

Advances in Pattern Recognition

Advances in Pattern Recognition is a series of books which brings together current developments in all areas of this multi-disciplinary topic. It covers both theoretical and applied aspects of pattern recognition, and provides texts for students and senior researchers.

Springer also publishes a related journal, **Pattern Analysis and Applications**.
For more details see: springeronline.com

The book series and journal are both edited by Professor Sameer Singh of Exeter University, UK.

Also in this series:

Principles of Visual Information Retrieval
Michael S. Lew (Ed.)
1-85233-381-2

Statistical and Neural Classifiers: An Integrated Approach to Design
Šarūnas Raudys
1-85233-297-2

Advanced Algorithmic Approaches to Medical Image Segmentation
Jasjit Suri, Kamaledin Setarehdan and Sameer Singh (Eds)
1-85233-389-8

NETLAB: Algorithms for Pattern Recognition
Ian T. Nabney
1-85233-440-1

Object Recognition: Fundamentals and Case Studies
M. Bennamoun and G.J. Mamic
1-85233-398-7

Computer Vision Beyond the Visible Spectrum
Bir Bhanu and Ioannis Pavlidis (Eds)
1-85233-604-8

Lee Middleton and Jayanthi Sivaswamy

Hexagonal Image Processing

A Practical Approach

With 116 Figures

Foreword

The sampling lattice used to digitize continuous image data is a significant determinant of the quality of the resulting digital image, and therefore, of the efficacy of its processing. The nature of sampling lattices is intimately tied to the tessellations of the underlying continuous image plane. To allow uniform sampling of arbitrary size images, the lattice needs to correspond to a regular - spatially repeatable - tessellation. Although drawings and paintings from many ancient civilisations made ample use of regular triangular, square and hexagonal tessellations, and Euler later proved that these three are indeed the only three regular planar tessellations possible, sampling along only the square lattice has found use in forming digital images. The reasons for these are varied, including extensibility to higher dimensions, but the literature on the ramifications of this commitment to the square lattice for the dominant case of planar data is relatively limited. There seems to be neither a book nor a survey paper on the subject of alternatives. This book on hexagonal image processing is therefore quite appropriate.

Lee Middleton and Jayanthi Sivaswamy well motivate the need for a concerted study of hexagonal lattice and image processing in terms of their known uses in biological systems, as well as computational and other theoretical and practical advantages that accrue from this approach. They present the state of the art of hexagonal image processing and a comparative study of processing images sampled using hexagonal and square grids. They address the hexagonal counterparts of a wide range of issues normally encountered in square lattice-based digital image processing - data structures for image representation, efficient pixel access, geometric and topological computations, frequency domain processing, morphological operations, multiscale processing, feature detection, and shape representation. The discussions of transformations between square and hexagonal lattice-based images and of hybrid systems involving both types of sampling are useful for taking advantage of both in real-life applications. The book presents a framework that makes it easy to implement hexagonal processing systems using the square grid as the base,

e.g., to accommodate existing hardware for image acquisition and display, and gives sample computer code for some commonly encountered computations.

This book will serve as a good reference for hexagonal imaging and hexagonal image processing and will help in their further development. I congratulate the authors on this timely contribution.

Professor Narendra Ahuja
August, 2004

Preface

The field of image processing has seen many developments in many fronts since its inception. However, there is a dearth of knowledge when it comes to one area namely the area of using alternate sampling grids. Almost every textbook on Digital Image Processing mentions the possibility of using hexagonal sampling grids as an alternative to the conventional square grid. The mention, however, is usually cursory, leading one to wonder if considering an alternative sampling grid is just a worthless exercise. Nevertheless, the cursory mention also often includes a positive point about a hexagonal grid being advantageous for certain types of functions. While it was curiosity that got us interested in using hexagonal grids, it was the positive point that spurred us to study the possibility of using such a grid further and deeper. In this process we discovered that while many researchers have considered the use of hexagonal grids for image processing, most material on this topic is available only in the form of research papers in journals or conference proceedings. In fact it is not possible to find even a comprehensive survey on this topic in any journal. Hence the motivation for this monograph.

In writing this book, we were mindful of the above point as well as the fact that there are no hardware resources that currently produce or display hexagonal images. Hence, we have tried to cover not only theoretical aspects of using this alternative grid but also the practical aspects of how one could actually perform hexagonal image processing. For the latter, we have drawn from our own experience as well that of other researchers who have tried to solve the problem of inadequate hardware resources.

A large part of the work that is reported in the book was carried out when the authors were at the Department of Electrical and Electronic Engineering, The University of Auckland, New Zealand. The book took its current shape and form when the authors had moved on to the University of Southampton (LM) and IIIT-Hyderabad (JS). Special thanks to Prof. Narendra Ahuja for readily agreeing to write the foreword. Thanks are due to the anonymous reviewers whose feedback helped towards making some key improvements to the book.

