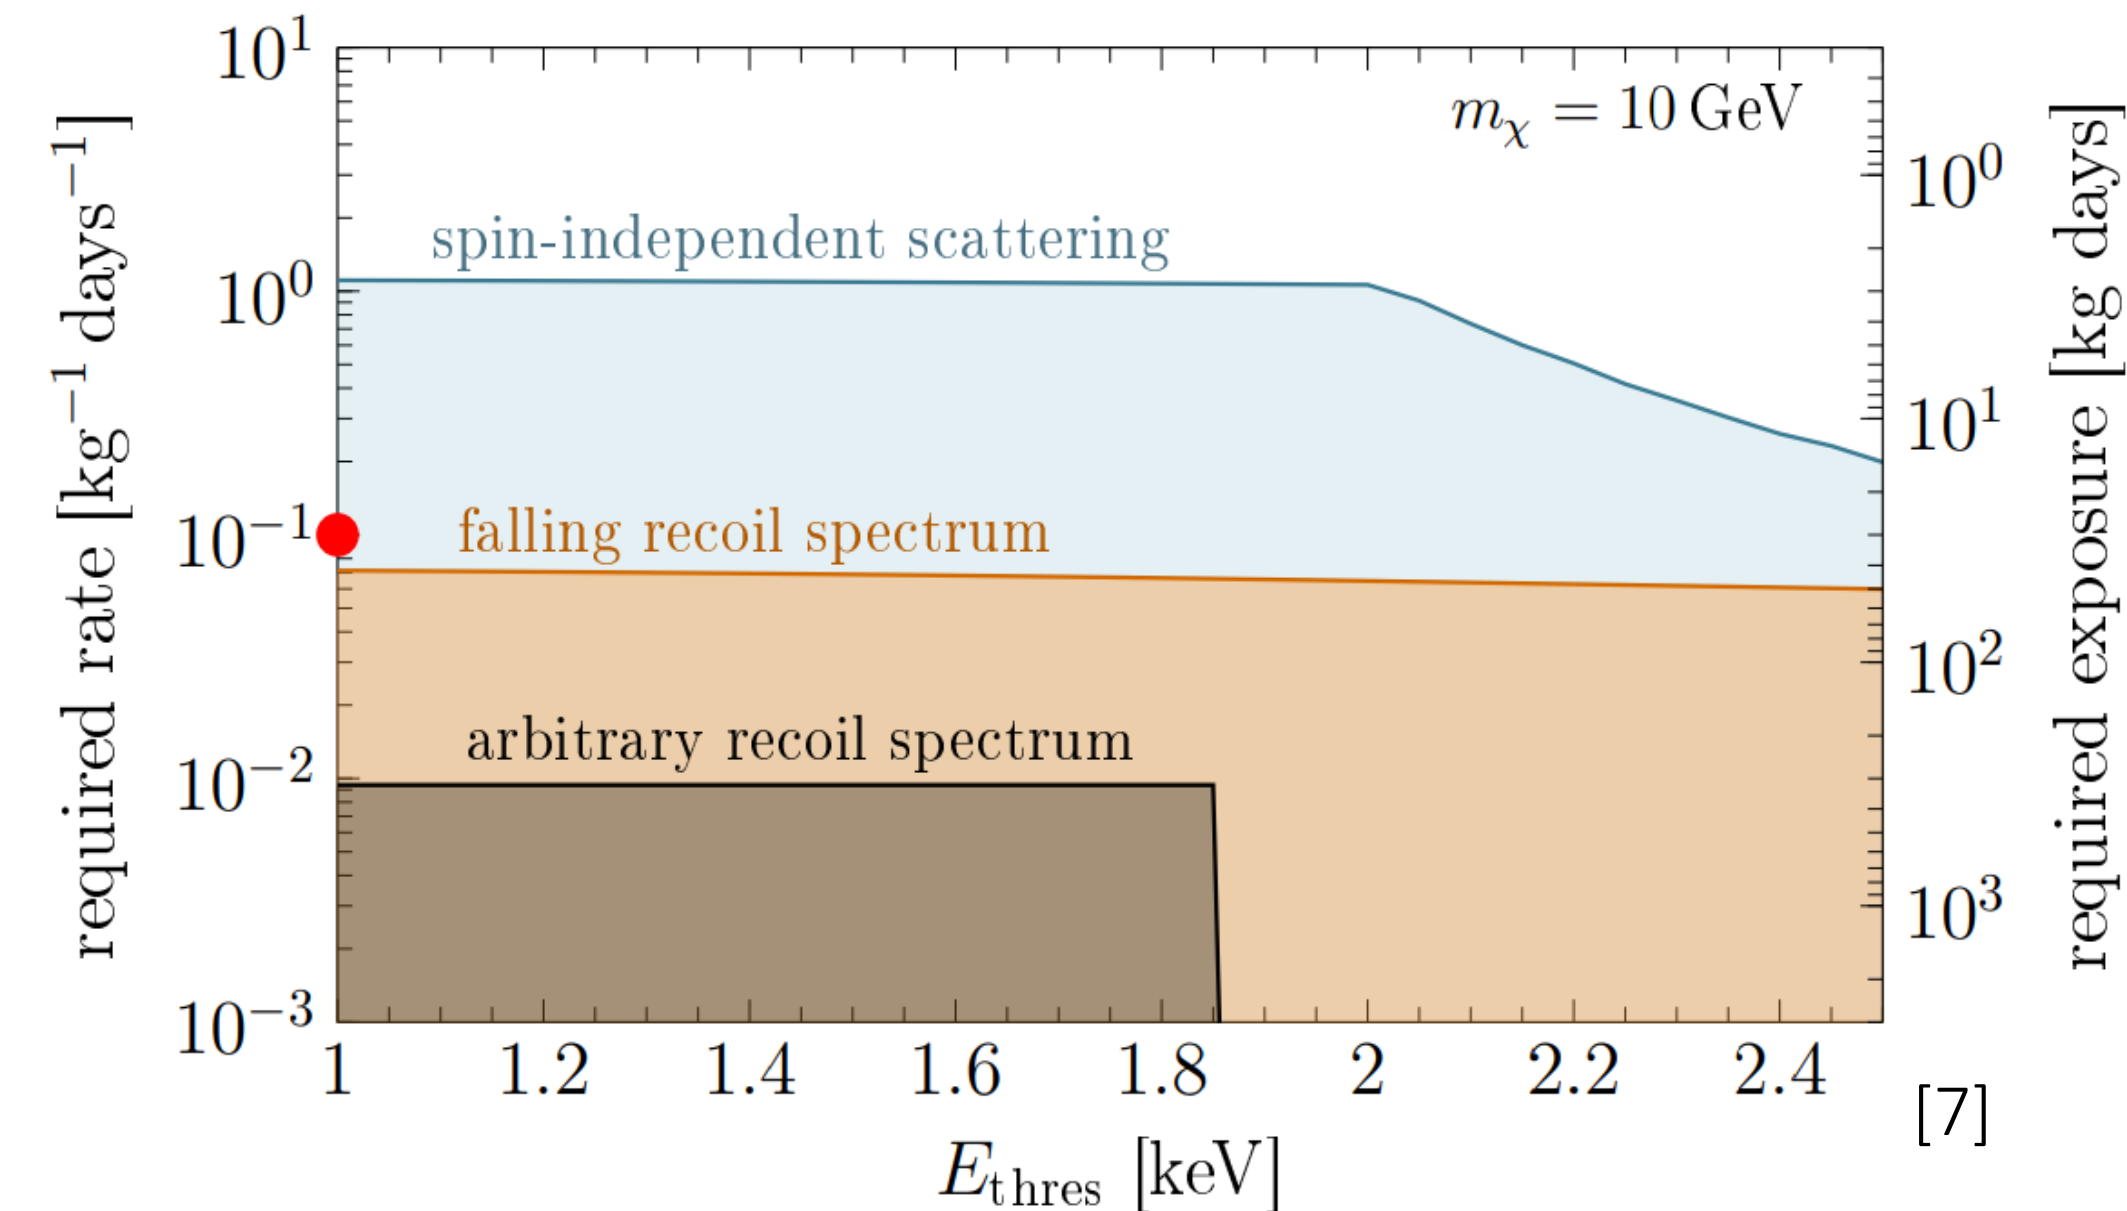

Water Tank

# COSINUS Physics Goals I

\*Not Updated for DAMA  $< 1 \text{ keV}_{ee}$  result

- COSINUS- $1\pi$ :  $1000 \text{ kg}\cdot\text{days}$ 
  - Run time of 1-3 years
  - Exclude or confirm a nuclear recoil origin of the DAMA\LIBRA result
  - Model independent exclusion
  - $100 \text{ kg}\cdot\text{days}$ : Exclude an elastic scattering scenario independent of DM halo
- COSINUS- $2\pi$ 
  - Annual modulation signal
  - Increase target mass capability, more than double the number of detectors

# COSINUS Timeline

# Conclusion/ Summary

- The search for dark matter is on the forefront of modern particle physics
- Effective annual modulation of dark matter is a unique and important way to continue this search
- COSINUS is a cryogenic NaI dark matter experiment whose goal is to verify the longstanding DAMA/LIBRA dark matter claim
- COSINUS will begin commissioning in 2023 and we look forward to great results!!
- Follow us on Twitter: @COSINUSdm

