Abstract

This contribution describes a measurement campaign carried out in the living room environment at TUBS. The scenarios, the set-up, the phenomena and parameters measured are described. A very few first results are presented. More results of the processed measurements will be shown in the up-coming TGad meetings and/or phone conferences.

Living Room Scenario

- **Living Room Scenario**
 - Similar to scenario from [1]
 - Typical furniture

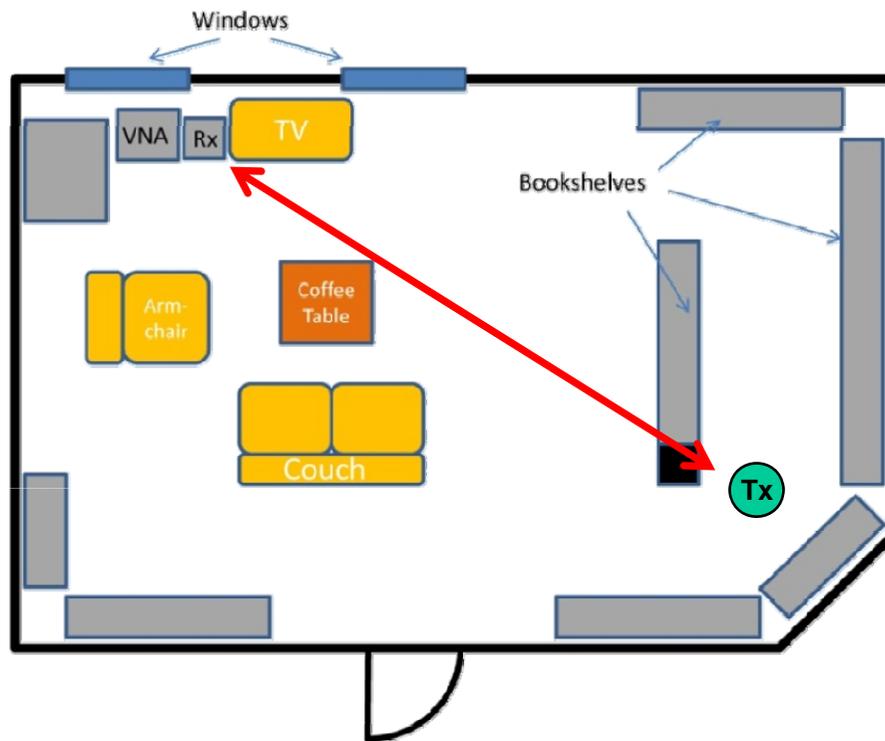

Measurement Campaign

- **Measurement Equipment as used in [2]**
- **AoA vs. AoD measurements**
 - Polarization (HH,VV,HV)
 - Horn-Horn, Open-Open
 - NLOS
- **Grid Measurements → small scale behaviour**
- **Dynamic Measurements**
- **Different Tx Positions**
 - Horn-Horn
 - Open-Open