Lee: Thanks are first due to Prof. Mark Nixon and Dr John Carter who were understanding and provided me time to work on the book. Secondly thanks go to my, then, supervisor Jayanthi for believing in the idea I came to her office with. Thirdly, I would like to thank the *crew* at Auckland University for making my time there interesting: adrian, anthony, bev, bill, brian, brad, bruce, colin, david, dominic, evans, evan, geoff ($\times 2$), jamie, joseph, nigel, russell m, and woei. Finally, thanks go to Sylvia for being herself the whole time I was writing the manuscript.

Jayanthi: Thanks to Richard Staunton for many helpful comments and discussions, to Prof. Mark Nixon for the hospitality. I am also grateful to Bikash for clarifications on some of the finer points and to Professors K Naidu, V U Reddy, R Sangal and other colleagues for the enthusiastic encouragement and support. The leave from IIIT Hyderabad which allowed me to spend concentrated time on writing the book is very much appreciated. The financial support provided by the DST, Government of India, the Royal Society and the British Council partly for the purpose of completing the writing is also gratefully acknowledged. Finally, I am indebted to Prajit for always being there and cheering me on.

Contents

1	Introduction	1
1.1	Scope of the book	2
1.2	Book organisation	3
2	Current approaches to vision	5
2.1	Biological vision	5
2.1.1	The human sensor array	6
2.1.2	Hierarchy of visual processes	9
2.2	Hexagonal image processing in computer vision	10
2.2.1	Acquisition of hexagonally sampled images	11
2.2.2	Addressing on hexagonal lattices	15
2.2.3	Processing of hexagonally sampled images	18
2.2.4	Visualisation of hexagonally sampled images	21
2.3	Concluding Remarks	24
3	The Proposed HIP Framework	27
3.1	Sampling as a tiling	27
3.2	Addressing on hexagonal lattices	35
3.2.1	Hexagonal addressing scheme	35
3.2.2	Arithmetic	43
3.2.3	Closed arithmetic	49
3.3	Conversion to other coordinate systems	52
3.4	Processing	54
3.4.1	Boundary and external points	54
3.4.2	Distance measures	56
3.4.3	HIP neighbourhood definitions	59
3.4.4	Convolution	61
3.4.5	Frequency Domain processing	62
3.5	Concluding remarks	68

4	Image processing within the HIP framework	71
4.1	Spatial domain processing	71
4.1.1	Edge detection	71
4.1.2	Skeletonisation	79
4.2	Frequency Domain Processing	82
4.2.1	Fast algorithm for the discrete Fourier transform	83
4.2.2	Linear Filtering	91
4.3	Image pyramids	96
4.3.1	Subsampling	97
4.3.2	Averaging	98
4.4	Morphological processing	100
4.5	Concluding remarks	103
5	Applications of the HIP framework	105
5.1	Saccadic search	105
5.1.1	Saccadic exploration	106
5.1.2	Discussion	109
5.2	Shape extraction	111
5.2.1	Shape extraction system	111
5.2.2	Critical point extraction	111
5.2.3	Attention window	112
5.2.4	Feature extraction	113
5.2.5	Integration	113
5.2.6	Discussion	115
5.3	Logo shape discrimination	117
5.3.1	Shape extraction system	117
5.3.2	Image conversion	120
5.3.3	Local energy computation	120
5.3.4	Feature vectors	123
5.3.5	LVQ classifier	123
5.3.6	Discussion	124
5.4	Concluding remarks	125
6	Practical aspects of hexagonal image processing	127
6.1	Resampling	128
6.1.1	True hexagonal lattice	128
6.1.2	Irregular hexagonal lattice	136
6.1.3	Hexagonal to square resampling	138
6.2	Display of hexagonal images	141
6.2.1	Approximation with rectangular hyperpixels	142
6.2.2	Approximation with hexagonal hyperpixels	143
6.2.3	Approximation via polygon generation	144
6.2.4	Displaying HIP images	145
6.3	Concluding remarks	148

7	Processing images on square and hexagonal grids - a comparison	151
7.1	Sampling density	151
7.2	Comparison of line and curve representation	155
7.2.1	Algorithmic comparison	156
7.2.2	Down-sampling comparison	165
7.2.3	Overview of line and curve experiments	167
7.3	General computational requirement analysis	168
7.4	Performance of image processing algorithms	175
7.4.1	Edge detection	175
7.4.2	Skeletonisation	180
7.4.3	Fast Fourier transform	182
7.4.4	Linear Filtering	186
7.4.5	Image pyramids	192
7.5	Concluding Remarks	195
8	Conclusion	197
A	Mathematical derivations	201
A.1	Cardinality of A_λ	201
A.2	Locus of aggregate centres	202
A.3	Conversion from HIP address to Her's 3-tuple	206
A.4	Properties of the HDFT	208
A.4.1	Linearity	208
A.4.2	Shift/translation	209
A.4.3	Convolution theorem	210
B	Derivation of HIP arithmetic tables	211
B.1	HIP addition	211
B.2	HIP multiplication	213
C	Bresenham algorithms on hexagonal lattices	215
C.1	HIP Bresenham line algorithm	215
C.2	Hexagonal Bresenham circle algorithm	215
D	Source code	219
D.1	HIP addressing	219
D.2	HIP data structure	227
D.3	HIP resampling	230
D.4	HIP visualisation	236