# Thank You!

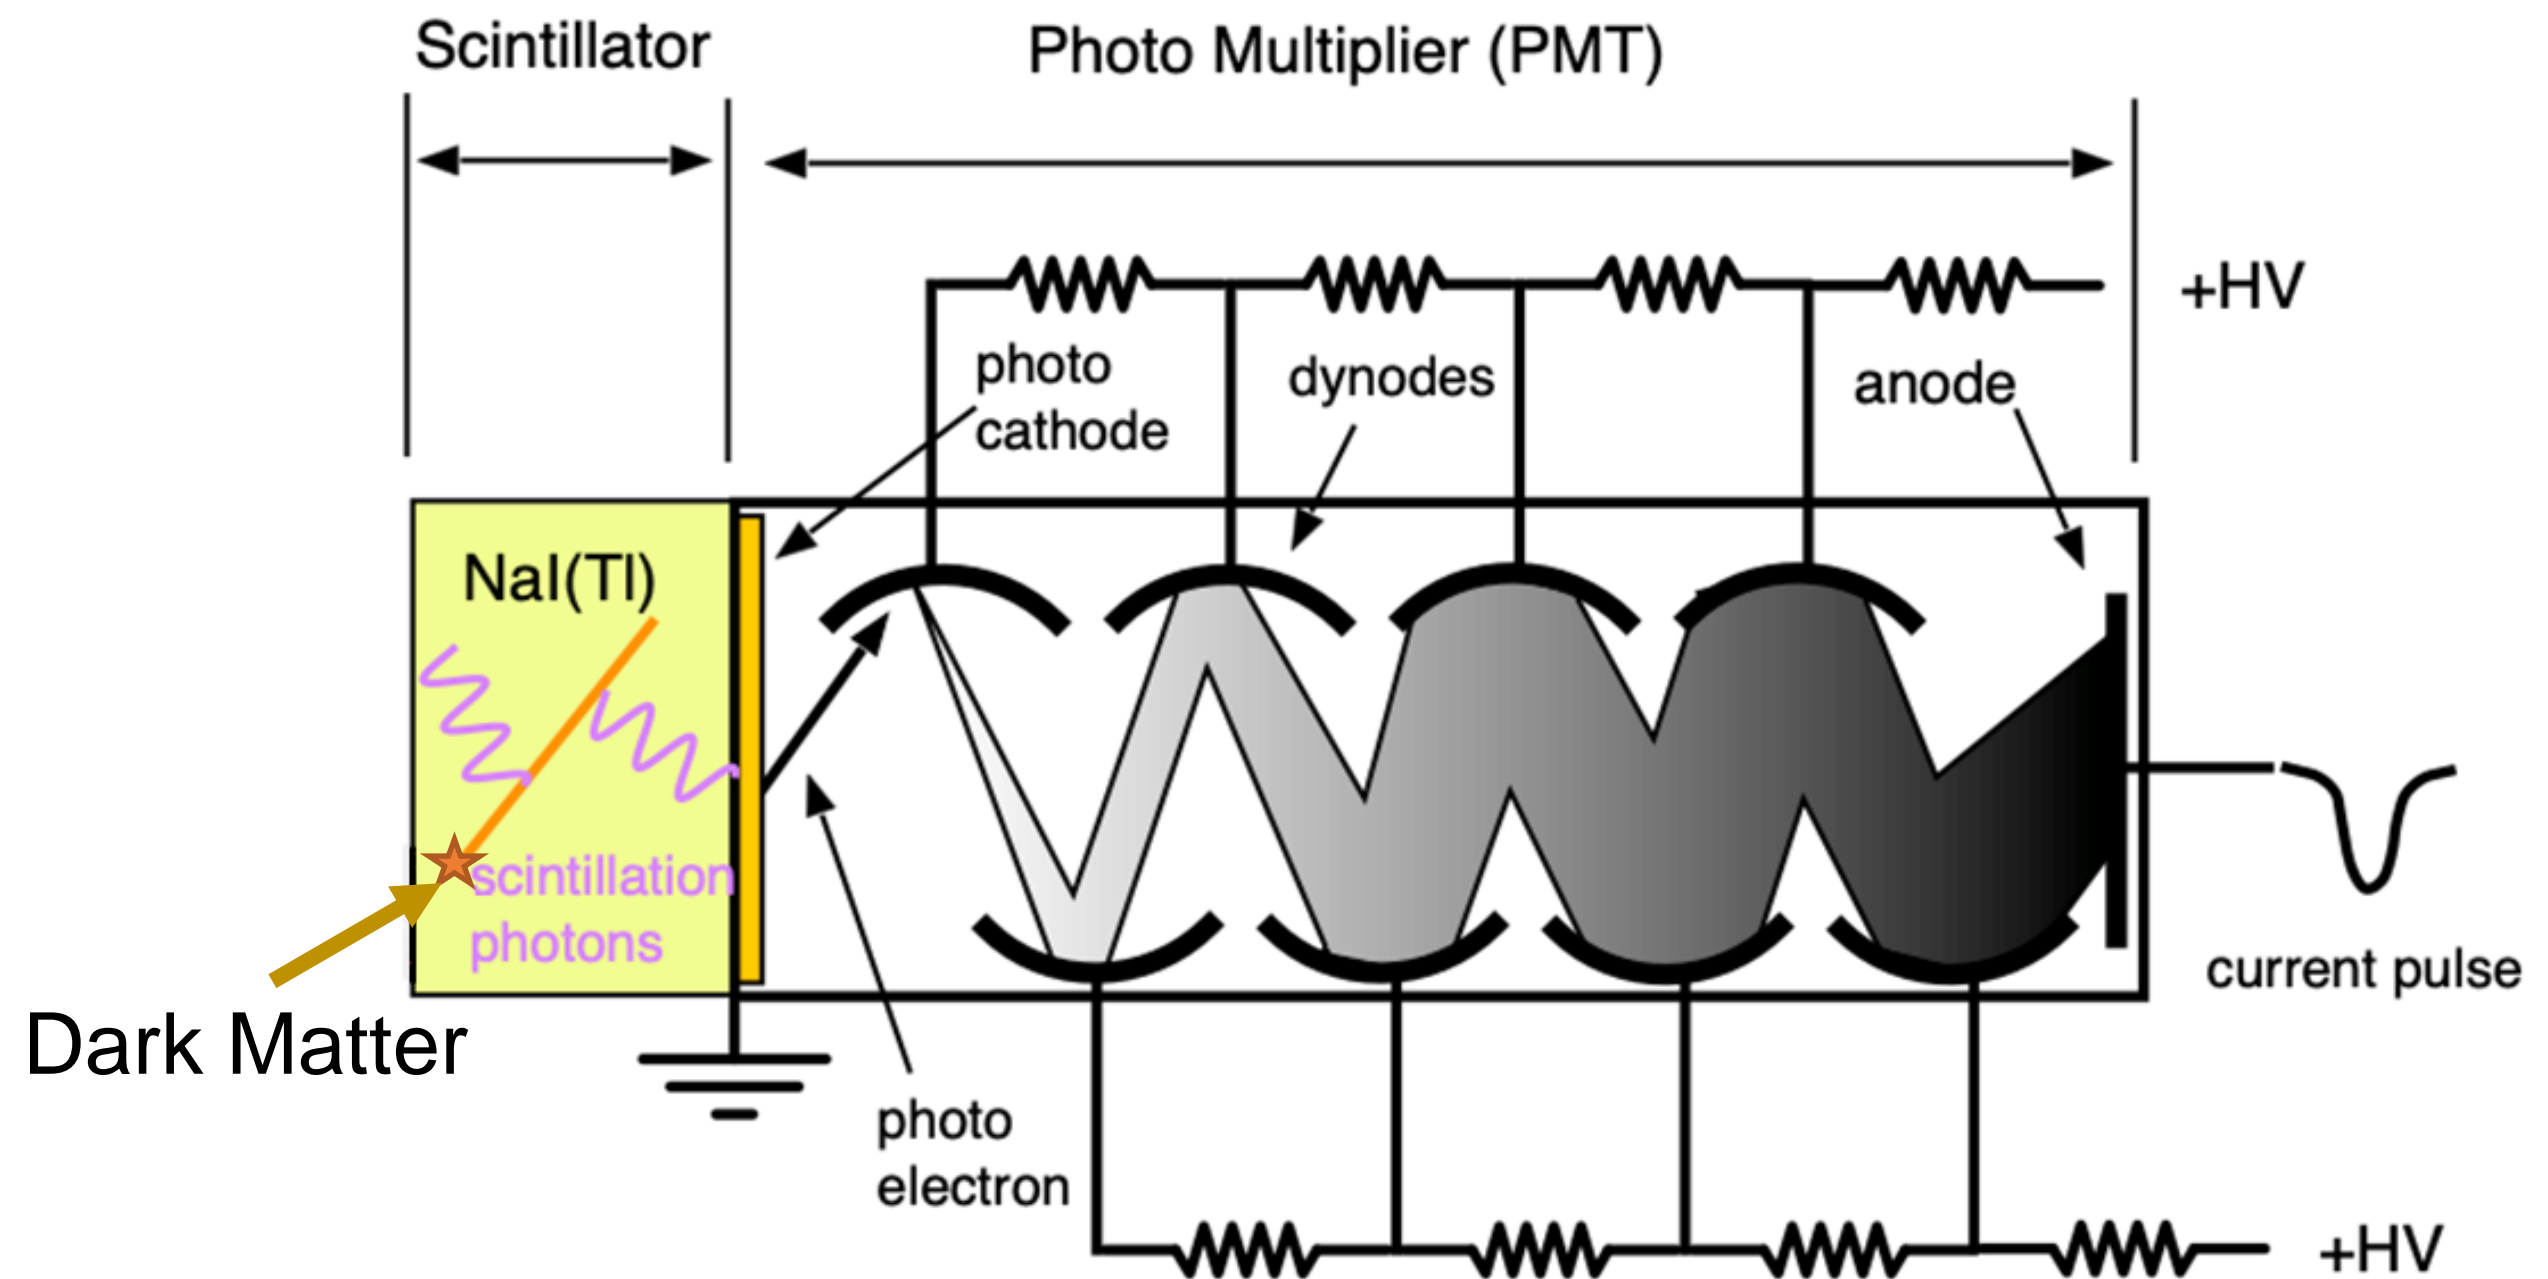

COSINUS

# DAMA/LIBRA Experiment

Bernabei, R., et al. "The dama/libra apparatus." *Nuclear Instruments and Methods in Physics Research Section A: Accelerators, Spectrometers, Detectors and Associated Equipment* 592.3 (2008): 297-315.