AoA vs. AoD – Antennas/NLOS

- **NLOS**

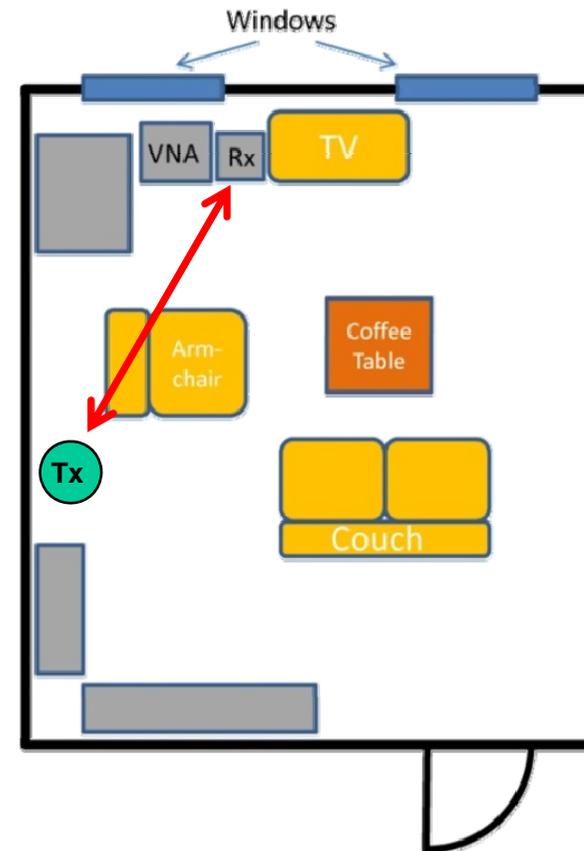

- **Antennas**

- Horn-Horn vs. Open-Open

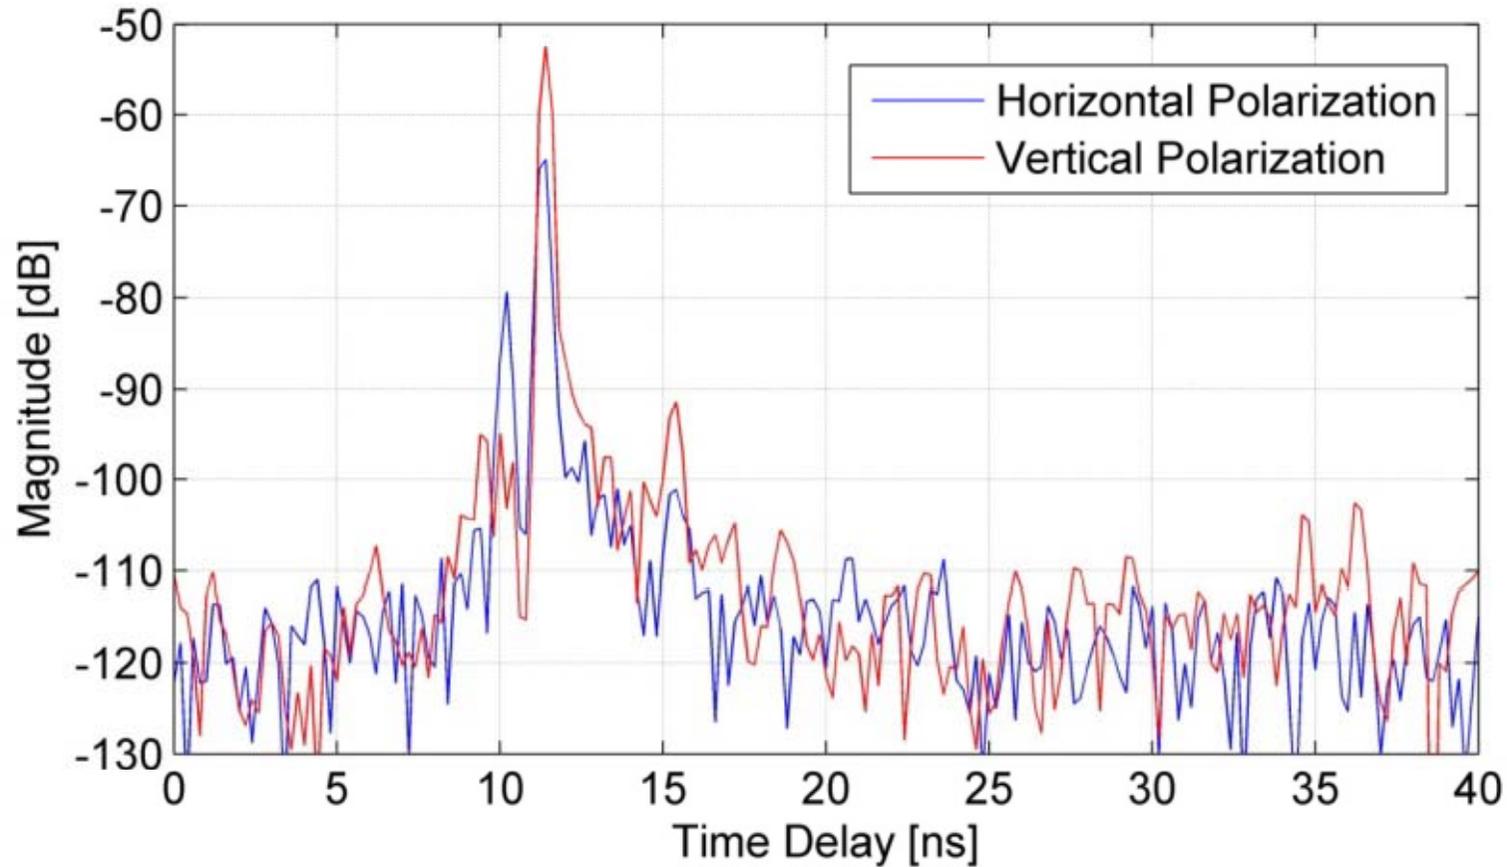

AoA vs. AoD - Polarization

- **Horn-Horn Configuration**
 - Horizontal – Horizontal
 - Vertical – Vertical
