Title: Min-Based Altruism in Coalition Formation Games

Authors: Simon Cramer, Anna Maria Kerkmann, and Jörg Rothe

Abstract: We introduce min-based altruism in coalition formation games where players behave altruistically towards their friends and aggregate their friends' valuations for different coalition structures in an egalitarian way. We compare our approach with previous models, study some common stability notions, analyze the computational complexity of the associated verification and existence problems, and give characterizations for some of these notions.