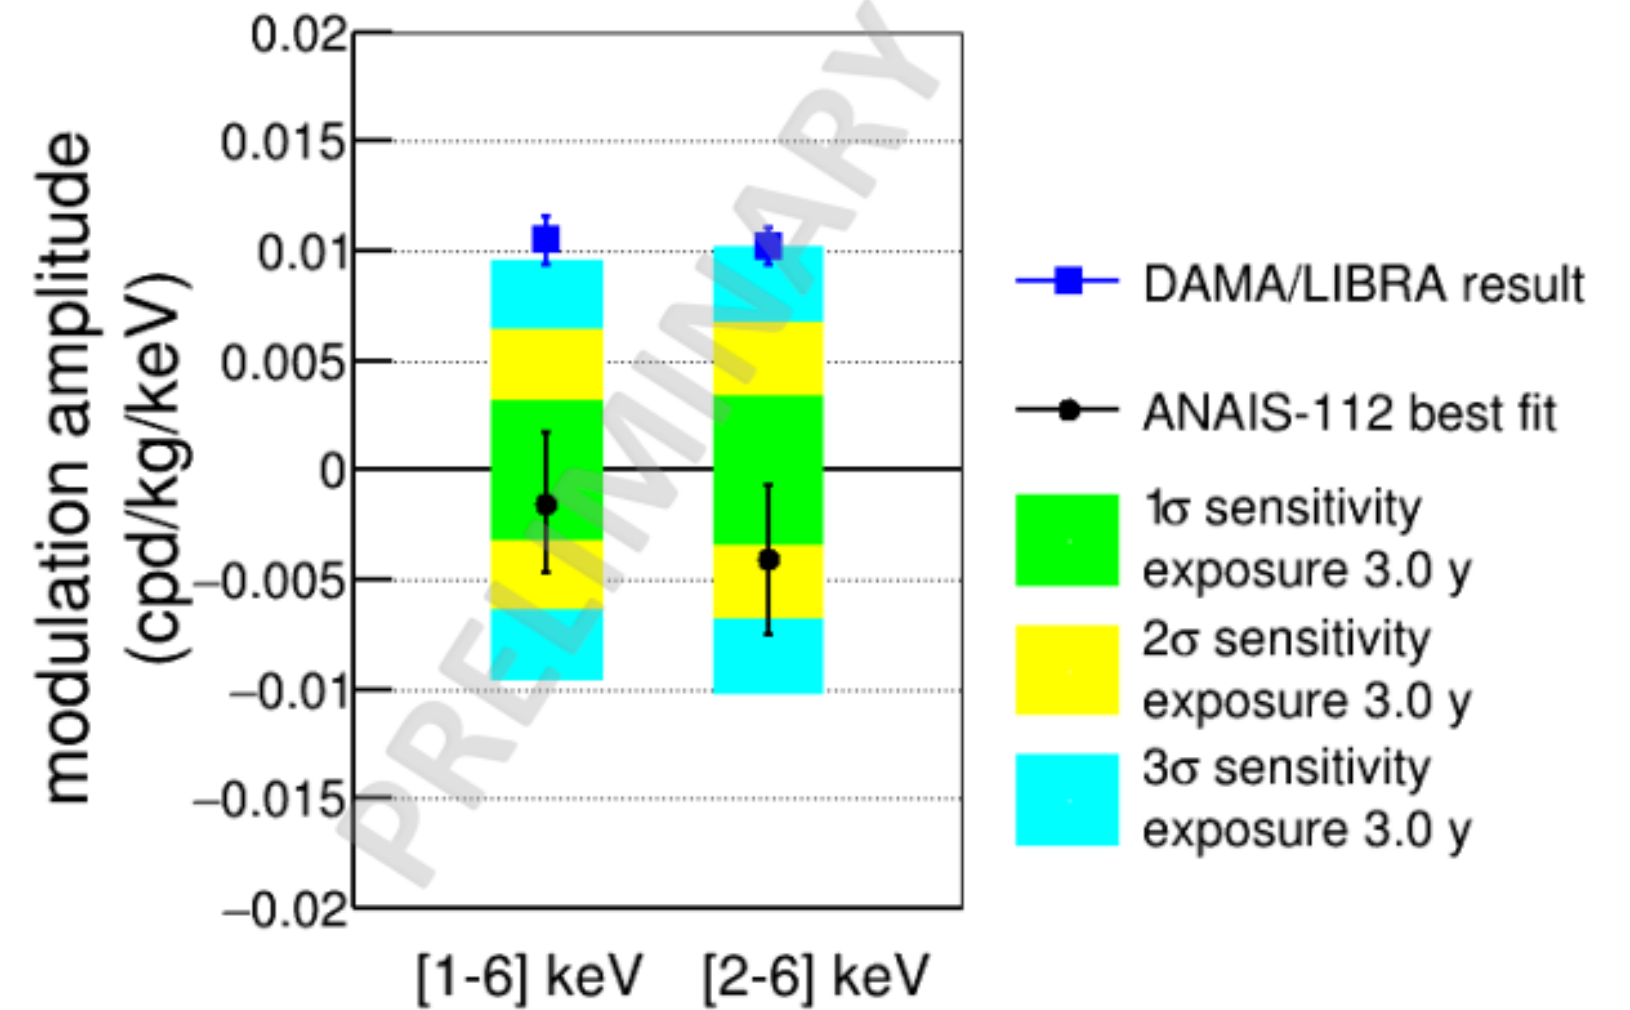

Based On: [https://wanda.fiu.edu/boeglinw/courses/Modern\\_lab\\_manual3/scintillator.html](https://wanda.fiu.edu/boeglinw/courses/Modern_lab_manual3/scintillator.html)

- The DAMA detector consists of 25 highly radiopure NaI(Tl) crystals. (~10 kg each)
- Search for dark matter model-independent annual modulation signature
- **Single-channel Experiment** -> Scintillation light from NaI(Tl)

# ANAIS-112: 3 Years of Data Taking

Amare, J., et al. "Annual Modulation Results from Three Years Exposure of ANAIS-112." *arXiv preprint arXiv:2103.01175* (2021).

[https://indico.cern.ch/event/1188759/contributions/5222288/attachments/2622529/4534685/UCLADM\\_23\\_MMartinez.pdf](https://indico.cern.ch/event/1188759/contributions/5222288/attachments/2622529/4534685/UCLADM_23_MMartinez.pdf)

- Incompatible with the DAMA results at 3.7 (4.2) $\sigma$ , for a sensitivity of 3.3(3.0)  $\sigma$  for [1-6] ([2-6]) keV energy region

COSINUS Productions™<sub>(pending)</sub>

# Quenching Factor Measurement

- Performed at TUNL (Triangle Universities Nuclear Laboratory)
- 5 NaI crystals with different Tl doping (0.1-0.9%)
- Neutron beam scatters in the crystal and arrives at backing detector
- Based on the angle we know the actual energy of the recoil
- Can then compare to energy measured and determine the QF!!

# Dilution refrigerator

- Pure  $^4\text{He}$  obeys boson statistics ( $T_c = 2.17$  K)
- Pure  $^3\text{He}$  obeys fermi statistics (no superfluid until very, very low temperature)
- When a fluid at point A is cooled to point B it undergoes superfluid transition
- At point C it separates into the  $^3\text{He}$  and  $^4\text{He}$  ('dilute phase') rich phase
- $^3\text{He}$  will float on top of the  $^4\text{He}$  phase in the 'mixing chamber'
- If we remove  $^3\text{He}$  atoms from the dilute phase  $^3\text{He}$  from the concentrated phase will cross the phase boundary to occupy the vacant state
- Cooling power =  $T^2 \times$  Flow rate of  $^3\text{He}$

# Crystal Growth

- Crystals are grown in collaboration with SICCAS using Astrograde (MERCK) powder in a modified Bridgeman technique
- Keep isotope contamination down (K, Th, U)
- First sample hexagonal crystals have been made and will be tested soon