 - Horizontal – Vertical
- **Example (see next slide):**
 - 12 dB higher reflection loss for horizontal polarization

AoA vs. AoD - Polarization

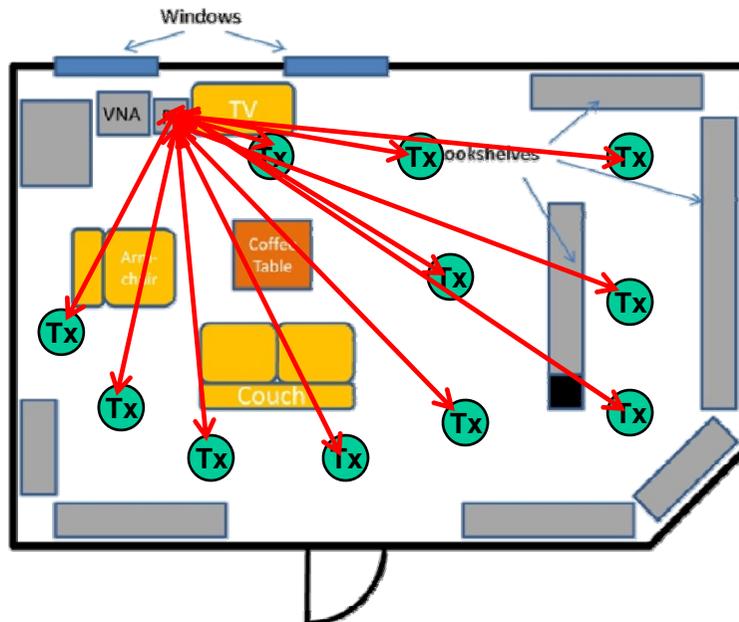

- **Proposal: Comparison with results from Sawada et al.[4] and Maltsev et. al. [5].**

Grid Measurements / Tx positions

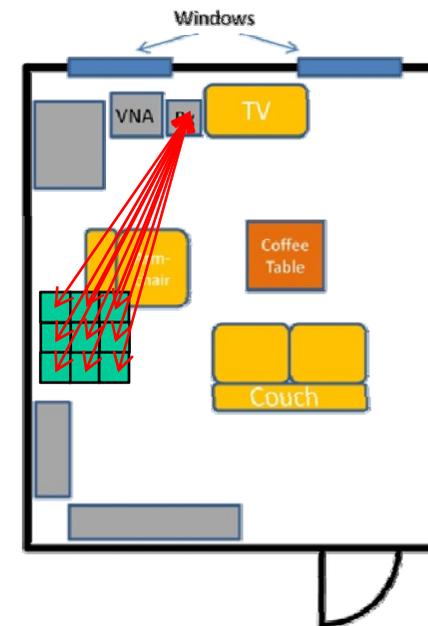

- **Different Tx Positions**

- Horn-Horn
- Open-Open
- Path Loss Model, Calibration

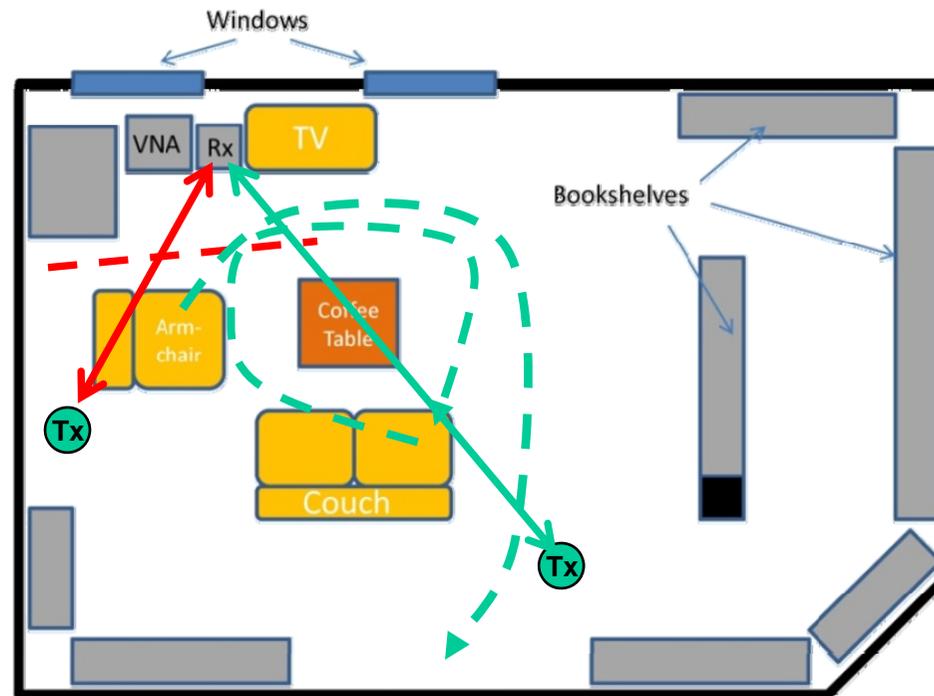

- **Grid Measurements**

- Small Scale Fading

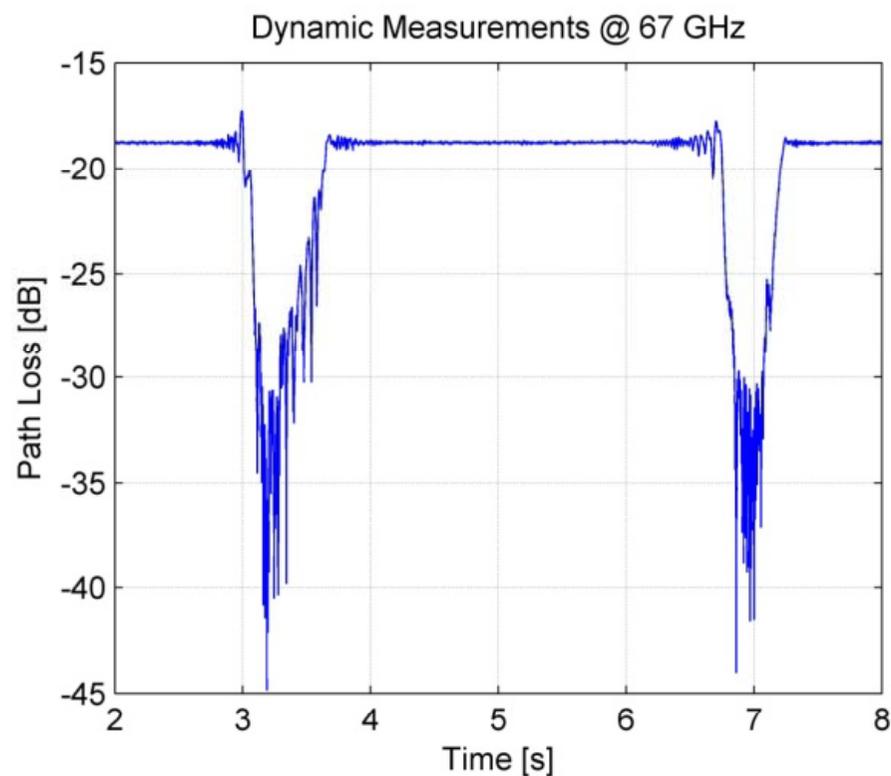

Dynamic Measurements

- **Single Person moving around**
- **Single Frequency: 67 GHz**
- **Horn-Horn, Open-Open Configuration**

Dynamic Measurements – Exemplary Result

- **Next Steps: Parameterize single shadowing events, compare results with literature [6] and develop a shadowing model**

Outlook on Ray Tracing Activities at TUBS

- **Polarization Model from Maltsev et. al. [5] has been implemented**
- **Next Steps**
 - Finish 3D models with furniture for Conference Room and Living Room
 - Calibrate RayTracing Simulations with measurements
 - Build statistical models from Ray Tracing results
